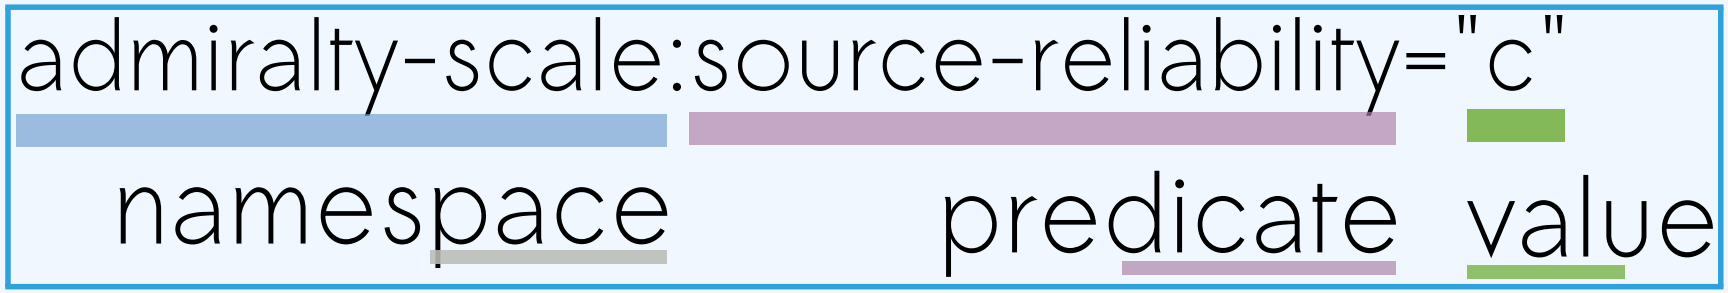
Activity	

- Tagging is a simple way to attach a classification to an event or an attribute.
- In the early version of MISP, tagging was local to an instance.
- **Classification must be globally used to be efficient**.
- After evaluating different solutions of classification, we built a new scheme using the concept of machine tags.

Machine Tags

- Triple tag, or machine tag, format was introduced in 2004 to extend geotagging on images.



- A machine tag is just a tag expressed in way that allows systems to parse and interpret it.
- Still have a human-readable version:
  - admiralty-scale:source-reliability="Fairly reliable"

MISP Taxonomies

- Taxonomies are implemented in a simple JSON format.
- Anyone can create their own taxonomy or reuse an existing one.
- The taxonomies are in an independent git repository[1].
- These can be freely reused and integrated into other threat intel tools.
- Taxonomies are licensed under Creative Commons (public domain) except if the taxonomy author decided to use another license.

[1] https://www.github.com/MISP/misp-taxonomies/

Existing Taxonomies

- NATO - **Admiralty Scale**
- CIRCL Taxonomy - **Schemes of Classification in Incident Response and Detection**
- eCSIRT and IntelMQ incident classification
- EUCI **EU classified information marking**
- Information Security Marking Metadata from DNI (Director of National Intelligence - US)
- NATO Classification Marking
- OSINT **Open Source Intelligence - Classification**
- TLP - **Traffic Light Protocol**
- Vocabulary for Event Recording and Incident Sharing - **VERIS**
- And many more like ENISA, Europol, or the draft FIRST SIG Information Exchange Policy.

Want to write your own taxonomy? 1/2

```
{
  "namespace": "admiralty-scale",
  "description": "The Admiralty Scale (also called the NATO System
      ) is used to rank the reliability of a source and the
      credibility of an information.",
  "version": 1,
  "predicates": [
    {
      "value": "source-reliability",
      "expanded": "Source Reliability"
    },
    {
      "value": "information-credibility",
      "expanded": "Information Credibility"
    }
  ],
....
```

Want to write your own taxonomy? 2/2

```
{
  "values": [
    {
      "predicate": "source-reliability",
      "entry": [
        {
          "value": "a",
          "expanded": "Completely reliable"
        },
....
```

- Publishing your taxonomy is as easy as a simple git pull request on misp-taxonomies[2].

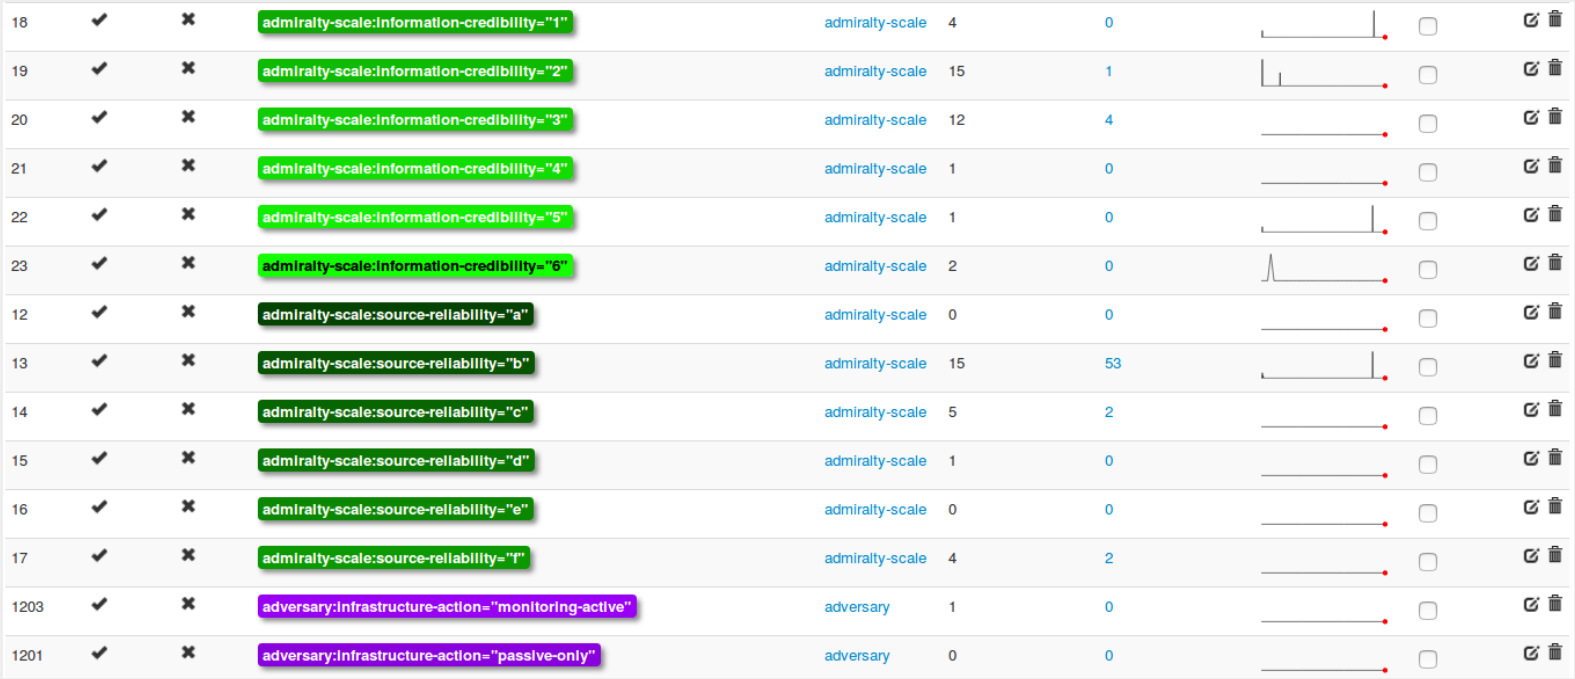
How are taxonomies integrated in MISP?

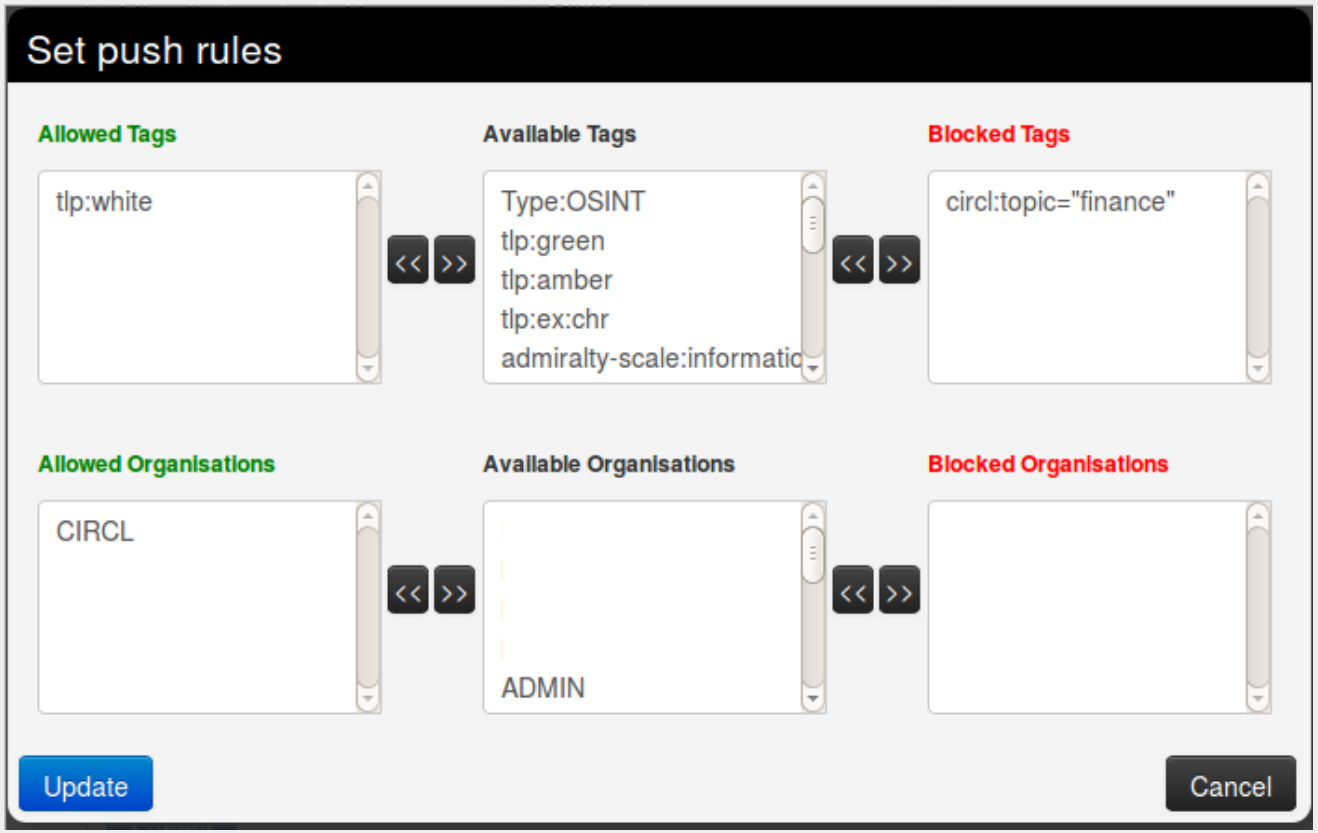


18	✔	✖	admiralty-scale:information-credibility="1"	admiralty-scale	4	0			
19	✔	✖	admiralty-scale:information-credibility="2"	admiralty-scale	15	1			
20	✔	✖	admiralty-scale:information-credibility="3"	admiralty-scale	12	4			
21	✔	✖	admiralty-scale:information-credibility="4"	admiralty-scale	1	0			
22	✔	✖	admiralty-scale:information-credibility="5"	admiralty-scale	1	0			
23	✔	✖	admiralty-scale:information-credibility="6"	admiralty-scale	2	0			
12	✔	✖	admiralty-scale:source-reliability="a"	admiralty-scale	0	0			
13	✔	✖	admiralty-scale:source-reliability="b"	admiralty-scale	15	53			
14	✔	✖	admiralty-scale:source-reliability="c"	admiralty-scale	5	2			
15	✔	✖	admiralty-scale:source-reliability="d"	admiralty-scale	1	0			
16	✔	✖	admiralty-scale:source-reliability="e"	admiralty-scale	0	0			
17	✔	✖	admiralty-scale:source-reliability="f"	admiralty-scale	4	2			
1203	✔	✖	adversary:infrastructure-action="monitoring-active"	adversary	1	0			
1201	✔	✖	adversary:infrastructure-action="passive-only"	adversary	0	0			

- MISP administrator can just import (or even cherry pick) the namespace or predicates they want to use as tags.
- Tags can be exported to other instances.
- Tags are also accessible via the MISP REST API.

Filtering the distribution of events among MISP instances

- Applying rules for distribution based on tags:



Other use cases using MISP taxonomies

- Tags can be used to set events or attributes for **further processing by external tools** (e.g. VirusTotal auto-expansion using Viper).
- Ensuring a classification manager **classifies the events before release** (e.g. release of information from air-gapped/classified networks).
- **Enriching IDS export** with tags to fit your NIDS deployment.
- Using **IntelMQ** and MISP together to process events (tags limited per organization introduced in MISP 2.4.49).

Future functionalities related to MISP taxonomies

- **Sighting** support (thanks to NCSC-NL) is integrated in MISP allowing to auto expire IOC based on user detection.
- Adjusting taxonomies (adding/removing tags) based on their score or visibility via sighting.
- Simple taxonomy editors to **help non-technical users** to create their taxonomies.
- **Filtering mechanisms** in MISP to rename or replace taxonomies/tags at pull and push synchronisation.
- More public taxonomies to be included.

PyTaxonomies

- **Python module** to handle the taxonomies
- **Offline** and online mode (fetch the newest taxonomies from GitHub)
- Simple **search** to make tagging easy
- Totally independent from MISP
- **No external dependencies** in offline mode
- Python3 only
- Can be used to create & **dump a new taxonomy**

PyTaxonomies

```python
from pytaxonomies import Taxonomies
taxonomies = Taxonomies()
taxonomies.version
# => '20160725'
taxonomies.description
# => 'Manifest file of MISP taxonomies available.'
list(taxonomies.keys())
# => ['tlp', 'eu-critical-sectors', 'de-vs', 'osint', 'circl', 'veris',
#         'ecsirt', 'dhs-ciip-sectors', 'fr-classif', 'misp', 'admiralty-scale', ...]
taxonomies.get('enisa').description
# 'The present threat taxonomy is an initial version that has been developed on
# the basis of available ENISA material. This material has been used as an ENISA-internal
# structuring aid for information collection and threat  consolidation purposes.
# It emerged in the time period 2012-2015.'
print(taxonomies.get('circl'))
# circl:incident-classification="vulnerability"
# circl:incident-classification="malware"
# circl:incident-classification="fastflux"
# circl:incident-classification="system-compromise"
# circl:incident-classification="sql-injection"
# ....
print(taxonomies.get('circl').machinetags_expanded())
# circl:incident-classification="Phishing"
# circl:incident-classification="Malware"
# circl:incident-classification="XSS"
# circl:incident-classification="Copyright issue"
# circl:incident-classification="Spam"
# circl:incident-classification="SQL Injection"
```

The dilemma of false-positives

- False-positives are a **common issue** in threat intelligence sharing.
- It's often a contextual issue:
  - False-positives might be different per community of users sharing information.
  - Organizations might have their **own view** on false-positives.
- Based on the success of the MISP taxonomy model, we built misp-warninglists.

MISP warning lists

- misp-warninglists are lists of well-known indicators that can be associated to potential false positives, errors, or mistakes.
- Simple JSON files

```
{
  "name": "List of known public DNS resolvers",
  "version": 2,
  "description": "Event contains one or more public DNS resolvers
      as attribute with an IDS flag set",
  "matching_attributes": [
    "ip-src",
    "ip-dst"
  ],
  "list": [
    "8.8.8.8",
    "8.8.4.4",...]
}
```

MISP warning lists

- The warning lists are integrated in MISP to display an info/warning box at the event and attribute level.
- Enforceable via the API where all attributes that have a hit on a warninglist will be excluded.
- This can be enabled at MISP instance level.
- Default warning lists can be enabled or disabled like **known public resolver**, **multicast IP addresses**, **hashes for empty values**, **rfc1918**, **TLDs** or **known Google domains**.
- The warning lists can be expanded or added in JSON locally or via pull requests.
- Warning lists can be also used for **critical or core infrastructure warning**, **personally identifiable information**...
