# REQUIREMENTS TO ENJOY THE DECAYING FEATURE IN MISP

- Starting from **MISP 2.4.116**, the decaying feature is available
- Don't forget to update the decay models and enable the ones you want
- The decaying feature has no impact on the information in MISP, it's just an overlay to be used in the user-interface and API
- Decay strongly relies on *Taxonomies* and *Sightings*, don't forget to review their configuration

2022-09-16

## MISP and Decaying of Indicators

### └ Expiring IOCs: Why and How?

### └ Requirements to enjoy the decaying feature in MISP

- Starting from **MISP 2.4.116**, the decaying feature is available
- Don't forget to update the decay models and enable the ones you want
- The decaying feature has no impact on the information in MISP, it's just an overlay to be used in the user-interface and API
- Decay strongly relies on *Taxonomies* and *Sightings*, don't forget to review their configuration

*Sightings* add temporal context to indicators. A user, script or an IDS can extend the information related to indicators by reporting back to MISP that an indicator has been seen, or that an indicator can be considered as a false-positive

- *Sightings* give more credibility/visibility to indicators
- This information can be used to **prioritise and decay indicators**

2022-09-16

MISP and Decaying of Indicators

└ Expiring IOCs: Why and How?

└ *Sightings* - Refresher

Sightings add temporal context to indicators. A user, script or an IDS can extend the information related to indicators by reporting back to MISP that an indicator has been seen, or that an indicator can be considered as a false-positive

- Sightings give more credibility/visibility to indicators
- This information can be used to **prioritise and decay indicators**

MISP is a peer-to-peer system, information passes through multiple instances.

- **Producers can add context** (such as tags from *Taxonomies*, *Galaxies*) about their asserted confidence or the reliability of the data
- Consumers can have **different levels of trust** in the producers and/or analysts themselves
- Users might have other contextual needs

→ Achieved thanks to *Taxonomies*

- **Producers can add context** (such as tags from *Taxonomies*, *Galaxies*) about their asserted confidence or the reliability of the data
- Consumers can have **different levels of trust** in the producers and/or analysts themselves
- Users might have other contextual needs

# CURRENT IMPLEMENTATION IN MISIP

# IMPLEMENTATION IN MISP: Event/view

The screenshot shows the MISP Event/view interface. At the top, there are navigation tabs: 'Photos', 'Galaxy', 'Event graph', 'Correlation graph', 'ATTACK matrix', 'Attributes', and 'Discussion'. Below these is a search bar for 'Galaxies' and a 'Decay' toggle button. The main content is a table of events with columns for Date, Org, Category, Type, Value, Tags, Galaxies, Comment, Correlate, Related Events, Feed hits, IDS, Distribution, Sightings, Activity, Score, and Actions. The 'Decay score' toggle is visible in the top right of the table area. The table lists several events, including one from 2019-09-12 with a score of 65.26 and another from 2019-08-13 with a score of 54.6.

# DECAYING MODELS IN DEPTH

2022-09-16

MISP and Decaying of Indicators  
└─ Decaying Models in Depth

DECAYING MODELS IN DEPTH

$$\text{score}(\text{Attribute}) = \text{base\_score}(\text{Attribute}, \text{Model}) \bullet \text{decay}(\text{Model}, \text{time})$$

When scoring indicators<sup>1</sup>, multiple parameters<sup>2</sup> can be taken into account. The **base score** is calculated with the following in mind:

- Data reliability, credibility, analyst skills, custom prioritisation tags (economical-impact), etc.
- Trust in the source

$$\text{base\_score} = \omega_{tg} \cdot \text{tags} + \omega_{sc} \cdot \text{source\_confidence}$$

Where,

$$\omega_{sc} + \omega_{tg} = 1$$

<sup>1</sup>Paper available: <https://arxiv.org/pdf/1803.11052>

<sup>2</sup>at a variable extent as required

- Data reliability, credibility, analyst skills, custom prioritisation tags (economical-impact), etc.
- Trust in the source

$$\text{base\_score} = \omega_{tg} \cdot \text{tags} + \omega_{sc} \cdot \text{source\_confidence}$$

Where,

$$\omega_{sc} + \omega_{tg} = 1$$

<sup>1</sup>Paper available: <https://arxiv.org/pdf/1803.11052>  
<sup>2</sup>at a variable extent as required

# SCORING INDICATORS: base\_score (2)

Current implentation ignores source\_confidence:

→ base\_score = tags

Tag	Computation			Result
	Eff. Ratio		numerical_value	
admiralty-scale:source-reliability="Completely reliable"	0.50	*	100.00	50.00
phishing:psychological-acceptability="high"	0.50	*	75.00	37.50
				<b>87.50</b>

→ The base\_score can be use to prioritize attribute based on their attached context and source

2022-09-16

## MISP and Decaying of Indicators

└ Decaying Models in Depth

└ Scoring Indicators: base\_score (2)

Current implentation ignores source\_confidence:

→ base\_score = tags

Tag	Computation			Result
	Eff. Ratio		numerical_value	
admiralty-scale:source-reliability="Completely reliable"	0.50	*	100.00	50.00
phishing:psychological-acceptability="high"	0.50	*	75.00	37.50
				<b>87.50</b>

→ The base\_score can be use to prioritize attribute based on their attached context and source

$$\text{score}(\text{Attribute}) = \text{base\_score}(\text{Attribute}, \text{Model}) \bullet \text{decay}(\text{Model}, \text{time})$$

The decay is calculated using:

- The lifetime of the indicator
  - ▶ May vary depending on the indicator type
  - ▶ short for an IP, long for an hash
- The decay rate, or speed at which an attribute loses score over time
- The time elapsed since the latest update or sighting

- The lifetime of the indicator
  - ▶ May vary depending on the indicator type
  - ▶ short for an IP, long for an hash
- The decay rate, or speed at which an attribute loses score over time
- The time elapsed since the latest update or sighting

→ decay rate is **re-initialized upon sighting** addition, or said differently, the score is reset to its base score as new *sightings* are applied.

$$\text{score} = \text{base\_score} \cdot \left( 1 - \left( \frac{t}{\tau} \right)^{\frac{1}{\delta}} \right)$$

- $\tau$  = lifetime
- $\delta$  = decay speed

$$\text{score} = \text{base\_score} \cdot \left( 1 - \left( \frac{t}{\tau} \right)^{\frac{1}{\delta}} \right)$$

- $\tau$  = lifetime
- $\delta$  = decay speed

$\rightarrow score = base\_score \cdot \left(1 - \left(\frac{t}{\tau}\right)^{\frac{1}{\delta}}\right)$

*Models* are an instantiation of the formula where elements can be defined:

- Parameters: *lifetime*, *decay\_rate*, *threshold*
- *base\_score*
- *default base\_score*
- *formula*
- *associate Attribute types*
- *creator organisation*

Multiple model types are available

MISP and Decaying of Indicators

└─ Decaying Models in Depth

└─ Implementation in MISP: API query body

/attributes/restSearch

```
"includeDecayScore": 1,  
"includeFullModel": 0,  
"excludeDecayed": 0,  
"decayingModel": [85],  
"modelOverrides": {  
  "threshold": 30  
}  
"score": 30,
```

The current architecture allows users to create their **own** formulae.

1. Create a new file `$filename` in `app/Model/DecayingModelsFormulas/`
2. Extend the Base class as defined in `DecayingModelBase`
3. Implement the two mandatory functions `computeScore` and `isDecayed` using your own formula/algorithm
4. Create a Model and set the formula field to `$filename`

Use cases:

- Add support for **more feature** (expiration taxonomy)
- **Query external services** then influence the score
- Completely **different approach** (i.e streaming algorithm)
- ...

# CREATING A NEW DECAY ALGORITHM (2)

```
1 <?php
2 include_once 'Base.php';
3
4 class Polynomial extends DecayingModelBase
5 {
6     public const DESCRIPTION = 'The description of your new
7     decaying algorithm';
8
9     public function computeScore($model, $attribute, $base_score,
10     $elapsed_time)
11     {
12         // algorithm returning a numerical score
13     }
14
15     public function isDecayed($model, $attribute, $score)
16     {
17         // algorithm returning a boolean stating
18         // if the attribute is expired or not
19     }
20 }
```

```
1 <?php
2 include_once "Base.php";
3
4 class Polynomial extends DecayingModelBase
5 {
6     public const DESCRIPTION = "The description of your new
7     decaying algorithm";
8
9     public function computeScore($model, $attribute, $base_score,
10     $elapsed_time)
11     {
12         // algorithm returning a numerical score
13     }
14
15     public function isDecayed($model, $attribute, $score)
16     {
17         // algorithm returning a boolean stating
18         // if the attribute is expired or not
19     }
20 }
```

- Improved support of *Sightings*
  - ▶ False positive *Sightings* should somehow reduce the score
  - ▶ Expiration *Sightings* should mark the attribute as decayed
- Potential *Model* improvements
  - ▶ Instead of resetting the score to `base_score` once a *Sighting* is set, the score should be increased additively (based on a defined coefficient); thus **prioritizing surges** rather than infrequent *Sightings*
  - ▶ Take into account related *Tags* or *Correlations* when computing score
- Increase *Taxonomy* coverage
  - ▶ Users should be able to manually override the `numerical_value` of *Tags*
- For specific type, take into account data from other services
  - ▶ Could fetch data from *BGP ranking*, *Virus Total*, *Passive X* for IP/domain/... and adapt the score
