## Volgmer - S0180

[Volgmer](<https://attack.mitre.org/software/S0180>) is a backdoor Trojan designed to provide covert access to a compromised system. It has been used since at least 2013 to target the government, financial, automotive, and media industries. Its primary delivery mechanism is suspected to be spearphishing. (Citation: US-CERT Volgmer Nov 2017)

## InvisiMole - S0260

[InvisiMole](<https://attack.mitre.org/software/S0260>) is a modular spyware program that has been used by threat actors since at least 2013. [InvisiMole](<https://attack.mitre.org/software/S0260>) has two backdoor modules called RC2FM and RC2CL that are used to perform post-exploitation activities. It has been discovered on compromised victims in the Ukraine and Russia. (Citation: ESET InvisiMole June 2018)

## ADVSTORESHELL - S0045

[ADVSTORESHELL](<https://attack.mitre.org/software/S0045>) is a spying backdoor that has been used by [APT28](<https://attack.mitre.org/groups/G0007>) from at least 2012 to 2016. It is generally used for long-term espionage and is deployed on targets deemed interesting after a reconnaissance phase.

## BlackEnergy - S0089

[BlackEnergy](<https://attack.mitre.org/software/S0089>) is a malware toolkit that has been used by both criminal and APT actors. It dates back to at least 2007 and was originally designed to create botnets for use in conducting Distributed Denial of Service (DDoS) attacks, but its use has evolved to support various plug-ins. It is well known for being used during the confrontation between Georgia and Russia in 2008, as well as in targeting Ukrainian institutions. Variants include BlackEnergy 2 and BlackEnergy 3. ## Reaver - S0172

[Reaver](<https://attack.mitre.org/software/S0172>) is a malware family that has been in the wild since at least late 2016. Reporting indicates victims have primarily been associated with the "Five Poisons," which are movements the Chinese government considers dangerous. The type of malware is rare due to its final payload being in the form of [Control Panel Items](<https://attack.mitre.org/techniques/T1196>). (Citation: Palo Alto Reaver Nov 2017)

## FinFisher - S0182

[FinFisher](<https://attack.mitre.org/software/S0182>) is a government-grade commercial surveillance spyware reportedly sold exclusively to government agencies for use in targeted and lawful criminal investigations. It is heavily obfuscated and uses multiple anti-analysis techniques. It has other variants including [Wingbird](<https://attack.mitre.org/software/S0176>). (Citation: FinFisher Citation) (Citation: Microsoft SIR Vol 21) (Citation: FireEye FinSpy Sept 2017) (Citation: Securelist BlackOasis Oct 2017) (Citation: Microsoft FinFisher March 2018)

## Xbash - S0341

[Xbash](<https://attack.mitre.org/software/S0341>) is a malware family that has targeted Linux and Microsoft Windows servers. The malware has been tied to the Iron Group, a threat actor group known for previous ransomware attacks. [Xbash](<https://attack.mitre.org/software/S0341>) was developed in Python and then converted into a self-contained Linux ELF executable by using PyInstaller.(Citation: Unit42 Xbash Sept 2018)

The tag is: *misp-galaxy:mitre-malware="Xbash - S0341"*

Xbash - S0341 is also known as:

- Xbash

Xbash - S0341 has relationships with:

- uses: misp-galaxy:mitre-enterprise-attack-attack-pattern="Standard Application Layer Protocol - T1071" with estimative-language:likelihood-probability="almost-certain"

## POWERTON - S0371

[POWERTON](<https://attack.mitre.org/software/S0371>) is a custom PowerShell backdoor first observed in 2018. It has typically been deployed as a late-stage backdoor by [APT33](<https://attack.mitre.org/groups/G0064>). At least two variants of the backdoor have been identified, with the later version containing improved functionality.(Citation: FireEye APT33 Guardrail)

## POWERSOURCE - S0145

[POWERSOURCE](<https://attack.mitre.org/software/S0145>) is a PowerShell backdoor that is a heavily obfuscated and modified version of the publicly available tool DNS\_TXT\_Pwnage. It was observed in February 2017 in spearphishing campaigns against personnel involved with United States Securities and Exchange Commission (SEC) filings at various organizations. The malware was delivered when macros were enabled by the victim and a VBS script was dropped. (Citation: FireEye FIN7 March 2017) (Citation: Cisco DNSMessenger March 2017)

## Proxysvc - S0238

[Proxysvc](<https://attack.mitre.org/software/S0238>) is a malicious DLL used by [Lazarus Group](<https://attack.mitre.org/groups/G0032>) in a campaign known as Operation GhostSecret. It has appeared to be operating undetected since 2017 and was mostly observed in higher education organizations. The goal of [Proxysvc](<https://attack.mitre.org/software/S0238>) is to deliver additional payloads to the target and to maintain control for the attacker. It is in the form of a DLL that can also be executed as a standalone process. (Citation: McAfee GhostSecret)

## More\_eggs - S0284

[More\_eggs](<https://attack.mitre.org/software/S0284>) is a JScript backdoor used by [Cobalt Group](<https://attack.mitre.org/groups/G0080>). Its name was given based on the variable "More\_eggs" being present in its code. There are at least two different versions of the backdoor being used, version 2.0 and version 4.4. ## TrickBot - S0266

[TrickBot](<https://attack.mitre.org/software/S0266>) is a Trojan spyware program that has mainly been used for targeting banking sites in United States, Canada, UK, Germany, Australia, Austria, Ireland, London, Switzerland, and Scotland. TrickBot first emerged in the wild in September 2016 and appears to be a successor to [Dyre](<https://attack.mitre.org/software/S0024>). [TrickBot](<https://attack.mitre.org/software/S0266>) is developed in the C++ programming language. (Citation: S2 Grupo TrickBot June 2017) (Citation: Fidelis TrickBot Oct 2016) (Citation: IBM TrickBot Nov 2016)

## NOKKI - S0353

[NOKKI](<https://attack.mitre.org/software/S0353>) is a modular remote access tool. The earliest observed attack using [NOKKI](<https://attack.mitre.org/software/S0353>) was in January 2018. [NOKKI](<https://attack.mitre.org/software/S0353>) has significant code overlap with the [KONNI](<https://attack.mitre.org/software/S0356>) malware family. There is some evidence potentially linking [NOKKI](<https://attack.mitre.org/software/S0353>) to [APT37](<https://attack.mitre.org/groups/G0067>). (Citation: Unit 42 NOKKI Sept 2018)(Citation: Unit 42 Nokki Oct 2018)

## LightNeuron - S0395

[LightNeuron](<https://attack.mitre.org/software/S0395>) is a sophisticated backdoor that has targeted Microsoft Exchange servers since at least 2014. [LightNeuron](<https://attack.mitre.org/software/S0395>) has been used by [Turla](<https://attack.mitre.org/groups/G0010>) to target diplomatic and foreign affairs-related organizations. The presence of certain strings in the malware suggests a Linux variant of [LightNeuron](<https://attack.mitre.org/software/S0395>) exists.(Citation: ESET LightNeuron May 2019)

## NotPetya - S0368

[NotPetya](<https://attack.mitre.org/software/S0368>) is malware that was first seen in a worldwide attack starting on June 27, 2017. The main purpose of the malware appeared to be to effectively destroy data and disk structures on compromised systems. Though [NotPetya](<https://attack.mitre.org/software/S0368>) presents itself as a form of ransomware, it appears likely that the attackers never intended to make the encrypted data recoverable. As such, [NotPetya](<https://attack.mitre.org/software/S0368>) may be more appropriately thought of as a form of wiper malware. [NotPetya](<https://attack.mitre.org/software/S0368>) contains worm-like features to spread itself across a computer network using the SMBv1 exploits EternalBlue and EternalRomance.(Citation: Talos Nyetya June 2017)(Citation: Talos Nyetya June 2017)(Citation: US-CERT NotPetya 2017)

The tag is: *misp-galaxy:mitre-malware="NotPetya - S0368"*

### authors

MITRE

## Malicious SMS Message - MOB-T1057

An SMS message could contain content designed to exploit vulnerabilities in the SMS parser on the receiving device. For example, Mulliner and Miller demonstrated such an attack against the iPhone in 2009 as described in (Citation: Forbes-iPhoneSMS).

An SMS message could also contain a link to a web site containing malicious content designed to exploit the device web browser.

As described by SRLabs in (Citation: SRLabs-SIMCard), vulnerable SIM cards may be remotely exploited and reprogrammed via SMS messages.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Malicious SMS Message - MOB-T1057"*

Malicious SMS Message - MOB-T1057 has relationships with:

## Eavesdrop on Insecure Network Communication - MOB-T1042

If network traffic between the mobile device and remote servers is unencrypted or is encrypted in an insecure manner, then an adversary positioned on the network can eavesdrop on communication. For example, He et al. (Citation: mHealth) describe numerous healthcare-related applications that did not properly protect network communication.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Eavesdrop on Insecure Network Communication - MOB-T1042"*

## Disguise Root/Jailbreak Indicators - MOB-T1011

An adversary could use knowledge of the techniques used by security software to evade detection. For example, some mobile security products perform compromised device detection by searching for particular artifacts such as an installed "su" binary, but that check could be evaded by naming the binary something else. Similarly, polymorphic code techniques could be used to evade signature-based detection as described by (Citation: Rastogi) et al. (Citation: Rastogi).

(Citation: Brodie) (Citation: Brodie) describes limitations of jailbreak/root detection mechanisms.

(Citation: Tan) (Citation: Tan) describes his experience defeating the jailbreak detection used by the iOS version of Good for Enterprise.

## Premium SMS Toll Fraud - MOB-T1051

A malicious app could use standard Android APIs to send SMS messages. SMS messages could potentially be sent to premium numbers that charge the device owner and generate revenue for an adversary, for example as described by Lookout in (Citation: Lookout-SMS).

On iOS, apps cannot send SMS messages.

On Android, apps must hold the `SEND_SMS` permission to send SMS messages. Additionally, Android version 4.2 and above has mitigations against this threat by requiring user consent before

allowing SMS messages to be sent to premium numbers (Citation: AndroidSecurity2014).

Detection: As described in Google's Android Security 2014 Year in Review Report (Citation: AndroidSecurity2014), starting with Android 4.2 the user is prompted and must provide consent before applications can send SMS messages to premium numbers.

On Android 6.0 and up, the user can view which applications have permission to send SMS messages through the device settings screen, and the user can choose to revoke the permissions.

Platforms: Android

## Obtain Device Cloud Backups - MOB-T1073

An adversary who is able to obtain unauthorized access to or misuse authorized access to cloud backup services (e.g. Google's Android backup service or Apple's iCloud) could use that access to obtain sensitive data stored in device backups. For example, the Elcomsoft Phone Breaker product advertises the ability to retrieve iOS backup data from Apple's iCloud (Citation: Elcomsoft-EPPB).

Detection: Google provides the ability for users to view their account activity. Apple iCloud also provides notifications to users of account activity.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Obtain Device Cloud Backups - MOB-T1073"*

<a href="https://www.elcomsoft.com/eppb.html">https://www.elcomsoft.com/eppb.html</a>

## Access Sensitive Data in Device Logs - MOB-T1016

On versions of Android prior to 4.1, an adversary may use a malicious application that holds the READ\_LOGS permission to obtain private keys, passwords, other credentials, or other sensitive data

stored in the device's system log. On Android 4.1 and later, an adversary would need to attempt to perform an operating system privilege escalation attack to be able to access the log.

Platforms: Android

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Access Sensitive Data in Device Logs - MOB-T1016"*

Table 3661. Table References

## Attack PC via USB Connection - MOB-T1030

With escalated privileges, an adversary could program the mobile device to impersonate USB devices such as input devices (keyboard and mouse), storage devices, and/or networking devices in order to attack a physically connected PC. Wang and Stavrou (Citation: Wang-ExploitingUSB) and Kamkar (Citation: ArsTechnica-PoisonTap) describe this technique. This technique has been demonstrated on Android, and we are unaware of any demonstrations on iOS.

Platforms: Android

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Attack PC via USB Connection - MOB-T1030"*

-------

<https://attack.mitre.org/mobile/index.php/Technique/MOB-T1019>

<https://tools.ietf.org/html/rfc7636>

## URL Scheme Hijacking - MOB-T1018

An iOS application may be able to maliciously claim a URL scheme, allowing it to intercept calls that are meant for a different application. This technique, for example, could be used to capture OAuth authorization codes as described in (Citation: IETF-PKCE) or to phish user credentials as described in (Citation: MobileIron-XARA). Related potential security implications are described in (Citation: Dhanjani-URLScheme). FireEye researchers describe URL scheme hijacking in a blog post (Citation: FireEye-Masque2), including evidence of its use.

Platforms: iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="URL Scheme Hijacking - MOB-T1018"*

## Modify System Partition - MOB-T1003

If an adversary can escalate privileges, he or she may be able to use those privileges to place malicious code in the device system partition, where it may persist after device resets and may not be easily removed by the device user.

Many Android devices provide the ability to unlock the bootloader for development purposes. An unlocked bootloader may provide the ability for an adversary to modify the system partition. Even if the bootloader is locked, it may be possible for an adversary to escalate privileges and then modify the system partition.

Detection: Android devices with the Verified Boot capability (Citation: Android-VerifiedBoot) perform cryptographic checks of the integrity of the system partition.

The Android SafetyNet API's remote attestation capability could potentially be used to identify and respond to compromised devices.

Samsung KNOX also provides a remote attestation capability on supported Samsung Android devices.

As described in the iOS Security Guide (Citation: Apple-iOSSecurityGuide), iOS devices will fail to boot or fail to allow device activation if unauthorized modifications are detected.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Modify System Partition - MOB-T1003"*

## System Information Discovery - MOB-T1029

An adversary may attempt to get detailed information about the operating system and hardware, including version, patches, and architecture.

On Android, much of this information is programmatically accessible to applications through the android.os.Build class (Citation: Android-Build).

On iOS, techniques exist for applications to programmatically access this information, for example as described in (Citation: StackOverflow-iOSVersion).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="System Information Discovery - MOB-*

T1029"

Table 3667. Table References

## Network Service Scanning - MOB-T1026

Adversaries may attempt to get a listing of services running on remote hosts, including those that may be vulnerable to remote software exploitation. Methods to acquire this information include port scans and vulnerability scans from the mobile device. This technique may take advantage of the mobile device's access to an internal enterprise network either through local connectivity or through a Virtual Private Network (VPN).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Network Service Scanning - MOB-T1026"*

<a href="https://attack.mitre.org/mobile/index.php/Technique/MOB-T1026">https://attack.mitre.org/mobile/index.php/Technique/MOB-T1026</a>

## Access Call Log - MOB-T1036

On Android, an adversary could call standard operating system APIs from a malicious application to gather call log data, or with escalated privileges could directly access files containing call log data.

On iOS, applications do not have access to the call log, so privilege escalation would be required in order to access the data.

Detection: On Android 6.0 and up, the user can view which applications have permission to access call log information through the device settings screen, and the user can choose to revoke the permissions.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Access Call Log - MOB-T1036"*

## Detect App Analysis Environment - MOB-T1043

An adversary could evade app vetting techniques by placing code in a malicious application to detect whether it is running in an app analysis environment and, if so, avoid performing malicious actions while under analysis.

Discussion of general Android anti-analysis techniques can be found in (Citation: Petsas). Discussion of Google Play Store-specific anti-analysis techniques can be found in (Citation: Oberheide-Bouncer), (Citation: Percoco-Bouncer).

(Citation: Wang) presents a discussion of iOS anti-analysis techniques.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Detect App Analysis Environment - MOB-T1043"*

Detect App Analysis Environment - MOB-T1043 has relationships with:

## Standard Application Layer Protocol - MOB-T1040

Adversaries may communicate using a common, standardized application layer protocol such as HTTP, HTTPS, SMTP, or DNS to avoid detection by blending in with existing traffic.

In the mobile environment, the Google Cloud Messaging (GCM; two-way) and Apple Push Notification Service (APNS; one-way server-to-device) are commonly used protocols on Android and iOS respectively that would blend in with routine device traffic and are difficult for enterprises to inspect. As described by Kaspersky (Citation: Kaspersky-MobileMalware), Google responds to reports of abuse by blocking access to GCM.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Standard Application Layer Protocol - MOB-T1040"*

## File and Directory Discovery - MOB-T1023

On Android, command line tools or the Java file APIs can be used to enumerate file system contents. However, Linux file permissions and SELinux policies generally strongly restrict what can be accessed by apps (without taking advantage of a privilege escalation exploit). The contents of the external storage directory are generally visible, which could present concern if sensitive data is inappropriately stored there.

iOS's security architecture generally restricts the ability to perform file and directory discovery without use of escalated privileges.

Platforms: Android

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="File and Directory Discovery - MOB-T1023"*

*Table 3676. Table References*

## User Interface Spoofing - MOB-T1014

At least three methods exist to perform User Interface Spoofing:

First, on both Android and iOS, an adversary could impersonate the user interface of a legitimate app or device function to trick a user into entering account credentials.

Second, on both Android and iOS, a malicious app could impersonate the identity of another app in order to trick users into installing and using it.

Third, on older versions of Android, a malicious app could abuse mobile operating system features to interfere with a running legitimate app as described in (Citation: Felt-PhishingOnMobileDevices) and (Citation: Hassell-ExploitingAndroid). However, this technique appears to have been addressed starting in Android 5.0 with the deprecation of the Android's `ActivityManager.getRunningTasks` method and modification of its behavior (Citation: Android-getRunningTasks) and further addressed in Android 5.1.1 (Citation: StackOverflow-getRunningAppProcesses) to prevent a malicious app from determining what app is currently in the foreground.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="User Interface Spoofing - MOB-T1014"*

## Exploit Baseband Vulnerability - MOB-T1058

A message sent over a radio interface (typically cellular, but potentially Bluetooth, GPS, NFC, Wi-Fi or other) to the mobile device could exploit a vulnerability in code running on the device.

1. Komaromy and N. Golde demonstrated baseband exploitation of a Samsung mobile device at the PacSec 2015 security conference (Citation: Register-BaseStation).

Weinmann described and demonstrated "the risk of remotely exploitable memory corruptions in cellular baseband stacks." (Citation: Weinmann-Baseband)

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Exploit Baseband Vulnerability - MOB-T1058"*

Exploit Baseband Vulnerability - MOB-T1058 has relationships with:

- revoked-by: *misp-galaxy:mitre-attack-pattern="Exploit via Radio Interfaces - T1477"* with estimative-language:likelihood-probability="almost-certain"

## Process Discovery - MOB-T1027

On Android versions prior to 5, applications can observe information about other processes that are running through methods in the ActivityManager class. On Android versions prior to 7, applications can obtain this information by executing the `ps` command, or by examining the `/proc` directory. Starting in Android version 7, use of the Linux kernel's `hidepid` feature prevents applications (without escalated privileges) from accessing this information (Citation: Android-SELinuxChanges).

Platforms: Android

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Process Discovery - MOB-T1027"*

## App Delivered via Web Download - MOB-T1034

The application is downloaded from an arbitrary web site. A link to the application's download URI may be sent in an email or SMS, placed on another web site that the target is likely to view, or sent via other means (such as QR code).

Detection: An EMM/MDM or mobile threat protection solution can identify the presence of unwanted, known insecure, or malicious apps on devices.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="App Delivered via Web Download - MOB-T1034"*

App Delivered via Web Download - MOB-T1034 has relationships with:

- revoked-by: *misp-galaxy:mitre-attack-pattern="Deliver Malicious App via Other Means - T1476"* with estimative-language:likelihood-probability="almost-certain"

## Capture SMS Messages - MOB-T1015

A malicious application could capture sensitive data sent via SMS, including authentication credentials. SMS is frequently used to transmit codes used for multi-factor authentication.

On Android, a malicious application must request and obtain permission (either at app install time or run time) in order to receive SMS messages. Alternatively, a malicious application could attempt to perform an operating system privilege escalation attack to bypass the permission requirement.

On iOS, applications cannot access SMS messages in normal operation, so an adversary would need to attempt to perform an operating system privilege escalation attack to potentially be able to access SMS messages.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Capture SMS Messages - MOB-T1015"*

Table 3686. Table References

Links
<a href="https://attack.mitre.org/mobile/index.php/Technique/MOB-T1015">https://attack.mitre.org/mobile/index.php/Technique/MOB-T1015</a>

## Encrypt Files for Ransom - MOB-T1074

An adversary may encrypt files stored on the mobile device to prevent the user from accessing them, only unlocking access to the files after a ransom is paid. Without escalated privileges, the adversary is generally limited to only encrypting files in external/shared storage locations. This technique has been demonstrated on Android, and we are unaware of any demonstrated use on iOS.

Platforms: Android

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Encrypt Files for Ransom - MOB-T1074"*

Table 3687. Table References

## Abuse of iOS Enterprise App Signing Key - MOB-T1048

An adversary could abuse an iOS enterprise app signing key (intended for enterprise in-house distribution of apps) to sign malicious iOS apps so that they can be installed on iOS devices without the app needing to be published on Apple's App Store. For example, Xiao describes use of this technique in (Citation: Xiao-iOS).

Detection: iOS 9 and above typically requires explicit user consent before allowing installation of applications signed with enterprise distribution keys rather than installed from Apple's App Store.

Platforms: iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Abuse of iOS Enterprise App Signing Key - MOB-T1048"*

Abuse of iOS Enterprise App Signing Key - MOB-T1048 has relationships with:

- revoked-by: *misp-galaxy:mitre-attack-pattern="Deliver Malicious App via Other Means - T1476"* with estimative-language:likelihood-probability="almost-certain"

## Exploit TEE Vulnerability - MOB-T1008

A malicious app or other attack vector could be used to exploit vulnerabilities in code running within the Trusted Execution Environment (TEE) (Citation: Thomas-TrustZone). The adversary could then obtain privileges held by the TEE potentially including the ability to access cryptographic keys or other sensitive data (Citation: QualcommKeyMaster). Escalated operating system privileges may be first required in order to have the ability to attack the TEE (Citation: EkbergTEE). If not, privileges within the TEE can potentially be used to exploit the operating system (Citation: luginimaineb-TEE).

Platforms: Android

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Exploit TEE Vulnerability - MOB-T1008"*

## Rogue Wi-Fi Access Points - MOB-T1068

An adversary could set up unauthorized Wi-Fi access points or compromise existing access points and, if the device connects to them, carry out network-based attacks such as eavesdropping on or modifying network communication as described in NIST SP 800-153 (Citation: NIST-SP800153).

For example, Kaspersky describes a threat actor they call DarkHotel that targeted hotel Wi-Fi networks, using them to compromise computers belonging to business executives (Citation: Kaspersky-DarkHotel).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Rogue Wi-Fi Access Points - MOB-T1068"*

*Table 3694. Table References*

## Remotely Track Device Without Authorization - MOB-T1071

An adversary who is able to obtain unauthorized access to or misuse authorized access to cloud services (e.g. Google's Android Device Manager or Apple iCloud's Find my iPhone) or to an enterprise mobility management (EMM) / mobile device management (MDM) server console could use that access to track mobile devices.

Detection: Google sends a notification to the device when Android Device Manager is used to locate it. Additionally, Google provides the ability for users to view their general account activity. Apple iCloud also provides notifications to users of account activity.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Remotely Track Device Without*

## Biometric Spoofing - MOB-T1063

An adversary could attempt to spoof a mobile device's biometric authentication mechanism, for example by providing a fake fingerprint as described by SRLabs in (Citation: SRLabs-Fingerprint).

iOS partly mitigates this attack by requiring the device passcode rather than a fingerprint to unlock the device after every device restart and after 48 hours since the device was last unlocked (Citation: Apple-TouchID).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Biometric Spoofing - MOB-T1063"*

Biometric Spoofing - MOB-T1063 has relationships with:

- revoked-by: *misp-galaxy:mitre-mobile-attack-attack-pattern="Lockscreen Bypass - MOB-T1064"* with estimative-language:likelihood-probability="almost-certain"

## Capture Clipboard Data - MOB-T1017

A malicious app or other attack vector could capture sensitive data stored in the device clipboard, for example passwords being copy-and-pasted from a password manager app.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Capture Clipboard Data - MOB-T1017"*

*Table 3698. Table References*

Links

<https://attack.mitre.org/mobile/index.php/Technique/MOB-T1017>

<https://pages.nist.gov/mobile-threat-catalogue/application-threats/APP-35.html>

## Access Contact List - MOB-T1035

An adversary could call standard operating system APIs from a malicious application to gather contact list (i.e., address book) data, or with escalated privileges could directly access files containing contact list data.

Detection: On both Android (6.0 and up) and iOS, the user can view which applications have permission to access contact list information through the device settings screen, and the user can choose to revoke the permissions.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Access Contact List - MOB-T1035"*

*Table 3699. Table References*

Links

<https://attack.mitre.org/mobile/index.php/Technique/MOB-T1035>

<https://pages.nist.gov/mobile-threat-catalogue/application-threats/APP-13.html>

## Stolen Developer Credentials or Signing Keys - MOB-T1044

An adversary could steal developer account credentials on an app store and/or signing keys to publish malicious updates to existing Android or iOS apps, or to abuse the developer's identity and reputation to publish new malicious applications. For example, Infoworld describes this technique and suggests mitigations in (Citation: Infoworld-Appstore).

Detection: Developers can regularly scan (or have a third party scan on their behalf) the app stores for presence of unauthorized apps that were submitted using the developer's identity.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Stolen Developer Credentials or Signing Keys - MOB-T1044"*

Stolen Developer Credentials or Signing Keys - MOB-T1044 has relationships with:

## Network Traffic Capture or Redirection - MOB-T1013

An adversary may capture network traffic to and from the device to obtain credentials or other sensitive data, or redirect network traffic to flow through an adversary-controlled gateway to do the same.

A malicious app could register itself as a VPN client on Android or iOS to gain access to network packets. However, on both platforms, the user must grant consent to the app to act as a VPN client, and on iOS the app requires a special entitlement that must be granted by Apple.

Alternatively, if a malicious app is able to escalate operating system privileges, it may be able to use those privileges to gain access to network traffic.

An adversary could redirect network traffic to an adversary-controlled gateway by establishing a VPN connection or by manipulating the device's proxy settings. For example, Skycure (Citation: Skycure-Profiles) describes the ability to redirect network traffic by installing a malicious iOS Configuration Profile.

If applications encrypt their network traffic, sensitive data may not be accessible to an adversary, depending on the point of capture.

Detection: On both Android and iOS the user must grant consent to an app to act as a VPN. Both platforms also provide visual context to the user in the top status bar when a VPN connection is in place.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Network Traffic Capture or Redirection -*

MOB-T1013"

Table 3701. Table References

## Access Sensitive Data or Credentials in Files - MOB-T1012

An adversary could attempt to read files that contain sensitive data or credentials (e.g., private keys, passwords, access tokens). This technique requires either escalated privileges or for the targeted app to have stored the data in an insecure manner (e.g., with insecure file permissions or in an insecure location such as an external storage directory).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Access Sensitive Data or Credentials in Files - MOB-T1012"*

Table 3702. Table References

Links
<a href="https://attack.mitre.org/mobile/index.php/Technique/MOB-T1012">https://attack.mitre.org/mobile/index.php/Technique/MOB-T1012</a>

## Modify Trusted Execution Environment - MOB-T1002

If an adversary can escalate privileges, he or she may be able to use those privileges to place malicious code in the device's Trusted Execution Environment (TEE) or other similar isolated execution environment where the code can evade detection, may persist after device resets, and may not be removable by the device user. Running code within the TEE may provide an adversary with the ability to monitor or tamper with overall device behavior.

Thomas Roth describes the potential for placing a rootkit within the TrustZone secure world (Citation: Roth-Rootkits).

Detection: Devices may perform cryptographic integrity checks of code running within the TEE at boot time.

As described in the iOS Security Guide (Citation: Apple-iOSSecurityGuide), iOS devices will fail to boot if the software running within the Secure Enclave does not pass signature verification.

Platforms: Android

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Modify Trusted Execution Environment - MOB-T1002"*

## Downgrade to Insecure Protocols - MOB-T1069

An adversary could cause the mobile device to use less secure protocols, for example by jamming frequencies used by newer protocols such as LTE and only allowing older protocols such as GSM to communicate as described in draft NIST SP 800-187 (Citation: NIST-SP800187). Use of less secure protocols may make communication easier to eavesdrop upon or manipulate.

Platforms: Android, iOS

## App Auto-Start at Device Boot - MOB-T1005

An Android application can listen for the BOOT\_COMPLETED broadcast, ensuring that the app's functionality will be activated every time the device starts up without having to wait for the device

user to manually start the app.

(Citation: Zhou) and Jiang (Citation: Zhou) analyzed 1260 Android malware samples belonging to 49 families of malware, and determined that 29 malware families and 83.3% of the samples listened for BOOT\_COMPLETED.

Platforms: Android

## Commonly Used Port - MOB-T1039

Adversaries may communicate over a commonly used port to bypass firewalls or network detection systems and to blend with normal network activity to avoid more detailed inspection. They may use commonly open ports such as \* TCP:80 (HTTP) \* TCP:443 (HTTPS) \* TCP:25 (SMTP) \* TCP/UDP:53 (DNS)

They may use the protocol associated with the port or a completely different protocol.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Commonly Used Port - MOB-T1039"*

Table 3707. Table References

## Exploit SS7 to Redirect Phone Calls/SMS - MOB-T1052

An adversary could exploit signaling system vulnerabilities to redirect calls or text messages to a phone number under the attacker's control. The adversary could then act as a man-in-the-middle to intercept or manipulate the communication. These issues are discussed in (Citation: Engel-SS7), (Citation: Engel-SS7)-2008, (Citation: 3GPP-Security), (Citation: Positive-SS7), as well as in a report from the Communications, Security, Reliability, and Interoperability Council (CSRIC) (Citation: CSRIC5-WG10-FinalReport).

Detection: Network carriers may be able to use firewalls, Intrusion Detection Systems (IDS), or Intrusion Prevention Systems (IPS) to detect and/or block SS7 exploitation as described by the CSRIC (Citation: CSRIC5-WG10-FinalReport). The CSRIC also suggests threat information sharing between telecommunications industry members.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Exploit SS7 to Redirect Phone Calls/SMS - MOB-T1052"*

## Modify OS Kernel or Boot Partition - MOB-T1001

If an adversary can escalate privileges, he or she may be able to use those privileges to place malicious code in the device kernel or other boot partition components, where the code may evade detection, may persist after device resets, and may not be removable by the device user. In some cases (e.g., the Samsung Knox warranty bit as described under Detection), the attack may be detected but could result in the device being placed in a state that no longer allows certain functionality.

Many Android devices provide the ability to unlock the bootloader for development purposes, but doing so introduces the potential ability for others to maliciously update the kernel or other boot partition code.

If the bootloader is not unlocked, it may still be possible to exploit device vulnerabilities to update the code.

Detection: The Android SafetyNet API's remote attestation capability could potentially be used to identify and respond to compromised devices. Samsung KNOX also provides a remote attestation

capability on supported Samsung Android devices.

Samsung KNOX devices include a non-reversible Knox warranty bit fuse that is triggered "if a non-Knox kernel has been loaded on the device" (Citation: Samsung-KnoxWarrantyBit). If triggered, enterprise Knox container services will no longer be available on the device.

As described in the iOS Security Guide (Citation: Apple-iOSSecurityGuide), iOS devices will fail to boot or fail to allow device activation if unauthorized modifications are detected.

Many enterprise applications perform their own checks to detect and respond to compromised devices. These checks are not foolproof but can detect common signs of compromise.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Modify OS Kernel or Boot Partition - MOB-T1001"*

## Insecure Third-Party Libraries - MOB-T1028

Third-party libraries incorporated into mobile apps could contain malicious behavior, privacy-invasive behavior, or exploitable vulnerabilities. An adversary could deliberately insert malicious behavior or could exploit inadvertent vulnerabilities.

For example, Ryan Welton of NowSecure identified exploitable remote code execution vulnerabilities in a third-party advertisement library (Citation: NowSecure-RemoteCode). Grace et al. identified security issues in mobile advertisement libraries (Citation: Grace-Advertisement).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Insecure Third-Party Libraries - MOB-T1028"*

Insecure Third-Party Libraries - MOB-T1028 has relationships with:

## Download New Code at Runtime - MOB-T1010

An app could download and execute dynamic code (not included in the original application package) after installation to evade static analysis techniques (and potentially dynamic analysis techniques) used for application vetting or application store review (Citation: Poeplau-ExecuteThis).

On Android, dynamic code could include native code, Dalvik code, or JavaScript code that uses the Android WebView's JavascriptInterface capability (Citation: Bromium-AndroidRCE).

On iOS, techniques for executing dynamic code downloaded after application installation include JSPatch (Citation: FireEye-JSPatch). (Citation: Wang) et al. describe a related method of constructing malicious logic at app runtime on iOS (Citation: Wang).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Download New Code at Runtime - MOB-T1010"*

## Malicious Third Party Keyboard App - MOB-T1020

A malicious app can register as a device keyboard and intercept keypresses containing sensitive values such as usernames and passwords. Zeltser (Citation: Zeltser-Keyboards) describes these risks.

Both iOS and Android require the user to explicitly authorize use of third party keyboard apps. Users should be advised to use extreme caution before granting this authorization when it is requested.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Malicious Third Party Keyboard App - MOB-T1020"*

*Table 3717. Table References*

Links
-------

## Exploit OS Vulnerability - MOB-T1007

A malicious app can exploit unpatched vulnerabilities in the operating system to obtain escalated privileges.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Exploit OS Vulnerability - MOB-T1007"*

*Table 3718. Table References*

Links

<https://attack.mitre.org/mobile/index.php/Technique/MOB-T1007>

<https://pages.nist.gov/mobile-threat-catalogue/application-threats/APP-26.html>

## Remotely Install Application - MOB-T1046

An adversary with control of a target's Google account can use the Google Play Store's remote installation capability to install apps onto the Android devices associated with the Google account as described in (Citation: Oberheide-RemoteInstall), (Citation: Konoth). However, only applications that are available for download through the Google Play Store can be remotely installed using this technique.

Detection: An EMM/MDM or mobile threat protection solution can identify the presence of unwanted or known insecure or malicious apps on devices.

Platforms: Android

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Remotely Install Application - MOB-T1046"*

Remotely Install Application - MOB-T1046 has relationships with:

- revoked-by: *misp-galaxy:mitre-attack-pattern="Deliver Malicious App via Authorized App Store - T1475"* with estimative-language:likelihood-probability="almost-certain"

## Modify cached executable code - MOB-T1006

ART (the Android Runtime) compiles optimized code on the device itself to improve performance. If an adversary can escalate privileges, he or she may be able to use those privileges to modify the cached code in order to hide malicious behavior. Since the code is compiled on the device, it may not receive the same level of integrity checks that are provided to code running in the system partition.

Sabanal describes the potential use of this technique in (Citation: Sabanal-ART).

Platforms: Android

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Modify cached executable code - MOB-T1006"*

*Table 3720. Table References*

## Application Discovery - MOB-T1021

Adversaries may seek to identify all applications installed on the device. One use case for doing so is to identify the presence of endpoint security applications that may increase the adversary's risk of detection. Another use case is to identify the presence of applications that the adversary may wish to target.

On Android, applications can use methods in the PackageManager class (Citation: Android-PackageManager) to enumerate other apps installed on device, or an entity with shell access can use the pm command line tool.

On iOS, apps can use private API calls to obtain a list of other apps installed on the device as described by Kurtz (Citation: Kurtz-MaliciousiOSApps), however use of private API calls will likely prevent the application from being distributed through Apple's App Store.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Application Discovery - MOB-T1021"*

*Table 3721. Table References*

## SIM Card Swap - MOB-T1054

An adversary could convince the mobile network operator (e.g. through social networking or forged identification) to issue a new SIM card and associate it with an existing phone number and account (Citation: NYGov-Simswap). The adversary could then obtain SMS messages or hijack phone calls intended for someone else (Citation: Betanews-Simswap). One use case is intercepting authentication messages or phone calls to obtain illicit access to online banking or other online accounts (Citation: Guardian-Simswap).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="SIM Card Swap - MOB-T1054"*

## Exploit via Charging Station or PC - MOB-T1061

If the mobile device is connected (typically via USB) to a charging station or a PC, for example to charge the device's battery, then a compromised or malicious charging station or PC could attempt to exploit the mobile device via the connection.

Krebs described this technique in (Citation: Krebs-JuiceJacking). Lau et al. (Citation: Lau-Mactans) demonstrated the ability to inject malicious applications into an iOS device via USB. Hay (Citation: IBM-NexusUSB) demonstrated the ability to exploit a Nexus 6 or 6P device over USB and then gain the ability to perform actions including intercepting phone calls, intercepting network traffic, and obtaining the device physical location.

## Manipulate Device Communication - MOB-T1066

If network traffic between the mobile device and a remote server is not securely protected, then an attacker positioned on the network may be able to manipulate network communication without being detected. For example, FireEye researchers found in 2014 that 68% of the top 1,000 free applications in the Google Play Store had at least one Transport Layer Security (TLS) implementation vulnerability potentially opening the applications' network traffic to man-in-the-

middle attacks (Citation: FireEye-SSL).

Platforms: Android, iOS

## Rogue Cellular Base Station - MOB-T1070

An adversary could set up a rogue cellular base station and then use it to eavesdrop on or manipulate cellular device communication. For example, Ritter and DePerry of iSEC Partners demonstrated this technique using a compromised cellular femtocell at Black Hat USA 2013 (Citation: Computerworld-Femtocell).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Rogue Cellular Base Station - MOB-T1070"*

## Repackaged Application - MOB-T1047

An adversary could download a legitimate app, disassemble it, add malicious code, and then reassemble the app, for example as described by (Citation: Zhou) and Jiang in (Citation: Zhou). The app would appear to be the original app but contain additional malicious functionality. The adversary could then publish this app to app stores or use another delivery technique.

Detection: An EMM/MDM or mobile threat protection solution can identify the presence of unwanted, known insecure, or malicious apps on devices.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Repackaged Application - MOB-T1047"*

Table 3728. Table References

## Lock User Out of Device - MOB-T1049

An adversary may seek to lock the legitimate user out of the device, for example until a ransom is paid.

On Android versions prior to 7, apps can abuse Device Administrator access to reset the device lock passcode to lock the user out of the device.

On iOS devices, this technique does not work because mobile device management servers can only remove the screen lock passcode, they cannot set a new passcode. However, on jailbroken devices, malware has been demonstrated that can lock the user out of the device (Citation: KeyRaider).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Lock User Out of Device - MOB-T1049"*

## Malicious Software Development Tools - MOB-T1065

As demonstrated by the XcodeGhost attack (Citation: PaloAlto-XcodeGhost1), app developers could be provided with modified versions of software development tools (e.g. compilers) that automatically inject malicious or exploitable code into applications.

Detection: Enterprises could deploy integrity checking software to the computers that they use to develop code to detect presence of unauthorized, modified software development tools.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Malicious Software Development Tools - MOB-T1065"*

MITRE

## Deploy Compromised Device Detection Method - MOB-M1010

A variety of methods exist that can be used to enable enterprises to identify compromised (e.g. rooted/jailbroken) devices, whether using security mechanisms built directly into the device, third-party mobile security applications, enterprise mobility management (EMM)/mobile device management (MDM) capabilities, or other methods. Some methods may be trivial to evade while others may be more sophisticated.

The tag is: *misp-galaxy:mitre-mobile-attack-course-of-action="Deploy Compromised Device Detection Method - MOB-M1010"*

Deploy Compromised Device Detection Method - MOB-M1010 has relationships with:

- mitigates: *misp-galaxy:mitre-mobile-attack-attack-pattern="Lock User Out of Device - MOB-T1049"* with estimative-language:likelihood-probability="almost-certain"

## Interconnection Filtering - MOB-M1014

In order to mitigate Signaling System 7 (SS7) exploitation, the Communications, Security, Reliability, and Interoperability Council (CSRIC) describes filtering interconnections between network operators to block inappropriate requests (Citation: CSRIC5-WG10-FinalReport).

The tag is: *misp-galaxy:mitre-mobile-attack-course-of-action="Interconnection Filtering - MOB-M1014"*

Interconnection Filtering - MOB-M1014 has relationships with:

- mitigates: *misp-galaxy:mitre-mobile-attack-attack-pattern="Exploit SS7 to Redirect Phone*

Calls/SMS - MOB-T1052" with estimative-language:likelihood-probability="almost-certain"

- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Exploit SS7 to Track Device Location - MOB-T1053" with estimative-language:likelihood-probability="almost-certain"

## Use Device-Provided Credential Storage - MOB-M1008

Application developers should use device-provided credential storage mechanisms such as Android's KeyStore or iOS's KeyChain. These can prevent credentials from being exposed to an adversary.

The tag is: *misp-galaxy:mitre-mobile-attack-course-of-action="Use Device-Provided Credential Storage - MOB-M1008"*

Use Device-Provided Credential Storage - MOB-M1008 has relationships with:

- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Access Sensitive Data or Credentials in Files - MOB-T1012" with estimative-language:likelihood-probability="almost-certain"

## Use Recent OS Version - MOB-M1006

New mobile operating system versions bring not only patches against discovered vulnerabilities but also often bring security architecture improvements that provide resilience against potential vulnerabilities or weaknesses that have not yet been discovered. They may also bring improvements that block use of observed adversary techniques.

The tag is: *misp-galaxy:mitre-mobile-attack-course-of-action="Use Recent OS Version - MOB-M1006"*

Use Recent OS Version - MOB-M1006 has relationships with:

- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Attack PC via USB Connection - MOB-T1030" with estimative-language:likelihood-probability="almost-certain"
- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Abuse Accessibility Features - MOB-T1056" with estimative-language:likelihood-probability="almost-certain"

## Security Updates - MOB-M1001

Install security updates in response to discovered vulnerabilities.

Purchase devices with a vendor and/or mobile carrier commitment to provide security updates in a prompt manner for a set period of time.

Decommission devices that will no longer receive security updates.

Limit or block access to enterprise resources from devices that have not installed recent security updates. \* On Android devices, access can be controlled based on each device's security patch level.

\* On iOS devices, access can be controlled based on the iOS version.

The tag is: *misp-galaxy:mitre-mobile-attack-course-of-action="Security Updates - MOB-M1001"*

Security Updates - MOB-M1001 has relationships with:

- mitigates: `misp-galaxy:mitre-mobile-attack-attack-pattern="Device Unlock Code Guessing or Brute Force - MOB-T1062"` with `estimative-language:likelihood-probability="almost-certain"`
- mitigates: `misp-galaxy:mitre-mobile-attack-attack-pattern="Network Traffic Capture or Redirection - MOB-T1013"` with `estimative-language:likelihood-probability="almost-certain"`

## Lock Bootloader - MOB-M1003

On devices that provide the capability to unlock the bootloader (hence allowing any operating system code to be flashed onto the device), perform periodic checks to ensure that the bootloader is locked.

The tag is: `misp-galaxy:mitre-mobile-attack-course-of-action="Lock Bootloader - MOB-M1003"`

Lock Bootloader - MOB-M1003 has relationships with:

- mitigates: `misp-galaxy:mitre-mobile-attack-attack-pattern="Modify OS Kernel or Boot Partition - MOB-T1001"` with `estimative-language:likelihood-probability="almost-certain"`
- mitigates: `misp-galaxy:mitre-mobile-attack-attack-pattern="Exploit via Charging Station or PC - MOB-T1061"` with `estimative-language:likelihood-probability="almost-certain"`

## System Partition Integrity - MOB-M1004

Ensure that Android devices being used include and enable the Verified Boot capability, which cryptographically ensures the integrity of the system partition.

The tag is: `misp-galaxy:mitre-mobile-attack-course-of-action="System Partition Integrity - MOB-M1004"`

System Partition Integrity - MOB-M1004 has relationships with:

- mitigates: `misp-galaxy:mitre-mobile-attack-attack-pattern="Modify System Partition - MOB-T1003"` with `estimative-language:likelihood-probability="almost-certain"`

## Attestation - MOB-M1002

Enable remote attestation capabilities when available (such as Android SafetyNet or Samsung Knox TIMA Attestation) and prohibit devices that fail the attestation from accessing enterprise resources.

The tag is: `misp-galaxy:mitre-mobile-attack-course-of-action="Attestation - MOB-M1002"`

Attestation - MOB-M1002 has relationships with:

- mitigates: `misp-galaxy:mitre-mobile-attack-attack-pattern="Modify OS Kernel or Boot Partition - MOB-T1001"` with `estimative-language:likelihood-probability="almost-certain"`

## Caution with Device Administrator Access - MOB-M1007

Warn device users not to accept requests to grant Device Administrator access to applications without good reason.

Additionally, application vetting should include a check on whether the application requests Device Administrator access. Applications that do request Device Administrator access should be carefully scrutinized and only allowed to be used if a valid reason exists.

The tag is: *misp-galaxy:mitre-mobile-attack-course-of-action="Caution with Device Administrator Access - MOB-M1007"*

Caution with Device Administrator Access - MOB-M1007 has relationships with:

- mitigates: *misp-galaxy:mitre-mobile-attack-attack-pattern="Wipe Device Data - MOB-T1050"* with *estimative-language:likelihood-probability="almost-certain"*

## Application Developer Guidance - MOB-M1013

This mitigation describes any guidance or training given to developers of applications to avoid introducing security weaknesses that an adversary may be able to take advantage of.

The tag is: *misp-galaxy:mitre-mobile-attack-course-of-action="Application Developer Guidance - MOB-M1013"*

Application Developer Guidance - MOB-M1013 has relationships with:

- mitigates: *misp-galaxy:mitre-mobile-attack-attack-pattern="Access Sensitive Data in Device Logs - MOB-T1016"* with *estimative-language:likelihood-probability="almost-certain"*

## Application Vetting - MOB-M1005

Enterprises can vet applications for exploitable vulnerabilities or unwanted (privacy-invasive or malicious) behaviors. Enterprises can inspect applications themselves or use a third-party service.

Enterprises may impose policies to only allow pre-approved applications to be installed on their devices or may impose policies to block use of specific applications known to have issues. In Bring Your Own Device (BYOD) environments, enterprises may only be able to impose these policies over an enterprise-managed portion of the device.

Application Vetting is not a complete mitigation. Techniques such as Detect App Analysis Environment exist that can enable adversaries to bypass vetting.

The tag is: *misp-galaxy:mitre-mobile-attack-course-of-action="Application Vetting - MOB-M1005"*

Application Vetting - MOB-M1005 has relationships with:

- mitigates: *misp-galaxy:mitre-mobile-attack-attack-pattern="Obfuscated or Encrypted Payload -*

MOB-T1009" with estimative-language:likelihood-probability="almost-certain"

- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Access Call Log - MOB-T1036" with estimative-language:likelihood-probability="almost-certain"

## User Guidance - MOB-M1011

Describes any guidance or training given to users to set particular configuration settings or avoid specific potentially risky behaviors.

The tag is: *misp-galaxy:mitre-mobile-attack-course-of-action="User Guidance - MOB-M1011"*

User Guidance - MOB-M1011 has relationships with:

- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Attack PC via USB Connection - MOB-T1030" with estimative-language:likelihood-probability="almost-certain"
- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Remotely Track Device Without Authorization - MOB-T1071" with estimative-language:likelihood-probability="almost-certain"

## Enterprise Policy - MOB-M1012

An enterprise mobility management (EMM), also known as mobile device management (MDM), system can be used to provision policies to mobile devices to control aspects of their allowed behavior.

The tag is: *misp-galaxy:mitre-mobile-attack-course-of-action="Enterprise Policy - MOB-M1012"*

Enterprise Policy - MOB-M1012 has relationships with:

- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Abuse of iOS Enterprise App Signing Key - MOB-T1048" with estimative-language:likelihood-probability="almost-certain"
- mitigates: misp-galaxy:mitre-attack-pattern="Deliver Malicious App via Other Means - T1476" with estimative-language:likelihood-probability="almost-certain"
- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Abuse Accessibility Features - MOB-T1056" with estimative-language:likelihood-probability="almost-certain"

## Encrypt Network Traffic - MOB-M1009

Application developers should encrypt all of their application network traffic using the Transport Layer Security (TLS) protocol to ensure protection of sensitive data and deter network-based attacks. If desired, application developers could perform message-based encryption of data before passing it for TLS encryption.

iOS's App Transport Security feature can be used to help ensure that all application network traffic is appropriately protected. Apple intends to mandate use of App Transport Security (Citation: TechCrunch-ATS) for all apps in the Apple App Store unless appropriate justification is given.

Android's Network Security Configuration feature similarly can be used by app developers to help

ensure that all of their application network traffic is appropriately protected (Citation: Android-NetworkSecurityConfig).

Use of Virtual Private Network (VPN) tunnels, e.g. using the IPsec protocol, can help mitigate some types of network attacks as well.

The tag is: *misp-galaxy:mitre-mobile-attack-course-of-action="Encrypt Network Traffic - MOB-M1009"*

Encrypt Network Traffic - MOB-M1009 has relationships with:

- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Eavesdrop on Insecure Network Communication - MOB-T1042" with estimative-language:likelihood-probability="almost-certain"
- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Rogue Cellular Base Station - MOB-T1070" with estimative-language:likelihood-probability="almost-certain"

## Test ability to evade automated mobile application security analysis performed by app stores - PRE-T1170

Many mobile devices are configured to only allow applications to be installed from the mainstream vendor app stores (e.g., Apple App Store and Google Play Store). An adversary can submit multiple code samples to these stores deliberately designed to probe the stores' security analysis capabilities, with the goal of determining effective techniques to place malicious applications in the stores that could then be delivered to targeted devices. (Citation: Android Bouncer) (Citation: Adventures in BouncerLand) (Citation: Jekyll on iOS) (Citation: Fruit vs Zombies)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: The app store operators (e.g., Apple and Google) may detect the attempts, but it would not be observable to those being attacked.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: An adversary can submit code remotely using throwaway accounts, although a registration fee may need to be paid for each new account (e.g., \$99 for Apple and \$25 for Google Play Store).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Test ability to evade automated mobile application security analysis performed by app stores - PRE-T1170"*

Table 3768. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1170">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1170</a>

## Obfuscate infrastructure - PRE-T1108

Obfuscation is hiding the day-to-day building and testing of new tools, chat servers, etc. (Citation: FireEyeAPT17)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defender will generally not have visibility into their infrastructure.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Building and testing infrastructure and obfuscating it to protect it against intrusions are a standard part of the adversary process in preparing to conduct an operation against a target.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Obfuscate infrastructure - PRE-T1108"*

Obfuscate infrastructure - PRE-T1108 has relationships with:

- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Obfuscate infrastructure - PRE-T1086"*

with estimative-language:likelihood-probability="almost-certain"

Table 3769. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1108">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1108</a>

## Create backup infrastructure - PRE-T1116

Backup infrastructure allows an adversary to recover from environmental and system failures. It also facilitates recovery or movement to other infrastructure if the primary infrastructure is discovered or otherwise is no longer viable. (Citation: LUCKYCAT2012)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Infrastructure is (typically) outside of control/visibility of defender and as such as tools are staged for specific campaigns, it will not be obvious to those being attacked.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: The adversary has control of the infrastructure and will likely be able to add/remove tools to infrastructure, whether acquired via hacking or standard computer acquisition (e.g., [<https://aws.amazon.com> AWS], commercial storage solutions).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Create backup infrastructure - PRE-T1116"*

Table 3770. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1116">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1116</a>

## Assess targeting options - PRE-T1073

An adversary may assess a target's operational security (OPSEC) practices in order to identify targeting options. A target may share different information in different settings or be more of less cautious in different environments. (Citation: Scasny2015) (Citation: EverstineAirStrikes)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defender does not have access to information stored outside of defenders scope or visibility (e.g., log data for Facebook is not easily accessible). Defender has very infrequent visibility into an adversary's more detailed TTPs for developing people targets.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Information is out in the open for items that are available - part of this is ease of use for consumers to support the expected networking use case. OSINT can provide many avenues to gather intel which contain weaknesses. Developing and refining the methodology to exploit weak human targets has been done for years (e.g., spies).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Assess targeting options - PRE-T1073"*

Table 3771. Table References

Links

<https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1073>

## Receive operator KITs/KIQs tasking - PRE-T1012

Analysts may receive intelligence requirements from leadership and begin research process to satisfy a requirement. Part of this process may include delineating between needs and wants and thinking through all the possible aspects associating with satisfying a requirement. (Citation: FBIIntelligencePrimer)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Receive operator KITs/KIQs tasking - PRE-T1012"*

Table 3772. Table References

Links

<https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1012>

## Procure required equipment and software - PRE-T1112

An adversary will require some physical hardware and software. They may only need a lightweight set-up if most of their activities will take place using on-line infrastructure. Or, they may need to build extensive infrastructure if they want to test, communicate, and control other aspects of their activities on their own systems. (Citation: NYTStuxnet)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Outside of highly specific or rare HW, nearly impossible to detect and track.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Ease and availability of current hardware and software, mobile phones (cash and go phones), and additional online technology simplifies adversary process to achieve this technique (and possibly without traceability). The adversary has control of the infrastructure and will likely be able to add/remove tools to infrastructure, whether acquired via

hacking or standard computer acquisition (e.g., [<https://aws.amazon.com> AWS], VPS).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Procure required equipment and software - PRE-T1112"*

Table 3773. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1112">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1112</a>

## Identify security defensive capabilities - PRE-T1040

Security defensive capabilities are designed to stop or limit unauthorized network traffic or other types of accesses. (Citation: OSFingerprinting2014) (Citation: NMAP WAF NSE)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Technically, the defender has the ability to detect. However, this is typically not performed as this type of traffic would likely not prompt the defender to take any actionable defense. In addition, this would require the defender to closely review their access logs for any suspicious activity (if the activity is even logged).

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: The adversary will have some insight into defenses based on dropped traffic or filtered responses. It is more difficult to pinpoint which defenses are implemented (e.g., [<https://www.fireeye.com> FireEye] WMPS, [<https://www.hpe.com> Hewlett Packard Enterprise] Tipping Point IPS).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify security defensive capabilities - PRE-T1040"*

Table 3774. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1040">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1040</a>

## Derive intelligence requirements - PRE-T1007

Leadership or key decision makers may derive specific intelligence requirements from Key Intelligence Topics (KITs) or Key Intelligence Questions (KIQs). Specific intelligence requirements assist analysts in gathering information to establish a baseline of information about a topic or question and collection managers to clarify the types of information that should be collected to satisfy the requirement. (Citation: LowenthalCh4) (Citation: Heffter)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Derive intelligence requirements - PRE-T1007"*

Table 3775. Table References

Links
-------

---

## Domain Generation Algorithms (DGA) - PRE-T1100

The use of algorithms in malware to periodically generate a large number of domain names which function as rendezvous points for malware command and control servers. (Citation: DamballaDGA) (Citation: DambballeDGACyberCriminals)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: It is possible to detect the use of DGAs; however, defenders have largely not been successful at mitigating the domains because they are generally registered less than an hour before they are used and disposed of within 24 hours.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: This technique does not require a significant amount of sophistication while still being highly effective. It was popularized by the Conficker worms but is prevalent in crimeware such as Murofet and BankPatch.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Domain Generation Algorithms (DGA) - PRE-T1100"*

Table 3776. Table References

Links
-------

<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1100">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1100</a>
---

## Leverage compromised 3rd party resources - PRE-T1152

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

The utilization of resources not owned by the adversary to launch exploits or operations. This includes utilizing equipment that was previously compromised or leveraging access gained by other methods (such as compromising an employee at a business partner location). (Citation: CitizenLabGreatCannon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: While possible to detect, it requires a broader vantage point than is typical that provides increased insight and conducts extensive data analysis and correlation between events.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Conducting technique requires either nation-state level capabilities or large amounts of financing to coordinate multiple 3rd party resources to gain desired insight.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Leverage compromised 3rd party resources - PRE-T1152"*

Table 3777. Table References

Links
-------

<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1152">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1152</a>
---

## Review logs and residual traces - PRE-T1135

Execution of code and network communications often result in logging or other system or network forensic artifacts. An adversary can run their code to identify what is recorded under different conditions. This may result in changes to their code or adding additional actions (such as deleting a record from a log) to the code. (Citation: EDB-39007) (Citation: infosec-covering-tracks)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary controls the test and defender likely has no visibility.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Adversary has full control of environment to determine what level of auditing and traces exist on a system after execution.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Review logs and residual traces - PRE-T1135"*

Table 3778. Table References

Links
-------

<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1135">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1135</a>
---

## Identify job postings and needs/gaps - PRE-T1025

Job postings, on either company sites, or in other forums, provide information on organizational structure and often provide contact information for someone within the organization. This may give an adversary information on technologies within the organization which could be valuable in

attack or provide insight in to possible security weaknesses or limitations in detection or protection mechanisms. (Citation: JobPostingThreat)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Impossible to differentiate between an adversary and a normal user when accessing open/public information.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Publicly posted information by design. Providing too much detail in the job posting could aid the adversary in learning more about the target's environment and possible technical weaknesses/deficiencies.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify job postings and needs/gaps - PRE-T1025"*

Identify job postings and needs/gaps - PRE-T1025 has relationships with:

- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify job postings and needs/gaps - PRE-T1055"* with estimative-language:likelihood-probability="almost-certain"

*Table 3779. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1025">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1025</a>

## **Spear phishing messages with malicious attachments - PRE-T1144**

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Emails with malicious attachments are designed to get a user to open/execute the attachment in order to deliver malware payloads. (Citation: APT1)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Many technologies exist to scan content and/or emulate a workstation prior to the target receiving and executing the attachment (detonation chambers) in order to reduce malicious emails and attachments being delivered to the intended target. However, encryption continues to be a stumbling block. In addition, there are a variety of commercial technologies available that enable users to screen for phishing messages and which are designed to enhance email security.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Sending the emails is the simple part, ensuring they make it to the target (e.g., not being filtered) may be challenging. Over time, an adversary refines their techniques to minimize detection by making their emails seem legitimate in structure and content.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Spear phishing messages with malicious attachments - PRE-T1144"*

Table 3780. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1144">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1144</a>

## SSL certificate acquisition for trust breaking - PRE-T1115

Fake certificates can be acquired by legal process or coercion. Or, an adversary can trick a Certificate Authority into issuing a certificate. These fake certificates can be used as a part of Man-in-the-Middle attacks. (Citation: SubvertSSL)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: The certificate authority who is hacked cannot easily see they've been compromised, but [<https://www.google.com> Google] has caught on to this occurring in previous attacks such as DigiNotar (Citation: DigiNotar2016) and [<https://www.verisign.com> Verisign].

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: One example of it occurring in the real world is the DigiNotar (Citation: DigiNotar2016) case. To be able to do this usually requires sophisticated skills and is traditionally done by a nation state to spy on its citizens.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="SSL certificate acquisition for trust breaking - PRE-T1115"*

Table 3781. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1115">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1115</a>

## Proxy/protocol relays - PRE-T1081

Proxies act as an intermediary for clients seeking resources from other systems. Using a proxy may make it more difficult to track back the origin of a network communication. (Citation: APT1)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defenders with standard capabilities will traditionally be able to see the first hop but not all the subsequent earlier hops an adversary takes to be able to conduct reconnaissance.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Proxies are readily available for the adversary with both free and cost-based options available.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Proxy/protocol relays - PRE-T1081"*

Table 3782. Table References

## Determine domain and IP address space - PRE-T1027

Domain Names are the human readable names used to represent one or more IP addresses. IP addresses are the unique identifier of computing devices on a network. Both pieces of information are valuable to an adversary who is looking to understand the structure of a network. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Public or easily obtainable information by design.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: AS and IANA data are easily available, existing research tools.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Determine domain and IP address space - PRE-T1027"*

Table 3783. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1027">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1027</a>

## Remote access tool development - PRE-T1128

A remote access tool (RAT) is a piece of software that allows a remote user to control a system as if they had physical access to that system. An adversary may utilize existing RATs, modify existing RATs, or create their own RAT. (Citation: ActiveMalwareEnergy)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary will likely use code repositories, but development will be performed on their local systems.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Many successful RATs exist for re-use/tailoring in addition to those an adversary may choose to build from scratch. The adversary's capabilities, target sensitivity, and needs will likely determine whether a previous RAT is modified for use a new one is

built from scratch.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Remote access tool development - PRE-T1128"*

## Push-notification client-side exploit - PRE-T1150

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

A technique to push an [<https://www.apple.com/ios> iOS] or [<https://www.android.com> Android] MMS-type message to the target which does not require interaction on the part of the target to be successful. (Citation: BlackHat Stagefright) (Citation: WikiStagefright)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: For non-corporate cellular devices not joined to the corporate network, it is not possible to detect an adversary's use of the technique because messages traverse networks outside of the control of the employer. For corporate cellular devices which are joined to the corporate network, monitoring of messages and ability to patch against push attacks is possible, assuming they are fully monitored.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Easily executed technique to push an MMS-type message to the target which does not require interaction on the part of the target to be successful.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Push-notification client-side exploit - PRE-T1150"*

## Authorized user performs requested cyber action - PRE-T1163

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Clicking on links in email, opening attachments, or visiting websites that result in drive by downloads can all result in compromise due to users performing actions of a cyber nature. (Citation: AnonHBGary)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Some environments have anti-spearphishing mechanisms to detect or block the link before it reaches the user.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Users unwittingly click on spearphishing links frequently, despite training designed to educate about the perils of spearphishing.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Authorized user performs requested cyber action - PRE-T1163"*

Table 3786. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1163">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1163</a>

## Submit KITs, KIQs, and intelligence requirements - PRE-T1014

Once they have been created, intelligence requirements, Key Intelligence Topics (KITs), and Key Intelligence Questions (KIQs) are submitted into a central management system. (Citation: ICD204) (Citation: KIT-Herring)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Submit KITs, KIQs, and intelligence requirements - PRE-T1014"*

Table 3787. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1014">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1014</a>

## Misattributable credentials - PRE-T1099

The use of credentials by an adversary with the intent to hide their true identity and/or portray them self as another person or entity. An adversary may use misattributable credentials in an attack to convince a victim that credentials are legitimate and trustworthy when this is not actually the case. (Citation: FakeSSLCerts)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: If a previous incident identified the credentials used by an adversary, defenders can potentially use these credentials to track the adversary through reuse of the same credentials.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: An adversary can easily create and use misattributable credentials to obtain servers, build environment, [<https://aws.amazon.com> AWS] accounts, etc. Many service providers require some form of identifiable information such as a phone number or email address, but there are several avenues to acquire these consistent with the misattributable identity.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Misattributable credentials - PRE-T1099"*

*Table 3788. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1099">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1099</a>

## Create strategic plan - PRE-T1008

Strategic plans outline the mission, vision, and goals for an adversary at a high level in relation to the key partners, topics, and functions the adversary carries out. (Citation: KPMGChina5Year) (Citation: China5YearPlans) (Citation: ChinaUN)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Create strategic plan - PRE-T1008"*

*Table 3789. Table References*

<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1008">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1008</a>

## Assess vulnerability of 3rd party vendors - PRE-T1075

Once a 3rd party vendor has been identified as being of interest it can be probed for vulnerabilities just like the main target would be. (Citation: Zetter2015Threats) (Citation: WSJTargetBreach)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: 3rd parties would most likely not report network scans to their partners. Target network would not know that their 3rd party partners were being used as a vector.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: The difficult part is enumerating all 3rd parties. Finding major partners would not be difficult. Significantly easier with insider knowledge. Vulnerability scanning the 3rd party networks is trivial.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Assess vulnerability of 3rd party vendors - PRE-T1075"*

*Table 3790. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1075">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1075</a>

## Authentication attempt - PRE-T1158

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Attempt to use default vendor credentials, brute force credentials, or previously obtained legitimate credentials to authenticate remotely. This access could be to a web portal, through a VPN, or in a phone app. (Citation: Remote Access Healthcare) (Citation: RDP Point of Sale)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: This is possible with diligent monitoring of login anomalies, expected user behavior/location. If the adversary uses legitimate credentials, it may go undetected.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Attempt to use default vendor credentials, brute force credentials, or previously obtained legitimate credentials. This is increasingly difficult to obtain access when two-factor authentication mechanisms are employed.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Authentication attempt - PRE-T1158"*

*Table 3791. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1158">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1158</a>

## Domain registration hijacking - PRE-T1103

Domain Registration Hijacking is the act of changing the registration of a domain name without the permission of the original registrant. (Citation: ICANNDomainNameHijacking)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Generally not easily detectable unless domain registrar provides alerting on any updates.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Requires adversary to gain access to an email account for person listed as the domain registrar/POC. The adversary can then claim that they forgot their password in order to make changes to the domain registration. Other possibilities include social engineering a domain registration help desk to gain access to an account or take advantage of renewal process gaps.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Domain registration hijacking - PRE-T1103"*

# Conduct active scanning - PRE-T1031

Active scanning is the act of sending transmissions to end nodes, and analyzing the responses, in order to identify information about the communications system. (Citation: RSA-APTRecon)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: This technique is an expected and voluminous activity when on the Internet. Active scanning techniques/tools typically generate benign traffic that does not require further investigation by a defender since there is no actionable defense to execute. The high volume of this activity makes it burdensome for any defender to chase and therefore often ignored.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Various available tools and data sources for scouting and detecting address, routing, version numbers, patch levels, protocols/services running, etc.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Conduct active scanning - PRE-T1031"*

Table 3794. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1031">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1031</a>

# Unconditional client-side exploitation/Injected Website/Driveby - PRE-T1149

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

A technique used to compromise victims wherein the victims visit a compromised website that redirects their browser to a malicious web site, such as an exploit kit's landing page. The exploit kit landing page will probe the victim's operating system, web browser, or other software to find an exploitable vulnerability to infect the victim. (Citation: GeorgeDriveBy) (Citation: BellDriveBy)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: With the use of malware detonation chambers (e.g., for web or email traffic), this improves detection. Encryption and other techniques reduces the efficacy of these defenses.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Placing an exploit on a public web site for driveby types of delivery is not impossible. However, gaining access to a web site with high enough traffic to meet specific objectives could be the challenge.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Unconditional client-side exploitation/Injected Website/Driveby - PRE-T1149"*

Table 3795. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1149">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1149</a>

## Test signature detection - PRE-T1069

An adversary can test the detections of malicious emails or files by using publicly available services, such as virus total, to see if their files or emails cause an alert. They can also use similar services that are not openly available and don't publicly publish results or they can test on their own internal infrastructure. (Citation: WiredVirusTotal)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: If using a common service like [\[https://www.virustotal.com](https://www.virustotal.com) VirusTotal], it is possible to detect. If the adversary uses a hostile, less well-known service, the defender would not be aware.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Easy to automate upload/email of a wide range of data packages.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Test signature detection - PRE-T1069"*

Table 3796. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1069">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1069</a>

## Fast Flux DNS - PRE-T1102

A technique in which a fully qualified domain name has multiple IP addresses assigned to it which are swapped with extreme frequency, using a combination of round robin IP address and short Time-To-Live (TTL) for a DNS resource record. (Citation: HoneyNetFastFlux) (Citation: MisnomerFastFlux) (Citation: MehtaFastFluxPt1) (Citation: MehtaFastFluxPt2)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: In general, detecting usage of fast flux DNS is difficult due to web traffic load balancing that services client requests quickly. In single flux cases only IP addresses change for static domain names. In double flux cases, nothing is static. Defenders such as IPS, domain registrars, and service providers are likely in the best position for detection.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Fast flux is generally simple for an adversary to set up and offers several advantages. Such advantages include limited audit trails for defenders to find, ease of operation for an adversary to maintain, and support for main nodes.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Fast Flux DNS - PRE-T1102"*

Table 3797. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1102">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1102</a>

## Conduct social engineering - PRE-T1026

Social Engineering is the practice of manipulating people in order to get them to divulge information or take an action. (Citation: SEAttackVectors) (Citation: BeachSE2003)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: No technical means to detect an adversary collecting technical information about a target. Any detection would be based upon strong OPSEC policy implementation.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Very effective technique for the adversary that does not require any formal training and relies upon finding just one person who exhibits poor judgement.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Conduct social engineering - PRE-T1026"*

Conduct social engineering - PRE-T1026 has relationships with:

## Acquire and/or use 3rd party infrastructure services - PRE-T1106

A wide variety of cloud, virtual private services, hosting, compute, and storage solutions are available. Additionally botnets are available for rent or purchase. Use of these solutions allow an adversary to stage, launch, and execute an attack from infrastructure that does not physically tie back to them and can be rapidly provisioned, modified, and shut down. (Citation: TrendmicroHideoutsLease)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Hard to differentiate from standard business operations.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Wide variety of cloud/VPS/hosting/compute/storage solutions available for adversary to acquire freely or at a low cost.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Acquire and/or use 3rd party infrastructure services - PRE-T1106"*

Acquire and/or use 3rd party infrastructure services - PRE-T1106 has relationships with:

## Obfuscate or encrypt code - PRE-T1096

Obfuscation is the act of creating code that is more difficult to understand. Encoding transforms the code using a publicly available format. Encryption transforms the code such that it requires a key to reverse the encryption. (Citation: CylanceOpClever)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Detecting encryption is easy, decrypting/deobfuscating is hard.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Various solutions exist for the adversary to use. This technique is commonly used to prevent attribution and evade detection.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Obfuscate or encrypt code - PRE-T1096"*

*Table 3800. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1096">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1096</a>

## Analyze organizational skillsets and deficiencies - PRE-T1074

Understanding organizational skillsets and deficiencies could provide insight in to weakness in defenses, or opportunities for exploitation. (Citation: FakeLinkedIn)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: No access to who is consuming the job postings to know what is being observed.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Job postings have to be made public for contractors and many times have the name of the organization being supported.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Analyze organizational skillsets and deficiencies - PRE-T1074"*

Analyze organizational skillsets and deficiencies - PRE-T1074 has relationships with:

- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Analyze organizational skillsets and deficiencies - PRE-T1066" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Analyze organizational skillsets and deficiencies - PRE-T1077" with estimative-language:likelihood-probability="almost-certain"

Table 3801. Table References

<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1074">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1074</a>

## Distribute malicious software development tools - PRE-T1171

An adversary could distribute malicious software development tools (e.g., compiler) that hide malicious behavior in software built using the tools. (Citation: PA XcodeGhost) (Citation: Reflections on Trusting Trust)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Developers could check a hash or signature of their development tools to ensure that they match expected values (e.g., Apple provides instructions of how to do so for its Xcode developer tool), but developers may not always do so.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: The adversary would need to either replace the tools provided at the official download location or influence developers to download the tools from an adversary-controlled third-party download location. Desktop operating systems (e.g., Windows, macOS) are increasingly encouraging use of vendor-provided official app stores to distribute software, which utilize code signing and increase the difficulty of replacing development tools with malicious versions.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Distribute malicious software development tools - PRE-T1171"*

Table 3802. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1171">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1171</a>

## Acquire or compromise 3rd party signing certificates - PRE-T1109

Code signing is the process of digitally signing executables and scripts to confirm the software author and guarantee that the code has not been altered or corrupted. Users may trust a signed piece of code more than an unsigned piece of code even if they don't know who issued the certificate or who the author is. (Citation: DiginotarCompromise)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defender will not know what certificates an adversary acquires from a 3rd party. Defender will not know prior to public disclosure if a 3rd party has had their certificate compromised.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: It is trivial to purchase code signing certificates within an organization; many exist and are available at reasonable cost. It is complex to factor or steal 3rd party code signing certificates for use in malicious mechanisms

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Acquire or compromise 3rd party signing certificates - PRE-T1109"*

Acquire or compromise 3rd party signing certificates - PRE-T1109 has relationships with:

- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Acquire or compromise 3rd party signing certificates - PRE-T1087"* with *estimative-language:likelihood-probability="almost-certain"*

Table 3803. Table References

## Develop social network persona digital footprint - PRE-T1119

Both newly built personas and pre-compromised personas may require development of additional documentation to make them seem real. This could include filling out profile information, developing social networks, or incorporating photos. (Citation: NEWSCASTER2014) (Citation: BlackHatRobinSage) (Citation: RobinSageInterview)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Unless there is some threat intelligence reporting, these users are hard to differentiate.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: The only difference between an adversary conducting this technique and a typical user, is the adversary's intent - to target an individual for compromise.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Develop social network persona digital footprint - PRE-T1119"*

Table 3804. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1119">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1119</a>

## Use multiple DNS infrastructures - PRE-T1104

A technique used by the adversary similar to Dynamic DNS with the exception that the use of multiple DNS infrastructures likely have whois records. (Citation: KrebsStLouisFed)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: This is by design captured in public registration logs. Various tools and services exist to track/query/monitor domain name registration information. However, tracking multiple DNS infrastructures will likely require multiple tools/services or more advanced analytics.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Requires more planning, but feasible.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Use multiple DNS infrastructures - PRE-T1104"*

Table 3805. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1104">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1104</a>

## Identify vulnerabilities in third-party software libraries - PRE-T1166

Many applications use third-party software libraries, often without full knowledge of the behavior of the libraries by the application developer. For example, mobile applications often incorporate advertising libraries to generate revenue for the application developer. Vulnerabilities in these third-party libraries could potentially be exploited in any application that uses the library, and even if the vulnerabilities are fixed, many applications may still use older, vulnerable versions of the library. (Citation: Flexera News Vulnerabilities) (Citation: Android Security Review 2015) (Citation: Android Multidex RCE)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: Open source software has great appeal mostly due to

the time savings and that it is free. However, using this code without assessing its security is akin to blindly executing third party software. Companies often do not dedicate the time to appropriately detect and scan for vulnerabilities. The mainstream mobile application stores scan applications for some known vulnerabilities. For example, Google's Android Application Security Improvement Program identifies and alerts developers to vulnerabilities present in their applications from use of the Vungle, Apache Cordova, WebView SSL, GnuTLS, and Vitamio third-party libraries. However, these scans are not likely to cover all vulnerable libraries, developers may not always act on the results, and the results may not be made available to impacted end users of the applications.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Developers commonly use open source libraries such that where an adversary can easily discover known vulnerabilities and create exploits. It is also generally easy to decompile arbitrary mobile applications to determine what libraries they use, and similarly use this information to correlate against known CVEs and exploit packages.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify vulnerabilities in third-party software libraries - PRE-T1166"*

Table 3806. Table References

# Compromise of externally facing system - PRE-T1165

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Externally facing systems allow connections from outside the network as a normal course of operations. Externally facing systems may include, but are not limited to, websites, web portals, email, DNS, FTP, VPN concentrators, and boarder routers and firewalls. These systems could be in a demilitarized zone (DMZ) or may be within other parts of the internal environment. (Citation: CylanceOpClever) (Citation: DailyTechAntiSec)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Most DMZs are monitored but are also designed so that if they are compromised, the damage/risk is limited.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: DMZ environments are specifically designed to be isolated because one assumes they will ultimately be compromised by the adversary.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Compromise of externally facing system - PRE-T1165"*

Table 3808. Table References

# Identify supply chains - PRE-T1023

Supply chains include the people, processes, and technologies used to move a product or service from a supplier to a consumer. Understanding supply chains may provide an adversary with opportunities to exploit the technology or interconnections that are part of the supply chain. (Citation: SmithSupplyChain) (Citation: CERT-UKSupplyChain) (Citation: RSA-supply-chain)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Difficult, if not impossible to detect, because the adversary may collect this information from external sources that cannot be monitored by a defender.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Supply chain diversity of sourcing increases adversary difficulty with accurate mapping. Industry practice has moved towards agile sourcing.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify supply chains - PRE-T1023"*

Identify supply chains - PRE-T1023 has relationships with:

- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Identify supply chains - PRE-T1053" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Identify supply chains - PRE-T1042" with estimative-language:likelihood-probability="almost-certain"

Table 3809. Table References

## Dumpster dive - PRE-T1063

Dumpster diving is looking through waste for information on technology, people, and/or organizational items of interest. (Citation: FriedDumpsters)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Strong physical security and monitoring will detect this behavior if performed on premises.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Not difficult if waste is placed in an unsecured or minimally secured area before collection.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Dumpster dive - PRE-T1063"*

Table 3810. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1063">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1063</a>

## Obtain domain/IP registration information - PRE-T1028

For a computing resource to be accessible to the public, domain names and IP addresses must be registered with an authorized organization. (Citation: Google Domains WHOIS) (Citation: FunAndSun2012) (Citation: Scasny2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Open access to DNS registration/routing information is inherent in Internet architecture.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Proliferation of DNS information makes registration information functionally freely available.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Obtain domain/IP registration information - PRE-T1028"*

Table 3811. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1028">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1028</a>

## Identify business relationships - PRE-T1060

Business relationship information may be used by an adversary to shape social engineering attempts (exploiting who a target expects to hear from) or to plan for technical actions such as exploiting network trust relationship. (Citation: 11StepsAttackers)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Exception to the rule is if the adversary tips off the target that others have been asking about the relationship with them.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Requires an intensive process. In some industries, business relationships may be public in order to generate business, but this is not the case for all industries and all relationships.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify business relationships - PRE-T1060"*

Identify business relationships - PRE-T1060 has relationships with:

- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Identify business relationships - PRE-T1049" with estimative-language:likelihood-probability="almost-certain"

Table 3812. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1060">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1060</a>

## Anonymity services - PRE-T1083

Anonymity services reduce the amount of information available that can be used to track an adversary's activities. Multiple options are available to hide activity, limit tracking, and increase anonymity. (Citation: TOR Design) (Citation: Stratfor2012)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Depends on service. Some are easy to detect, but are hard to trace (e.g., [<https://torproject.org> TOR]).

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Easy access to anonymizers, quasi-anonymous services like remailers, [<https://torproject.org> TOR], relays, burner phones, etc.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Anonymity services - PRE-T1083"*

Table 3813. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1083">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1083</a>

## C2 protocol development - PRE-T1129

Command and Control (C2 or C&C) is a method by which the adversary communicates with malware. An adversary may use a variety of protocols and methods to execute C2 such as a centralized server, peer to peer, IRC, compromised web sites, or even social media. (Citation: HAMMERTOSS2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary will likely use code repositories, but development will be performed on their local systems.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: C2 over commonly used and permitted protocols provides the necessary cover and access.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="C2 protocol development - PRE-T1129"*

Table 3814. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1129">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1129</a>

## Build social network persona - PRE-T1118

For attacks incorporating social engineering the utilization of an on-line persona is important. These personas may be fictitious or impersonate real people. The persona may exist on a single site or across multiple sites ([<https://www.facebook.com> Facebook], [<https://www.linkedin.com> LinkedIn], [<https://twitter.com> Twitter], [<https://plus.google.com> Google+], etc.). (Citation: NEWSCASTER2014) (Citation: BlackHatRobinSage) (Citation: RobinSageInterview)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Unless there is some threat intelligence reporting, these users are hard to differentiate.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Performing activities like typical users, but with specific intent in mind.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Build social network persona - PRE-T1118"*

Table 3815. Table References

Links

## Spearphishing for Information - PRE-T1174

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Spearphishing for information is a specific variant of spearphishing. Spearphishing for information is different from other forms of spearphishing in that it doesn't leverage malicious code. All forms of spearphishing are electronically delivered social engineering targeted at a specific individual, company, or industry. Spearphishing for information is an attempt to trick targets into divulging information, frequently credentials, without involving malicious code. Spearphishing for information frequently involves masquerading as a source with a reason to collect information (such as a system administrator or a bank) and providing a user with a website link to visit. The given website often closely resembles a legitimate site in appearance and has a URL containing elements from the real site. From the fake website, information is gathered in web forms and sent to the attacker. Spearphishing for information may also try to obtain information directly through the exchange of emails, instant messengers or other electronic conversation means. (Citation: ATTACKREF GRIZZLY STEPPE JAR)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: Depending on the specific method of phishing, the detections can vary. For emails, filtering based on DKIM+SPF or header analysis can help detect when the email sender is spoofed. When it comes to following links, network intrusion detection

systems (NIDS), firewalls, removing links, exploding shortened links, proxy monitoring, blocking uncategorized sites, and site reputation based filtering can all provide detection opportunities.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Sending emails is trivial, and, over time, an adversary can refine their technique to minimize detection by making their emails seem legitimate in structure and content.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Spearphishing for Information - PRE-T1174"*

Table 3817. Table References

Links
-------

## Buy domain name - PRE-T1105

Domain Names are the human readable names used to represent one or more IP addresses. They can be purchased or, in some cases, acquired for free. (Citation: PWCSofacy2014)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: This is by design captured in public registration logs. Various tools and services exist to track/query/monitor domain name registration information.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Proliferation of DNS TLDs and registrars. Adversary may choose domains that are similar to legitimate domains (aka "domain typosquatting" or homoglyphs).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Buy domain name - PRE-T1105"*

Table 3818. Table References

Links
-------

<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1105">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1105</a>
---

## Identify technology usage patterns - PRE-T1041

Technology usage patterns include identifying if users work offsite, connect remotely, or other possibly less restricted/secured access techniques. (Citation: SANSRemoteAccess)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Physical observations, OSINT for remote access instructions, and other techniques are not detectable.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Determine if users work offsite, connect remotely, or other possibly less restricted/secured access techniques.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify technology usage patterns - PRE-T1041"*

Table 3819. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1041">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1041</a>

## Identify business relationships - PRE-T1049

Business relationship information includes the associates of a target and may be discovered via social media sites such as [<https://www.linkedin.com> LinkedIn] or public press releases announcing new partnerships between organizations or people (such as key hire announcements in industry articles). This information may be used by an adversary to shape social engineering attempts (exploiting who a target expects to hear from) or to plan for technical actions such as exploiting network trust relationship. (Citation: RSA-APTRecon) (Citation: Scasny2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Searching publicly available sources that cannot be monitored by a defender. Much of this information is widely known and difficult to obscure.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Made easier by today's current social media.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify business relationships - PRE-T1049"*

Identify business relationships - PRE-T1049 has relationships with:

- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify business relationships - PRE-T1060"* with estimative-language:likelihood-probability="almost-certain"

Table 3820. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1049">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1049</a>

## Runtime code download and execution - PRE-T1172

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Many mobile devices are configured to only allow applications to be installed from the mainstream vendor app stores (e.g., Apple App Store and Google Play Store). These app stores scan submitted applications for malicious behavior. However, applications can evade these scans by downloading and executing new code at runtime that was not included in the original application package.

(Citation: Fruit vs Zombies) (Citation: Android Hax) (Citation: Execute This!) (Citation: HT Fake News App) (Citation: Anywhere Computing kill 2FA) (Citation: Android Security Review 2015)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: Third-party mobile application security analysis services exist that scan for use of these techniques in iOS and Android applications. Additionally, Google specifically calls out the ability to "identify attacks that require connection to a server and dynamic downloading of code" in its Android Security 2015 Year in Review report. However, many applications use these techniques as part of their legitimate operation, increasing the difficulty of detecting or preventing malicious use.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Runtime code execution techniques and examples of their use are widely documented on both Apple iOS and Android.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Runtime code download and execution - PRE-T1172"*

*Table 3821. Table References*

Links
-------

---

## Obtain templates/branding materials - PRE-T1058

Templates and branding materials may be used by an adversary to add authenticity to social engineering message. (Citation: Scasny2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary may download templates or branding from publicly available presentations that the defender can't monitor.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Some branding information is publicly available when a corporation publishes their briefings to the internet which provides insight into branding information and template materials. An exhaustive list of templating and branding is likely not available on the internet.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Obtain templates/branding materials - PRE-T1058"*

*Table 3823. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1058">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1058</a>

## Dynamic DNS - PRE-T1088

Dynamic DNS is a method of automatically updating a name in the DNS system. Providers offer this rapid reconfiguration of IPs to hostnames as a service. (Citation: DellMirage2012)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defender will not know at first use what is valid or hostile traffic without more context. It is possible, however, for defenders to see if the PTR record for an address is hosted by a known DDNS provider. There is potential to assign some level of risk based on this.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Flexible and re-configurable command and control servers, along with deniable ownership and reduced cost of ownership.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Dynamic DNS - PRE-T1088"*

Dynamic DNS - PRE-T1088 has relationships with:

- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Dynamic DNS - PRE-T1110"* with estimative-language:likelihood-probability="almost-certain"

*Table 3824. Table References*

Links

<https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1088>

## Spear phishing messages with malicious links - PRE-T1146

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Emails with malicious links are designed to get a user to click on the link in order to deliver malware payloads. (Citation: GoogleDrive Phishing) (Citation: RSASethreat)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Defenders can implement mechanisms to analyze links and identify levels of concerns. However, the adversary has the advantage of creating new links or finding ways to obfuscate the link so that common detection lists can not identify it. Detection of a malicious link could be identified once the file has been downloaded.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Sending emails is trivial and expected. The adversary needs to ensure links don't get tampered, removed, or flagged as a previously black-listed site.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Spear phishing messages with malicious links - PRE-T1146"*

Table 3825. Table References

Links

<https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1146>

## Hardware or software supply chain implant - PRE-T1142

During production and distribution, the placement of software, firmware, or a CPU chip in a computer, handheld, or other electronic device that enables an adversary to gain illegal entrance. (Citation: McDRecall) (Citation: SeagateMaxtor)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: The number of elements and components in a supply chain of HW or SW is vast and detecting an implant is complex for SW, but more complex for HW.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Access to the supply chain by an adversary can be a challenging endeavor, depending on what element is attempting to be subverted.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Hardware or software supply chain implant - PRE-T1142"*

Table 3826. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1142">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1142</a>

## Determine secondary level tactical element - PRE-T1021

The secondary level tactical element the adversary seeks to attack is the specific network or area of a network that is vulnerable to attack. Within the corporate network example, the secondary level tactical element might be a SQL server or a domain controller with a known vulnerability. (Citation: CyberAdversaryBehavior) (Citation: JP3-60) (Citation: JP3-12 ®) (Citation: DoD Cyber 2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. May change for special use cases or adversary and defender overlays.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: This is the normal adversary targeting cycle where they utilize our poor OPSEC practices to their advantage.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Determine secondary level tactical element - PRE-T1021"*

Table 3827. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1021">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1021</a>

## Upload, install, and configure software/tools - PRE-T1139

An adversary may stage software and tools for use during later stages of an attack. The software and tools may be placed on systems legitimately in use by the adversary or may be placed on previously compromised infrastructure. (Citation: APT1) (Citation: RedOctober)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Infrastructure is (typically) outside of control/visibility of defender and as such as tools are staged for specific campaigns, it will not be observable to those being attacked.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Adversary has control of the infrastructure and will likely be able to add/remove tools to infrastructure, whether acquired via hacking or standard computer acquisition (e.g., [<https://aws.amazon.com> AWS], VPS providers).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Upload, install, and configure software/tools - PRE-T1139"*

Table 3828. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1139">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1139</a>

## Assign KITs/KIQs into categories - PRE-T1005

Leadership organizes Key Intelligence Topics (KITs) and Key Intelligence Questions (KIQs) into three types of categories and creates more if necessary. An example of a description of key players KIT would be when an adversary assesses the cyber defensive capabilities of a nation-state threat actor. (Citation: Herring1999)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Assign KITs/KIQs into categories - PRE-T1005"*

Table 3829. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1005">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1005</a>

## Analyze application security posture - PRE-T1070

An adversary can probe a victim's network to determine configurations. The configurations may provide opportunities to route traffic through the network in an undetected or less detectable way. (Citation: Li2014ExploitKits) (Citation: RecurlyGHOST)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This can be done offline after the data has been collected.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Analyze technical scanning results to identify weaknesses in the configuration or architecture. Many of the common tools highlight these weakness automatically (e.g., software security scanning tools or published vulnerabilities about commonly used libraries).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Analyze application security posture - PRE-T1070"*

*Table 3830. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1070">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1070</a>

## Targeted social media phishing - PRE-T1143

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Sending messages through social media platforms to individuals identified as a target. These messages may include malicious attachments or links to malicious sites or they may be designed to establish communications for future actions. (Citation: APT1) (Citation: Nemucod Facebook)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Extremely hard to identify (in the launch phase) what message via social media is hostile versus what is not. Increased use of encrypted communications increases the difficulty average defender's have in detecting use of this technique.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Sending messages to individuals identified as a target follows normal tradecraft for using social media.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Targeted social media phishing - PRE-T1143"*

*Table 3831. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1143">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1143</a>

## Obtain Apple iOS enterprise distribution key pair and certificate - PRE-T1169

The adversary can obtain an Apple iOS enterprise distribution key pair and certificate and use it to distribute malicious apps directly to Apple iOS devices without the need to publish the apps to the Apple App Store (where the apps could potentially be detected). (Citation: Apple Developer Enterprise Program Apps) (Citation: Fruit vs Zombies) (Citation: WIRELURKER) (Citation: Sideloaded Change)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: Starting in iOS 9, Apple has changed the user interface when installing apps to better indicate to users the potential implications of installing apps signed by an enterprise distribution key rather than from Apple's App Store and to make it more difficult for users to inadvertently install these apps. Additionally, enterprise management controls are available that can be imposed to prevent installing these apps. Also, enterprise mobility management / mobile device management (EMM/MDM) systems can be used to scan for the presence of undesired apps on enterprise mobile devices.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Apple requires a DUNS number, corporate documentation, and \$299 to obtain an enterprise distribution certificate. Additionally, Apple revokes certificates if they discover malicious use. However, the enrollment information could be falsified to Apple by an adversary, or an adversary could steal an existing enterprise distribution certificate (and the corresponding private key) from a business that already possesses one.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Obtain Apple iOS enterprise distribution key pair and certificate - PRE-T1169"*

## Determine 3rd party infrastructure services - PRE-T1037

Infrastructure services includes the hardware, software, and network resources required to operate a communications environment. This infrastructure can be managed by a 3rd party rather than being managed by the owning organization. (Citation: FFIECAwareness) (Citation: Zetter2015Threats)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: The data is passive in nature or not controlled by the defender, so it is hard to identify when an adversary is getting or analyzing the data.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Based on what the 3rd party infrastructure is, there are many tell tail signs which indicate it is hosted by a 3rd party, such as ASN data, MX or CNAME pointers or IP addresses

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Determine 3rd party infrastructure services - PRE-T1037"*

Determine 3rd party infrastructure services - PRE-T1037 has relationships with:

- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Determine 3rd party infrastructure services - PRE-T1061" with estimative-language:likelihood-probability="almost-certain"

## Identify resources required to build capabilities - PRE-T1125

As with legitimate development efforts, different skill sets may be required for different phases of an attack. The skills needed may be located in house, can be developed, or may need to be contracted out. (Citation: APT1)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Recruitment is, by its nature, either clandestine or off the record.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Like target organizations, adversary organizations are competing to identify and hire top technical talent. Training less technical staff is also a viable option.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify resources required to build capabilities - PRE-T1125"*

Table 3834. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1125">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1125</a>

## Friend/Follow/Connect to targets of interest - PRE-T1141

A form of social engineering designed build trust and to lay the foundation for future interactions or attacks. (Citation: BlackHatRobinSage)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Users have the ability to detect and report non-authenticated individuals requesting to follow, friend or connect to a target. However the rigidity in validating the users is not typically followed by standard users.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Connecting with "friends" is a fundamental requirement

for social media - without it, social media is worthless. An adversary can easily create a profile and request targets to validate the requests.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Friend/Follow/Connect to targets of interest - PRE-T1141"*

Friend/Follow/Connect to targets of interest - PRE-T1141 has relationships with:

- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Friend/Follow/Connect to targets of interest - PRE-T1121"* with *estimative-language:likelihood-probability="almost-certain"*

*Table 3835. Table References*

<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1141">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1141</a>

## Create infected removable media - PRE-T1132

Use of removable media as part of the Launch phase requires an adversary to determine type, format, and content of the media and associated malware. (Citation: BadUSB)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary will likely use code repositories, but development will be performed on their local systems.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Several exploit repositories and tool suites exist for re-use and tailoring.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Create infected removable media - PRE-T1132"*

*Table 3836. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1132">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1132</a>

## DNS poisoning - PRE-T1159

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

DNS (cache) poisoning is the corruption of an Internet server's domain name system table by replacing an Internet address with that of another, rogue address. When a Web user seeks the page with that address, the request is redirected by the rogue entry in the table to a different address. (Citation: Google DNS Poisoning) (Citation: DNS Poisoning China) (Citation: Mexico Modem DNS Poison)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: Tracking multiple DNS infrastructures will likely require multiple tools/services, more advanced analytics, and mature detection/response capabilities in order to be effective. Few defenders demonstrate the mature processes to immediately detect and mitigate against the use of this technique.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Adversary poisons DNS entry to redirect traffic designated for one site to route to an adversary controlled resource.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="DNS poisoning - PRE-T1159"*

*Table 3837. Table References*

Links

<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1159">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1159</a>
---

## Identify web defensive services - PRE-T1033

An adversary can attempt to identify web defensive services as [<https://www.cloudflare.com/> CloudFlare], [<https://github.com/jjxtra/Windows-IP-Ban-Service> IPBan], and [<https://www.snort.org/> Snort]. This may be done by passively detecting services, like [<https://www.cloudflare.com/> CloudFlare] routing, or actively, such as by purposefully tripping security defenses. (Citation: NMAP WAF NSE)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Active service detection may trigger an alert. Passive service enumeration is not detected.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Adversary can passively detect services (e.g., [<https://www.cloudflare.com/> CloudFlare] routing) or actively detect services (e.g., by purposefully tripping security defenses)

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify web defensive services - PRE-T1033"*

*Table 3838. Table References*

Links
-------

<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1033">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1033</a>

## Analyze architecture and configuration posture - PRE-T1065

An adversary may analyze technical scanning results to identify weaknesses in the configuration or architecture of a victim network. These weaknesses could include architectural flaws,

misconfigurations, or improper security controls. (Citation: FireEyeAPT28)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This can be done offline after the data has been collected.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Many of the common tools highlight these weakness automatically.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Analyze architecture and configuration posture - PRE-T1065"*

*Table 3839. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1065">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1065</a>

## **Acquire and/or use 3rd party infrastructure services - PRE-T1084**

A wide variety of cloud, virtual private services, hosting, compute, and storage solutions are available. Additionally botnets are available for rent or purchase. Use of these solutions allow an adversary to stage, launch, and execute an attack from infrastructure that does not physically tie back to them and can be rapidly provisioned, modified, and shut down. (Citation: LUCKYCAT2012)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: 3rd party services highly leveraged by legitimate services, hard to distinguish from background noise. While an adversary can use their own infrastructure, most know this is a sure- re way to get caught. To add degrees of separation, they can buy or rent from another adversary or accomplice.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Wide range of 3rd party services for hosting, rotating, or moving C2, static data, exploits, exfiltration, etc.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Acquire and/or use 3rd party infrastructure services - PRE-T1084"*

Acquire and/or use 3rd party infrastructure services - PRE-T1084 has relationships with:

- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Acquire and/or use 3rd party infrastructure services - PRE-T1106"* with estimative-language:likelihood-probability="almost-certain"

*Table 3840. Table References*

Links

<https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1084>

## Determine approach/attack vector - PRE-T1022

The approach or attack vector outlines the specifics behind how the adversary would like to attack the target. As additional information is known through the other phases of PRE-ATT&CK, an adversary may update the approach or attack vector. (Citation: CyberAdversaryBehavior) (Citation: WITCHCOVEN2015) (Citation: JP3-60) (Citation: JP3-12 ®) (Citation: DoD Cyber 2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. May change for special use cases or adversary and defender overlays.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: This is the normal adversary targeting cycle where they utilize our poor OPSEC practices to their advantage.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Determine approach/attack vector - PRE-T1022"*

*Table 3841. Table References*

Links

<https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1022>

## Research visibility gap of security vendors - PRE-T1067

If an adversary can identify which security tools a victim is using they may be able to identify ways around those tools. (Citation: CrowdStrike Putter Panda)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Public source external to the defender's organization.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Requires in-depth research and potentially other intrusions, requires unbounded amount of work to possibly find a return on investment

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Research visibility gap of security vendors - PRE-T1067"*

*Table 3842. Table References*

Links

<https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1067>

## Analyze business processes - PRE-T1078

Business processes, such as who typically communicates with who, or what the supply chain is for a particular part, provide opportunities for social engineering or other (Citation: Warwick2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Social engineering and other attempts to learn about business practices and processes would not immediately be associated with an impending cyber event.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: To get any kind of fidelity into business processes would require insider access. Basic processes could be mapped, but understanding where in the organization these processes take place and who to target during any given phase of the process would generally be difficult.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Analyze business processes - PRE-T1078"*

*Table 3843. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1078">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1078</a>

## Assess security posture of physical locations - PRE-T1079

Physical access may be required for certain types of adversarial actions. (Citation: CyberPhysicalAssessment) (Citation: CriticalInfrastructureAssessment)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Physical security is often unaware of implications of physical access to network. However, some organizations have thorough physical security measures that would log and report attempted incursions, perimeter breaches, unusual RF at a site, etc.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Social engineering and OSINT are still generally successful. Physical locations of offices/sites are easily determined. Monitoring for other sites of interest, such as backup storage vendors, is also easy to accomplish.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Assess security posture of physical locations - PRE-T1079"*

*Table 3844. Table References*

Links
-------

## Obtain booter/stressor subscription - PRE-T1173

Configure and setup booter/stressor services, often intended for server stress testing, to enable denial of service attacks. (Citation: Krebs-Anna) (Citation: Krebs-Booter) (Citation: Krebs-Bazaar)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Purchase of booster services is not observable; potentially can trace booster service used to origin of sale, yet not before attack is executed. Furthermore, subscription does not automatically mean foul intention.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Easily accessible and used to launch DDoS attacks by even novice Internet users, and can be purchased from providers for a nominal fee, some of which even accept credit cards and PayPal payments to do.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Obtain booter/stressor subscription - PRE-T1173"*

*Table 3845. Table References*

Links

<https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1173>

## Analyze data collected - PRE-T1064

An adversary will assess collected information such as software/hardware versions, vulnerabilities, patch level, etc. They will analyze technical scanning results to identify weaknesses in the confirmation or architecture. (Citation: SurveyDetectionStrategies) (Citation: CyberReconPaper) (Citation: RSA-APTRecon) (Citation: FireEyeAPT28)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This can be done offline after the data has been collected.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Many of the common tools highlight these weaknesses automatically. Adversary can "dry run" against the target using known exploits or burner devices to determine key identifiers of software, hardware, and services.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Analyze data collected - PRE-T1064"*

*Table 3846. Table References*

Links

## Enumerate externally facing software applications technologies, languages, and dependencies - PRE-T1038

Software applications will be built using different technologies, languages, and dependencies. This information may reveal vulnerabilities or opportunities to an adversary. (Citation: CommonApplicationAttacks) (Citation: WebApplicationSecurity) (Citation: SANSTop25)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Impossible to differentiate between an adversary and a normal user when accessing a site to determine the languages/technologies used. If active scanning tools are employed, then the defender has the ability to detect. However, this is typically not acted upon due to the large volume of this type of traffic and it will likely not prompt the defender to take any actionable defense. Defender review of access logs may provide some insight based on trends or patterns.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Basic interaction with the site provides insight into the programming languages/technologies used for a given web site. Additionally many of the active scanning tools will also provide some insight into this information.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Enumerate externally facing software applications technologies, languages, and dependencies - PRE-T1038"*

Table 3847. Table References

Links

<https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1038>

## Generate analyst intelligence requirements - PRE-T1011

Analysts may receive Key Intelligence Topics (KITs) and Key Intelligence Questions (KIQs) from leadership or key decision makers and generate intelligence requirements to articulate intricacies of information required on a topic or question. (Citation: Herring1999)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Generate analyst intelligence requirements - PRE-T1011"*

Table 3848. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1011">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1011</a>

## Port redirector - PRE-T1140

Redirecting a communication request from one address and port number combination to another. May be set up to obfuscate the final location of communications that will occur in later stages of an attack. (Citation: SecureWorks HTRAN Analysis)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Infrastructure is (typically) outside of control/visibility of defender and as such as tools are staged for specific campaigns, it will not be observable to those being attacked.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Adversary has control of the infrastructure and will likely be able to add/remove tools to infrastructure, whether acquired via hacking or standard computer acquisition (e.g., [<https://aws.amazon.com> AWS], VPS providers).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Port redirector - PRE-T1140"*

Table 3849. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1140">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1140</a>

## Identify business processes/tempo - PRE-T1057

Understanding an organizations business processes and tempo may allow an adversary to more effectively craft social engineering attempts or to better hide technical actions, such as those that generate network traffic. (Citation: Scasny2015) (Citation: Infosec-osint)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Current or previous employees may divulge information on the Internet. If insiders are used, the defender may have policies or tools in place to detect loss of this data or knowledge.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: In some cases, this requires some insider knowledge or specialized access to learn when critical operations occur in a corporation. For publicly traded US corporations, there is a lot of open source information about their financial reporting obligations

(per SEC). Companies announce their annual shareholder meeting and their quarter phone calls with investors. Information such as this can help the adversary to glean certain aspects of the business processes and/or rhythm.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify business processes/tempo - PRE-T1057"*

Table 3850. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1057">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1057</a>

## Build and configure delivery systems - PRE-T1124

Delivery systems are the infrastructure used by the adversary to host malware or other tools used during exploitation. Building and configuring delivery systems may include multiple activities such as registering domain names, renting hosting space, or configuring previously exploited environments. (Citation: APT1)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: It is detectable once deployed to the public Internet, used for adversarial purposes, discovered, and reported to defenders.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: It is easy to create and burn infrastructure. Otherwise, blacklisting would be more successful for defenders.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Build and configure delivery systems - PRE-T1124"*

Table 3851. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1124">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1124</a>

## Identify personnel with an authority/privilege - PRE-T1048

Personnel internally to a company may have non-electronic specialized access, authorities, or privilege that make them an attractive target for an adversary. One example of this is an individual with financial authority to authorize large transactions. An adversary who compromises this individual might be able to subvert large dollar transfers. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: The layers of data required and potential gaps of information to map a specific person to an authority or privilege on a network requires access to

resources that may not tip off a defender.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Requires an adversary to undergo an intensive research process. It is resource intensive or requires special data access. May be easier for certain specialty use cases.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify personnel with an authority/privilege - PRE-T1048"*

Table 3852. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1048">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1048</a>

## Mine social media - PRE-T1050

An adversary may research available open source information about a target commonly found on social media sites such as [<https://www.facebook.com> Facebook], [<https://www.instagram.com> Instagram], or [<https://www.pinterest.com> Pinterest]. Social media is public by design and provides insight into the interests and potentially inherent weaknesses of a target for exploitation by the adversary. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Searching publicly available sources that cannot be monitored by a defender.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Very public by design. Application of privacy settings is not a panacea.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Mine social media - PRE-T1050"*

Table 3853. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1050">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1050</a>

## Credential pharming - PRE-T1151

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Credential pharming a form of attack designed to steal users' credential by redirecting users to fraudulent websites. Pharming can be conducted either by changing the hosts file on a victim's computer or by exploitation of a vulnerability in DNS server software. (Citation: DriveByPharming) (Citation: GoogleDrive Phishing)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Fidelity of networking monitoring must be able to detect when traffic is diverted to non-normal sources at a site level. It is possible to identify some methods of pharming, but detection capabilities are limited and not commonly implemented.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Although it can be difficult to spoof/redirect content to a hostile service via DNS poisoning or MiTM attacks, current malware such as Zeus is able to successfully pharm credentials and end users are not well-versed in checking for certificate mismatches.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Credential pharming - PRE-T1151"*

Table 3854. Table References

## OS-vendor provided communication channels - PRE-T1167

Google and Apple provide Google Cloud Messaging and Apple Push Notification Service, respectively, services designed to enable efficient communication between third-party mobile app backend servers and the mobile apps running on individual devices. These services maintain an encrypted connection between every mobile device and Google or Apple that cannot easily be

inspected and must be allowed to traverse networks as part of normal device operation. These services could be used by adversaries for communication to compromised mobile devices. (Citation: Securelist Mobile Malware 2013) (Citation: DroydSeuss)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: These services are heavily utilized by mainstream mobile app developers. High volume of communications makes it extremely hard for a defender to distinguish between legitimate and adversary communications.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: These are free services provided by Google and Apple to app developers, and information on how to use them is readily available.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="OS-vendor provided communication channels - PRE-T1167"*

*Table 3856. Table References*

## Obfuscate infrastructure - PRE-T1086

Obfuscation is hiding the day-to-day building and testing of new tools, chat servers, etc. (Citation: LUCKYCAT2012)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Difficult, but defender is well aware of technique and attempts to find discrepancies.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Adversary has a variety of solutions, ranging in difficulty, that can be employed (e.g., BGP hijacking, tunneling, reflection, multi-hop, etc.) Adversary can also use misattributable credentials to obtain servers, build environment, [<https://aws.amazon.com> Amazon Web Services] (AWS) accounts, etc.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Obfuscate infrastructure - PRE-T1086"*

Obfuscate infrastructure - PRE-T1086 has relationships with:

- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Obfuscate infrastructure - PRE-T1108" with estimative-language:likelihood-probability="almost-certain"

Table 3862. Table References

<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1086">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1086</a>

## Deploy exploit using advertising - PRE-T1157

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Exploits spread through advertising (malvertising) involve injecting malicious or malware-laden

advertisements into legitimate online advertising networks and webpages. (Citation: TPMalvertising)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Although some commercial technologies are being advertised which claim to detect malvertising, it largely spreads unknowingly because it doesn't always require an action by a user.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: An adversary can deploy exploits via malvertising using multiple mechanisms. Such mechanisms include an image ad that is infected, redirection, or using social engineering to get the end user to install the malicious software themselves.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Deploy exploit using advertising - PRE-T1157"*

*Table 3863. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1157">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1157</a>

## Map network topology - PRE-T1029

A network topology is the arrangement of the various elements of a network (e.g., servers, workstations, printers, routers, firewalls, etc.). Mapping a network allows an adversary to understand how the elements are connected or related. (Citation: man traceroute) (Citation: Shodan Tutorial)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Network mapping techniques/tools typically generate benign traffic that does not require further investigation by a defender since there is no actionable defense to execute. Defender review of access logs may provide some insight based on trends or patterns.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Various available tools and data sources for scouting and detecting network topologies.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Map network topology - PRE-T1029"*

*Table 3864. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1029">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1029</a>

## Obfuscation or cryptography - PRE-T1090

Obfuscation is the act of creating communications that are more difficult to understand. Encryption transforms the communications such that it requires a key to reverse the encryption. (Citation: FireEyeAPT28)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Techniques and signatures are hard to detect. Advanced communications and exfiltration channels are nearly indistinguishable from background noise.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Known approaches include the use of cryptography for communications, rotating drops sites (such as random list of chat fora), and one-time [https://aws.amazon.com/s3/ Simple Storage Service (S3)] buckets, etc. All require sophisticated knowledge, infrastructure, and funding.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Obfuscation or cryptography - PRE-T1090"*

Table 3865. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1090">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1090</a>

## Choose pre-compromised mobile app developer account credentials or signing keys - PRE-T1168

The adversary can use account credentials or signing keys of an existing mobile app developer to publish malicious updates of existing mobile apps to an application store, or to abuse the developer's identity and reputation to publish new malicious apps. Many mobile devices are configured to automatically install new versions of already-installed apps. (Citation: Fraudulent Apps Stolen Dev Credentials)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Possible to detect compromised credentials if alerting from a service provider is enabled and acted upon by the individual.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: The difficulty of obtaining useful developer credentials may vary. Well-organized, professional app developers whose credentials or signing keys would be the most useful to an adversary because of the large install bases of their apps, would likely strongly protect their credentials and signing keys. Less-organized app developers may not protect their credentials and signing keys as strongly, but the credentials and signing keys would also be less useful to an adversary. These less-organized app developers may reuse passwords across sites, fail to turn on multi-factor authentication features when available, or store signing keys in

unprotected locations.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Choose pre-compromised mobile app developer account credentials or signing keys - PRE-T1168"*

Table 3866. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1168">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1168</a>

## Spear phishing messages with text only - PRE-T1145

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Emails with text only phishing messages do not contain any attachments or links to websites. They are designed to get a user to take a follow on action such as calling a phone number or wiring money. They can also be used to elicit an email response to confirm existence of an account or user. (Citation: Paypal Phone Scam)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: End user training and awareness is the primary defense for flagging a plain text email so the end user does not respond or take any requested action (e.g., calling a designated number).

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Sending messages with text only should be accepted in most cases (e.g., not being filtered based on source, content).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Spear phishing messages with text only - PRE-T1145"*

Table 3867. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1145">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1145</a>

## Test callback functionality - PRE-T1133

Callbacks are malware communications seeking instructions. An adversary will test their malware to ensure the appropriate instructions are conveyed and the callback software can be reached. (Citation: LeeBeaconing)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary controls the test and defender likely has no visibility.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Adversary controls or acquires all pieces of infrastructure and can test outside of defender's visibility.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Test callback functionality - PRE-T1133"*

Table 3868. Table References

Links
-------

<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1133">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1133</a>

## Mine technical blogs/forums - PRE-T1034

Technical blogs and forums provide a way for technical staff to ask for assistance or troubleshoot problems. In doing so they may reveal information such as operating system (OS), network devices, or applications in use. (Citation: FunAndSun2012)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Cannot detect access to public sites.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Success is dependent upon the existence of detailed technical specifications for target network posted in blogs/forums. Poor OPSEC practices result in an adversary gleaning a lot of sensitive information about configurations and/or issues encountered.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Mine technical blogs/forums - PRE-T1034"*

Table 3869. Table References

Links
-------

<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1034">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1034</a>

## Automated system performs requested action - PRE-T1161

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Users may be performing legitimate activity but using media that is compromised (e.g., using a USB drive that comes with malware installed during manufacture or supply). Upon insertion in the system the media auto-runs and the malware executes without further action by the user. (Citation: WSUSpect2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Environments without extensive endpoint sensing

capabilities do not typically collect this level of detailed information.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Autoruns with USB keys and CDs traditionally were always on (e.g., [<http://windows.microsoft.com> Windows] 7 is now an exception with a new policy of limiting the always on nature of Autoruns), ensuring and automated system completes a requested action. Specialized use cases exist where automated systems are specifically designed against automatically performing certain actions (e.g., USB/CD insertion and automatically running is disabled in certain environments).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Automated system performs requested action - PRE-T1161"*

*Table 3870. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1161">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1161</a>

## Obtain/re-use payloads - PRE-T1123

A payload is the part of the malware which performs a malicious action. The adversary may re-use payloads when the needed capability is already available. (Citation: SonyDestover)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary will likely use code repositories, but detecting an adversary acquiring a payload would require the defender to be monitoring the code repository where the payload is stored. If the adversary re-uses payloads, this allows the defender to create signatures to detect using these known indicators of compromise (e.g., hashes).

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Several exploit repositories and tool suites exist for re-use and tailoring.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Obtain/re-use payloads - PRE-T1123"*

*Table 3871. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1123">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1123</a>

## Conduct passive scanning - PRE-T1030

Passive scanning is the act of looking at existing network traffic in order to identify information about the communications system. (Citation: SurveyDetectionStrategies) (Citation: CyberReconPaper)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Generates no network traffic that would enable detection.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Easy to do but it requires a vantage point conducive to accessing this data.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Conduct passive scanning - PRE-T1030"*

Table 3872. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1030">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1030</a>

## Analyze social and business relationships, interests, and affiliations - PRE-T1072

Social media provides insight into the target's affiliations with groups and organizations. Certification information can explain their technical associations and professional associations. Personal information can provide data for exploitation or even blackmail. (Citation: Scasny2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Public sources are external to the defender's organization. Some social media sites have an option to show you when users are looking at your profile, but an adversary can evade this tracking depending on how they conduct the searches.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Social and business relationship information for an individual can be found by examining their social media contacts (e.g., [<https://www.facebook.com> Facebook] and [<https://www.linkedin.com> LinkedIn]). Social media also provides insight into the target's affiliations with groups and organizations. Finally, certification information can explain their technical associations and professional associations.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Analyze social and business relationships, interests, and affiliations - PRE-T1072"*

Table 3873. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1072">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1072</a>

## Network-based hiding techniques - PRE-T1092

Technical network hiding techniques are methods of modifying traffic to evade network signature detection or to utilize misattribution techniques. Examples include channel/IP/VLAN hopping, mimicking legitimate operations, or seeding with misinformation. (Citation: HAMMERTOSS2015)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Unless defender is dissecting protocols or performing network signature analysis on any protocol deviations/patterns, this technique is largely undetected.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Some of the hiding techniques require special accesses (network, proximity, physical, etc.) and/or may rely on knowledge of how the defender operates and/or awareness on what visibility the defender has and how it is obtained

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Network-based hiding techniques - PRE-T1092"*

Table 3874. Table References

Links

<https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1092>

## Friend/Follow/Connect to targets of interest - PRE-T1121

Once a persona has been developed an adversary will use it to create connections to targets of interest. These connections may be direct or may include trying to connect through others. (Citation: NEWSCASTER2014) (Citation: BlackHatRobinSage)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Unless there is some threat intelligence reporting, these users are hard to differentiate.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: The nature of social media is such that the adversary naturally connects to a target of interest without suspicion, given the purpose of the platform is to promote connections between individuals. Performing activities like typical users, but with specific intent in mind.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Friend/Follow/Connect to targets of interest - PRE-T1121"*

Friend/Follow/Connect to targets of interest - PRE-T1121 has relationships with:

- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Friend/Follow/Connect to targets of interest - PRE-T1141"* with estimative-language:likelihood-probability="almost-certain"

Table 3875. Table References

## Disseminate removable media - PRE-T1156

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Removable media containing malware can be injected in to a supply chain at large or small scale. It can also be physically placed for someone to find or can be sent to someone in a more targeted manner. The intent is to have the user utilize the removable media on a system where the adversary is trying to gain access. (Citation: USBMalwareAttacks) (Citation: FPDefendNewDomain) (Citation: ParkingLotUSB)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: From a technical perspective, detection of an adversary disseminating removable media is not possible as there is no technical element involved until the compromise phase. Most facilities generally do not perform extensive physical security patrols, which would be necessary in order to promptly identify an adversary deploying removable media to be used in an attack.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Commonly executed technique by penetration testers to gain access to networks via end users who are innately trusting of newly found or available technology.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Disseminate removable media - PRE-T1156"*

Table 3876. Table References

## Replace legitimate binary with malware - PRE-T1155

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Replacing a legitimate binary with malware can be accomplished either by replacing a binary on a legitimate download site or standing up a fake or alternative site with the malicious binary. The intent is to have a user download and run the malicious binary thereby executing malware. (Citation: FSecureICS)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: On the host end user system, integrity checking (e.g., hash verification, code signing enforcement), application whitelisting, sandboxing, or behavioral-based/heuristic-based systems are most likely to be successful in detecting this technique. On the

source webserver, detecting binary changes is easy to detect if performed.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Requires the adversary to replace a binary on a website where users will download the binary (e.g., patch, firmware update, software application) as innately trusted. The additional challenge is the reduced set of vendor-trusted websites that are vulnerable.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Replace legitimate binary with malware - PRE-T1155"*

Table 3877. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1155">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1155</a>

## Acquire OSINT data sets and information - PRE-T1054

Data sets can be anything from Security Exchange Commission (SEC) filings to public phone numbers. Many datasets are now either publicly available for free or can be purchased from a variety of data vendors. Open source intelligence (OSINT) is intelligence gathered from publicly available sources. This can include both information gathered on-line as well as in the physical world. (Citation: SANSThreatProfile) (Citation: Infosec-osint) (Citation: isight-osint)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This activity is indistinguishable from legitimate business uses and easy to obtain.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Large quantities of data exists on people, organizations and technologies whether divulged wittingly or collected as part of doing business on the Internet (unbeknownst to the user/company). Search engine and database indexing companies continuously mine this information and make it available to anyone who queries for it.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Acquire OSINT data sets and information - PRE-T1054"*

Acquire OSINT data sets and information - PRE-T1054 has relationships with:

- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Acquire OSINT data sets and information - PRE-T1043"* with estimative-language:likelihood-probability="almost-certain"

Table 3878. Table References

## Secure and protect infrastructure - PRE-T1094

An adversary may secure and protect their infrastructure just as defenders do. This could include the use of VPNs, security software, logging and monitoring, passwords, or other defensive measures. (Citation: KrebsTerracottaVPN)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Indistinguishable from standard security practices employed by legitimate operators.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Adversary benefits from our own advances, techniques, and software when securing and protecting their own development infrastructure.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Secure and protect infrastructure - PRE-T1094"*

*Table 3879. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1094">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1094</a>

## Determine firmware version - PRE-T1035

Firmware is permanent software programmed into the read-only memory of a device. As with other types of software, firmware may be updated over time and have multiple versions. (Citation: Abdelnur Advanced Fingerprinting)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: No easy way for defenders to detect when an adversary collects this information.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Depending upon the target device, there are variable ways for an adversary to determine the firmware version. In some cases, this information can be derived from easily obtained information. For example, in [<http://www.cisco.com> Cisco] devices, the firmware version is easily determined once the device model and OS version is known since it is included in the release notes.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Determine firmware version - PRE-T1035"*

*Table 3880. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1035">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1035</a>

## Develop KITs/KIQs - PRE-T1004

Leadership derives Key Intelligence Topics (KITs) and Key Intelligence Questions (KIQs) from the areas of most interest to them. KITs are an expression of management's intelligence needs with respect to early warning, strategic and operational decisions, knowing the competition, and understanding the competitive situation. KIQs are the critical questions aligned by KIT which provide the basis for collection plans, create a context for analytic work, and/or identify necessary external operations. (Citation: Herring1999)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Develop KITs/KIQs - PRE-T1004"*

*Table 3881. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1004">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1004</a>

## Research relevant vulnerabilities/CVEs - PRE-T1068

Common Vulnerability Enumeration (CVE) is a dictionary of publicly known information about security vulnerabilities and exposures. An adversary can use this information to target specific software that may be vulnerable. (Citation: WeaponsVulnerable) (Citation: KasperskyCarbanak)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Public source external to the defender's organization.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Using standard headers/fingerprints from normal traffic, it is often trivial to identify the SW or HW the target is running, which can be correlated against known CVEs and exploit packages.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Research relevant vulnerabilities/CVEs - PRE-T1068"*

*Table 3882. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1068">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1068</a>

## Determine 3rd party infrastructure services - PRE-T1061

A wide variety of cloud, virtual private services, hosting, compute, and storage solutions are available as 3rd party infrastructure services. These services could provide an adversary with another avenue of approach or compromise. (Citation: LUCKYCAT2012) (Citation: Schneier-cloud) (Citation: Computerworld-suppliers)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary searches publicly available sources and may find this information on the 3rd party web site listing new customers/clients.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Press releases may reveal this information particularly when it is an expected cost savings or improvement for scalability/reliability.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Determine 3rd party infrastructure services - PRE-T1061"*

Determine 3rd party infrastructure services - PRE-T1061 has relationships with:

- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Determine 3rd party infrastructure services - PRE-T1037" with estimative-language:likelihood-probability="almost-certain"

*Table 3883. Table References*

<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1061">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1061</a>

## Untargeted client-side exploitation - PRE-T1147

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

A technique that takes advantage of flaws in client-side applications without targeting specific users. For example, an exploit placed on an often widely used public web site intended for drive-by delivery to whomever visits the site. (Citation: CitizenLabGreatCannon)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Defensive technologies exist to scan web content before delivery to the requested end user. However, this is not fool proof as some sites encrypt web communications and the adversary constantly moves to sites not previously flagged as malicious thus defeating this defense. Host-based defenses can also aid in detection/mitigation as well as detection by the web site that got compromised.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Commonly executed technique to place an exploit on an often widely used public web site intended for driveby delivery.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Untargeted client-side exploitation - PRE-T1147"*

Table 3884. Table References

## Discover target logon/email address format - PRE-T1032

Email addresses, logon credentials, and other forms of online identification typically share a common format. This makes guessing other credentials within the same domain easier. For example if a known email address is [first.last@company.com](mailto:first.last@company.com) it is likely that others in the company

will have an email in the same format. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Easily determined and not intended to be protected information. Publicly collected and shared repositories of email addresses exist.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Scraping of known email addresses from the target will likely reveal the target standard for address/username format. This information is easily discoverable.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Discover target logon/email address format - PRE-T1032"*

## Exploit public-facing application - PRE-T1154

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

The use of software, data, or commands to take advantage of a weakness in a computer system or program in order to cause unintended or unanticipated behavior. The weakness in the system can be a bug, a glitch, or a design vulnerability. (Citation: GoogleCrawlerSQLInj)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: If the application and network are designed well, the defender should be able to utilize logging and application logic to catch and deflect SQL injection attacks.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Launching a SQL injection attack is not overly complex and a commonly used technique. This technique, however, requires finding a vulnerable application.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Exploit public-facing application - PRE-T1154"*

*Table 3887. Table References*

Links

## Assess KITs/KIQs benefits - PRE-T1006

Key Intelligence Topics (KITs) and Key Intelligence Questions (KIQs) may be further subdivided to focus on political, economic, diplomatic, military, financial, or intellectual property categories. An adversary may specify KITs or KIQs in this manner in order to understand how the information they are pursuing can have multiple uses and to consider all aspects of the types of information they need to target for a particular purpose. (Citation: CompetitiveIntelligence) (Citation: CompetitiveIntelligence)KIT.

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Assess KITs/KIQs benefits - PRE-T1006"*

Table 3888. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1006">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1006</a>

## Obfuscate operational infrastructure - PRE-T1095

Obfuscation is hiding the day-to-day building and testing of new tools, chat servers, etc. (Citation: DellComfooMasters)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: While possible to detect given a significant sample size, depending on how the unique identifier is used detection may be difficult as similar patterns may be employed elsewhere (e.g., content hosting providers, account reset URLs).

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: An adversary can easily generate pseudo-random identifiers to associate with a specific target, include the indicator as part of a URL and then identify which target was successful.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Obfuscate operational infrastructure - PRE-T1095"*

Table 3889. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1095">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1095</a>

## Test malware in various execution environments - PRE-T1134

Malware may perform differently on different platforms (computer vs handheld) and different operating systems ([<http://www.ubuntu.com> Ubuntu] vs [<http://www.apple.com/osx/> OS X]), and versions ([<http://windows.microsoft.com> Windows] 7 vs 10) so malicious actors will test their malware in the environment(s) where they most expect it to be executed. (Citation: BypassMalwareDefense)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary controls the test and defender likely has no visibility.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Adversary can simulate most environments (e.g., variable operating systems, patch levels, application versions) with details available from other techniques.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Test malware in various execution environments - PRE-T1134"*

*Table 3890. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1134">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1134</a>

## Determine centralization of IT management - PRE-T1062

Determining if a "corporate" help desk exists, the degree of access and control it has, and whether there are "edge" units that may have different support processes and standards. (Citation: SANSCentralizeManagement)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: No technical means to detect an adversary collecting information about a target. Any detection would be based upon strong OPSEC policy implementation.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Requires an adversary to undergo a research process to learn the internal workings of an organization. An adversary can do this by social engineering individuals in the company by claiming to need to find information for the help desk, or through social engineering of former employees or business partners.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Determine centralization of IT management - PRE-T1062"*

Table 3891. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1062">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1062</a>

## Test physical access - PRE-T1137

An adversary can test physical access options in preparation for the actual attack. This could range from observing behaviors and noting security precautions to actually attempting access. (Citation: OCIAAC Pre Incident Indicators) (Citation: NewsAgencySpy)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Defender often install badging, cameras, security guards or other detection techniques for physical security and monitoring.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Requires a physical presence in the space being entered and increased risk of being detected/detained (e.g., recorded on video camera)

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Test physical access - PRE-T1137"*

Table 3892. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1137">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1137</a>

## Acquire or compromise 3rd party signing certificates - PRE-T1087

Code signing is the process of digitally signing executables or scripts to confirm the software author and guarantee that the code has not been altered or corrupted. Users may trust a signed piece of code more than an unsigned piece of code even if they don't know who issued the certificate or who the author is. (Citation: Adobe Code Signing Cert)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defender will not know what certificates an adversary acquires from a 3rd party. Defender will not know prior to public disclosure if a 3rd party has had their certificate compromised.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: It is trivial to purchase code signing certificates within an organization; many exist and are available at reasonable cost. It is complex to factor or steal 3rd party code signing certificates for use in malicious mechanisms

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Acquire or compromise 3rd party signing*

*certificates - PRE-T1087"*

Acquire or compromise 3rd party signing certificates - PRE-T1087 has relationships with:

- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Acquire or compromise 3rd party signing certificates - PRE-T1109"* with *estimative-language:likelihood-probability="almost-certain"*

*Table 3893. Table References*

<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1087">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1087</a>

## Assess leadership areas of interest - PRE-T1001

Leadership assesses the areas of most interest to them and generates Key Intelligence Topics (KIT) or Key Intelligence Questions (KIQ). For example, an adversary knows from open and closed source reporting that cyber is of interest, resulting in it being a KIT. (Citation: ODNIIntegration)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Assess leadership areas of interest - PRE-T1001"*

*Table 3894. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1001">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1001</a>

## Enumerate client configurations - PRE-T1039

Client configurations information such as the operating system and web browser, along with additional information such as version or language, are often transmitted as part of web browsing communications. This can be accomplished in several ways including use of a compromised web site to collect details on visiting computers. (Citation: UnseenWorldOfCookies) (Citation: Panopticlick)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Typical information collected as part of accessing web sites (e.g., operating system, browser version, basic configurations).

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Basic web scripting capability to collect information of interest on users of interest. Requires a compromised web site and the users of interest to navigate there.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Enumerate client configurations - PRE-T1039"*

*Table 3895. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1039">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1039</a>

## Private whois services - PRE-T1082

Every domain registrar maintains a publicly viewable database that displays contact information for every registered domain. Private 'whois' services display alternative information, such as their own company data, rather than the owner of the domain. (Citation: APT1)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Algorithmically possible to detect COTS service usage or use of non-specific mailing addresses (PO Boxes, drop sites, etc.)

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Commercially available or easy to set up and/or register using a disposable email account.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Private whois services - PRE-T1082"*

*Table 3896. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1082">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1082</a>

## Assign KITs, KIQs, and/or intelligence requirements - PRE-T1015

Once generated, Key Intelligence Topics (KITs), Key Intelligence Questions (KIQs), and/or intelligence requirements are assigned to applicable agencies and/or personnel. For example, an adversary may decide nuclear energy requirements should be assigned to a specific organization based on their mission. (Citation: AnalystsAndPolicymaking) (Citation: JP2-01)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Assign KITs, KIQs, and/or intelligence requirements - PRE-T1015"*

Table 3897. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1015">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1015</a>

## Identify groups/roles - PRE-T1047

Personnel internally to a company may belong to a group or maintain a role with electronic specialized access, authorities, or privilege that make them an attractive target for an adversary. One example of this is a system administrator. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Searching publicly available sources that cannot be monitored by a defender.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Requires an adversary to undergo an intensive research process. It is resource intensive or requires special data access. May be easier for certain specialty use cases.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify groups/roles - PRE-T1047"*

Table 3898. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1047">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1047</a>

## Post compromise tool development - PRE-T1130

After compromise, an adversary may utilize additional tools to facilitate their end goals. This may include tools to further explore the system, move laterally within a network, exfiltrate data, or destroy data. (Citation: SofacyHits)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary will likely use code repositories, but development will be performed on their local systems.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Post compromise tool development is a standard part of

the adversary's protocol in developing the necessary tools required to completely conduct an attack.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Post compromise tool development - PRE-T1130"*

Table 3899. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1130">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1130</a>

## Compromise 3rd party or closed-source vulnerability/exploit information - PRE-T1131

There is usually a delay between when a vulnerability or exploit is discovered and when it is made public. An adversary may target the systems of those known to research vulnerabilities in order to gain that knowledge for use during a different attack. (Citation: TempertonDarkHotel)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: The compromise of unknown vulnerabilities would provide little attack and warning against a defender, rendering it highly challenging to detect.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Finding, attacking, and compromising a 3rd party or closed vulnerability entity is challenging, because those containing the vulnerabilities should be very aware of attacks on their environments have a heightened awareness.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Compromise 3rd party or closed-source vulnerability/exploit information - PRE-T1131"*

Table 3900. Table References

Links

## Acquire OSINT data sets and information - PRE-T1024

Open source intelligence (OSINT) is intelligence gathered from publicly available sources. This can include both information gathered on-line, such as from search engines, as well as in the physical world. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This activity is indistinguishable from legitimate business uses and easy to obtain. Direct access to the selected target is not required for the adversary to conduct this technique. There is a limited ability to detect this by looking at referrer fields on local web site accesses (e.g., a person who has accessed your web servers from

[<https://www.shodan.io> Shodan]).

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Possible to gather technical intelligence about Internet accessible systems/devices by obtaining various commercial data sets and supporting business intelligence tools for ease of analysis. Commercial data set examples include advertising content delivery networks, Internet mapping/traffic collections, system fingerprinting data sets, device fingerprinting data sets, etc.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Acquire OSINT data sets and information - PRE-T1024"*

Acquire OSINT data sets and information - PRE-T1024 has relationships with:

## Confirmation of launched compromise achieved - PRE-T1160

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Upon successful compromise the adversary may implement methods for confirming success including communication to a command and control server, exfiltration of data, or a verifiable intended effect such as a publicly accessible resource being inaccessible or a web page being defaced. (Citation: FireEye Malware Stages) (Citation: APTNetworkTrafficAnalysis)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Current commercial tools and sensitive analytics can be used to detect communications to command and control servers or data exfiltration.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Certainty of the confirmation of compromise is not guaranteed unless the adversary sees communication to a command and control server, exfiltration of data, or an intended effect occur.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Confirmation of launched compromise achieved - PRE-T1160"*

*Table 3903. Table References*

Links

<https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1160>

## Identify job postings and needs/gaps - PRE-T1044

Job postings, on either company sites, or in other forums, provide information on organizational structure and often provide contact information for someone within the organization. This may give an adversary information on people within the organization which could be valuable in social engineering attempts. (Citation: JobPostingThreat)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Public source external to the defender's organization.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Very public by design.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify job postings and needs/gaps - PRE-*

T1044"

Identify job postings and needs/gaps - PRE-T1044 has relationships with:

- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Identify job postings and needs/gaps - PRE-T1055" with estimative-language:likelihood-probability="almost-certain"

Table 3904. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1044">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1044</a>

## Conduct social engineering or HUMINT operation - PRE-T1153

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Social Engineering is the practice of manipulating people in order to get them to divulge information or take an action. Human Intelligence (HUMINT) is intelligence collected and provided by human sources. (Citation: 17millionScam) (Citation: UbiquityEmailScam)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Assuming an average company does not train its employees to be aware of social engineering techniques, it is not possible to detect the adversary's use unless a highly motivated or paranoid employee informs security. This assessment flips to a 1 in cases of environments where security trains employees to be vigilant or in specialized industries where competitive intelligence and business intelligence train employees to be highly aware. Most likely more complex for an adversary to detect as methods move to physical or non traditionally monitored mechanisms (such as phone calls outside of call centers). Furthermore, the content of such an interaction may be lost due to lack of collection.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Assuming an average adversary whose focus is social engineering, it is not difficult for an adversary. Assuming a HUMINT operation and specialized circumstances, the adversary difficulty becomes 1. Social engineering can be easily done remotely via email or phone. In contrast, HUMINT operations typically would require physical contact at some point in the process, increasing the difficulty.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Conduct social engineering or HUMINT operation - PRE-T1153"*

Table 3905. Table References

## Discover new exploits and monitor exploit-provider forums - PRE-T1127

An exploit takes advantage of a bug or vulnerability in order to cause unintended or unanticipated behavior to occur on computer hardware or software. The adversary may need to discover new exploits when existing exploits are no longer relevant to the environment they are trying to compromise. An adversary may monitor exploit provider forums to understand the state of existing, as well as newly discovered, exploits. (Citation: EquationQA)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Public source external to the defender's organization.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Many public sources exist for this information.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Discover new exploits and monitor exploit-provider forums - PRE-T1127"*

Table 3909. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1127">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1127</a>

## Choose pre-compromised persona and affiliated accounts - PRE-T1120

For attacks incorporating social engineering the utilization of an on-line persona is important. Utilizing an existing persona with compromised accounts may engender a level of trust in a potential victim if they have a relationship, or knowledge of, the compromised persona. (Citation: AnonHBGary) (Citation: Hacked Social Media Accounts)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Possible to detect compromised credentials if alerting from a service provider is enabled and acted upon by the individual.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: It is relatively easy and low cost to purchase compromised credentials. Mining social media sites offers open source information about a particular target. Most users tend to reuse passwords across sites and are not paranoid enough to check and see if spoofed sites from their persona exist across current social media.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Choose pre-compromised persona and affiliated accounts - PRE-T1120"*

Table 3910. Table References

## Identify people of interest - PRE-T1046

The attempt to identify people of interest or with an inherent weakness for direct or indirect targeting to determine an approach to compromise a person or organization. Such targets may include individuals with poor OPSEC practices or those who have a trusted relationship with the intended target. (Citation: RSA-APTRecon) (Citation: Scasny2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Common defenses protecting against poor OPSEC practices are traditionally more policy-based in nature rather than technical. Policy-based mitigations are generally more difficult to enforce and track violations, making it more difficult that this technique can be detected by common defenses.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Specialty cases enable an adversary to use key words in order to search social media and identify personnel with poor OPSEC practices who may have access to specialized information which would make them a target of interest. In addition, the open nature of social media leads to a tendency among individuals to overshare, encouraging poor OPSEC and increasing the ease by which an adversary can identify interesting targets.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify people of interest - PRE-T1046"*

*Table 3912. Table References*

## Determine external network trust dependencies - PRE-T1036

Network trusts enable communications between different networks with specific accesses and permissions. Network trusts could include the implementation of domain trusts or the use of virtual private networks (VPNs). (Citation: CuckoosEgg) (Citation: CuckoosEgg)Wikipedia (Citation: KGBComputerMe)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This is not easily performed remotely and therefore not a detectable event. If the adversary can sniff traffic to deduce trust relations, this is a passive activity and not detectable.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Determining trust relationships once internal to a network is trivial. Simple tools like trace route can show evidence of firewalls or VPNs and then hosts on the either side of the firewall indicating a different trusted network. Active Directory command line tools can also identify separate trusted networks.

If completely external to a network, sniffing traffic (if possible) could also reveal the communications protocols that could be guessed to be a trusted network connection (e.g., IPsec, maybe SSL, etc.) though this is error-prone.

With no other access, this is hard for an adversary to do completely from a remote vantage point.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Determine external network trust dependencies - PRE-T1036"*

*Table 3913. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1036">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1036</a>

## Determine strategic target - PRE-T1018

An adversary undergoes an iterative target selection process that may begin either broadly and narrow down into specifics (strategic to tactical) or narrowly and expand outward (tactical to strategic). As part of this process, an adversary may determine a high level target they wish to attack. One example of this may be a particular country, government, or commercial sector. (Citation: CyberAdversaryBehavior) (Citation: JP3-60) (Citation: JP3-12 ®) (Citation: DoD Cyber 2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. May change for special use cases or adversary and defender overlays.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: This is the normal adversary targeting cycle where they utilize our poor OPSEC practices to their advantage.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Determine strategic target - PRE-T1018"*

Table 3914. Table References

<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1018">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1018</a>

## Analyze organizational skillsets and deficiencies - PRE-T1066

Analyze strengths and weaknesses of the target for potential areas of where to focus compromise efforts. (Citation: FakeLinkedIn)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This can be done offline after the data has been collected.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Job postings and hiring requisitions have to be made public for contractors and many times have the name of the organization being supported. In addition, they outline the skills needed to do a particular job, which can provide insight into the technical structure and organization of a target.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Analyze organizational skillsets and deficiencies - PRE-T1066"*

Analyze organizational skillsets and deficiencies - PRE-T1066 has relationships with:

## Test signature detection for file upload/email filters - PRE-T1138

An adversary can test their planned method of attack against existing security products such as email filters or intrusion detection sensors (IDS). (Citation: WiredVirusTotal)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Use of sites like [<https://www.virustotal.com> VirusTotal] to test signature detection often occurs to test detection. Defender can also look for newly added uploads as a precursor to an adversary's launch of an attack.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Current open source technologies and websites exist to facilitate adversary testing of malware against signatures.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Test signature detection for file upload/email filters - PRE-T1138"*

Table 3917. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1138">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1138</a>

## Determine highest level tactical element - PRE-T1020

From a tactical viewpoint, an adversary could potentially have a primary and secondary level target. The primary target represents the highest level tactical element the adversary wishes to attack. For example, the corporate network within a corporation or the division within an agency. (Citation: CyberAdversaryBehavior) (Citation: JP3-60) (Citation: JP3-12 ®) (Citation: DoD Cyber 2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. May change for special use cases or adversary and defender overlays.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: This is the normal adversary targeting cycle where they utilize our poor OPSEC practices to their advantage.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Determine highest level tactical element - PRE-T1020"*

*Table 3918. Table References*

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1020">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1020</a>

## Targeted client-side exploitation - PRE-T1148

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

A technique used to compromise a specific group of end users by taking advantage of flaws in client-side applications. For example, infecting websites that members of a targeted group are known to visit with the goal to infect a targeted user's computer. (Citation: RSASSThreat) (Citation: WikiStagefright) (Citation: ForbesSecurityWeek) (Citation: StrongPity-waterhole)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Defensive technologies exist to scan web content before delivery to the requested end user. However, this is not foolproof as some sites encrypt web communications and the adversary constantly moves to sites not previously flagged as malicious thus defeating this defense. Host-based defenses can also aid in detection/mitigation as well as detection by the web site that got compromised. The added challenge for a conditional watering hole is the reduced scope and likely reduced ability to detect or be informed. Determining deltas in content (e.g., differences files type/size/number/ hashes) downloaded could also aid in detection.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Commonly executed technique to place an exploit on an often widely used public web site intended for driveby delivery. The additional challenge is the reduced set of options for web sites to compromise since the set is reduced to those often visited by targets of interest.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Targeted client-side exploitation - PRE-T1148"*

*Table 3919. Table References*

## Identify supply chains - PRE-T1042

Supply chains include the people, processes, and technologies used to move a product or service from a supplier to a consumer. Understanding supply chains may provide an adversary with opportunities to exploit the people, their positions, and relationships, that are part of the supply chain. (Citation: SmithSupplyChain) (Citation: CERT-UKSupplyChain)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Searching publicly available sources that cannot be monitored by a defender.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Requires an intensive process to obtain the full picture. It is possible to obtain basic information/some aspects via OSINT. May be easier in certain industries where there are a limited number of suppliers (e.g., SCADA).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify supply chains - PRE-T1042"*

Identify supply chains - PRE-T1042 has relationships with:

- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify supply chains - PRE-T1053"* with estimative-language:likelihood-probability="almost-certain"

*Table 3920. Table References*

---

## Host-based hiding techniques - PRE-T1091

Host based hiding techniques are designed to allow an adversary to remain undetected on a machine upon which they have taken action. They may do this through the use of static linking of binaries, polymorphic code, exploiting weakness in file formats, parsers, or self-deleting code. (Citation: VirutAP)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Techniques are difficult to detect and might occur in uncommon use-cases (e.g., patching, anti-malware, anti-exploitation software).

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Some of the host-based hiding techniques require advanced knowledge combined with an understanding and awareness of the target's environment (e.g., exploiting weaknesses in file formats, parsers and detection capabilities).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Host-based hiding techniques - PRE-T1091"*

*Table 3922. Table References*

Links

## Determine physical locations - PRE-T1059

Physical locality information may be used by an adversary to shape social engineering attempts (language, culture, events, weather, etc.) or to plan for physical actions such as dumpster diving or attempting to access a facility. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary searches publicly available sources that list physical locations that cannot be monitored by a defender or are not necessarily monitored (e.g., all IP addresses touching their public web space listing physical locations).

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Most corporations now list their locations on public facing websites. Some challenge still exists to find covert or sensitive locations.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Determine physical locations - PRE-T1059"*

*Table 3923. Table References*

Links
-------

## Conduct cost/benefit analysis - PRE-T1003

Leadership conducts a cost/benefit analysis that generates a compelling need for information gathering which triggers a Key Intelligence Tactic (KIT) or Key Intelligence Question (KIQ). For example, an adversary compares the cost of cyber intrusions with the expected benefits from increased intelligence collection on cyber adversaries. (Citation: LowenthalCh4) (Citation: KIT-Herring)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Conduct cost/benefit analysis - PRE-T1003"*

*Table 3924. Table References*

Links

<https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1003>

## Receive KITs/KIQs and determine requirements - PRE-T1016

Applicable agencies and/or personnel receive intelligence requirements and evaluate them to determine sub-requirements related to topics, questions, or requirements. For example, an adversary's nuclear energy requirements may be further divided into nuclear facilities versus nuclear warhead capabilities. (Citation: AnalystsAndPolicymaking)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Receive KITs/KIQs and determine requirements - PRE-T1016"*

*Table 3925. Table References*

Links

<https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1016>

## Analyze presence of outsourced capabilities - PRE-T1080

Outsourcing, the arrangement of one company providing goods or services to another company for something that could be done in-house, provides another avenue for an adversary to target. Businesses often have networks, portals, or other technical connections between themselves and their outsourced/partner organizations that could be exploited. Additionally, outsourced/partner organization information could provide opportunities for phishing. (Citation: Scasny2015) (Citation: OPM Breach)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Much of this analysis can be done using the target's open source website, which is purposely designed to be informational and may not have extensive visitor tracking capabilities.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Analyzing business relationships from information gathering may provide insight into outsourced capabilities. In certain industries, outsourced capabilities or close business partnerships may be advertised on corporate websites.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Analyze presence of outsourced capabilities - PRE-T1080"*

*Table 3926. Table References*

Links

<https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1080>

## Create implementation plan - PRE-T1009

Implementation plans specify how the goals of the strategic plan will be executed. (Citation: ChinaCollectionPlan) (Citation: OrderOfBattle)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Create implementation plan - PRE-T1009"*

Table 3927. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1009">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1009</a>

## Non-traditional or less attributable payment options - PRE-T1093

Using alternative payment options allows an adversary to hide their activities. Options include crypto currencies, barter systems, pre-paid cards or shell accounts. (Citation: Goodin300InBitcoins)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defender likely will not have access to payment information. Monitoring crypto-currency or barter boards is resource intensive and not fully automatable.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Easy to use pre-paid cards or shell accounts to pay for services online. Crypto currencies and barter systems can avoid use of trace-able bank or credit apparatus.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Non-traditional or less attributable payment options - PRE-T1093"*

Table 3928. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1093">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1093</a>

## Aggregate individual's digital footprint - PRE-T1052

In addition to a target's social media presence may exist a larger digital footprint, such as accounts and credentials on e-commerce sites or usernames and logins for email. An adversary familiar with a target's username can mine to determine the target's larger digital footprint via publicly available sources. (Citation: DigitalFootprint) (Citation: trendmicro-vtech)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Searching publicly available sources that cannot be monitored by a defender.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Information readily available through searches

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Aggregate individual's digital footprint - PRE-T1052"*

Table 3929. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1052">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1052</a>

## Identify sensitive personnel information - PRE-T1051

An adversary may identify sensitive personnel information not typically posted on a social media site, such as address, marital status, financial history, and law enforcement infractions. This could be conducted by searching public records that are frequently available for free or at a low cost online. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Searching publicly available sources that cannot be monitored by a defender.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: This type of information is useful to understand the individual and their ability to be blackmailed. Searching public records is easy and most information can be purchased for a low cost if the adversary really wants it.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify sensitive personnel information - PRE-T1051"*

Table 3930. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1051">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1051</a>

## Human performs requested action of physical nature - PRE-T1162

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Through social engineering or other methods, an adversary can get users to perform physical actions that provide access to an adversary. This could include providing a password over the phone or inserting a 'found' CD or USB into a system. (Citation: AnonHBGary) (Citation: CSOInsideOutside)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Non-hypersensing environments do not typically collect this level of detailed information.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Ill-informed users insert devices into their network that

they randomly find, despite training educating them why this is not a wise idea.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Human performs requested action of physical nature - PRE-T1162"*

Table 3931. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1162">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1162</a>

## Assess opportunities created by business deals - PRE-T1076

During mergers, divestitures, or other period of change in joint infrastructure or business processes there may be an opportunity for exploitation. During this type of churn, unusual requests, or other non standard practices may not be as noticeable. (Citation: RossiMergers) (Citation: MeidlHealthMergers)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Most of this activity would target partners and business processes. Partners would not report. Difficult to tie this activity to a cyber attack.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Mapping joint infrastructure and business processes is difficult without insider knowledge or SIGINT capability. While a merger creates and opportunity to exploit potentially cumbersome or sloppy business processes, advance notice of a merger is difficult; merger information is typically close-hold until the deal is done.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Assess opportunities created by business deals - PRE-T1076"*

Table 3932. Table References

Links
<a href="https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1076">https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1076</a>

## Shadow DNS - PRE-T1117

The process of gathering domain account credentials in order to silently create subdomains pointed at malicious servers without tipping off the actual owner. (Citation: CiscoAngler) (Citation: ProofpointDomainShadowing)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: Detection of this technique requires individuals to monitor their domain registrant accounts routinely. In addition, defenders have had success with blacklisting sites or IP addresses, but an adversary can defeat this by rotating either the

subdomains or the IP addresses associated with the campaign.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: To successfully conduct this attack, an adversary usually phishes the individual behind the domain registrant account, logs in with credentials, and creates a large amount of subdomains.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Shadow DNS - PRE-T1117"*

*Table 3933. Table References*

## SSL certificate acquisition for domain - PRE-T1114

Certificates are designed to instill trust. They include information about the key, information about its owner's identity, and the digital signature of an entity that has verified the certificate's contents are correct. If the signature is valid, and the person examining the certificate trusts the signer, then they know they can use that key to communicate with its owner. Acquiring a certificate for a domain name similar to one that is expected to be trusted may allow an adversary to trick a user in to trusting the domain (e.g., *vvachovia* instead of [<https://www.wellsfargo.com/about/corporate/wachovia/> Wachovia] — homoglyphs). (Citation: SubvertSSL) (Citation: PaypalScam)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Defender can monitor for domains similar to popular sites (possibly leverage [<https://www.alexa.com> Alexa] top "N" lists as starting point).

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: SSL certificates are readily available at little to no cost.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="SSL certificate acquisition for domain - PRE-T1114"*

*Table 3936. Table References*

## Unauthorized user introduces compromise delivery mechanism - PRE-T1164

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

If an adversary can gain physical access to the target's environment they can introduce a variety of devices that provide compromise mechanisms. This could include installing keyboard loggers,

adding routing/wireless equipment, or connecting computing devices. (Citation: Credit Card Skimmers)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This varies depending on the amount of monitoring within the environment. Highly secure environments might have more innate monitoring and catch an adversary doing this more easily.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: This likely requires the adversary to have close or insider access to introduce the mechanism of compromise.

## Common, high volume protocols and software - PRE-T1098

Certain types of traffic (e.g., Twitter14, HTTP) are more commonly used than others. Utilizing more common protocols and software may make an adversary's traffic more difficult to distinguish from legitimate traffic. (Citation: symantecNITRO)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: High level of entropy in communications. High volume of communications makes it extremely hard for a defender to distinguish between legitimate and adversary communications.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Communications are hidden (but not necessarily encrypted) in an attempt to make the content more difficult to decipher or to make the communication less conspicuous.

---

## Data Hiding - PRE-T1097

Certain types of traffic (e.g., DNS tunneling, header inject) allow for user-defined fields. These fields can then be used to hide data. In addition to hiding data in network protocols, steganography techniques can be used to hide data in images or other file formats. Detection can be difficult unless a particular signature is already known. (Citation: BotnetsDNSC2) (Citation: HAMMERTOSS2015) (Citation: DNS-Tunnel)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Unless defender is dissecting protocols or performing network signature analysis on any protocol deviations/patterns, this technique is largely undetected.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: This technique requires a more advanced protocol understanding and testing to insert covert communication into legitimate protocol fields.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Data Hiding - PRE-T1097"*

## Invoke-PSImage - S0231

[Invoke-PSImage](<https://attack.mitre.org/software/S0231>) takes a PowerShell script and embeds the bytes of the script into the pixels of a PNG image. It generates a one liner for executing either from a file or from the web. Example of usage is embedding the PowerShell code from the Invoke-Mimikatz module and embed it into an image file. By calling the image file from a macro for example, the macro will download the picture and execute the PowerShell code, which in this case will dump the passwords. (Citation: GitHub Invoke-PSImage)

## Tasklist - S0057

The [Tasklist](<https://attack.mitre.org/software/S0057>) utility displays a list of applications and services with their Process IDs (PID) for all tasks running on either a local or a remote computer. It is packaged with Windows operating systems and can be executed from the command-line interface. (Citation: Microsoft Tasklist)

## Tor - S0183

[Tor](<https://attack.mitre.org/software/S0183>) is a software suite and network that provides increased anonymity on the Internet. It creates a multi-hop proxy network and utilizes multilayer encryption to protect both the message and routing information. [Tor](<https://attack.mitre.org/software/S0183>) utilizes "Onion Routing," in which messages are encrypted with multiple layers of encryption; at each step in the proxy network, the topmost layer is decrypted and the contents forwarded on to the next node until it reaches its destination. (Citation: Dingedine Tor The Second-Generation Onion Router)

The tag is: `misp-galaxy:mitre-tool="Tor - S0183"`

## RawDisk - S0364

[RawDisk](<https://attack.mitre.org/software/S0364>) is a legitimate commercial driver from the EldoS Corporation that is used for interacting with files, disks, and partitions. The driver allows for direct modification of data on a local computer's hard drive. In some cases, the tool can enact these raw disk modifications from user-mode processes, circumventing Windows operating system security features.(Citation: EldoS RawDisk ITpro)(Citation: Novetta Blockbuster Destructive Malware)

## Telecrypt Ransomware

This is most likely to affect Russian speaking users, since the note is written in Russian. Therefore, residents of Russian speaking country are affected. The hacker spread the virus using email spam, fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc.. The ransomware's authors would request around \$75 from their victims to provide them with a decryptor (payments are accepted via Russian payment services Qiwi or Yandex.Money ). Right from the start, however, researchers suggested that TeleCrypt was written by cybercriminals without advanced skills. Telecrypt will generate a random string to encrypt with that is between 10-20 length and only contain the letters vo,pr,bm,xu,zt,dq.

The tag is: *misp-galaxy:ransomware="Telecrypt Ransomware"*

## WannaCry

According to numerous open-source reports, a widespread ransomware campaign is affecting various organizations with reports of tens of thousands of infections in as many as 74 countries, including the United States, United Kingdom, Spain, Russia, Taiwan, France, and Japan. The software can run in as many as 27 different languages. The latest version of this ransomware variant, known as WannaCry, WCry, or Wanna Decryptor, was discovered the morning of May 12, 2017, by an independent security researcher and has spread rapidly over several hours, with initial reports beginning around 4:00 AM EDT, May 12, 2017. Open-source reporting indicates a requested ransom of .1781 bitcoins, roughly \$300 U.S.

The tag is: `misp-galaxy:ransomware="WannaCry"`

WannaCry is also known as:

- WannaCrypt
- WannaCry
- WanaCrypt0r
- WCrypt
- WCRY

WannaCry has relationships with:

- similar: `misp-galaxy:malpedia="WannaCryptor"` with `estimative-language:likelihood-probability="likely"`

# Bandarchor

Ransomware Files might be partially encrypted

The tag is: *misp-galaxy:ransomware="Bandarchor"*

Bandarchor is also known as:

- Rakhni

Bandarchor has relationships with:

- similar: *misp-galaxy:ransomware="Rakhni"* with *estimative-language:likelihood-probability="likely"*

Table 4254. Table References

Links
<a href="https://reaqta.com/2016/03/bandarchor-ransomware-still-active/">https://reaqta.com/2016/03/bandarchor-ransomware-still-active/</a>

# Booyah

Ransomware EXE was replaced to neutralize threat

The tag is: *misp-galaxy:ransomware="Booyah"*

Booyah is also known as:

- Salami

Booyah has relationships with:

- similar: *misp-galaxy:ransomware="MM Locker"* with *estimative-language:likelihood-probability="likely"*

# Brazilian

Ransomware Based on EDA2

The tag is: *misp-galaxy:ransomware="Brazilian"*

*Table 4260. Table References*

Links
<a href="http://www.nyxbone.com/malware/brazilianRansom.html">http://www.nyxbone.com/malware/brazilianRansom.html</a>

# CryLocker

Ransomware Identifies victim locations w/Google Maps API

The tag is: *misp-galaxy:ransomware="CryLocker"*

CryLocker is also known as:

- Cry
- CSTO
- Central Security Treatment Organization

CryLocker has relationships with:

- similar: *misp-galaxy:ransomware="Central Security Treatment Organization"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="CryLocker"* with *estimative-language:likelihood-probability="likely"*

## CryptoGraphic Locker

Ransomware Has a GUI. Subvariants: CoinVault BitCryptor

The tag is: *misp-galaxy:ransomware="CryptoGraphic Locker"*

## CryptoHost

Ransomware RAR's victim's files has a GUI

The tag is: *misp-galaxy:ransomware="CryptoHost"*

CryptoHost is also known as:

- Manamecrypt
- Telograph
- ROI Locker

CryptoHost has relationships with:

- similar: *misp-galaxy:malpedia="ManameCrypt"* with *estimative-language:likelihood-probability="likely"*

Table 4286. Table References

## Rakhni

Ransomware Files might be partially encrypted

The tag is: *misp-galaxy:ransomware="Rakhni"*

Rakhni is also known as:

- Agent.iih
- Aura
- Autoit
- Pletor

- Rotor
- Lamer
- Isda
- Cryptokluchen
- Bandarchor

Rakhni has relationships with:

- similar: `misp-galaxy:ransomware="Bandarchor"` with `estimative-language:likelihood-probability="likely"`

Table 4436. Table References

## Samas-Samsam

Ransomware Targeted attacks -Jexboss -PSExec -Hyena

The tag is: *misp-galaxy:ransomware="Samas-Samsam"*

Samas-Samsam is also known as:

- samsam.exe
- MIKOPONI.exe
- RikiRafael.exe
- showmehowto.exe
- SamSam Ransomware
- SamSam

- Samsam

Samas-Samsam has relationships with:

- similar: `misp-galaxy:malpedia="SamSam"` with `estimative-language:likelihood-probability="likely"`

## Threat Finder

Ransomware Files cannot be decrypted Has a GUI

The tag is: *misp-galaxy:ransomware="Threat Finder"*

## TorrentLocker

Ransomware Newer variants not decryptable. Only first 2 MB are encrypted

The tag is: *misp-galaxy:ransomware="TorrentLocker"*

TorrentLocker is also known as:

- Crypt0Locker
- CryptoFortress
- Teerac

TorrentLocker has relationships with:

- similar: *misp-galaxy:ransomware="CryptoFortress"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="CryptoFortress"* with *estimative-language:likelihood-probability="likely"*

# Jaff

We recently observed several large scale email campaigns that were attempting to distribute a new variant of ransomware that has been dubbed "Jaff". Interestingly we identified several characteristics that we have previously observed being used during Dridex and Locky campaigns. In a short period of time, we observed multiple campaigns featuring high volumes of malicious spam emails being distributed, each using a PDF attachment with an embedded Microsoft Word document functioning as the initial downloader for the Jaff ransomware.

The tag is: *misp-galaxy:ransomware="Jaff"*

Jaff has relationships with:

- similar: *misp-galaxy:malpedia="Jaff"* with *estimative-language:likelihood-probability="likely"*

## SynAck

The ransomware does not use a customized desktop wallpaper to signal its presence, and the only way to discover that SynAck has infected your PC is by the ransom notes dropped on the user's desktop, named in the format: RESTORE\_INFO-[id].txt. For example: RESTORE\_INFO-4ABFA0EF.txt. In addition, SynAck also appends its own extension at the end of all files it encrypted. This file

extensions format is ten random alpha characters for each file. For example: test.jpg.XbMiJQiuoh. Experts believe the group behind SynAck uses RDP brute-force attacks to access remote computers and manually download and install the ransomware.

The tag is: *misp-galaxy:ransomware="SynAck"*

SynAck is also known as:

- Syn Ack

SynAck has relationships with:

- similar: *misp-galaxy:malpedia="SynAck"* with *estimative-language:likelihood-probability="likely"*

## Bad Rabbit

On October 24, 2017, Cisco Talos was alerted to a widescale ransomware campaign affecting organizations across eastern Europe and Russia. As was the case in previous situations, we quickly mobilized to assess the situation and ensure that customers remain protected from this and other threats as they emerge across the threat landscape. There have been several large scale

ransomware campaigns over the last several months. This appears to have some similarities to Nyetya in that it is also based on Petya ransomware. Major portions of the code appear to have been rewritten. The distribution does not appear to have the sophistication of the supply chain attacks we have seen recently.

The tag is: *misp-galaxy:ransomware="Bad Rabbit"*

Bad Rabbit is also known as:

- BadRabbit
- Bad-Rabbit

Bad Rabbit has relationships with:

- similar: *misp-galaxy:malpedia="EternalPetya"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:tool="NotPetya"* with *estimative-language:likelihood-probability="likely"*

## StorageCrypt

Recently BleepingComputer has received a flurry of support requests for a new ransomware being named StorageCrypt that is targeting NAS devices such as the Western Digital My Cloud. Victims have been reporting that their files have been encrypted and a note left with a ransom demand of between .4 and 2 bitcoins to get their files back. User's have also reported that each share on their NAS device contains a Autorun.inf file and a Windows executable named 美女与野 .exe, which translates to Beauty and the beast. From the samples BleepingComputer has received, this Autorun.inf is an attempt to spread the 美女与野 .exe file to other computers that open the folders

on the NAS devices.

The tag is: *misp-galaxy:ransomware="StorageCrypt"*

*Table 4517. Table References*

## HC7

A new ransomware called HC7 is infecting victims by hacking into Windows computers that are running publicly accessible Remote Desktop services. Once the developers gain access to the hacked computer, the HC7 ransomware is then installed on all accessible computers on the network. Originally released as HC6, victims began posting about it in the BleepingComputer forums towards the end of November. As this is a Python-to-exe executable, once the script was extracted ID Ransomware creator Michael Gillespie was able determine that it was decryptable and released a decryptor. Unfortunately, a few days later, the ransomware developers released a new version called HC7 that was not decryptable. This is because they removed the hard coded encryption key and instead switched to inputting the key as a command line argument when the attackers run the ransomware executable. Thankfully, there may be a way to get around that as well so that victims can recover their keys.

The tag is: *misp-galaxy:ransomware="HC7"*

## Scarab

The Scarab ransomware is a relatively new ransomware strain that was first spotted by security researcher Michael Gillespie in June this year. Written in Delphi, the first version was simplistic and was recognizable via the ".scarab" extension it appended after the names of encrypted files. Malwarebytes researcher Marcelo Rivera spotted a second version in July that used the ".scorpio" extension. The version spotted with the Necurs spam today has reverted back to using the .scarab extension. The current version of Scarab encrypts files but does not change original file names as previous versions. This Scarab version appends each file's name with the "[suupport@protonmail.com].scarab" extension. Scarab also deletes shadow volume copies and drops a ransom note named "IF YOU WANT TO GET ALL YOUR FILES BACK, PLEASE READ THIS.TXT" on users' computers, which it opens immediately.

The tag is: *misp-galaxy:ransomware="Scarab"*

## File Spider

A new ransomware called File Spider is being distributed through spam that targets victims in Bosnia and Herzegovina, Serbia, and Croatia. These spam emails contains malicious Word documents that will download and install the File Spider ransomware onto a victims computer. File Spider is currently being distributed through malspam that appears to be targeting countries such as Croatia, Bosnia and Herzegovina, and Serbia. The spam start with subjects like "Potrazivanje dugovanja", which translates to "Debt Collection" and whose message, according to Google Translate, appear to be in Serbian.

The tag is: *misp-galaxy:ransomware="File Spider"*

# ShurL0ckr

Security researchers uncovered a new ransomware named ShurL0ckr (detected by Trend Micro as RANSOM\_GOSHIFR.B) that reportedly bypasses detection mechanisms of cloud platforms. Like Cerber and Satan, ShurL0ckr's operators further monetize the ransomware by peddling it as a turnkey service to fellow cybercriminals, allowing them to earn additional income through a commission from each victim who pays the ransom.

The tag is: *misp-galaxy:ransomware="ShurL0ckr"*

## Qwerty Ransomware

A new ransomware has been discovered that utilizes the legitimate GnuPG, or GPG, encryption program to encrypt a victim's files. Currently in the wild, this ransomware is called Qwerty Ransomware and will encrypt a victims files, overwrite the originals, and the append the .qwerty extension to an encrypted file's name.

The tag is: *misp-galaxy:ransomware="Qwerty Ransomware"*

*Table 4530. Table References*

## Links

<https://www.bleepingcomputer.com/news/security/qwerty-ransomware-utilizes-gnupg-to-encrypt-a-victims-files/>

## Zenis Ransomware

A new ransomware was discovered this week by MalwareHunterTeam called Zenis Ransomware.

While it is currently unknown how Zenis is being distributed, multiple victims have already become infected with this ransomware. What is most disturbing about Zenis is that it not encrypts your files, but also purposely deletes your backups.

The tag is: *misp-galaxy:ransomware="Zenis Ransomware"*

Table 4531. Table References

## Black Ruby

A new ransomware was discovered this week by MalwareHunterTeam called Black Ruby. This ransomware will encrypt the files on a computer, scramble the file name, and then append the BlackRuby extension. To make matters worse, Black Ruby will also install a Monero miner on the computer that utilizes as much of the CPU as it can. Discovered on February 6, 2018. May have been distributed through unknown vectors. Will not encrypt a machine if its IP address is identified as coming from Iran; this feature enables actors to avoid a particular Iranian cybercrime law that prohibits Iran-based actors from attacking Iranian victims. Encrypts files on the infected machine, scrambles files, and appends the .BlackRuby extension to them. Installs a Monero miner on the infected computer that utilizes the machine's maximum CPU power. Delivers a ransom note in English asking for US\$650 in Bitcoins. Might be installed via Remote Desktop Services.

The tag is: *misp-galaxy:ransomware="Black Ruby"*

## PUBG Ransomware

In what could only be a joke, a new ransomware has been discovered called "PUBG Ransomware" that will decrypt your files if you play the game called PlayerUnknown's Battlegrounds. Discovered by MalwareHunterTeam, when the PUBG Ransomware is launched it will encrypt a user's files and folders on the user's desktop and append the .PUBG extension to them. When it has finished encrypting the files, it will display a screen giving you two methods that you can use to decrypt the encrypted files.

The tag is: *misp-galaxy:ransomware="PUBG Ransomware"*

## LockCrypt

LockCrypt is an example of yet another simple ransomware created and used by unsophisticated attackers. Its authors ignored well-known guidelines about the proper use of cryptography. The internal structure of the application is also unprofessional. Sloppy, unprofessional code is pretty commonplace when ransomware is created for manual distribution. Authors don't take much time preparing the attack or the payload. Instead, they're rather focused on a fast and easy gain, rather than on creating something for the long run. Because of this, they could easily be defeated.

The tag is: *misp-galaxy:ransomware="LockCrypt"*

## Reveton ransomware

A ransomware family that targets users from certain countries or regions. It locks the computer and displays a location-specific webpage that covers the desktop and demands that the user pay a fine for the supposed possession of illicit material. The Reveton ransomware is one of the first screen-locking ransomware strains, and it appeared when Bitcoin was still in its infancy, and before it became the cryptocurrency of choice in all ransomware operations. Instead, Reveton operators asked victims to buy GreenDot MoneyPak vouchers, take the code on the voucher and enter it in the Reveton screen locker.

The tag is: *misp-galaxy:ransomware="Reveton ransomware"*

## Fusob

Fusob is one of the major mobile ransomware families. Between April 2015 and March 2016, about 56 percent of accounted mobile ransomware was Fusob. Like a typical mobile ransomware, it employs scare tactics to extort people to pay a ransom. The program pretends to be an accusatory authority, demanding the victim to pay a fine from \$100 to \$200 USD or otherwise face a fictitious charge. Rather surprisingly, Fusob suggests using iTunes gift cards for payment. Also, a timer clicking down on the screen adds to the users' anxiety as well. In order to infect devices, Fusob masquerades as a pornographic video player. Thus, victims, thinking it is harmless, unwittingly download Fusob. When Fusob is installed, it first checks the language used in the device. If it uses Russian or certain Eastern European languages, Fusob does nothing. Otherwise, it proceeds on to lock the device and demand ransom. Among victims, about 40% of them are in Germany with the United Kingdom and the United States following with 14.5% and 11.4% respectively. Fusob has lots in common with Small, which is another major family of mobile ransomware. They represented over 93% of mobile ransoms between 2015 and 2016.

The tag is: *misp-galaxy:ransomware="Fusob"*

## NMCRYPT Ransomware

The NMCRYPT Ransomware is a generic file encryption Trojan that was detected in the middle of April 2018. The NMCRYPT Ransomware is a file encoder Trojan that is designed to make data unreadable and convince users to pay a fee for unlocking content on the infected computers. The NMCRYPT Ransomware is nearly identical to hundreds of variants of the HiddenTear open-source ransomware and compromised users are unable to use the Shadow Volume snapshots made by Windows to recover. Unfortunately, the NMCRYPT Ransomware disables the native recovery features on Windows, and you need third-party applications to rebuild your data.

The tag is: *misp-galaxy:ransomware="NMCRYPT Ransomware"*

## HPE iLO 4 Ransomware

Attackers are targeting Internet accessible HPE iLO 4 remote management interfaces, supposedly encrypting the hard drives, and then demanding Bitcoins to get access to the data again. According to the victim, the attackers are demanding 2 bitcoins to gain access to the drives again. The attackers will also provide a bitcoin address to the victim that should be used for payment. These bitcoin addresses appear to be unique per victim as the victim's was different from other reported ones. An interesting part of the ransom note is that the attackers state that the ransom price is not negotiable unless the victim's are from Russia. This is common for Russian based attackers, who in many cases tries to avoid infecting Russian victims. Finally, could this be a decoy/wiper rather than an actual true ransomware attack? Ransomware attacks typically provide a unique ID to the victim in order to distinguish one victim from another. This prevents a victim from "stealing" another victim's payment and using it to unlock their computer. In a situation like this, where no unique ID is given to identify the encrypted computer and the email is publicly accessible, it could be a case where the main goal is to wipe a server or act as a decoy for another attack.

The tag is: *misp-galaxy:ransomware="HPE iLO 4 Ransomware"*

## RedEye

Jakub Kroustek discovered the RedEye Ransomware, which appends the .RedEye extension and wipes the contents of the files. RedEye can also rewrite the MBR with a screen that gives authors contact info and YouTube channel. Bart also wrote an article on this ransomware detailing how it works and what it does on a system. The ransomware author contacted BleepingComputer and told us that this ransomware was never intended for distribution and was created just for fun.

## Aurora Ransomware

Typical ransom software, Aurora virus plays the role of blackmailing PC operators. It encrypts files and the encryption cipher it uses is pretty strong. After encryption, the virus attaches .aurora at the end of the file names that makes it impossible to open the data. Thereafter, it dispatches the ransom note totaling 6 copies, without any change to the main objective i.e., victims must write an electronic mail addressed to [anonimus.mr@yahoo.com](mailto:anonimus.mr@yahoo.com) while stay connected until the criminals reply telling the ransom amount.

The tag is: *misp-galaxy:ransomware="Aurora Ransomware"*

Aurora Ransomware is also known as:

- Zorro Ransomware

## DBGer Ransomware

The authors of the Satan ransomware have rebranded their "product" and they now go by the name of DBGer ransomware, according to security researcher MalwareHunter, who spotted this new

version earlier today. The change was not only in name but also in the ransomware's modus operandi. According to the researcher, whose discovery was later confirmed by an Intezer code similarity analysis, the new (Satan) DBGer ransomware now also incorporates Mimikatz, an open-source password-dumping utility. The purpose of DBGer incorporating Mimikatz is for lateral movement inside compromised networks. This fits a recently observed trend in Satan's modus operandi.

The tag is: *misp-galaxy:ransomware="DBGer Ransomware"*

## TYRANT

DUMB variant discovered on November 16, 2017. Disguised itself as a popular virtual private network (VPN) in Iran known as Psiphon and infected Iranian users. Included Farsi-language ransom note, decryptable in the same way as previous DUMB-based variants. Message requested only US\$15 for unlock key. Advertised two local and Iran-based payment processors: exchange.ir and webmoney.ir. Shared unique and specialized indicators with RASTAKHIZ; iDefense threat intelligence analysts believe this similarity confirms that the same actor was behind the repurposing of both types of ransomware.

The tag is: *misp-galaxy:ransomware="TYRANT"*

TYRANT is also known as:

- Crypto Tyrant

# CryptoNar

When the CryptoNar, or Crypto Nar, Ransomware encrypts a victims files it will perform the encryption differently depending on the type of file being encrypted. If the targeted file has a .txt or .md extension, it will encrypt the entire file and append the .fully.cryptoNar extension to the encrypted file's name. All other files will only have the first 1,024 bytes encrypted and will have the .partially.cryptoNar extensions appended to the file's name.

The tag is: *misp-galaxy:ransomware="CryptoNar"*

CryptoNar has relationships with:

- similar: *misp-galaxy:ransomware="CryptoJoker"* with *estimative-language:likelihood-probability="likely"*

## Sigma Ransomware

Today one of our volunteers, Aura, told me about a new new malspam campaign pretending to be from Craigslist that is under way and distributing the Sigma Ransomware. These spam emails contain password protected Word or RTF documents that download the Sigma Ransomware executable from a remote site and install it on a recipients computer.

The tag is: *misp-galaxy:ransomware="Sigma Ransomware"*

## Crypt0saur

The tag is: *misp-galaxy:ransomware="Crypt0saur"*

## Mongo Lock

An attack called Mongo Lock is targeting remotely accessible and unprotected MongoDB databases, wiping them, and then demanding a ransom in order to get the contents back. While this new campaign is using a name to identify itself, these types of attacks are not new and MongoDB databases have been targeted for a while now. These hijacks work by attackers scanning the Internet or using services such as Shodan.io to search for unprotected MongoDB servers. Once connected, the attackers may export the databases, delete them, and then create a ransom note

explaining how to get the databases back.

The tag is: *misp-galaxy:ransomware="Mongo Lock"*

*Table 4584. Table References*

## Kraken Cryptor Ransomware

The Kraken Cryptor Ransomware is a newer ransomware that was released in August 2018. A new version, called Kraken Cryptor 1.5, was recently released that is masquerading as the legitimate SuperAntiSpyware anti-malware program in order to trick users into installing it.

The tag is: *misp-galaxy:ransomware="Kraken Cryptor Ransomware"*

*Table 4585. Table References*

## File-Locker

The File-Locker Ransomware is a Hidden Tear variant that is targeting victims in Korea. When victim's are infected it will leave a ransom requesting 50,000 Won, or approximately 50 USD, to get the files back. This ransomware uses AES encryption with a static password of "dnwls07193147", so it is easily decryptable.

The tag is: *misp-galaxy:ransomware="File-Locker"*

*Table 4587. Table References*

## Links

## Ryuk ransomware

Similar to Samas and BitPaymer, Ryuk is specifically used to target enterprise environments. Code comparison between versions of Ryuk and Hermes ransomware indicates that Ryuk was derived from the Hermes source code and has been under steady development since its release. Hermes is commodity ransomware that has been observed for sale on forums and used by multiple threat actors. However, Ryuk is only used by GRIM SPIDER and, unlike Hermes, Ryuk has only been used to target enterprise environments. Since Ryuk's appearance in August, the threat actors operating it have netted over 705.80 BTC across 52 transactions for a total current value of \$3,701,893.98 USD.

The tag is: *misp-galaxy:ransomware="Ryuk ransomware"*

## BitPaymer

In August 2017, a new ransomware variant identified as BitPaymer was reported to have ransomed the U.K.'s National Health Service (NHS), with a high ransom demand of 53 BTC (approximately \$200,000 USD). The targeting of an organization rather than individuals, and the high ransom demands, made BitPaymer stand out from other contemporary ransomware at the time. Though the encryption and ransom functionality of BitPaymer was not technically sophisticated, the malware contained multiple anti-analysis features that overlapped with Dridex. Later technical analysis of BitPaymer indicated that it had been developed by INDRIK SPIDER, suggesting the group had expanded its criminal operation to include ransomware as a monetization strategy.

The tag is: *misp-galaxy:ransomware="BitPaymer"*

## Princess Evolution

We have been observing a malvertising campaign via Rig exploit kit delivering a cryptocurrency-mining malware and the GandCrab ransomware since July 25. On August 1, we found Rig's traffic stream dropping a then-unknown ransomware. Delving into this seemingly new ransomware, we checked its ransom payment page in the Tor network and saw it was called Princess Evolution (detected by Trend Micro as RANSOM\_PRINCESSLOCKER.B), and was actually a new version of the Princess Locker ransomware that emerged in 2016. Based on its recent advertisement in underground forums, it appears that its operators are peddling Princess Evolution as a ransomware as a service (RaaS) and are looking for affiliates. The new malvertising campaign we observed since July 25 is notable in that the malvertisements included Coinhive (COINMINER\_MALXMR.TIDBF). Even if users aren't diverted to the exploit kit and infected with the ransomware, the cybercriminals can still earn illicit profit through cryptocurrency mining. Another characteristic of this new campaign is that they hosted their malvertisement page on a free web hosting service and used domain name system canonical name (DNS CNAME) to map their advertisement domain on a malicious webpage on the service.

The tag is: *misp-galaxy:ransomware="Princess Evolution"*

## Jokeroo

A new Ransomware-as-a-Service called Jokeroo is being promoted on underground hacking sites and via Twitter that allows affiliates to allegedly gain access to a fully functional ransomware and

payment server. According to a malware researcher named Damian, the Jokeroo RaaS first started promoting itself as a GandCrab Ransomware RaaS on the underground hacking forum Exploit.in.

The tag is: *misp-galaxy:ransomware="Jokeroo"*

Jokeroo is also known as:

- Fake GandCrab

*Table 4617. Table References*

## GlobeImposter

During December 2017, a new variant of the GlobeImposter Ransomware was detected for the first time and reported on malware-traffic-analysis. At first sight this ransomware looks very similar to other ransomware samples and uses common techniques such as process hollowing. However, deeper inspection showed that like LockPoS, which was analyzed by CyberBit, GlobeImposter too bypasses user-mode hooks by directly invoking system calls. Given this evasion technique is being leveraged by new malware samples may indicate that this is a beginning of a trend aiming to bypass user-mode security products.

The tag is: *misp-galaxy:ransomware="GlobeImposter"*

## BlackWorm

BlackWorm Ransomware is a malicious computer infection that encrypts your files, and then does everything it can to prevent you from restoring them. It needs you to pay \$200 for the decryption key, but there is no guarantee that the people behind this infection would really issue the decryption tool for you.

The tag is: *misp-galaxy:ransomware="BlackWorm"*

## Sodinokibi

Attackers are actively exploiting a recently disclosed vulnerability in Oracle WebLogic to install a new variant of ransomware called "Sodinokibi." Sodinokibi attempts to encrypt data in a user's directory and delete shadow copy backups to make data recovery more difficult. Oracle first patched the issue on April 26, outside of their normal patch cycle, and assigned it CVE-2019-2725. This vulnerability is easy for attackers to exploit, as anyone with HTTP access to the WebLogic server could carry out an attack. Because of this, the bug has a CVSS score of 9.8/10. Attackers have been making use of this exploit in the wild since at least April 17. Cisco's Incident Response (IR) team, along with Cisco Talos, are actively investigating these attacks and Sodinokibi.

The tag is: *misp-galaxy:ransomware="Sodinokibi"*

## Back Orifice 2000

Back Orifice 2000 (often shortened to BO2k) is a computer program designed for remote system administration. It enables a user to control a computer running the Microsoft Windows operating system from a remote location. The name is a pun on Microsoft BackOffice Server software. Back Orifice 2000 is a new version of the famous Back Orifice backdoor trojan (hacker's remote access tool). It was created by the Cult of Dead Cow hackers group in July 1999. Originally the BO2K was released as a source code and utilities package on a CD-ROM. There are reports that some files on that CD-ROM were infected with CIH virus, so the people who got that CD might get infected and spread not only the compiled backdoor, but also the CIH virus.

The tag is: *misp-galaxy:rat="Back Orifice 2000"*

Back Orifice 2000 is also known as:

- BO2k

## NJRat

NJRat is a remote access trojan (RAT), first spotted in June 2013 with samples dating back to November 2012. It was developed and is supported by Arabic speakers and mainly used by cybercrime groups against targets in the Middle East. In addition to targeting some governments in the region, the trojan is used to control botnets and conduct other typical cybercrime activity. It infects victims via phishing attacks and drive-by downloads and propagates through infected USB keys or networked drives. It can download and execute additional malware, execute shell commands, read and write registry keys, capture screenshots, log keystrokes, and spy on webcams.

The tag is: `misp-galaxy:rat="NJRat"`

NJRat is also known as:

- Njw0rm

NJRat has relationships with:

- similar: `misp-galaxy:rat="Kiler RAT"` with `estimative-language:likelihood-probability="likely"`

## Pandora

Remote administrator tool that has been developed for Windows operation system. With advanced features and stable structure, Pandora's structure is based on advanced client / server architecture. was configured using modern technology.

The tag is: `misp-galaxy:rat="Pandora"`

Table 4658. Table References

Links
<a href="https://www.rekings.com/pandora-rat-2-2/">https://www.rekings.com/pandora-rat-2-2/</a>

## Predator Pain

Unlike Zeus, Predator Pain and Limitless are relatively simple keyloggers. They indiscriminately steal web credentials and mail client credentials, as well as capturing keystrokes and screen captures. The output is human readable, which is good if you are managing a few infected machines only, but the design doesn't scale well when there are a lot of infected machines and logs involved.

The tag is: `misp-galaxy:rat="Predator Pain"`

Predator Pain is also known as:

- PredatorPain

Predator Pain has relationships with:

- similar: `misp-galaxy:malpedia="HawkEye Keylogger"` with `estimative-language:likelihood-probability="likely"`

## Plasma RAT

Plasma RAT's stub is fairly advanced, having many robust features. Some of the features include botkilling, Cryptocurrencies Mining (CPU and GPU), persistence, anti-analysis, torrent seeding, AV killer, 7 DDoS methods and a keylogger. The RAT is coded in VB.Net. There is also a Botnet version of it (Plasma HTTP), which is pretty similar to the RAT version.

The tag is: `misp-galaxy:rat="Plasma RAT"`

# Dendroid

Dendroid is malware that affects Android OS and targets the mobile platform. It was first discovered in early of 2014 by Symantec and appeared in the underground for sale for \$300. Some things were noted in Dendroid, such as being able to hide from emulators at the time. When first discovered in 2014 it was one of the most sophisticated Android remote administration tools known at that time. It was one of the first Trojan applications to get past Google’s Bouncer and caused researchers to warn about it being easier to create Android malware due to it. It also seems to have follow in the footsteps of Zeus and SpyEye by having simple-to-use command and control panels. The code appeared to be leaked somewhere around 2014. It was noted that an apk binder was included in the leak, which provided a simple way to bind Dendroid to legitimate applications.

The tag is: *misp-galaxy:rat="Dendroid"*

Dendroid has relationships with:

- similar: *misp-galaxy:mitre-mobile-attack-malware="Dendroid - MOB-S0017"* with *estimative-language:likelihood-probability="likely"*

# Kiler RAT

This remote access trojan (RAT) has capabilities ranging from manipulating the registry to opening a reverse shell. From stealing credentials stored in browsers to accessing the victims webcam. Through the Command & Control (CnC) server software, the attacker has capabilities to create and configure the malware to spread utilizing physic devices, such as USB drives, but also to use the victim as a pivot point to gain more access laterally throughout the network. This remote access trojan could be classified as a variant of the well known njrat, as they share many similar features such as their display style, several abilities and a general template for communication methods . However, where njrat left off KilerRat has taken over. KilerRat is a very feature rich RAT with an active development force that is rapidly gaining in popularity amongst the middle eastern community and the world.

The tag is: *misp-galaxy:rat="Kiler RAT"*

Kiler RAT is also known as:

- Njw0rm

## Turkojan

Turkojan is a remote administration and spying tool for Microsoft Windows operating systems.

The tag is: *misp-galaxy:rat="Turkojan"*

*Table 4716. Table References*

Links

<http://turkojan.blogspot.lu/>

## TINY

TINY is a set of programs that lets you control a DOS computer from any Java-capable machine over a TCP/IP connection. It is comparable to programs like VNC, CarbonCopy, and GotoMyPC except that the host machine is a DOS computer rather than a Windows one.

The tag is: *misp-galaxy:rat="TINY"*

*Table 4717. Table References*

Links

<http://josh.com/tiny/>

## SharK

sharK is an advanced reverse connecting, firewall bypassing remote administration tool written in VB6. With sharK you will be able to administrate every PC (using Windows OS) remotely.

The tag is: *misp-galaxy:rat="SharK"*

SharK is also known as:

- SHARK
- Shark

SharK has relationships with:

- similar: *misp-galaxy:ransomware="Shark"* with *estimative-language:likelihood-probability="likely"*

*Table 4718. Table References*

Links

<https://www.security-database.com/toolswatch/SharK-3-Remote-Administration-Tool.html>

## Snowdoor

Backdoor.Snowdoor is a Backdoor Trojan Horse that allows unauthorized access to an infected computer. It creates an open C drive share with its default settings. By default, the Trojan listens on port 5,328.

The tag is: *misp-galaxy:rat="Snowdoor"*

Snowdoor is also known as:

- Backdoor.Blizzard
- Backdoor.Fxdoor
- Backdoor.Snowdoor
- Backdoor:Win32/Snowdoor

# ZOMBIE SLAYER

The tag is: *misp-galaxy:rat="ZOMBIE SLAYER"*

# HTTP WEB BACKDOOR

The tag is: *misp-galaxy:rat="HTTP WEB BACKDOOR"*

# NET-MONITOR PRO

Net Monitor for Employees lets you see what everyone's doing - without leaving your desk. Monitor the activity of all employees. Plus you can share your screen with your employees PCs, making demos and presentations much easier.

The tag is: *misp-galaxy:rat="NET-MONITOR PRO"*

*Table 4722. Table References*

Links
<a href="https://networklookout.com/help/">https://networklookout.com/help/</a>

# DameWare Mini Remote Control

Affordable remote control software for all your customer support and help desk needs.

The tag is: *misp-galaxy:rat="DameWare Mini Remote Control"*

DameWare Mini Remote Control is also known as:

- dameware

*Table 4723. Table References*

Links
<a href="http://www.dameware.com/dameware-mini-remote-control">http://www.dameware.com/dameware-mini-remote-control</a>

# Remote Utilities

Remote Utilities is a free remote access program with some really great features. It works by pairing two remote computers together with what they call an "Internet ID." You can control a total of 10 PCs with Remote Utilities.

The tag is: *misp-galaxy:rat="Remote Utilities"*

*Table 4724. Table References*

Links
<a href="https://www.remoteutilities.com/">https://www.remoteutilities.com/</a>

## Ammyy Admin

Ammyy Admin is a completely portable remote access program that's extremely simple to setup. It works by connecting one computer to another via an ID supplied by the program.

The tag is: *misp-galaxy:rat="Ammyy Admin"*

Ammyy Admin is also known as:

- Ammyy

*Table 4725. Table References*

Links
<a href="http://ammyy-admin.soft32.com/">http://ammyy-admin.soft32.com/</a>

## Ultra VNC

UltraVNC works a bit like Remote Utilities, where a server and viewer is installed on two PCs, and the viewer is used to control the server.

The tag is: *misp-galaxy:rat="Ultra VNC"*

*Table 4726. Table References*

Links
<a href="http://www.uvnc.com/">http://www.uvnc.com/</a>

## AeroAdmin

AeroAdmin is probably the easiest program to use for free remote access. There are hardly any settings, and everything is quick and to the point, which is perfect for spontaneous support.

The tag is: *misp-galaxy:rat="AeroAdmin"*

*Table 4727. Table References*

Links
<a href="http://www.aeroadmin.com/en/">http://www.aeroadmin.com/en/</a>

## Windows Remote Desktop

Windows Remote Desktop is the remote access software built into the Windows operating system. No additional download is necessary to use the program.

The tag is: *misp-galaxy:rat="Windows Remote Desktop"*

# RemotePC

RemotePC, for good or bad, is a more simple free remote desktop program. You're only allowed one connection (unless you upgrade) but for many of you, that'll be just fine.

The tag is: *misp-galaxy:rat="RemotePC"*

Table 4728. Table References

Links
<a href="https://www.remotepc.com/">https://www.remotepc.com/</a>

# Seecreen

Seecreen (previously called Firnass) is an extremely tiny (500 KB), yet powerful free remote access program that's absolutely perfect for on-demand, instant support.

The tag is: *misp-galaxy:rat="Seecreen"*

Seecreen is also known as:

- Firnass

Table 4729. Table References

Links
<a href="http://seecreen.com/">http://seecreen.com/</a>

# Chrome Remote Desktop

Chrome Remote Desktop is an extension for the Google Chrome web browser that lets you setup a computer for remote access from any other Chrome browser.

The tag is: *misp-galaxy:rat="Chrome Remote Desktop"*

Table 4730. Table References

Links
<a href="https://chrome.google.com/webstore/detail/chrome-remote-desktop/gbchcmhahfdphkhkmpfmihenigmpp?hl=en">https://chrome.google.com/webstore/detail/chrome-remote-desktop/gbchcmhahfdphkhkmpfmihenigmpp?hl=en</a>

# AnyDesk

AnyDesk is a remote desktop program that you can run portably or install like a regular program.

The tag is: *misp-galaxy:rat="AnyDesk"*

Table 4731. Table References

Links
-------

<https://anydesk.com/remote-desktop>

## LiteManager

LiteManager is another remote access program, and it's strikingly similar to Remote Utilities, which I explain on the first page of this list. However, unlike Remote Utilities, which can control a total of only 10 PCs, LiteManager supports up to 30 slots for storing and connecting to remote computers, and also has lots of useful features.

The tag is: *misp-galaxy:rat="LiteManager"*

*Table 4732. Table References*

Links

<http://www.litemanager.com/>

## Comodo Unite

Comodo Unite is another free remote access program that creates a secure VPN between multiple computers. Once a VPN is established, you can remotely have access to applications and files through the client software.

The tag is: *misp-galaxy:rat="Comodo Unite"*

*Table 4733. Table References*

Links

<https://www.comodo.com/home/download/download.php?prod=comodounite>

## ShowMyPC

ShowMyPC is a portable and free remote access program that's nearly identical to UltraVNC but uses a password to make a connection instead of an IP address.

The tag is: *misp-galaxy:rat="ShowMyPC"*

*Table 4734. Table References*

Links

<https://showmypc.com/>

## join.me

join.me is a remote access program from the producers of LogMeIn that provides quick access to another computer over an internet browser.

The tag is: *misp-galaxy:rat="join.me"*

*Table 4735. Table References*

Links
<a href="https://www.join.me/">https://www.join.me/</a>

## DesktopNow

DesktopNow is a free remote access program from NCH Software. After optionally forwarding the proper port number in your router, and signing up for a free account, you can access your PC from anywhere through a web browser.

The tag is: *misp-galaxy:rat="DesktopNow"*

*Table 4736. Table References*

## NanoCore

In September of 2015, a DigiTrust client visited a web link that was providing an Adobe Flash Player update. The client, an international retail organization, attempted to download and run what appeared to be a regular update. The computer trying to download this update was a back office system that processed end of day credit card transactions. This system also had the capability of connecting to the corporate network which contained company sales reports. DigiTrust experts were alerted to something malicious and blocked the download. The investigation found that what appeared to be an Adobe Flash Player update, was a Remote Access Trojan called NanoCore. If installation had been successful, customer credit card data, personal information, and internal sales information could have been captured and monetized. During the analysis of NanoCore, our experts found that there was much more to this RAT than simply being another Remote Access Trojan.

The tag is: `misp-galaxy:rat="NanoCore"`

NanoCore has relationships with:

- similar: `misp-galaxy:tool="NanoCoreRAT"` with `estimative-language:likelihood-probability="likely"`

Table 4742. Table References

## Cobian RAT

The Zscaler ThreatLabZ research team has been monitoring a new remote access Trojan (RAT) family called Cobian RAT since February 2017. The RAT builder for this family was first advertised on multiple underground forums where cybercriminals often buy and sell exploit and malware kits. This RAT builder caught our attention as it was being offered for free and had lot of similarities to the njRAT/H-Worm family

The tag is: `misp-galaxy:rat="Cobian RAT"`

Cobian RAT has relationships with:

- similar: `misp-galaxy:malpedia="Cobian RAT"` with `estimative-language:likelihood-probability="likely"`

Table 4743. Table References

## Xsser

Xsser mRAT is a piece of malware that targets iOS devices that have software limitations removed. The app is installed via a rogue repository on Cydia, the most popular third-party application store for jailbroken iPhones. Once the malicious bundle has been installed and executed, it gains persistence - preventing the user from deleting it. The mRAT then makes server-side checks and proceeds to steal data from the user's device and executes remote commands as directed by its command-and-control (C2) server.

The tag is: *misp-galaxy:rat="Xsser"*

Xsser is also known as:

- mRAT

## Quaverse

Quaverse RAT or QRAT is a fairly new Remote Access Tool (RAT) introduced in May 2015. This RAT is marketed as an undetectable Java RAT. As you might expect from a RAT, the tool is capable of grabbing passwords, key logging and browsing files on the victim's computer. On a regular basis for the past several months, we have observed the inclusion of QRAT in a number of spam campaigns.

The tag is: *misp-galaxy:rat="Quaverse"*

Quaverse is also known as:

- QRAT

## Trochilus

Trochilus is a remote access trojan (RAT) first identified in October 2015 when attackers used it to infect visitors of a Myanmar website. It was then used in a 2016 cyber-espionage campaign, dubbed "the Seven Pointed Dagger," managed by another group, "Group 27," who also uses the PlugX trojan. Trochilus is primarily spread via emails with a malicious .RAR attachment containing the malware. The trojan's functionality includes a shellcode extension, remote uninstall, a file manager, and the ability to download and execute, upload and execute, and access the system information. Once present on a system, Trochilus can move laterally in the network for better access. This trojan operates in memory only and does not write to the disk, helping it evade detection.

The tag is: *misp-galaxy:rat="Trochilus"*

Trochilus has relationships with:

- similar: *misp-galaxy:tool="Trochilus"* with *estimative-language:likelihood-probability="likely"*

## Matryoshka

Their most commonly used initial attack vector is a simple, yet alarmingly effective, spearphishing attack, infecting unsuspecting victims via a malicious email attachment (usually an executable that has been disguised as something else). From there, Matryoshka runs second stage malware via a dropper and covertly installs a Remote Access Toolkit (RAT). This is done using a reflective loader technique that allows the malware to run in process memory, rather than being written to disk. This not only hides the install of the RAT but also ensures that the RAT will be 'reinstalled' after system restart.

The tag is: *misp-galaxy:rat="Matryoshka"*

Matryoshka has relationships with:

- similar: *misp-galaxy:tool="Matryoshka"* with *estimative-language:likelihood-probability="likely"*

# Mangit

First discovered by Trend Micro in June, Mangit is a new malware family being marketed on both the Dark web and open internet. Users have the option to rent the trojan's infrastructure for about \$600 per 10-day period or buy the source code for about \$8,800. Mangit was allegedly developed by "Ric", a Brazilian hacker, who makes himself available via Skype to discuss rental agreements. Once the malware is rented or purchased, the user controls a portion of the Mangit botnet, the trojan, the dropper, an auto-update system, and the server infrastructure to run their attacks. Mangit contains support for nine Brazillian banks including Citibank, HSBC, and Santander. The malware can also be used to steal user PayPal credentials. Mangit has the capability to collect banking credentials, receive SMS texts when a victim is accessing their bank account, and take over victim's browsers. To circumvent two-factor authentication, attackers can use Mangit to lock victim's browsers and push pop-ups to the victim asking for the verification code they just received.

The tag is: *misp-galaxy:rat="Mangit"*

# Revenge-RAT

Revenge v0.1 was a simple tool, according to a researcher known as Rui, who says the malware's author didn't bother obfuscating the RAT's source code. This raised a question mark with the researchers, who couldn't explain why VirusTotal scanners couldn't pick it up as a threat right away. Revenge, which was written in Visual Basic, also didn't feature too many working features, compared to similar RATs. Even Napoleon admitted that his tool was still in the early development stages, a reason why he provided the RAT for free.

## rokrat

ROKRAT is a remote access trojan (RAT) that leverages a malicious Hanguang Word Processor (HWP) document sent in spearphishing emails to infect hosts. The HWP document contains an embedded Encapsulated PostScript (EPS) object. The object exploits an EPS buffer overflow vulnerability and downloads a binary disguised as a .JPG file. The file is then decoded and the ROKRAT executable is initiated. The trojan uses legitimate Twitter, Yandex, and Mediafire websites for its command and control communications and exfiltration platforms, making them difficult to block globally. Additionally, the platforms use HTTPS connections, making it more difficult to gather additional data on its activities. Cisco's Talos Group identified two email campaigns. In one, attackers send potential victims emails from an email server of a private university in Seoul, South Korea with a sender email address of "[kgf2016@yonsei.ac.kr](mailto:kgf2016@yonsei.ac.kr)," the contact email for the Korea Global Forum, adding a sense of legitimacy to the email. It is likely that the email address was compromised and used by the attackers in this campaign. The second is less sophisticated and sends emails claiming to be from a free Korean mail service with a the subject line, "Request Help" and attached malicious HWP filename, "I'm a munchon person in Gangwon-do, North Korea." The ROKRAT developer uses several techniques to hinder analysis, including identifying tools usually used by malware analysts or within sandbox environments. Once it has infected a device, this trojan can execute commands, move a file, remove a file, kill a process, download and execute a file, upload documents, capture screenshots, and log keystrokes. Researchers believe the developer is a native Korean speaker and the campaign is currently targeting Korean-speakers.

The tag is: *misp-galaxy:rat="rokrat"*

rokrat is also known as:

- ROKRAT

## Client Maximus

The purpose of the Client Maximus malware is financial fraud. As such, its code aspires to create the capabilities that most banking Trojans have, which allow attackers to monitor victims' web navigation and interrupt online banking session at will. After taking over a victim's banking session, an attacker operating this malware can initiate a fraudulent transaction from the account and use social engineering screens to manipulate the unwitting victim into authorizing it.

The tag is: *misp-galaxy:rat="Client Maximus"*

## RATAttack

RATAttack is a remote access trojan (RAT) that uses the Telegram protocol to support encrypted communication between the victim's machine and the attacker. The Telegram protocol also provides a simple method to communicate to the target, negating the need for port forwarding. Before using RATAttack, the attacker must create a Telegram bot and embed the bot's Telegram token into the trojan's configuration file. When a system is infected with RATAttack, it connects to the bot's Telegram channel. The attacker can then connect to the same channel and manage the

RATAttack clients on the infected host machines. The trojan's code was available on GitHub then was taken down by the author on April 19, 2017.

The tag is: *misp-galaxy:rat="RATAttack"*

*Table 4803. Table References*

## Socket23

SOCKET23 was launched from his web site and immediately infected major French corporations

between August and October 1998. The virus (distributing the Trojan) was known as W32/HLLP.DeTroie.A (alias W32/Cheval.TCV). Never had a virus so disrupted French industry. The author quickly offered his own remover and made his apologies on his web site (now suppressed). Jean-Christophe X (18) was arrested on Tuesday 15 June 1999 in the Paris area and placed under judicial investigation for 'fraudulent intrusion of data in a data processing system, suppression and fraudulent modification of data'

## DNSMessenger

Talos recently analyzed an interesting malware sample that made use of DNS TXT record queries and responses to create a bidirectional Command and Control (C2) channel. This allows the attacker to use DNS communications to submit new commands to be run on infected machines and return the results of the command execution to the attacker. This is an extremely uncommon and evasive way of administering a RAT. The use of multiple stages of Powershell with various stages being completely fileless indicates an attacker who has taken significant measures to avoid detection.

The tag is: *misp-galaxy:rat="DNSMessenger"*

DNSMessenger has relationships with:

## htpRAT

On November 8, 2016 a non-disclosed entity in Laos was spear-phished by a group closely related to known Chinese adversaries and most likely affiliated with the Chinese government. The attackers utilized a new kind of Remote Access Trojan (RAT) that has not been previously observed or reported. The new RAT extends the capabilities of traditional RATs by providing complete remote execution of custom commands and programming. htpRAT, uncovered by RiskIQ cyber investigators, is the newest weapon in the Chinese adversary's arsenal in a campaign against Association of Southeast Asian Nations (ASEAN). Most RATs can log keystrokes, take screenshots, record audio and video from a webcam or microphone, install and uninstall programs and manage files. They support a fixed set of commands operators can execute using different command IDs —'file download' or 'file upload,' for example—and must be completely rebuilt to have different functionality. htpRAT, on the other hand, serves as a conduit for operators to do their job with greater precision and effect. On the Command and Control (C2) server side, threat actors can build new functionality in commands, which can be sent to the malware to execute. This capability makes htpRAT a small, agile, and incredibly dynamic piece of malware. Operators can change functionality, such as searching for a different file on the victim's network, simply by wrapping commands.

The tag is: *misp-galaxy:rat="htpRAT"*

htpRAT has relationships with:

- similar: *misp-galaxy:malpedia="htpRAT"* with *estimative-language:likelihood-probability="likely"*

## FALLCHILL

According to trusted third-party reporting, HIDDEN COBRA actors have likely been using FALLCHILL malware since 2016 to target the aerospace, telecommunications, and finance industries. The malware is a fully functional RAT with multiple commands that the actors can issue from a command and control (C2) server to a victim's system via dual proxies. FALLCHILL typically infects a system as a file dropped by other HIDDEN COBRA malware or as a file downloaded unknowingly by users when visiting sites compromised by HIDDEN COBRA actors. HIDDEN COBRA actors use an external tool or dropper to install the FALLCHILL malware-as-a-service to establish persistence. Because of this, additional HIDDEN COBRA malware may be present on systems compromised with FALLCHILL.

The tag is: *misp-galaxy:rat="FALLCHILL"*

FALLCHILL has relationships with:

## UBoatRAT

Alto Networks Unit 42 has identified attacks with a new custom Remote Access Trojan (RAT) called UBoatRAT. The initial version of the RAT, found in May of 2017, was simple HTTP backdoor that uses a public blog service in Hong Kong and a compromised web server in Japan for command and control. The developer soon added various new features to the code and released an updated version in June. The attacks with the latest variants we found in September have following characteristics. Targets personnel or organizations related to South Korea or video games industry Distributes malware through Google Drive Obtains C2 address from GitHub Uses Microsoft Windows Background Intelligent Transfer Service(BITS) to maintain persistence.

The tag is: *misp-galaxy:rat="UBoatRAT"*

# TSCookieRAT

TSCookie provides parameters such as C&C server information when loading TSCookieRAT. Upon the execution, information of the infected host is sent with HTTP POST request to an external server. (The HTTP header format is the same as TSCookie.) The data is RC4-encrypted from the beginning to 0x14 (the key is Date header value), which is followed by the information of the infected host (host name, user name, OS version, etc.). Please refer to Appendix C, Table C-1 for the data format.

The tag is: *misp-galaxy:rat="TSCookieRAT"*

## Caesar RAT

Caesar is an HTTP-based RAT that allows you to remotely control devices directly from your browser.

The tag is: *misp-galaxy:rat="Caesar RAT"*

Table 4835. Table References

Links
<a href="https://securityonline.info/caesarrat-http-based-rat/">https://securityonline.info/caesarrat-http-based-rat/</a>

## FlawedAmmy

During the month of October, Check Point researchers discovered a widespread malware campaign spreading a remote access trojan (dubbed “FlawedAmmy”) that allows attackers to take over victims’ computers and data. The campaign was the latest and most widespread delivering the ‘FlawedAmmy’ RAT, following a number of campaigns that have spread this malware in recent months. The Trojan allows attackers to gain full access to the machine’s camera and microphone, collect screen grabs, steal credentials and sensitive files, and intrusively monitor the victims’ actions. As a result, FlawedAmmy is the first RAT to enter the Global Threat Index’s top 10 ranking.

The tag is: *misp-galaxy:rat="FlawedAmmy"*

## Felipe

The Zscaler ThreatLabZ team came across a new strain of infostealer Trojan called Felipe, which silently installs itself onto a user's system and connects to a command-and-control (C&C) server to send system information from the compromised system. This malware is compiled for both 32-bit and 64-bit Windows operating systems. Felipe basically steals the victim's debit and credit card information and sends it, along with other personal information, to the remote C&C server. It also sets a date and time to perform other malicious activity upon successful infection of the victim machine.

The tag is: *misp-galaxy:rat="Felipe"*

# Stealer

A list of malware stealer..

Stealer is a cluster galaxy available in JSON format at [this location](#) The JSON format can be freely reused in your application or automatically enabled in [MISP](#).

## authors

raw-data

# Nocturnal Stealer

It is designed to steal data found within multiple Chromium and Firefox based browsers, it can also steal many popular cryptocurrency wallets as well as any saved FTP passwords within FileZilla. Nocturnal Stealer uses several anti-VM and anti-analysis techniques, which include but are not limited to: environment fingerprinting, checking for debuggers and analyzers, searching for known virtual machine registry keys, and checking for emulation software.

The tag is: *misp-galaxy:stealer="Nocturnal Stealer"*

Nocturnal Stealer has relationships with:

- similar: *misp-galaxy:malpedia="Nocturnal Stealer"* with *estimative-language:likelihood-probability="likely"*

## TeleGrab

The first version stole browser credentials and cookies, along with all text files it can find on the system. The second variant added the ability to collect Telegram's desktop cache and key files, as well as login information for the video game storefront Steam.

The tag is: *misp-galaxy:stealer="TeleGrab"*

## AZORult

It is able to steal accounts from different software, such as, Firefox password Internet Explorer/Edge Thunderbird Chrome/Chromium and many more. It is also able to (1) list all installed software, (2) list processes, (3) Get information about the machine name (CPU type, Graphic card, size of memory), (4) take screen captures, (5) Steal cryptomoney wallet from Electrum, MultiBit, monero-project, bitcoin-qt.

## Stalker Panda

The group appears to have close ties to the Chinese National University of Defense and Technology, which is possibly linked to the PLA. Stalker Panda has been observed conducting targeted attacks against Japan, Taiwan, Hong Kong, and the United States. The attacks appear to be centered on political, media, and engineering sectors. The group appears to have been active since around 2010 and they maintain and upgrade their tools regularly.

## Nitro

These attackers were the subject of an extensive report by Symantec in 2011, which termed the attackers Nitro and stated: 'The goal of the attackers appears to be to collect intellectual property such as design documents, formulas, and manufacturing processes. In addition, the same attackers appear to have a lengthy operation history including attacks on other industries and organizations. Attacks on the chemical industry are merely their latest attack wave. As part of our investigations, we were also able to identify and contact one of the attackers to try and gain insights into the motivations behind these attacks.' Palo Alto Networks reported on continued activity by the attackers in 2014.

The tag is: *misp-galaxy:threat-actor="Nitro"*

Nitro is also known as:

- Covert Grove

## DarkHotel

Kaspersky described DarkHotel in a 2014 report as: '... DarkHotel drives its campaigns by spear-phishing targets with highly advanced Flash zero-day exploits that effectively evade the latest Windows and Adobe defenses, and yet they also imprecisely spread among large numbers of vague targets with peer-to-peer spreading tactics. Moreover, this crews most unusual characteristic is that for several years the Darkhotel APT has maintained a capability to use hotel networks to follow and hit selected targets as they travel around the world.'

The tag is: `misp-galaxy:threat-actor="DarkHotel"`

DarkHotel is also known as:

- DUBNIUM
- Fallout Team
- Karba
- Luder
- Nemim
- Nemin
- Tapaoux

## APT 16

Between November 26, 2015, and December 1, 2015, known and suspected China-based APT groups launched several spear-phishing attacks targeting Japanese and Taiwanese organizations in the high-tech, government services, media and financial services industries. Each campaign delivered a malicious Microsoft Word document exploiting the aforementioned EPS dict copy use-after-free vulnerability, and the local Windows privilege escalation vulnerability CVE-2015-1701. The successful exploitation of both vulnerabilities led to the delivery of either a downloader that we refer to as IRONHALO, or a backdoor that we refer to as ELMER.

The tag is: *misp-galaxy:threat-actor="APT 16"*

APT 16 is also known as:

- APT16
- SVCMONDR

## Wekby

Wekby was described by Palo Alto Networks in a 2015 report as: 'Wekby is a group that has been active for a number of years, targeting various industries such as healthcare, telecommunications, aerospace, defense, and high tech. The group is known to leverage recently released exploits very shortly after those exploits are available, such as in the case of HackingTeams Flash zero - day exploit.'

The tag is: `misp-galaxy:threat-actor="Wekby"`

Wekby is also known as:

- Dynamite Panda
- TG-0416
- APT 18
- SCANDIUM
- PLA Navy
- APT18

Wekby has relationships with:

- similar: `misp-galaxy:mitre-intrusion-set="APT18 - G0026"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:threat-actor="Samurai Panda"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:threat-actor="Maverick Panda"` with `estimative-language:likelihood-probability="likely"`

## Tropic Trooper

TrendMicro described Tropic Trooper in a 2015 report as: 'Taiwan and the Philippines have become the targets of an ongoing campaign called Operation TropicTrooper. Active since 2012, the attackers behind the campaign have set their sights on the Taiwanese government as well as a number of companies in the heavy industry. The same campaign has also targeted key Philippine military agencies.'

The tag is: `misp-galaxy:threat-actor="Tropic Trooper"`

Tropic Trooper is also known as:

- Operation Tropic Trooper
- Operation TropicTrooper
- TropicTrooper

# Axiom

The Winnti grouping of activity is large and may actually be a number of linked groups rather than a single discrete entity. Kaspersky describe Winnti as: 'The Winnti group has been attacking companies in the online video game industry since 2009 and is currently still active. The groups objectives are stealing digital certificates signed by legitimate software vendors in addition to intellectual property theft, including the source code of online game projects. The majority of the victims are from South East Asia.'

The tag is: *misp-galaxy:threat-actor="Axiom"*

Axiom is also known as:

- Winnti Group
- Tailgater Team
- Group 72
- Group72
- Tailgater
- Ragebeast
- Blackfly
- Lead
- Wicked Spider
- APT17
- APT 17
- Dogfish
- Deputy Dog
- Wicked Panda
- Barium

Axiom has relationships with:

- similar: *misp-galaxy:mitre-intrusion-set="Winnti Group - G0044"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:mitre-pre-attack-intrusion-set="APT17 - G0025"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:threat-actor="Aurora Panda"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:mitre-intrusion-set="Axiom - G0001"* with *estimative-language:likelihood-probability="likely"*

## Hurricane Panda

We have investigated their intrusions since 2013 and have been battling them nonstop over the last year at several large telecommunications and technology companies. The determination of this China-based adversary is truly impressive: they are like a dog with a bone. HURRICANE PANDA's preferred initial vector of compromise and persistence is a China Chopper webshell – a tiny and easily obfuscated 70 byte text file that consists of an 'eval()' command, which is then used to provide full command execution and file upload/download capabilities to the attackers. This script is typically uploaded to a web server via a SQL injection or WebDAV vulnerability, which is often trivial to uncover in a company with a large external web presence. Once inside, the adversary immediately moves on to execution of a credential theft tool such as Mimikatz (repacked to avoid AV detection). If they are lucky to have caught an administrator who might be logged into that web server at the time, they will have gained domain administrator credentials and can now roam your network at will via 'net use' and 'wmic' commands executed through the webshell terminal.

The tag is: `misp-galaxy:threat-actor="Hurricane Panda"`

Hurricane Panda is also known as:

- Black Vine
- TEMP.Avengers
- Zirconium
- APT 31
- APT31

Hurricane Panda has relationships with:

- similar: `misp-galaxy:mitre-intrusion-set="Deep Panda - G0009"` with `estimative-language:likelihood-probability="likely"`

## Anchor Panda

PLA Navy Anchor Panda is an adversary that CrowdStrike has tracked extensively over the last year targeting both civilian and military maritime operations in the green/brown water regions primarily in the area of operations of the South Sea Fleet of the PLA Navy. In addition to maritime operations in this region, Anchor Panda also heavily targeted western companies in the US, Germany, Sweden, the UK, and Australia, and other countries involved in maritime satellite systems, aerospace companies, and defense contractors. Not surprisingly, embassies and diplomatic missions in the region, foreign intelligence services, and foreign governments with space programs were also targeted.

The tag is: *misp-galaxy:threat-actor="Anchor Panda"*

Anchor Panda is also known as:

- APT14
- APT 14
- QAZTeam
- ALUMINUM

Anchor Panda has relationships with:

- uses: *misp-galaxy:rat="Gh0st RAT"* with estimative-language:likelihood-probability="likely"
- uses: *misp-galaxy:tool="Gh0st Rat"* with estimative-language:likelihood-probability="likely"

# Impersonating Panda

The tag is: *misp-galaxy:threat-actor="Impersonating Panda"*

# Violin Panda

We've uncovered some new data and likely attribution regarding a series of APT watering hole attacks this past summer. Watering hole attacks are an increasingly popular component of APT campaigns, as many people are more aware of spear phishing and are less likely to open documents or click on links in unsolicited emails. Watering hole attacks offer a much better chance of success because they involve compromising legitimate websites and installing malware intended to compromise website visitors. These are often popular websites frequented by people who work in specific industries or have political sympathies to which the actors want to gain access. In contrast to many other APT campaigns, which tend to rely heavily on spear phishing to gain victims, "th3bug" is known for compromising legitimate websites their intended visitors are likely to frequent. Over the summer they compromised several sites, including a well-known Uyghur

website written in that native language.

The tag is: *misp-galaxy:threat-actor="Violin Panda"*

Violin Panda is also known as:

- APT20
- APT 20
- APT8
- APT 8
- TH3Bug

## Temper Panda

China-based cyber threat group. It has previously used newsworthy events as lures to deliver malware and has primarily targeted organizations involved in financial, economic, and trade policy, typically using publicly available RATs such as PoisonIvy, as well as some non-public backdoors. This threat actor targets prodemocratic activists and organizations in Hong Kong, European and international financial institutions, and a U.S.-based think tank.

The tag is: *misp-galaxy:threat-actor="Temper Panda"*

Temper Panda is also known as:

- Admin338
- Team338
- MAGNESIUM
- admin@338

Temper Panda has relationships with:

- similar: `misp-galaxy:mitre-intrusion-set="admin@338 - G0018"` with `estimative-language:likelihood-probability="likely"`

## Cutting Kitten

While tracking a suspected Iran-based threat group known as Threat Group-2889[1] (TG-2889), Dell SecureWorks Counter Threat Unit™ (CTU) researchers uncovered a network of fake LinkedIn profiles. These convincing profiles form a self-referenced network of seemingly established LinkedIn users. CTU researchers assess with high confidence the purpose of this network is to target potential victims through social engineering. Most of the legitimate LinkedIn accounts associated with the fake accounts belong to individuals in the Middle East, and CTU researchers assess with medium confidence that these individuals are likely targets of TG-2889. One of the threat actors responsible for the denial of service attacks against U.S. in 2012–2013. Three individuals associated with the group—believed to be have been working on behalf of Iran’s Islamic Revolutionary Guard Corps—were indicted by the Justice Department in 2016.

The tag is: `misp-galaxy:threat-actor="Cutting Kitten"`

Cutting Kitten is also known as:

- ITSecTeam
- Threat Group 2889

- TG-2889

## APT33

Our analysis reveals that APT33 is a capable group that has carried out cyber espionage operations since at least 2013. We assess APT33 works at the behest of the Iranian government.

The tag is: *misp-galaxy:threat-actor="APT33"*

APT33 is also known as:

- APT 33
- Elfin
- MAGNALLIUM
- Refined Kitten

APT33 has relationships with:

- similar: *misp-galaxy:mitre-intrusion-set="APT33 - G0064"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:threat-actor="MAGNALLIUM"* with *estimative-language:likelihood-probability="likely"*

*Table 4898. Table References*

Links

<https://www.fireeye.com/blog/threat-research/2017/09/apt33-insights-into-iranian-cyber-espionage.html>

## Magic Kitten

Earliest activity back to November 2008. An established group of cyber attackers based in Iran, who carried on several campaigns in 2013, including a series of attacks targeting political dissidents and those supporting Iranian political opposition.

The tag is: *misp-galaxy:threat-actor="Magic Kitten"*

Magic Kitten is also known as:

- Group 42

*Table 4899. Table References*

# Rocket Kitten

Targets Saudi Arabia, Israel, US, Iran, high ranking defense officials, embassies of various target countries, notable Iran researchers, human rights activists, media and journalists, academic institutions and various scholars, including scientists in the fields of physics and nuclear sciences.

The tag is: *misp-galaxy:threat-actor="Rocket Kitten"*

Rocket Kitten is also known as:

- TEMP.Beanie
- Operation Woolen Goldfish
- Operation Woolen-Goldfish
- Thamar Reservoir
- Timberworm

Rocket Kitten has relationships with:

- similar: *misp-galaxy:threat-actor="Flying Kitten"* with *estimative-language:likelihood-probability="very-likely"*
- similar: *misp-galaxy:mitre-intrusion-set="Magic Hound - G0059"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:threat-actor="Charming Kitten"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:threat-actor="Cleaver"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:threat-actor="OilRig"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:threat-actor="Clever Kitten"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:threat-actor="CHRYSENE"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:mitre-pre-attack-intrusion-set="Cleaver - G0003"* with *estimative-language:likelihood-probability="likely"*

## Cleaver

A group of cyber actors utilizing infrastructure located in Iran have been conducting computer network exploitation activity against public and private U.S. organizations, including Cleared Defense Contractors (CDCs), academic institutions, and energy sector companies. This threat actor targets entities in the government, energy, and technology sectors that are located in or do business with Saudi Arabia.

The tag is: *misp-galaxy:threat-actor="Cleaver"*

Cleaver is also known as:

- Operation Cleaver
- Tarh Andishan
- Alibaba
- 2889
- TG-2889
- Cobalt Gypsy
- Rocket\_Kitten
- Cutting Kitten
- Group 41
- Magic Hound
- APT35

## Sands Casino

The tag is: *misp-galaxy:threat-actor="Sands Casino"*

## Rebel Jackal

This is a pro-Islamist organization that generally conducts attacks motivated by real world events in which its members believe that members of the Muslim faith were wronged. Its attacks generally involve website defacements; however, the group did develop a RAT that it refers to as Fallaga RAT, but which appears to simply be a fork of the njRAT malware popular amongst hackers in the Middle East/North Africa region.

The tag is: *misp-galaxy:threat-actor="Rebel Jackal"*

Rebel Jackal is also known as:

- FallagaTeam

## Viking Jackal

The tag is: *misp-galaxy:threat-actor="Viking Jackal"*

Viking Jackal is also known as:

- Vikingdom

## Sofacy

The Sofacy Group (also known as APT28, Pawn Storm, Fancy Bear and Sednit) is a cyber espionage group believed to have ties to the Russian government. Likely operating since 2007, the group is known to target government, military, and security organizations. It has been characterized as an advanced persistent threat.

The tag is: *misp-galaxy:threat-actor="Sofacy"*

Sofacy is also known as:

- APT 28
- APT28
- Pawn Storm
- PawnStorm
- Fancy Bear
- Sednit
- SNAKEMACKEREL
- TsarTeam
- Tsar Team
- TG-4127
- Group-4127

- STRONTIUM
- TAG\_0700
- Swallowtail
- IRON TWILIGHT
- Group 74
- SIG40
- Grizzly Steppe

Sofacy has relationships with:

- similar: misp-galaxy:mitre-pre-attack-intrusion-set="APT28 - G0007" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:microsoft-activity-group="STRONTIUM" with estimative-language:likelihood-probability="likely"

## APT 29

A 2015 report by F-Secure describe APT29 as: 'The Dukes are a well-resourced, highly dedicated and organized cyberespionage group that we believe has been working for the Russian Federation since at least 2008 to collect intelligence in support of foreign and security policy decision-making. The Dukes show unusual confidence in their ability to continue successfully compromising their targets, as well as in their ability to operate with impunity. The Dukes primarily target Western governments and related organizations, such as government ministries and agencies, political think tanks, and governmental subcontractors. Their targets have also included the governments of members of the Commonwealth of Independent States; Asian, African, and Middle Eastern governments; organizations associated with Chechen extremism; and Russian speakers engaged in the illicit trade of controlled substances and drugs. The Dukes are known to employ a vast arsenal of malware toolsets, which we identify as MiniDuke, CosmicDuke, OnionDuke, CozyDuke, CloudDuke, SeaDuke, HammerDuke, PinchDuke, and GeminiDuke. In recent years, the Dukes have engaged in apparently biannual large - scale spear - phishing campaigns against hundreds or even thousands of recipients associated with governmental institutions and affiliated organizations. These campaigns utilize a smash - and - grab approach involving a fast but noisy breakin followed by the rapid collection and exfiltration of as much data as possible. If the compromised target is discovered to be of value, the Dukes will quickly switch the toolset used and move to using stealthier tactics focused on persistent compromise and long - term intelligence gathering. This threat actor targets government ministries and agencies in the West, Central Asia, East Africa, and the Middle East; Chechen extremist groups; Russian organized crime; and think tanks. It is suspected to be behind the 2015 compromise of unclassified networks at the White House, Department of State, Pentagon, and the Joint Chiefs of Staff. The threat actor includes all of the Dukes tool sets, including MiniDuke, CosmicDuke, OnionDuke, CozyDuke, SeaDuke, CloudDuke (aka MiniDionis), and HammerDuke (aka Hammertoss).'

The tag is: *misp-galaxy:threat-actor="APT 29"*

APT 29 is also known as:

## Turla Group

A 2014 Guardian article described Turla as: 'Dubbed the Turla hackers, initial intelligence had indicated western powers were key targets, but it was later determined embassies for Eastern Bloc nations were of more interest. Embassies in Belgium, Ukraine, China, Jordan, Greece, Kazakhstan, Armenia, Poland, and Germany were all attacked, though researchers from Kaspersky Lab and Symantec could not confirm which countries were the true targets. In one case from May 2012, the office of the prime minister of a former Soviet Union member country was infected, leading to 60 further computers being affected, Symantec researchers said. There were some other victims, including the ministry for health of a Western European country, the ministry for education of a Central American country, a state electricity provider in the Middle East and a medical organisation in the US, according to Symantec. It is believed the group was also responsible for a much -

documented 2008 attack on the US Central Command. The attackers - who continue to operate - have ostensibly sought to carry out surveillance on targets and pilfer data, though their use of encryption across their networks has made it difficult to ascertain exactly what the hackers took. Kaspersky Lab, however, picked up a number of the attackers searches through their victims emails, which included terms such as Nato and EU energy dialogue. Though attribution is difficult to substantiate, Russia has previously been suspected of carrying out the attacks and Symantec's Gavin O' Gorman told the Guardian a number of the hackers appeared to be using Russian names and language in their notes for their malicious code. Cyrillic was also seen in use.'

The tag is: *misp-galaxy:threat-actor="Turla Group"*

Turla Group is also known as:

## Sandworm

This threat actor targets industrial control systems, using a tool called Black Energy, associated with electricity and power generation for espionage, denial of service, and data destruction purposes. Some believe that the threat actor is linked to the 2015 compromise of the Ukrainian electrical grid

and a distributed denial of service prior to the Russian invasion of Georgia. Believed to be responsible for the 2008 DDoS attacks in Georgia and the 2015 Ukraine power grid outage

The tag is: *misp-galaxy:threat-actor="Sandworm"*

Sandworm is also known as:

- Sandworm Team
- Black Energy
- BlackEnergy
- Quedagh
- Voodoo Bear
- TEMP.Noble
- Iron Viking

Sandworm has relationships with:

- similar: *misp-galaxy:mitre-intrusion-set="Sandworm Team - G0034"* with *estimative-language:likelihood-probability="likely"*

# TeleBots

We will refer to the gang behind the malware as TeleBots. However it's important to say that these attackers, and the toolset used, share a number of similarities with the BlackEnergy group, which conducted attacks against the energy industry in Ukraine in December 2015 and January 2016. In fact, we think that the BlackEnergy group has evolved into the TeleBots group. TeleBots appear to be associated with Sandworm Team, Iron Viking, Voodoo Bear.

The tag is: *misp-galaxy:threat-actor="TeleBots"*

TeleBots is also known as:

- Sandworm

## TeamSpy Crew

Researchers have uncovered a long-term cyber-espionage campaign that used a combination of legitimate software packages and commodity malware tools to target a variety of heavy industry, government intelligence agencies and political activists. Known as the TeamSpy crew because of its affinity for using the legitimate TeamViewer application as part of its toolset, the attackers may have been active for as long as 10 years, researchers say. The attack appears to be a years-long espionage campaign, but experts who have analyzed the victim profile, malware components and command-and-control infrastructure say that it's not entirely clear what kind of data the attackers are going after. What is clear, though, is that the attackers have been at this for a long time and that they have specific people in mind as targets. Researchers at the CrySys Lab in Hungary were alerted by the Hungarian National Security Authority to an attack against a high-profile target in the country and began looking into the campaign. They quickly discovered that some of the infrastructure being used in the attack had been in use for some time and that the target they were investigating was by no means the only one.

The tag is: *misp-galaxy:threat-actor="TeamSpy Crew"*

TeamSpy Crew is also known as:

- TeamSpy
- Team Bear
- Berserk Bear
- Anger Bear
- IRON LYRIC

TeamSpy Crew has relationships with:

- similar: *misp-galaxy:threat-actor="Berserk Bear"* with *estimative-language:likelihood-probability="likely"*

# BuhTrap

Buhtrap has been active since 2014, however their first attacks against financial institutions were only detected in August 2015. Earlier, the group had only focused on targeting banking clients. At the moment, the group is known to target Russian and Ukrainian banks. From August 2015 to February 2016 Buhtrap managed to conduct 13 successful attacks against Russian banks for a total amount of 1.8 billion rubles (\$25.7 mln). The number of successful attacks against Ukrainian banks has not been identified. Buhtrap is the first hacker group using a network worm to infect the overall bank infrastructure that significantly increases the difficulty of removing all malicious functions from the network. As a result, banks have to shut down the whole infrastructure which provokes delay in servicing customers and additional losses. Malicious programs intentionally scan for machines with an automated Bank-Customer system of the Central Bank of Russia (further referred to as BCS CBR). We have not identified incidents of attacks involving online money transfer systems, ATM machines or payment gates which are known to be of interest for other criminal groups.

# Berserk Bear

The tag is: *misp-galaxy:threat-actor="Berserk Bear"*

Berserk Bear has relationships with:

- similar: *misp-galaxy:threat-actor="TeamSpy Crew"* with *estimative-language:likelihood-probability="likely"*

# Wolf Spider

FIN4 is a financially-motivated threat group that has targeted confidential information related to the public financial market, particularly regarding healthcare and pharmaceutical companies, since at least 2013. FIN4 is unique in that they do not infect victims with typical persistent malware, but rather they focus on capturing credentials authorized to access email and other non-public correspondence.

The tag is: *misp-galaxy:threat-actor="Wolf Spider"*

Wolf Spider is also known as:

- FIN4

## Lazarus Group

Since 2009, HIDDEN COBRA actors have leveraged their capabilities to target and compromise a range of victims; some intrusions have resulted in the exfiltration of data while others have been disruptive in nature. Commercial reporting has referred to this activity as Lazarus Group and Guardians of Peace. Tools and capabilities used by HIDDEN COBRA actors include DDoS botnets, keyloggers, remote access tools (RATs), and wiper malware. Variants of malware and tools used by HIDDEN COBRA actors include Destover, Duuzer, and Hangman.

The tag is: *misp-galaxy:threat-actor="Lazarus Group"*

Lazarus Group is also known as:

- Operation DarkSeoul
- Dark Seoul
- Hidden Cobra

# SNOWGLOBE

In 2014, researchers at Kaspersky Lab discovered and reported on three zero-days that were being used in cyberattacks in the wild. Two of these zero-day vulnerabilities are associated with an advanced threat actor we call Animal Farm. Over the past few years, Animal Farm has targeted a wide range of global organizations. The group has been active since at least 2009 and there are signs that earlier malware versions were developed as far back as 2007.

The tag is: *misp-galaxy:threat-actor="SNOWGLOBE"*

SNOWGLOBE is also known as:

- Animal Farm
- Snowglobe

# Deadeye Jackal

The Syrian Electronic Army (SEA) is a group of computer hackers which first surfaced online in 2011 to support the government of Syrian President Bashar al-Assad. Using spamming, website defacement, malware, phishing, and denial of service attacks, it has targeted political opposition groups, western news organizations, human rights groups and websites that are seemingly neutral to the Syrian conflict. It has also hacked government websites in the Middle East and Europe, as well as US defense contractors. As of 2011 the SEA has been **the first Arab country to have a public Internet Army hosted on its national networks to openly launch cyber attacks on its enemies**. The precise nature of SEA's relationship with the Syrian government has changed over time and is unclear

The tag is: *misp-galaxy:threat-actor="Deadeye Jackal"*

Deadeye Jackal is also known as:

- SyrianElectronicArmy
- SEA

## Scarlet Mimic

Scarlet Mimic is a threat group that has targeted minority rights activists. This group has not been directly linked to a government source, but the group's motivations appear to overlap with those of the Chinese government. While there is some overlap between IP addresses used by Scarlet Mimic and Putter Panda, APT 2, it has not been concluded that the groups are the same. The attacks began over four years ago and their targeting pattern suggests that this adversary's primary mission is to gather information about minority rights activists. We do not have evidence directly linking these attacks to a government source, but the information derived from these activities supports an assessment that a group or groups with motivations similar to the stated position of the Chinese government in relation to these targets is involved. The attacks we attribute to Scarlet Mimic have primarily targeted Uyghur and Tibetan activists as well as those who are interested in their causes. Both the Tibetan community and the Uyghurs, a Turkic Muslim minority residing primarily in northwest China, have been targets of multiple sophisticated attacks in the past decade. Both also have history of strained relationships with the government of the People's Republic of China (PRC), though we do not have evidence that links Scarlet Mimic attacks to the PRC. Scarlet Mimic attacks have also been identified against government organizations in Russia and India, who are responsible for tracking activist and terrorist activities. While we do not know the precise target of each of the Scarlet Mimic attacks, many of them align to the patterns described above.

The tag is: *misp-galaxy:threat-actor="Scarlet Mimic"*

Scarlet Mimic has relationships with:

- similar: *misp-galaxy:mitre-intrusion-set="Scarlet Mimic - G0029"* with *estimative-language:likelihood-probability="likely"*

## ProjectSauron

ProjectSauron is the name for a top level modular cyber-espionage platform, designed to enable and manage long-term campaigns through stealthy survival mechanisms coupled with multiple exfiltration methods. Technical details show how attackers learned from other extremely advanced actors in order to avoid repeating their mistakes. As such, all artifacts are customized per given target, reducing their value as indicators of compromise for any other victim. Usually APT

campaigns have a geographical nexus, aimed at extracting information within a specific region or from a given industry. That usually results in several infections in countries within that region, or in the targeted industry around the world. Interestingly, ProjectSauron seems to be dedicated to just a couple of countries, focused on collecting high value intelligence by compromising almost all key entities it could possibly reach within the target area. The name, ProjectSauron reflects the fact that the code authors refer to 'Sauron' in the Lua scripts.

The tag is: *misp-galaxy:threat-actor="ProjectSauron"*

ProjectSauron is also known as:

- Strider
- Sauron
- Project Sauron

ProjectSauron has relationships with:

- similar: *misp-galaxy:mitre-intrusion-set="Strider - G0041"* with *estimative-language:likelihood-probability="likely"*

# OilRig

OilRig is an Iranian threat group operating primarily in the Middle East by targeting organizations in this region that are in a variety of different industries; however, this group has occasionally targeted organizations outside of the Middle East as well. It also appears OilRig carries out supply chain attacks, where the threat group leverages the trust relationship between organizations to attack their primary targets.

OilRig is an active and organized threat group, which is evident based on their systematic targeting of specific organizations that appear to be carefully chosen for strategic purposes. Attacks attributed to this group primarily rely on social engineering to exploit the human rather than software vulnerabilities; however, on occasion this group has used recently patched vulnerabilities in the delivery phase of their attacks. The lack of software vulnerability exploitation does not necessarily suggest a lack of sophistication, as OilRig has shown maturity in other aspects of their operations. Such maturities involve:

-Organized evasion testing used the during development of their tools. -Use of custom DNS Tunneling protocols for command and control (C2) and data exfiltration. -Custom web-shells and backdoors used to persistently access servers.

OilRig relies on stolen account credentials for lateral movement. After OilRig gains access to a system, they use credential dumping tools, such as Mimikatz, to steal credentials to accounts logged into the compromised system. The group uses these credentials to access and to move laterally to other systems on the network. After obtaining credentials from a system, operators in this group prefer to use tools other than their backdoors to access the compromised systems, such as remote desktop and putty. OilRig also uses phishing sites to harvest credentials to individuals at targeted organizations to gain access to internet accessible resources, such as Outlook Web Access.

The tag is: *misp-galaxy:threat-actor="OilRig"*

OilRig is also known as:

- Twisted Kitten
- Cobalt Gypsy

- Crambus
- Helix Kitten
- APT 34
- APT34
- IRN2

OilRig has relationships with:

## Volatile Cedar

Beginning in late 2012, a carefully orchestrated attack campaign we call Volatile Cedar has been targeting individuals, companies and institutions worldwide. This campaign, led by a persistent attacker group, has successfully penetrated a large number of targets using various attack techniques, and specifically, a custom-made malware implant codenamed Explosive .

The tag is: *misp-galaxy:threat-actor="Volatile Cedar"*

Volatile Cedar is also known as:

- Reuse team
- Malware reusers
- Dancing Salome

## Malware reusers

Threat Group conducting cyber espionage while re-using tools from other teams; like those of Hacking Team, and vmprotect to obfuscate.

The tag is: *misp-galaxy:threat-actor="Malware reusers"*

Malware reusers is also known as:

- Reuse team
- Dancing Salome

## TERBIUM

Microsoft Threat Intelligence identified similarities between this recent attack and previous 2012 attacks against tens of thousands of computers belonging to organizations in the energy sector. Microsoft Threat Intelligence refers to the activity group behind these attacks as TERBIUM, following our internal practice of assigning rogue actors chemical element names.

The tag is: *misp-galaxy:threat-actor="TERBIUM"*

TERBIUM has relationships with:

- similar: *misp-galaxy:microsoft-activity-group="TERBIUM"* with *estimative-language:likelihood-probability="likely"*

## Molerats

In October 2012, malware attacks against Israeli government targets grabbed media attention as officials temporarily cut off Internet access for its entire police force and banned the use of USB

memory sticks. Security researchers subsequently linked these attacks to a broader, yearlong campaign that targeted not just Israelis but Palestinians as well. and as discovered later, even the U.S. and UK governments. Further research revealed a connection between these attacks and members of the so-called “Gaza Hackers Team.” We refer to this campaign as “Molerats.”

The tag is: *misp-galaxy:threat-actor="Molerats"*

Molerats is also known as:

- Gaza Hackers Team
- Gaza cybergang
- Gaza Cybergang
- Operation Molerats
- Extreme Jackal
- Moonlight

Molerats has relationships with:

- similar: *misp-galaxy:mitre-intrusion-set="Molerats - G0021"* with *estimative-language:likelihood-probability="likely"*

# PROMETHIUM

PROMETHIUM is an activity group that has been active as early as 2012. The group primarily uses Truvasys, a first-stage malware that has been in circulation for several years. Truvasys has been involved in several attack campaigns, where it has masqueraded as one of server common computer utilities, including WinUtils, TrueCrypt, WinRAR, or SanDisk. In each of the campaigns, Truvasys malware evolved with additional features—this shows a close relationship between the activity groups behind the campaigns and the developers of the malware.

The tag is: *misp-galaxy:threat-actor="PROMETHIUM"*

PROMETHIUM is also known as:

- StrongPity

PROMETHIUM has relationships with:

- similar: `misp-galaxy:mitre-intrusion-set="PROMETHIUM - G0056"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:microsoft-activity-group="PROMETHIUM"` with `estimative-language:likelihood-probability="likely"`

## Packrat

A threat group that has been active for at least seven years has used malware, phishing and disinformation tactics to target activists, journalists, politicians and public figures in various Latin American countries. The threat actor, dubbed Packrat based on its preference for remote access Trojans (RATs) and because it has used the same infrastructure for several years, has been analyzed by Citizen Lab researchers John Scott-Railton, Morgan Marquis-Boire, and Claudio Guarnieri, and Cyphort researcher Marion Marschalek, best known for her extensive analysis of state-sponsored threats.

The tag is: *misp-galaxy:threat-actor="Packrat"*

<https://citizenlab.org/2015/12/packrat-report/>

## Cadelle

Symantec telemetry identified Cadelle and Chafer activity dating from as far back as July 2014, however, it's likely that activity began well before this date. Command-and-control (C&C) registrant information points to activity possibly as early as 2011, while executable compilation times suggest early 2012. Their attacks continue to the present day. Symantec estimates that each team is made up of between 5 and 10 people.

## PassCV

The PassCV group continues to be one of the most successful and active threat groups that leverage a wide array of stolen Authenticode-signing certificates. Snorre Fagerland of Blue Coat Systems first coined the term PassCV in a blog post. His post provides a good introduction to the group and covers some of the older infrastructure, stolen code-signing certificate reuse, and other connections associated with the PassCV malware. There are several clues alluding to the possibility that multiple groups may be utilizing the same stolen signing certificates, but at this time SPEAR believes the current attacks are more likely being perpetrated by a single group employing multiple publicly available Remote Administration Tools (RATs). The PassCV group has been operating with continued success and has already started to expand their malware repertoire into different off-the-shelf RATs and custom code. SPEAR identified eighteen previously undisclosed stolen Authenticode certificates. These certificates were originally issued to companies and individuals scattered across China, Taiwan, Korea, Europe, the United States and Russia. In this post we expand the usage of the term ‘PassCV’ to encompass the malware mentioned in the Blue Coat Systems report, as well as the APT group behind the larger C2 infrastructure and stolen Authenticode certificates. We’d like to share some of our findings as they pertain to the stolen certificates, command and control infrastructure, and some of the newer custom RATs they’ve begun development on.

The tag is: *misp-galaxy:threat-actor="PassCV"*

## Sath-1 Müdafaa

A Turkish hacking group, Sath-1 Müdafaa, is encouraging individuals to join its DDoS-for-Points platform that features points and prizes for carrying out distributed denial-of-service (DDoS) attacks against a list of predetermined targets. Their DDoS tool also contains a backdoor to hack the hackers. So the overarching motivation and allegiance of the group is not entirely clear.

The tag is: *misp-galaxy:threat-actor="Sath-1 Müdafaa"*

## Aslan Neferler Tim

Turkish nationalist hacktivist group that has been active for roughly one year. According to

Domaintools, the group's site has been registered since December 2015, with an active Twitter account since January 2016. The group carries out distributed denial-of-service (DDoS) attacks and defacements against the sites of news organizations and governments perceived to be critical of Turkey's policies or leadership, and purports to act in defense of Islam

The tag is: *misp-galaxy:threat-actor="Aslan Neferler Tim"*

Aslan Neferler Tim is also known as:

- Lion Soldiers Team
- Phantom Turk

## Ayyıldız Tim

Ayyıldız (Crescent and Star) Tim is a nationalist hacking group founded in 2002. It performs defacements and DDoS attacks against the websites of governments that it considers to be repressing Muslim minorities or engaged in Islamophobic policies.

The tag is: *misp-galaxy:threat-actor="Ayyıldız Tim"*

Ayyıldız Tim is also known as:

- Crescent and Star

## TurkHackTeam

Founded in 2004, Turkhackteam is one of Turkey's oldest and most high-profile hacking collectives. According to a list compiled on Turkhackteam's forum, the group has carried out almost 30 highly publicized hacking campaigns targeting foreign government and commercial websites, including websites of international corporations.

The tag is: *misp-galaxy:threat-actor="TurkHackTeam"*

TurkHackTeam is also known as:

- Turk Hack Team

## Equation Group

The Equation Group is a highly sophisticated threat actor described by its discoverers at Kaspersky Labs as one of the most sophisticated cyber attack groups in the world, operating alongside but always from a position of superiority with the creators of Stuxnet and Flame

The tag is: *misp-galaxy:threat-actor="Equation Group"*

Equation Group is also known as:

- Tilded Team
- Lamberts

- EQGRP
- Longhorn

Equation Group has relationships with:

- similar: `misp-galaxy:threat-actor="Longhorn"` with `estimative-language:likelihood-probability="likely"`

## Gamaredon Group

Unit 42 threat researchers have recently observed a threat group distributing new, custom developed malware. We have labelled this threat group the Gamaredon Group and our research shows that the Gamaredon Group has been active since at least 2013. In the past, the Gamaredon Group has relied heavily on off-the-shelf tools. Our new research shows the Gamaredon Group have made a shift to custom-developed malware. We believe this shift indicates the Gamaredon Group have improved their technical capabilities.

The tag is: *misp-galaxy:threat-actor="Gamaredon Group"*

Gamaredon Group has relationships with:

- similar: *misp-galaxy:mitre-intrusion-set="Gamaredon Group - G0047"* with estimative-language:likelihood-probability="likely"

## Infy

Infy is a group of suspected Iranian origin. Since early 2013, we have observed activity from a unique threat actor group, which we began to investigate based on increased activities against human right activists in the beginning of 2015. In line5with other research on the campaign,

released prior to publication of this document, we have adopted the name “Infy”, which is based on labels used in the infrastructure and its two families of malware agents. Thanks to information we have been able to collect during the course of our research, such as characteristics of the group’s malware and development cycle, our research strongly supports the claim that the Infy group is of Iranian origin and potentially connected to the Iranian state. Amongst a backdrop of other incidents, Infy became one of the most frequently observed agents for attempted malware attacks against Iranian civil society beginning in late 2014, growing in use up to the February 2016 parliamentary election in Iran. After the conclusion of the parliamentary election, the rate of attempted intrusions and new compromises through the Infy agent slowed, but did not end. The trends witnessed in reports from recipients are reinforced through telemetry provided by design failures in more recent versions of the Infy malware.

The tag is: *misp-galaxy:threat-actor="Infy"*

Infy is also known as:

- Operation Mermaid
- Prince of Persia

## Sima

Sima is a group of suspected Iranian origin targeting Iranians in diaspora. In February 2016, Iran-focused individuals received messages purporting to be from Human RightsWatch’s (HRW) Emergencies Director, requesting that they read an article about Iran pressing Afghanr efugees to fight in Syria. While referencing a real report published by HRW, the links provided for the Director’s biography and article directed the recipient to malware hosted elsewhere. These spear-phishing attempts represent an evolution of Iranian actors based on their social engineering tactics and narrow targeting. Although the messages still had minor grammatical and stylistic errors that would be obvious to a native speaker, the actors demonstrated stronger English-language proficiency than past intrusion sets and a deeper investment in background research prior to the attempt. The actors appropriated a real identity that would be expected to professionally interact with the subject, then offered validation through links to their biography and social media, the

former of which itself was malware as well. The bait documents contained a real article relevant to their interests and topic referenced, and the message attempted to address to how it aligned with their professional research or field of employment. The referenced documents sent were malware binaries posing as legitimate files using the common right-to-left filenames tactic in order to conceal the actual file extension. All of these techniques, while common pretexting mechanisms, are a refinement compared to a tendency amongst other groups to simply continually send different forms of generic malware or phishing, in the hopes that one would eventually be successful.

# Longhorn

Longhorn has been active since at least 2011. It has used a range of back door Trojans in addition to zero-day vulnerabilities to compromise its targets. Longhorn has infiltrated governments and internationally operating organizations, in addition to targets in the financial, telecoms, energy, aerospace, information technology, education, and natural resources sectors. All of the organizations targeted would be of interest to a nation-state attacker. Longhorn has infected 40 targets in at least 16 countries across the Middle East, Europe, Asia, and Africa. On one occasion a computer in the United States was compromised but, following infection, an uninstaller was launched within hours, which may indicate this victim was infected unintentionally. According to cfr, this threat actor compromises governments, international organizations, academic institutions, and financial, telecommunications, energy, aerospace, information technology, and natural resource industries for espionage purposes. Some of the tools used by this threat actor were released by Wikileaks under the name "Vault 7."

The tag is: *misp-galaxy:threat-actor="Longhorn"*

Longhorn is also known as:

- Lamberts
- the Lamberts

Longhorn has relationships with:

- similar: *misp-galaxy:threat-actor="Equation Group"* with *estimative-language:likelihood-probability="likely"*

## WildNeutron

A corporate espionage group has compromised a string of major corporations over the past three years in order to steal confidential information and intellectual property. The gang, which Symantec calls Butterfly, is not-state sponsored, rather financially motivated. It has attacked multi-billion dollar companies operating in the internet, IT software, pharmaceutical, and commodities sectors. Twitter, Facebook, Apple, and Microsoft are among the companies who have publicly acknowledged attacks. Butterfly is technically proficient and well resourced. The group has developed a suite of custom malware tools capable of attacking both Windows and Apple computers, and appears to have used at least one zero-day vulnerability in its attacks. It keeps a low profile and maintains good operational security. After successfully compromising a target organization, it cleans up after itself before moving on to its next target. This group operates at a much higher level than the average cybercrime gang. It is not interested in stealing credit card details or customer databases and is instead focused on high-level corporate information. Butterfly may be selling this information to the highest bidder or may be operating as hackers for hire. Stolen information could also be used for insider-trading purposes.

The tag is: *misp-galaxy:threat-actor="WildNeutron"*

WildNeutron is also known as:

- Butterfly
- Morpho
- Sphinx Moth

## PLATINUM

PLATINUM has been targeting its victims since at least as early as 2009, and may have been active for several years prior. Its activities are distinctly different not only from those typically seen in untargeted attacks, but from many targeted attacks as well. A large share of targeted attacks can be characterized as opportunistic: the activity group changes its target profiles and attack geographies based on geopolitical seasons, and may attack institutions all over the world. Like many such groups, PLATINUM seeks to steal sensitive intellectual property related to government interests, but its range of preferred targets is consistently limited to specific governmental organizations, defense institutes, intelligence agencies, diplomatic institutions, and telecommunication providers in South and Southeast Asia. The group's persistent use of spear phishing tactics (phishing attempts aimed at specific individuals) and access to previously undiscovered zero-day exploits have made it a highly resilient threat.

The tag is: `misp-galaxy:threat-actor="PLATINUM"`

PLATINUM is also known as:

- TwoForOne

## RASPITE

Dragos has identified a new activity group targeting access operations in the electric utility sector. We call this activity group RASPITE. Analysis of RASPITE tactics, techniques, and procedures (TTPs) indicate the group has been active in some form since early- to mid-2017. RASPITE targeting includes entities in the US, Middle East, Europe, and East Asia. Operations against electric utility organizations appear limited to the US at this time. RASPITE leverages strategic website compromise to gain initial access to target networks. RASPITE uses the same methodology as DYMALLOY and ALLANITE in embedding a link to a resource to prompt an SMB connection, from which it harvests Windows credentials. The group then deploys install scripts for a malicious service to beacon back to RASPITE-controlled infrastructure, allowing the adversary to remotely access the victim machine.

The tag is: *misp-galaxy:threat-actor="RASPITE"*

RASPITE is also known as:

- LeafMiner
- Raspite

## APT5

We have observed one APT group, which we call APT5, particularly focused on telecommunications and technology companies. More than half of the organizations we have observed being targeted or breached by APT5 operate in these sectors. Several times, APT5 has targeted organizations and personnel based in Southeast Asia. APT5 has been active since at least 2007. It appears to be a large threat group that consists of several subgroups, often with distinct tactics and infrastructure. APT5 has targeted or breached organizations across multiple industries, but its focus appears to be on telecommunications and technology companies, especially information about satellite communications. APT5 targeted the network of an electronics firm that sells products for both industrial and military applications. The group subsequently stole communications related to the firm's business relationship with a national military, including inventories and memoranda about specific products they provided. In one case in late 2014, APT5 breached the network of an international telecommunications company. The group used malware with keylogging capabilities to monitor the computer of an executive who manages the company's relationships with other telecommunications companies

## Madi

Kaspersky Lab and Seculert worked together to sinkhole the Madi Command & Control (C&C) servers to monitor the campaign. Kaspersky Lab and Seculert identified more than 800 victims located in Iran, Israel and select countries across the globe connecting to the C&Cs over the past eight months. Statistics from the sinkhole revealed that the victims were primarily business people working on Iranian and Israeli critical infrastructure projects, Israeli financial institutions, Middle Eastern engineering students, and various government agencies communicating in the Middle East. Common applications and websites that were spied on include accounts on Gmail, Hotmail, Yahoo! Mail, ICQ, Skype, Google+, and Facebook. Surveillance is also performed over integrated ERP/CRM systems, business contracts, and financial management systems.

## Snake Wine

While investigating some of the smaller name servers that APT28/Sofacy routinely use to host their infrastructure, Cylance discovered another prolonged campaign that appeared to exclusively target Japanese companies and individuals that began around August 2016. The later registration style was eerily close to previously registered APT28 domains, however, the malware used in the attacks did not seem to line up at all. During the course of our investigation, JPCERT published this analysis of one of the group's backdoors. Cylance tracks this threat group internally as 'Snake Wine'. The Snake Wine group has proven to be highly adaptable and has continued to adopt new tactics in order to establish footholds inside victim environments. The exclusive interest in Japanese government, education, and commerce will likely continue into the future as the group is just starting to build and utilize their existing current attack infrastructure.

## Careto

This threat actor targets governments, diplomatic missions, private companies in the energy sector, and academics for espionage purposes. The Mask is an advanced threat actor that has been involved in cyber-espionage operations since at least 2007. The name "Mask" comes from the Spanish slang word "Careto" ("Ugly Face" or "Mask") which the authors included in some of the

malware modules. More than 380 unique victims in 31 countries have been observed to date. What makes “The Mask” special is the complexity of the toolset used by the attackers. This includes an extremely sophisticated malware, a rootkit, a bootkit, 32-and 64-bit Windows versions, Mac OS X and Linux versions and possibly versions for Android and iPad/iPhone (Apple iOS).

The tag is: *misp-galaxy:threat-actor="Careto"*

Careto is also known as:

- The Mask

## Group 27

Arbor's ASERT team is now reporting that, after looking deeper at that particular campaign, and by exposing a new trail in the group's activities, they managed to identify a new RAT that was undetectable at that time by most antivirus vendors. Named Trochilus, this new RAT was part of Group 27's malware portfolio that included six other malware strains, all served together or in different combinations, based on the data that needed to be stolen from each victim. This collection of malware, dubbed the Seven Pointed Dagger by ASERT experts, included two different PlugX versions, two different Trochilus RAT versions, one version of the 3012 variant of the 9002 RAT, one EvilGrab RAT version, and one unknown piece of malware, which the team has not entirely decloaked just yet.

## APT 6

The FBI issued a rare bulletin admitting that a group named Advanced Persistent Threat 6 (APT6) hacked into US government computer systems as far back as 2011 and for years stole sensitive data. The FBI alert was issued in February and went largely unnoticed. Nearly a month later, security experts are now shining a bright light on the alert and the mysterious group behind the attack. “This is a rare alert and a little late, but one that is welcomed by all security vendors as it offers a chance to mitigate their customers and also collaborate further in what appears to be an ongoing FBI investigation,” said Deepen Desai, director of security research at the security firm Zscaler in an email to Threatpost. Details regarding the actual attack and what government systems were infected are scant. Government officials said they knew the initial attack occurred in 2011, but are unaware of who specifically is behind the attacks. “Given the nature of malware payload involved and the duration of this compromise being unnoticed – the scope of lateral movement inside the compromised network is very high possibly exposing all the critical systems,” Deepen said.

The tag is: *misp-galaxy:threat-actor="APT 6"*

APT 6 is also known as:

- 1.php Group
- APT6

## White Bear

As a part of our Kaspersky APT Intelligence Reporting subscription, customers received an update in mid-February 2017 on some interesting APT activity that we called WhiteBear. Much of the contents of that report are reproduced here. WhiteBear is a parallel project or second stage of the Skipper Turla cluster of activity documented in another private intelligence report “Skipper Turla – the White Atlas framework” from mid-2016. Like previous Turla activity, WhiteBear leverages compromised websites and hijacked satellite connections for command and control (C2) infrastructure. As a matter of fact, WhiteBear infrastructure has overlap with other Turla campaigns, like those deploying Kopiluwak, as documented in “KopiLuwak – A New JavaScript Payload from Turla” in December 2016. WhiteBear infected systems maintained a dropper (which was typically signed) as well as a complex malicious platform which was always preceded by WhiteAtlas module deployment attempts. However, despite the similarities to previous Turla campaigns, we believe that WhiteBear is a distinct project with a separate focus. We note that this observation of delineated target focus, tooling, and project context is an interesting one that also can be repeated across broadly labeled Turla and Sofacy activity. From February to September 2016, WhiteBear activity was narrowly focused on embassies and consular operations around the world. All of these early WhiteBear targets were related to embassies and diplomatic/foreign affair organizations. Continued WhiteBear activity later shifted to include defense-related organizations into June 2017. When compared to WhiteAtlas infections, WhiteBear deployments are relatively rare and represent a departure from the broader Skipper Turla target set. Additionally, a comparison of the WhiteAtlas framework to WhiteBear components indicates that the malware is the product of separate development efforts. WhiteBear infections appear to be preceded by a condensed spearphishing dropper, lack Firefox extension installer payloads, and contain several new components signed with a new code signing digital certificate, unlike WhiteAtlas incidents and modules.

The tag is: *misp-galaxy:threat-actor="White Bear"*

White Bear is also known as:

- Skipper Turla

## MuddyWater

The MuddyWater attacks are primarily against Middle Eastern nations. However, we have also observed attacks against surrounding nations and beyond, including targets in India and the USA. MuddyWater attacks are characterized by the use of a slowly evolving PowerShell-based first stage

backdoor we call “POWERSTATS”. Despite broad scrutiny and reports on MuddyWater attacks, the activity continues with only incremental changes to the tools and techniques.

The tag is: `misp-galaxy:threat-actor="MuddyWater"`

MuddyWater is also known as:

- TEMP.Zagros
- Static Kitten
- Seedworm

MuddyWater has relationships with:

- similar: `misp-galaxy:mitre-intrusion-set="MuddyWater - G0069"` with `estimative-language:likelihood-probability="likely"`

## MoneyTaker

In less than two years, this group has conducted over 20 successful attacks on financial institutions and legal firms in the USA, UK and Russia. The group has primarily been targeting card processing systems, including the AWS CBR (Russian Interbank System) and purportedly SWIFT (US). Given the wide usage of STAR in LATAM, financial institutions in LATAM could have particular exposure to a potential interest from the MoneyTaker group.

The tag is: *misp-galaxy:threat-actor="MoneyTaker"*

## Microcin

We're already used to the fact that complex cyberattacks use 0-day vulnerabilities, bypassing digital signature checks, virtual file systems, non-standard encryption algorithms and other tricks. Sometimes, however, all of this may be done in much simpler ways, as was the case in the malicious campaign that we detected a while ago – we named it 'Microcin' after microini, one of the malicious components used in it.

The tag is: *misp-galaxy:threat-actor="Microcin"*

## APT34

Since at least 2014, an Iranian threat group tracked by FireEye as APT34 has conducted reconnaissance aligned with the strategic interests of Iran. The group conducts operations primarily in the Middle East, targeting financial, government, energy, chemical, telecommunications and other industries. Repeated targeting of Middle Eastern financial, energy and government organizations leads FireEye to assess that those sectors are a primary concern of APT34. The use of infrastructure tied to Iranian operations, timing and alignment with the national interests of Iran also lead FireEye to assess that APT34 acts on behalf of the Iranian government.

The tag is: *misp-galaxy:threat-actor="APT34"*

APT34 is also known as:

- APT 34

APT34 has relationships with:

- similar: *misp-galaxy:mitre-intrusion-set="APT34 - G0057"* with *estimative-language:likelihood-probability="likely"*

## APT35

FireEye has identified APT35 operations dating back to 2014. APT35, also known as the Newscaster Team, is a threat group sponsored by the Iranian government that conducts long term, resource-intensive operations to collect strategic intelligence. APT35 typically targets U.S. and the Middle Eastern military, diplomatic and government personnel, organizations in the media, energy and defense industrial base (DIB), and engineering, business services and telecommunications sectors.

The tag is: *misp-galaxy:threat-actor="APT35"*

APT35 is also known as:

- APT 35
- Newscaster Team

## Orangeworm

Symantec has identified a previously unknown group called Orangeworm that has been observed installing a custom backdoor called Trojan.Kwampirs within large international corporations that operate within the healthcare sector in the United States, Europe, and Asia. First identified in January 2015, Orangeworm has also conducted targeted attacks against organizations in related industries as part of a larger supply-chain attack in order to reach their intended victims. Known victims include healthcare providers, pharmaceuticals, IT solution providers for healthcare and equipment manufacturers that serve the healthcare industry, likely for the purpose of corporate espionage.

The tag is: *misp-galaxy:threat-actor="Orangeworm"*

## ALLANITE

Adversaries abusing ICS (based on Dragos Inc adversary list). ALLANITE accesses business and industrial control (ICS) networks, conducts reconnaissance, and gathers intelligence in United States and United Kingdom electric utility sectors. Dragos assesses with moderate confidence that ALLANITE operators continue to maintain ICS network access to: (1) understand the operational environment necessary to develop disruptive capabilities, (2) have ready access from which to disrupt electric utilities. ALLANITE uses email phishing campaigns and compromised websites called watering holes to steal credentials and gain access to target networks, including collecting and distributing screenshots of industrial control systems. ALLANITE operations limit themselves to information gathering and have not demonstrated any disruptive or damaging capabilities. ALLANITE conducts malware-less operations primarily leveraging legitimate and available tools in the Windows operating system.

The tag is: *misp-galaxy:threat-actor="ALLANITE"*

ALLANITE is also known as:

- Palmetto Fusion

- Allanite

## RANCOR

The Rancor group's attacks use two primary malware families which are naming DDKONG and PLAINTEE. DDKONG is used throughout the campaign and PLAINTEE appears to be new addition to these attackers' toolkit. Countries Unit 42 has identified as targeted by Rancor with these malware families include, but are not limited to Singapore and Cambodia.

The tag is: *misp-galaxy:threat-actor="RANCOR"*

RANCOR is also known as:

- Rancor group
- Rancor
- Rancor Group

## The Big Bang

While it is not clear exactly what the attacker is looking for, what is clear is that once he finds it, a second stage of the attack awaits, fetching additional modules and/or malware from the Command and Control server. This then is a surveillance attack in progress and has been dubbed 'Big Bang' due to the attacker's fondness for the 'Big Bang Theory' TV show, after which some of the malware's modules are named.

The tag is: *misp-galaxy:threat-actor="The Big Bang"*

## The Gorgon Group

Unit 42 researchers have been tracking Subaat, an attacker, since 2017. Recently Subaat drew our attention due to renewed targeted attack activity. Part of monitoring Subaat included realizing the actor was possibly part of a larger crew of individuals responsible for carrying out targeted attacks against worldwide governmental organizations. Technical analysis on some of the attacks as well as attribution links with Pakistan actors have been already depicted by 360 and Tuisec, in which they found interesting connections to a larger group of attackers Unit 42 researchers have been tracking, which we are calling Gorgon Group.

The tag is: *misp-galaxy:threat-actor="The Gorgon Group"*

The Gorgon Group is also known as:

- Gorgon Group
- Subaat

## DarkHydrus

In July 2018, Unit 42 analyzed a targeted attack using a novel file type against at least one government agency in the Middle East. It was carried out by a previously unpublished threat group we track as DarkHydrus. Based on our telemetry, we were able to uncover additional artifacts leading us to believe this adversary group has been in operation with their current playbook since early 2016. This attack diverged from previous attacks we observed from this group as it involved spear-phishing emails sent to targeted organizations with password protected RAR archive attachments that contained malicious Excel Web Query files (.iqy).

The tag is: *misp-galaxy:threat-actor="DarkHydrus"*

DarkHydrus is also known as:

- LazyMeerkat

## RedAlpha

Recorded Future's Insikt Group has identified two new cyberespionage campaigns targeting the Tibetan Community over the past two years. The campaigns, which we are collectively naming RedAlpha, combine light reconnaissance, selective targeting, and diverse malicious tooling. We discovered this activity as the result of pivoting off of a new malware sample observed targeting the Tibetan community based in India.

The tag is: *misp-galaxy:threat-actor="RedAlpha"*

## APT-C-35

In March 2017, the 360 Chasing Team found a sample of targeted attacks that confirmed the previously unknown sample of APT's attack actions, which the organization can now trace back at least in April 2016. The chasing team named the attack organization APT-C-35. In June 2017, the 360 Threat Intelligence Center discovered the organization's new attack activity, confirmed and exposed the gang's targeted attacks against Pakistan, and analyzed in detail. The unique EHDevel malicious code framework used by the organization

## TempTick

This threat actor targets organizations in the finance, defense, aerospace, technology, health-care, and automotive sectors and media organizations in East Asia for the purpose of espionage. Believed to be responsible for the targeting of South Korean actors prior to the meeting of Donald J. Trump and Kim Jong-un

The tag is: *misp-galaxy:threat-actor="TempTick"*

Table 5029. Table References

Links
<a href="https://www.cfr.org/interactive/cyber-operations/temptick">https://www.cfr.org/interactive/cyber-operations/temptick</a>

## Operation Parliament

This threat actor uses spear-phishing techniques to target parliaments, government ministries, academics, and media organizations, primarily in the Middle East, for the purpose of espionage. Based on our findings, we believe the attackers represent a previously unknown geopolitically motivated threat actor. The campaign started in 2017, with the attackers doing just enough to achieve their goals. They most likely have access to additional tools when needed and appear to have access to an elaborate database of contacts in sensitive organizations and personnel worldwide, especially of vulnerable and non-trained staff. The victim systems range from personal desktop or laptop systems to large servers with domain controller roles or similar. The nature of the targeted ministries varied, including those responsible for telecommunications, health, energy, justice, finance and so on. Operation Parliament appears to be another symptom of escalating tensions in the Middle East region. The attackers have taken great care to stay under the radar, imitating another attack group in the region. They have been particularly careful to verify victim devices before proceeding with the infection, safeguarding their command and control servers. The targeting seems to have slowed down since the beginning of 2018, probably winding down when the desired data or access was obtained. The targeting of specific victims is unlike previously seen behavior in regional campaigns by Gaza Cybergang or Desert Falcons and points to an elaborate information-gathering exercise that was carried out before the attacks (physical and/or digital). With deception and false flags increasingly being employed by threat actors, attribution is a hard and complicated task that requires solid evidence, especially in complex regions such as the Middle East.

The tag is: *misp-galaxy:threat-actor="Operation Parliament"*

## Winnti Umbrella

This threat actor targets software companies and political organizations in the United States, China, Japan, and South Korea. It primarily acts to support cyber operations conducted by other threat actors affiliated with Chinese intelligence services. Believed to be associated with the Axiom, APT 17, and Mirage threat actors. Believed to share the same tools and infrastructure as the threat actors that carried out Operation Aurora, the 2015 targeting of video game companies, the 2015 targeting of the Thai government, and the 2017 targeting of Chinese-language news websites

## Mustang Panda

This threat actor targets nongovernmental organizations using Mongolian-themed lures for espionage purposes. In April 2017, CrowdStrike Falcon Intelligence observed a previously unattributed actor group with a Chinese nexus targeting a U.S.-based think tank. Further analysis revealed a wider campaign with unique tactics, techniques, and procedures (TTPs). This adversary targets non-governmental organizations (NGOs) in general, but uses Mongolian language decoys and themes, suggesting this actor has a specific focus on gathering intelligence on Mongolia. These campaigns involve the use of shared malware like Poison Ivy or PlugX. Recently, Falcon Intelligence observed new activity from MUSTANG PANDA, using a unique infection chain to target likely Mongolia-based victims. This newly observed activity uses a series of redirections and fileless, malicious implementations of legitimate tools to gain access to the targeted systems. Additionally, MUSTANG PANDA actors reused previously-observed legitimate domains to host files.

The tag is: *misp-galaxy:threat-actor="Mustang Panda"*

## PowerPool

Malware developers have started to use the zero-day exploit for Task Scheduler component in Windows, two days after proof-of-concept code for the vulnerability appeared online.

A security researcher who uses the online name SandboxEscaper on August 27 released the source code for exploiting a security bug in the Advanced Local Procedure Call (ALPC) interface used by Windows Task Scheduler.

More specifically, the problem is with the SchRpcSetSecurity API function, which fails to properly check user's permissions, allowing write privileges on files in C:\Windows\Task.

The vulnerability affects Windows versions 7 through 10 and can be used by an attacker to escalate

their privileges to all-access SYSTEM account level.

A couple of days after the exploit code became available (source and binary), malware researchers at ESET noticed its use in active malicious campaigns from a threat actor they call PowerPool, because of their tendency to use tools mostly written in PowerShell for lateral movement.

The group appears to have a small number of victims in the following countries: Chile, Germany, India, the Philippines, Poland, Russia, the United Kingdom, the United States, and Ukraine.

The researchers say that PowerPool developers did not use the binary version of the exploit, deciding instead to make some subtle changes to the source code before recompiling it.

The tag is: *misp-galaxy:threat-actor="PowerPool"*

## Domestic Kitten

An extensive surveillance operation targets specific groups of individuals with malicious mobile apps that collect sensitive information on the device along with surrounding voice recordings. Researchers with CheckPoint discovered the attack and named it Domestic Kitten. The targets are Kurdish and Turkish natives, and ISIS supporters, all Iranian citizens.

The tag is: *misp-galaxy:threat-actor="Domestic Kitten"*

## FASTCash

Treasury has identified a sophisticated cyber-enabled ATM cash out campaign we are calling FASTCash. FASTCash has been active since late 2016 targeting banks in Africa and Asia to remotely compromise payment switch application servers within banks to facilitate fraudulent transactions, primarily involving ATMs, to steal cash equivalent to tens of millions of dollars. FBI has attributed malware used in this campaign to the North Korean government. We expect FASTCash to continue targeting retail payment systems vulnerable to remote exploitation.

The tag is: *misp-galaxy:threat-actor="FASTCash"*

## Roaming Mantis

According to new research by Kaspersky's GREAT team, the online criminal activities of the Roaming Mantis Group have continued to evolve since they were first discovered in April 2018. As part of their activities, this group hacks into exploitable routers and changes their DNS configuration. This allows the attackers to redirect the router user's traffic to malicious Android apps disguised as Facebook and Chrome or to Apple phishing pages that were used to steal Apple ID credentials. Recently, Kaspersky has discovered that this group is testing a new monetization scheme by redirecting iOS users to pages that contain the Coinhive in-browser mining script rather than the normal Apple phishing page. When users are redirected to these pages, they will be shown a blank page in the browser, but their CPU utilization will jump to 90% or higher.

The tag is: *misp-galaxy:threat-actor="Roaming Mantis"*

Roaming Mantis is also known as:

- Roaming Mantis Group

# The Shadow Brokers

The Shadow Brokers (TSB) is a hacker group who first appeared in the summer of 2016. They published several leaks containing hacking tools from the National Security Agency (NSA, including several zero-day exploits.[1] Specifically, these exploits and vulnerabilities targeted enterprise firewalls, antivirus software, and Microsoft products. The Shadow Brokers originally attributed the leaks to the Equation Group threat actor, who have been tied to the NSA's Tailored Access Operations unit.

The tag is: *misp-galaxy:threat-actor="The Shadow Brokers"*

The Shadow Brokers is also known as:

- The ShadowBrokers
- TSB

## HookAds

HookAds is a malvertising campaign that purchases cheap ad space on low quality ad networks commonly used by adult web sites, online games, or blackhat seo sites. These ads will include JavaScript that redirects a visitor through a series of decoy sites that look like pages filled with native advertisements, online games, or other low quality pages. Under the right circumstances, a visitor will silently load the Fallout exploit kit, which will try and install its malware payload.

The tag is: *misp-galaxy:threat-actor="HookAds"*

## INDRIK SPIDER

INDRIK SPIDER is a sophisticated eCrime group that has been operating Dridex since June 2014. In 2015 and 2016, Dridex was one of the most prolific eCrime banking trojans on the market and, since

2014, those efforts are thought to have netted INDRIK SPIDER millions of dollars in criminal profits. Throughout its years of operation, Dridex has received multiple updates with new modules developed and new anti-analysis features added to the malware. In August 2017, a new ransomware variant identified as BitPaymer was reported to have ransomed the U.K.'s National Health Service (NHS), with a high ransom demand of 53 BTC (approximately \$200,000 USD). The targeting of an organization rather than individuals, and the high ransom demands, made BitPaymer stand out from other contemporary ransomware at the time. Though the encryption and ransom functionality of BitPaymer was not technically sophisticated, the malware contained multiple anti-analysis features that overlapped with Dridex. Later technical analysis of BitPaymer indicated that it had been developed by INDRIK SPIDER, suggesting the group had expanded its criminal operation to include ransomware as a monetization strategy.

The tag is: *misp-galaxy:threat-actor="INDRIK SPIDER"*

## DNSpionage

Cisco Talos recently discovered a new campaign targeting Lebanon and the United Arab Emirates (UAE) affecting .gov domains, as well as a private Lebanese airline company. Based on our research, it's clear that this adversary spent time understanding the victims' network infrastructure in order to remain under the radar and act as inconspicuous as possible during their attacks. Based on this actor's infrastructure and TTPs, we haven't been able to connect them with any other campaign or actor that's been observed recently. This particular campaign utilizes two fake, malicious websites containing job postings that are used to compromise targets via malicious Microsoft Office documents with embedded macros. The malware utilized by this actor, which we are calling "DNSpionage," supports HTTP and DNS communication with the attackers. In a separate campaign, the attackers used the same IP to redirect the DNS of legitimate .gov and private company domains. During each DNS compromise, the actor carefully generated Let's Encrypt certificates for the redirected domains. These certificates provide X.509 certificates for TLS free of charge to the user. We don't know at this time if the DNS redirections were successful. In this post, we will break down the attackers' methods and show how they used malicious documents to attempt to trick users into opening malicious websites that are disguised as "help wanted" sites for job seekers. Additionally, we will describe the malicious DNS redirection and the timeline of the events.

The tag is: *misp-galaxy:threat-actor="DNSpionage"*

## Operation Poison Needles

What's noteworthy is that according to the introduction on the compromised website of the polyclinic (<http://www.p2f.ru>), the institution was established in 1965 and it was founded by the Presidential Administration of Russia. The multidisciplinary outpatient institution mainly serves the civil servants of the highest executive, legislative, judicial authorities of the Russian Federation, as well as famous figures of science and art. Since it is the first detection of this APT attack by 360 Security on a global scale, we code-named it as "Operation Poison Needles", considering that the target was a medical institution. Currently, the attribution of the attacker is still under investigation. However, the special background of the polyclinic and the sensitiveness of the group it served both indicate the attack is highly targeted. Simultaneously, the attack occurred at a very sensitive timing of the Kerch Strait Incident, so it also aroused the assumption on the political attribution of the attack.

## Operation Sharpshooter

The McAfee Advanced Threat Research team and McAfee Labs Malware Operations Group have discovered a new global campaign targeting nuclear, defense, energy, and financial companies, based on McAfee® Global Threat Intelligence. This campaign, Operation Sharpshooter, leverages an in-memory implant to download and retrieve a second-stage implant—which we call Rising Sun—for further exploitation. According to our analysis, the Rising Sun implant uses source code from the Lazarus Group’s 2015 backdoor Trojan Duuzer in a new framework to infiltrate these key

industries. Operation Sharpshooter's numerous technical links to the Lazarus Group seem too obvious to immediately draw the conclusion that they are responsible for the attacks, and instead indicate a potential for false flags. Our research focuses on how this actor operates, the global impact, and how to detect the attack. We shall leave attribution to the broader security community.

## GRIM SPIDER

GRIM SPIDER is a sophisticated eCrime group that has been operating the Ryuk ransomware since

August 2018, targeting large organizations for a high-ransom return. This methodology, known as “big game hunting,” signals a shift in operations for WIZARD SPIDER, a criminal enterprise of which GRIM SPIDER appears to be a cell. The WIZARD SPIDER threat group, known as the Russia-based operator of the TrickBot banking malware, had focused primarily on wire fraud in the past. Similar to Samas and BitPaymer, Ryuk is specifically used to target enterprise environments. Code comparison between versions of Ryuk and Hermes ransomware indicates that Ryuk was derived from the Hermes source code and has been under steady development since its release. Hermes is commodity ransomware that has been observed for sale on forums and used by multiple threat actors. However, Ryuk is only used by GRIM SPIDER and, unlike Hermes, Ryuk has only been used to target enterprise environments. Since Ryuk’s appearance in August, the threat actors operating it have netted over 705.80 BTC across 52 transactions for a total current value of \$3,701,893.98 USD. Grim Spider is reportedly associated with Lunar Spider and Wizard Spider.

The tag is: *misp-galaxy:threat-actor="GRIM SPIDER"*

## WIZARD SPIDER

Wizard Spider is reportedly associated with Grim Spider and Lunar Spider. The WIZARD SPIDER threat group is the Russia-based operator of the TrickBot banking malware. This group represents a growing criminal enterprise of which GRIM SPIDER appears to be a subset. The LUNAR SPIDER threat group is the Eastern European-based operator and developer of the commodity banking malware called BokBot (aka IcedID), which was first observed in April 2017. The BokBot malware provides LUNAR SPIDER affiliates with a variety of capabilities to enable credential theft and wire fraud, through the use of webinjects and a malware distribution function. GRIM SPIDER is a sophisticated eCrime group that has been operating the Ryuk ransomware since August 2018, targeting large organizations for a high-ransom return. This methodology, known as “big game hunting,” signals a shift in operations for WIZARD SPIDER, a criminal enterprise of which GRIM SPIDER appears to be a cell. The WIZARD SPIDER threat group, known as the Russia-based operator of the TrickBot banking malware, had focused primarily on wire fraud in the past.

## MUMMY SPIDER

MUMMY SPIDER is a criminal entity linked to the core development of the malware most commonly known as Emotet or Geodo. First observed in mid-2014, this malware shared code with the Bugat (aka Feodo) banking Trojan. However, MUMMY SPIDER swiftly developed the malware's capabilities to include an RSA key exchange for command and control (C2) communication and a modular architecture. MUMMY SPIDER does not follow typical criminal behavioral patterns. In particular, MUMMY SPIDER usually conducts attacks for a few months before ceasing operations for a period of between three and 12 months, before returning with a new variant or version. After a 10 month hiatus, MUMMY SPIDER returned Emotet to operation in December 2016 but the latest variant is not deploying a banking Trojan module with web injects, it is currently acting as a 'loader' delivering other malware packages. The primary modules perform reconnaissance on victim machines, drop freeware tools for credential collection from web browsers and mail clients and a spam plugin for self-propagation. The malware is also issuing commands to download and execute other malware families such as the banking Trojans Dridex and Qakbot. MUMMY SPIDER advertised Emotet on underground forums until 2015, at which time it became private. Therefore, it is highly likely that Emotet is operate

The tag is: *misp-galaxy:threat-actor="MUMMY SPIDER"*

MUMMY SPIDER is also known as:

- TA542
- Mummy Spider

## Cold River

In short, “Cold River” is a sophisticated threat (actor) that utilizes DNS subdomain hijacking, certificate spoofing, and covert tunneled command and control traffic in combination with complex and convincing lure documents and custom implants.

The tag is: *misp-galaxy:threat-actor="Cold River"*

Cold River is also known as:

- Nahr Elbard
- Nahr el bared

*Table 5064. Table References*

Links

<https://www.lastline.com/labsblog/threat-actor-cold-river-network-traffic-analysis-and-a-deep-dive-on-agent-drable/>

## Silence group

a relatively new threat actor that’s been operating since mid-2016 Group-IB has exposed the attacks committed by Silence cybercriminal group. While the gang had previously targeted Russian banks, Group-IB experts also have discovered evidence of the group’s activity in more than 25 countries worldwide. Group-IB has published its first detailed report on tactics and tools employed by Silence. Group-IB security analysts’ hypothesis is that at least one of the gang members appears to be a former or current employee of a cyber security company. The confirmed damage from Silence activity is estimated at 800 000 USD. Silence is a group of Russian-speaking hackers, based on their commands language, the location of infrastructure they used, and the geography of their targets (Russia, Ukraine, Belarus, Azerbaijan, Poland, and Kazakhstan). Although phishing emails were also sent to bank employees in Central and Western Europe, Africa, and Asia). Furthermore, Silence used Russian words typed on an English keyboard layout for the commands of the employed backdoor. The hackers also used Russian-language web hosting services.

The tag is: *misp-galaxy:threat-actor="Silence group"*

Silence group is also known as:

- Silence

Links

<https://reaqta.com/2019/01/silence-group-targeting-russian-banks/>

<https://www.group-ib.com/blog/silence>

## APT39

APT39 was created to bring together previous activities and methods used by this actor, and its activities largely align with a group publicly referred to as "Chafer." However, there are differences in what has been publicly reported due to the variances in how organizations track activity. APT39 primarily leverages the SEAWEED and CACHEMONEY backdoors along with a specific variant of the POWBAT backdoor. While APT39's targeting scope is global, its activities are concentrated in the Middle East. APT39 has prioritized the telecommunications sector, with additional targeting of the travel industry and IT firms that support it and the high-tech industry.

The tag is: *misp-galaxy:threat-actor="APT39"*

APT39 is also known as:

- APT 39
- Chafer

## Siesta

FireEye recently looked deeper into the activity discussed in TrendMicro's blog and dubbed the "Siesta" campaign. The tools, modus operandi, and infrastructure used in the campaign present two possibilities: either the Chinese cyber-espionage unit APT1 is perpetrating this activity, or another group is using the same tactics and tools as the legacy APT1. The Siesta campaign reinforces the fact that analysts and network defenders should remain on the lookout for known, public indicators and for shared attributes that allow security experts to detect multiple actors with one signature.

## Gallmaker

Symantec researchers have uncovered a previously unknown attack group that is targeting government and military targets, including several overseas embassies of an Eastern European country, and military and defense targets in the Middle East. This group eschews custom malware and uses living off the land (LotL) tactics and publicly available hack tools to carry out activities that bear all the hallmarks of a cyber espionage campaign. The group, which we have given the name Gallmaker, has been operating since at least December 2017, with its most recent activity observed in June 2018.

The tag is: *misp-galaxy:threat-actor="Gallmaker"*

*Table 5068. Table References*

Links

<https://www.symantec.com/blogs/threat-intelligence/gallmaker-attack-group>

## Boss Spider

Throughout 2018, CrowdStrike Intelligence tracked BOSS SPIDER as it regularly updated Samas ransomware and received payments to known Bitcoin (BTC) addresses. This consistent pace of activity came to an abrupt halt at the end of November 2018 when the U.S. DoJ released an indictment for Iran-based individuals Faramarz Shahi Savandi and Mohammad Mehdi Shah Mansouri, alleged members of the group.

The tag is: *misp-galaxy:threat-actor="Boss Spider"*

*Table 5069. Table References*

Links

<https://www.crowdstrike.com/resources/reports/2019-crowdstrike-global-threat-report/>

## Pinchy Spider

First observed in January 2018, GandCrab ransomware quickly began to proliferate and receive regular updates from its developer, PINCHY SPIDER, which over the course of the year established a RaaS operation with a dedicated set of affiliates. CrowdStrike Intelligence has recently observed PINCHY SPIDER affiliates deploying GandCrab ransomware in enterprise environments, using lateral movement techniques and tooling commonly associated with nation-state adversary groups and penetration testing teams. This change in tactics makes PINCHY SPIDER and its affiliates the latest eCrime adversaries to join the growing trend of targeted, low-volume/high-return ransomware deployments known as “big game hunting.” PINCHY SPIDER is the criminal group behind the development of the ransomware most commonly known as GandCrab, which has been active since January 2018. PINCHY SPIDER sells access to use GandCrab ransomware under a partnership program with a limited number of accounts. The program is operated with a 60-40 split

in profits (60 percent to the customer), as is common among eCrime actors, but PINCHY SPIDER is also willing to negotiate up to a 70-30 split for “sophisticated” customers.

The tag is: *misp-galaxy:threat-actor="Pinchy Spider"*

*Table 5070. Table References*

## Guru Spider

Early in 2018, CrowdStrike Intelligence observed GURU SPIDER supporting the distribution of multiple crimeware families through its flagship malware loader, Quant Loader.

The tag is: *misp-galaxy:threat-actor="Guru Spider"*

*Table 5071. Table References*

Links
<a href="https://www.crowdstrike.com/resources/reports/2019-crowdstrike-global-threat-report/">https://www.crowdstrike.com/resources/reports/2019-crowdstrike-global-threat-report/</a>

## Salty Spider

Beginning in January 2018 and persisting through the first half of the year, CrowdStrike Intelligence observed SALTY SPIDER, developer and operator of the long-running Salty botnet, distribute malware designed to target cryptocurrency users.

The tag is: *misp-galaxy:threat-actor="Salty Spider"*

*Table 5072. Table References*

Links
<a href="https://www.crowdstrike.com/resources/reports/2019-crowdstrike-global-threat-report/">https://www.crowdstrike.com/resources/reports/2019-crowdstrike-global-threat-report/</a>

## Judgment Panda

This adversary is suspected of continuing to target upstream providers (e.g., law firms and managed service providers) to support additional intrusions against high-profile assets. In 2018, CrowdStrike observed this adversary using spear-phishing, URL 'web bugs' and scheduled tasks to automate credential harvesting.

The tag is: *misp-galaxy:threat-actor="Judgment Panda"*

*Table 5073. Table References*

Links
<a href="https://www.crowdstrike.com/resources/reports/2019-crowdstrike-global-threat-report/">https://www.crowdstrike.com/resources/reports/2019-crowdstrike-global-threat-report/</a>

## Kryptonite Panda

One of the first observed adopters of the 8.t exploit document builder in late 2017, further KRYPTONITE PANDA activity was limited in 2018. Last known activity for this adversary occurred in June 2018 and involved suspected targeting of Cambodia.

The tag is: *misp-galaxy:threat-actor="Kryptonite Panda"*

Table 5074. Table References

Links
<a href="https://www.crowdstrike.com/resources/reports/2019-crowdstrike-global-threat-report/">https://www.crowdstrike.com/resources/reports/2019-crowdstrike-global-threat-report/</a>

## Nomad Panda

In the first quarter of 2018, CrowdStrike Intelligence identified NOMAD PANDA activity targeting Central Asian nations with exploit documents built with the 8.t tool.

The tag is: *misp-galaxy:threat-actor="Nomad Panda"*

Table 5075. Table References

Links
<a href="https://www.crowdstrike.com/resources/reports/2019-crowdstrike-global-threat-report/">https://www.crowdstrike.com/resources/reports/2019-crowdstrike-global-threat-report/</a>

## Flash Kitten

This suspected Iran-based adversary conducted long-running SWC campaigns from December 2016 until public disclosure in July 2018. Like other Iran-based actors, the target scope for FLASH KITTEN appears to be focused on the MENA region.

The tag is: *misp-galaxy:threat-actor="Flash Kitten"*

Table 5076. Table References

Links
<a href="https://www.crowdstrike.com/resources/reports/2019-crowdstrike-global-threat-report/">https://www.crowdstrike.com/resources/reports/2019-crowdstrike-global-threat-report/</a>

## Skeleton Spider

According to CrowdStrike, this actor is using FrameworkPOS, potentially buying access through Dridex infections.

The tag is: *misp-galaxy:threat-actor="Skeleton Spider"*

Table 5077. Table References

Links
<a href="https://www.crowdstrike.com/resources/reports/2019-crowdstrike-global-threat-report/">https://www.crowdstrike.com/resources/reports/2019-crowdstrike-global-threat-report/</a>

## Tiny Spider

According to CrowdStrike, this actor is using TinyLoader and TinyPOS, potentially buying access through Dridex infections.

The tag is: *misp-galaxy:threat-actor="Tiny Spider"*

Table 5078. Table References

Links
<a href="https://www.crowdstrike.com/resources/reports/2019-crowdstrike-global-threat-report/">https://www.crowdstrike.com/resources/reports/2019-crowdstrike-global-threat-report/</a>

## Lunar Spider

According to CrowdStrike, this actor is using BokBok/IcedID, potentially buying distribution through Emotet infections. On March 17, 2019, CrowdStrike Intelligence observed the use of a new BokBot (developed and operated by LUNAR SPIDER) proxy module in conjunction with TrickBot (developed and operated by WIZARD SPIDER), which may provide WIZARD SPIDER with additional tools to steal sensitive information and conduct fraudulent wire transfers. This activity also provides further evidence to support the existence of a flourishing relationship between these two actors. Lunar Spider is reportedly associated with Grim Spider and Wizard Spider.

The tag is: *misp-galaxy:threat-actor="Lunar Spider"*

## SandCat

SandCat, on the other hand, is a group that was discovered more recently by Kaspersky. One of the Windows vulnerabilities patched by Microsoft in December had been exploited by both FruityArmor and SandCat in attacks targeting the Middle East and Africa. SandCat has been using FinFisher/FinSpy spyware and CHAINSHOT, a piece of malware analyzed earlier this year by Palo Alto Networks. The group has also used the CVE-2018-8589 and CVE-2018-8611 Windows vulnerabilities in its attacks, both of which had a zero-day status when Microsoft released fixes.

The tag is: *misp-galaxy:threat-actor="SandCat"*

## Operation Comando

Operation Comando is a pure cybercrime campaign, possibly with Brazilian origin, with a concrete and persistent focus on the hospitality sector, which proves how a threat actor can be successful in pursuing its objectives while maintaining a cheap budget. The use of DDNS services, publicly available remote access tools, and having a minimum knowledge on software development (in this case VB.NET) has been enough for running a campaign lasting month, and potentially gathering credit card information and other possible data.

The tag is: *misp-galaxy:threat-actor="Operation Comando"*

Table 5086. Table References

## APT-C-27

On March 17, 2019, 360 Threat Intelligence Center captured a target attack sample against the Middle East by exploiting WinRAR vulnerability (CVE-2018-20250[6]), and it seems that the attack is carried out by the Goldmouse APT group (APT-C-27). There is a decoy Word document inside the archive regarding terrorist attacks to lure the victim into decompressing. When the archive gets decompressed on the vulnerable computer, the embedded njRAT backdoor (Telegram Desktop.exe) will be extracted to the startup folder and then triggered into execution if the victim restarts the computer or performs re-login. After that, the attacker is capable to control the compromised device.

The tag is: *misp-galaxy:threat-actor="APT-C-27"*

APT-C-27 is also known as:

- GoldMouse

*Table 5087. Table References*

## Operation ShadowHammer

Newly discovered supply chain attack that leveraged ASUS Live Update software. The goal of the attack was to surgically target an unknown pool of users, which were identified by their network adapters' MAC addresses. To achieve this, the attackers had hardcoded a list of MAC addresses in the trojanized samples and this list was used to identify the actual intended targets of this massive operation. We were able to extract more than 600 unique MAC addresses from over 200 samples used in this attack. Of course, there might be other samples out there with different MAC addresses in their list.

The tag is: *misp-galaxy:threat-actor="Operation ShadowHammer"*

*Table 5088. Table References*

Links
<a href="https://securelist.com/operation-shadowhammer/89992/">https://securelist.com/operation-shadowhammer/89992/</a>

## Whitefly

In July 2018, an attack on Singapore's largest public health organization, SingHealth, resulted in a reported 1.5 million patient records being stolen. Until now, nothing was known about who was responsible for this attack. Symantec researchers have discovered that this attack group, which we call Whitefly, has been operating since at least 2017, has targeted organizations based mostly in Singapore across a wide variety of sectors, and is primarily interested in stealing large amounts of sensitive information.

The tag is: *misp-galaxy:threat-actor="Whitefly"*

Table 5089. Table References

## Sea Turtle

This blog post discusses the technical details of a state-sponsored attack manipulating DNS systems. While this incident is limited to targeting primarily national security organizations in the Middle East and North Africa, and we do not want to overstate the consequences of this specific campaign, we are concerned that the success of this operation will lead to actors more broadly attacking the global DNS system. DNS is a foundational technology supporting the Internet. Manipulating that system has the potential to undermine the trust users have on the internet. That trust and the stability of the DNS system as a whole drives the global economy. Responsible nations should avoid targeting this system, work together to establish an accepted global norm that this system and the organizations that control it are off-limits, and cooperate in pursuing those actors who act irresponsibly by targeting this system.

The tag is: *misp-galaxy:threat-actor="Sea Turtle"*

Table 5090. Table References

Links
<a href="https://blog.talosintelligence.com/2019/04/seaturtle.html">https://blog.talosintelligence.com/2019/04/seaturtle.html</a>

## Silent Librarian

Last Friday, Deputy Attorney General Rod Rosenstein announced the indictment of nine Iranians who worked for an organization named the Mabna Institute. According to prosecutors, the defendants stole more than 31 terabytes of data from universities, companies, and government agencies around the world. The cost to the universities alone reportedly amounted to approximately \$3.4 billion. The information stolen from these universities was used by the Islamic Revolutionary Guard Corps (IRGC) or sold for profit inside Iran. PhishLabs has been tracking this same threat group since late-2017, designating them Silent Librarian. Since discovery, we have been working with the FBI, ISAC partners, and other international law enforcement agencies to help understand and mitigate these attacks.

The tag is: *misp-galaxy:threat-actor="Silent Librarian"*

Silent Librarian is also known as:

- COBALT DICKENS
- Mabna Institute

## Blackgear

BLACKGEAR is an espionage campaign which has targeted users in Taiwan for many years. Multiple papers and talks have been released covering this campaign, which used the ELIRKS backdoor when it was first discovered in 2012. It is known for using blogs and microblogging services to hide the location of its actual command-and-control (C&C) servers. This allows an attacker to change the C&C server used quickly by changing the information in these posts. Like most campaigns, BLACKGEAR has evolved over time. Our research indicates that it has started targeting Japanese users. Two things led us to this conclusion: first, the fake documents that are used as part of its infection routines are now in Japanese. Secondly, it is now using blogging sites and microblogging services based in Japan for its C&C activity.

The tag is: *misp-galaxy:threat-actor="Blackgear"*

Blackgear is also known as:

- Topgear
- Comnie
- BLACKGEAR

## BlackTech

BlackTech is a cyber espionage group operating against targets in East Asia, particularly Taiwan, and occasionally, Japan and Hong Kong. Based on the mutexes and domain names of some of their C&C servers, BlackTech's campaigns are likely designed to steal their target's technology. Following their activities and evolving tactics and techniques helped us uncover the proverbial red string of fate that connected three seemingly disparate campaigns: PLEAD, Shrouded Crossbow, and of late, Waterbear. PLEAD is an information theft campaign with a penchant for confidential documents. Active since 2012, it has so far targeted Taiwanese government agencies and private organizations. PLEAD's toolset includes the self-named PLEAD backdoor and the DRIGO exfiltration tool. PLEAD uses spear-phishing emails to deliver and install their backdoor, either as an attachment or through links to cloud storage services. Some of the cloud storage accounts used to deliver PLEAD are also used as drop off points for exfiltrated documents stolen by DRIGO. PLEAD actors use a router scanner tool to scan for vulnerable routers, after which the attackers will enable the router's VPN

feature then register a machine as virtual server. This virtual server will be used either as a C&C server or an HTTP server that delivers PLEAD malware to their targets.

The tag is: *misp-galaxy:threat-actor="BlackTech"*

## FIN10

FireEye has observed multiple targeted intrusions occurring in North America — predominately in Canada — dating back to at least 2013 and continuing through at least 2016, in which the attacker(s) have compromised organizations' networks and sought to monetize this illicit access by exfiltrating sensitive data and extorting victim organizations. In some cases, when the extortion demand was not met, the attacker(s) destroyed production Windows systems by deleting critical operating system files and then shutting down the impacted systems. Based on near parallel TTPs used by the attacker(s) across these targeted intrusions, we believe these clusters of activity are linked to a single, previously unobserved actor or group that we have dubbed FIN10.

# GhostNet

Cyber espionage is an issue whose time has come. In this second report from the Information Warfare Monitor, we lay out the findings of a 10-month investigation of alleged Chinese cyber spying against Tibetan institutions. The investigation, consisting of fieldwork, technical scouting, and laboratory analysis, discovered a lot more. The investigation ultimately uncovered a network of over 1,295 infected hosts in 103 countries. Up to 30% of the infected hosts are considered high-value targets and include computers located at ministries of foreign affairs, embassies, international organizations, news media, and NGOs. The Tibetan computer systems we manually investigated, and from which our investigations began, were conclusively compromised by multiple infections that gave attackers unprecedented access to potentially sensitive information. Attacks on the Dalai Lama's Private Office The OHHDL started to suspect it was under surveillance while setting up meetings between His Holiness and foreign dignitaries. They sent an email invitation on behalf of His Holiness to a foreign diplomat, but before they could follow it up with a courtesy telephone call, the diplomat's office was contacted by the Chinese government and warned not to go ahead with the meeting. The Tibetans wondered whether a computer compromise might be the explanation; they called ONI Asia who called us. (Until May 2008, the first author was employed on a studentship funded by the OpenNet Initiative and the second author was a principal investigator for ONI.)

# GozNym

IBM X-Force Research uncovered a Trojan hybrid spawned from the Nymaim and Gozi ISFB malware. It appears that the operators of Nymaim have recompiled its source code with part of the Gozi ISFB source code, creating a combination that is being actively used in attacks against more than 24 U.S. and Canadian banks, stealing millions of dollars so far. X-Force named this new hybrid GozNym. The new GozNym hybrid takes the best of both the Nymaim and Gozi ISFB malware to create a powerful Trojan. From the Nymaim malware, it leverages the dropper's stealth and persistence; the Gozi ISFB parts add the banking Trojan's capabilities to facilitate fraud via infected Internet browsers. The end result is a new banking Trojan in the wild.

## Group5

A threat actor using Iranian-language tools, Iranian hosting companies, operating from the Iranian IP space at times was observed targeting the Syrian opposition in an elaborately staged malware operation, Citizen Lab researchers reveal. The operation was first noticed in late 2015, when a member of the Syrian opposition flagged a suspicious email containing a PowerPoint slideshow, which led researchers to a watering hole website with malicious programs, malicious PowerPoint files, and Android malware. The threat actor was targeting Windows and Android devices of well-connected individuals in the Syrian opposition, researchers discovered. They called the actor Group5, because it targets Syrian opposition after regime-linked malware groups, the Syrian Electronic Army, ISIS (also known as the Islamic State or ISIL), and a group linked to Lebanon did the same in the past

## Honeybee

McAfee Advanced Threat Research analysts have discovered a new operation targeting humanitarian aid organizations and using North Korean political topics as bait to lure victims into opening malicious Microsoft Word documents. Our analysts have named this Operation Honeybee, based on the names of the malicious documents used in the attacks. Advanced Threat Research analysts have also discovered malicious documents authored by the same actor that indicate a tactical shift. These documents do not contain the typical lures by this actor, instead using Word compatibility messages to entice victims into opening them. The Advanced Threat Research team also observed a heavy concentration of the implant in Vietnam from January 15–17.

# Lucky Cat

A series of attacks, targeting both Indian military research and south Asian shipping organizations, demonstrate the minimum level of effort required to successfully compromise a target and steal sensitive information. The attackers use very simple malware, which required little development time or skills, in conjunction with freely available Web hosting, to implement a highly effective attack. It is a case of the attackers obtaining a maximum return on their investment. The attack shows how an intelligent attacker does not need to be particularly technically skilled in order to steal the information they are after. The attack begins, as is often the case, with an email sent to the victim. A malicious document is attached to the email, which, when loaded, activates the malware. The attackers use tailored emails to encourage the victim to open the email. For example, one email sent to an academic claimed to be a call for papers for a conference (CFP). The vast majority of the victims were based in India, with some in Malaysia. The victim industry was mostly military research and also shipping based in the Arabian and South China seas. In some instances the attackers appeared to have a clear goal, whereby specific files were retrieved from certain compromised computers. In other cases, the attackers used more of a ‘shotgun’ like approach, copying every file from a computer. Military technologies were obviously the focus of one particular attack with what appeared to be source code stolen. 45 different attacker IP addresses were observed. Out of those, 43 were within the same IP address range based in Sichuan province, China. The remaining two were based in South Korea. The pattern of attacker connections implies that the IP addresses are being used as a VPN, probably in an attempt to render the attackers anonymous. The attacks have been active from at least April 2011 up to February 2012. The attackers are intelligent and focused, employing the minimum amount of work necessary for the maximum gain. They do not use zero day exploits or complicated threats, instead they rely on effective social engineering and lax security measures on the part of the victims.

## RTM

There are several groups actively and profitably targeting businesses in Russia. A trend that we have seen unfold before our eyes lately is these cybercriminals’ use of simple backdoors to gain a foothold in their targets’ networks. Once they have this access, a lot of the work is done manually, slowly getting to understand the network layout and deploying custom tools the criminals can use to steal funds from these entities. Some of the groups that best exemplify these trends are Buhtrap, Cobalt and Corkow. The group discussed in this white paper is part of this new trend. We call this new group RTM; it uses custom malware, written in Delphi, that we cover in detail in later sections. The first trace of this tool in our telemetry data dates back to late 2015. The group also makes use of several different modules that they deploy where appropriate to their targets. They are interested in users of remote banking systems (RBS), mainly in Russia and neighboring countries.

## Shadow Network

Shadows in the Cloud documents a complex ecosystem of cyber espionage that systematically compromised government, business, academic, and other computer network systems in India, the Offices of the Dalai Lama, the United Nations, and several other countries. The report also contains an analysis of data which were stolen from politically sensitive targets and recovered during the course of the investigation. These include documents from the Offices of the Dalai Lama and agencies of the Indian national security establishment. Data containing sensitive information on citizens of numerous third-party countries, as well as personal, financial, and business information, were also exfiltrated and recovered during the course of the investigation. The report analyzes the malware ecosystem employed by the Shadows' attackers, which leveraged multiple redundant cloud computing systems, social networking platforms, and free web hosting services in order to maintain persistent control while operating core servers located in the People's Republic of China (PRC). Although the identity and motivation of the attackers remain unknown, the report is able to determine the location (Chengdu, PRC) as well as some of the associations of the attackers through circumstantial evidence. The investigation is the product of an eight month, collaborative activity between the Information Warfare Monitor (Citizen Lab and SecDev) and the Shadowserver Foundation. The investigation employed a fusion methodology, combining technical interrogation techniques, data analysis, and field research, to track and uncover the Shadow cyber espionage network.

## Slingshot

While analysing an incident which involved a suspected keylogger, we identified a malicious library able to interact with a virtual file system, which is usually the sign of an advanced APT actor. This turned out to be a malicious loader internally named 'Slingshot', part of a new, and highly sophisticated attack platform that rivals Project Sauron and Regin in complexity. While for most victims the infection vector for Slingshot remains unknown, we were able to find several cases where the attackers got access to MikroTik routers and placed a component downloaded by Winbox Loader, a management suite for MikroTik routers. In turn, this infected the administrator of the router. We believe this cluster of activity started in at least 2012 and was still active at the time of this analysis (February 2018).

<a href="https://securelist.com/apt-slingshot/84312/">https://securelist.com/apt-slingshot/84312/</a>

## Taidoor

The Taidoor attackers have been actively engaging in targeted attacks since at least March 4, 2009. Despite some exceptions, the Taidoor campaign often used Taiwanese IP addresses as C&C servers and email addresses to send out socially engineered emails with malware as attachments. One of the primary targets of the Taidoor campaign appeared to be the Taiwanese government. The attackers spoofed Taiwanese government email addresses to send out socially engineered emails in the Chinese language that typically leveraged Taiwan-themed issues. The attackers actively sent out malicious documents and maintained several IP addresses for command and control. As part of their social engineering ploy, the Taidoor attackers attach a decoy document to their emails that, when opened, displays the contents of a legitimate document but executes a malicious payload in the background. We were only able to gather a limited amount of information regarding the Taidoor attackers' activities after they have compromised a target. We did, however, find that the Taidoor malware allowed attackers to operate an interactive shell on compromised computers and to upload and download files. In order to determine the operational capabilities of the attackers behind the Taidoor campaign, we monitored a compromised honeypot. The attackers issued out some basic commands in an attempt to map out the extent of the network compromise but quickly realized that the honeypot was not an intended targeted and so promptly disabled the Taidoor malware running on it. This indicated that while Taidoor malware were more widely distributed compared with those tied to other targeted campaigns, the attackers could quickly assess their targets and distinguish these from inadvertently compromised computers and honeypots.

## WindShift

In August of 2018, DarkMatter released a report entitled “In the Trails of WINDSHIFT APT”, which unveiled a threat actor with TTPs very similar to those of Bahamut. Subsequently, two additional articles were released by Objective-See which provide an analysis of some validated WINDSHIFT samples targeting OSX systems. Pivoting on specific file attributes and infrastructure indicators, Unit 42 was able to identify and correlate additional attacker activity and can now provide specific details on a targeted WINDSHIFT attack as it unfolded at a Middle Eastern government agency.

## [Unnamed group]

Over the last few weeks, several significant leaks regarding a number of Iranian APTs took place. After analyzing and investigating the documents we conclude that they are authentic. Consequently, this causes considerable harm to the groups and their operation. The identity of the actor behind the leak is currently unknown, however based on the scope and the quality of the exposed documents and information, it appears that they are professional and highly capable. This leak will likely hamstring the groups' operation in the near future. Accordingly, in our assessment this will minimize the risk of potential attacks in the next few months and possibly even year. Note -most of the leaks are posted on Telegram channels that were created specifically for this purpose. Below are the three main Telegram groups on which the leaks were posted: Lab Dookhtegam pseudonym ("The people whose lips are stitched and sealed" –translation from Persian) –In this channel attack tools attributed to the group 'OilRig' were leaked; including a webshell that was inserted into the Technion, various tools that were used for DNS attacks, and more. Green Leakers–In this channel attack tools attributed to the group 'MuddyWatter' were leaked. The group's name and its symbol are identified with the "green movement", which led the protests in Iran after the Presidential elections in 2009. These protests were heavily repressed by the revolutionary guards (IRGC) Black Box–Unlike the previous two channels this has been around for a long time. On Friday May 5th, dozens of confidential documents labeled as "secret" (a high confidentiality level in Iran, one before the highest -top secret) were posted on this channel. The

documents were related to Iranian attack groups' activity.

## Dungeon Spider

DUNGEON SPIDER is a criminal group operating the ransomware most commonly known as Locky, which has been active since February 2016 and was last observed in late 2017. Locky is a ransomware tool that encrypts files using a combination of cryptographic algorithms: RSA with a key size of 2,048 bits, and AES with a key size of 128 bits. Locky targets a large number of file extensions and is able to encrypt data on shared network drives. In an attempt to further impact victims and prevent file recovery, Locky deletes all of the Shadow Volume Copies on the machine. DUNGEON SPIDER primarily relies on broad spam campaigns with malicious attachments for distribution. Locky is the community/industry name associated with this actor.

## Fxmsp

Throughout 2017 and 2018, Fxmsp established a network of trusted proxy resellers to promote their breaches on the criminal underground. Some of the known Fxmsp TTPs included accessing network environments via externally available remote desktop protocol (RDP) servers and exposed active directory. Most recently, the actor claimed to have developed a credential-stealing botnet capable of infecting high-profile targets in order to exfiltrate sensitive usernames and passwords. Fxmsp has claimed that developing this botnet and improving its capabilities for stealing information from secured systems is their main goal.

The tag is: *misp-galaxy:threat-actor="Fxmsp"*

# Gnosticplayers

The hacker said that he put up the data for sale mainly because these companies had failed to protect passwords with strong encryption algorithms like bcrypt. Most of the hashed passwords the hacker put up for sale today can be cracked with various levels of difficulty --but they can be cracked. "I got upset because I feel no one is learning," the hacker told ZDNet in an online chat earlier today. "I just felt upset at this particular moment, because seeing this lack of security in 2019 is making me angry." In a conversation with ZDNet last month, the hacker told us he wanted to hack and put up for sale more than one billion records and then retire and disappear with the money. But in a conversation today, the hacker says this is not his target anymore, as he learned that other hackers have already achieved the same goal before him. Gnosticplayers also revealed that not all the data he obtained from hacked companies had been put up for sale. Some companies gave into extortion demands and paid fees so breaches would remain private. "I came to an agreement with some companies, but the concerned startups won't see their data for sale," he said. "I did it that's why I can't publish the rest of my databases or even name them."

## Hacking Team

The many 0-days that had been collected by Hacking Team and which became publicly available during the breach of their organization in 2015, have been used by several APT groups since. Since being founded in 2003, the Italian spyware vendor Hacking Team gained notoriety for selling surveillance tools to governments and their agencies across the world. The capabilities of its flagship product, the Remote Control System (RCS), include extracting files from a targeted device, intercepting emails and instant messaging, as well as remotely activating a device's webcam and microphone. The company has been criticized for selling these capabilities to authoritarian governments – an allegation it has consistently denied. When the tables turned in July 2015, with Hacking Team itself suffering a damaging hack, the reported use of RCS by oppressive regimes was confirmed. With 400GB of internal data – including the once-secret list of customers, internal communications, and spyware source code – leaked online, Hacking Team was forced to request its customers to suspend all use of RCS, and was left facing an uncertain future. Following the hack, the security community has been keeping a close eye on the company's efforts to get back on its feet. The first reports suggesting Hacking Team's resumed operations came six months later – a new

sample of Hacking Team’s Mac spyware was apparently in the wild. A year after the breach, an investment by a company named Tablem Limited brought changes to Hacking Team’s shareholder structure, with Tablem Limited taking 20% of Hacking Team’s shareholding. Tablem Limited is officially based in Cyprus; however, recent news suggests it has ties to Saudi Arabia.

## OurMine

OurMine is known for celebrity internet accounts, often causing cyber vandalism, to advertise their commercial services. (Trend Micro) In light of the recent report detailing its willingness to pay US\$250,000 in exchange for the 1.5 terabytes’ worth of data swiped by hackers from its servers, HBO finds itself dealing with yet another security breach. Known for hijacking prominent social media accounts, the self-styled white hat hacking group OurMine took over a number of verified Twitter and Facebook accounts belonging to the cable network. These include accounts for HBO shows, such as “Game of Thrones,” “Girls,” and “Ballers.” This is not the first time that OurMine has claimed responsibility for hacking high- profile social networking accounts. Last year, the group victimized Marvel, The New York Times, and even the heads of some of the biggest technology companies in the world. Mark Zuckerberg, Jack Dorsey, Sundar Pichai, and Daniel Ek — the CEOs of Facebook, Twitter, Google and Spotify, respectively — have also fallen victim to the hackers, dispelling the notion that a career in software and technology exempts one from being compromised.

## Pacha Group

Antd is a miner found in the wild on September 18, 2018. Recently we discovered that the authors from Antd are actively delivering newer campaigns deploying a broad number of components, most of them completely undetected and operating within compromised third party Linux servers. Furthermore, we have observed that some of the techniques implemented by this group are

unconventional, and there is an element of sophistication to them. We believe the authors behind this malware are from Chinese origin. We have labeled the undetected Linux.Antd variants, Linux.GreedyAntd and classified the threat actor as Pacha Group.

## [Vault 7/8]

An unnamed source leaked almost 10,000 documents describing a large number of 0-day vulnerabilities, methodologies and tools that had been collected by the CIA. This leaking was done through WikiLeaks, since March 2017. In weekly publications, the dumps were said to come from Vault 7 and later Vault 8, until his arrest in 2018. Most of the published vulnerabilities have since been fixed by the respective vendors, by many have been used by other threat actors. This actor turned out to be a former CIA software engineer. (WikiLeaks) Today, Tuesday 7 March 2017, WikiLeaks begins its new series of leaks on the U.S. Central Intelligence Agency. Code-named "Vault 7" by WikiLeaks, it is the largest ever publication of confidential documents on the agency. The first full part of the series, "Year Zero", comprises 8,761 documents and files from an isolated, high-security network situated inside the CIA's Center for Cyber Intelligence in Langley, Virginia. It follows an introductory disclosure last month of CIA targeting French political parties and candidates in the lead up to the 2012 presidential election. Recently, the CIA lost control of the majority of its hacking arsenal including malware, viruses, trojans, weaponized "zero day" exploits, malware remote control systems and associated documentation. This extraordinary collection, which amounts to more than several hundred million lines of code, gives its possessor the entire hacking capacity of the CIA. The archive appears to have been circulated among former U.S.

government hackers and contractors in an unauthorized manner, one of whom has provided WikiLeaks with portions of the archive. "Year Zero" introduces the scope and direction of the CIA's global covert hacking program, its malware arsenal and dozens of "zero day" weaponized exploits against a wide range of U.S. and European company products, include Apple's iPhone, Google's Android and Microsoft's Windows and even Samsung TVs, which are turned into covert microphones.

## Zombie Spider

CrowdStrike Intelligence has recently observed PINCHY SPIDER affiliates deploying GandCrab ransomware in enterprise environments, using lateral movement techniques and tooling commonly associated with nation-state adversary groups and penetration testing teams. This change in tactics makes PINCHY SPIDER and its affiliates the latest eCrime adversaries to join the growing trend of targeted, low-volume/high-return ransomware deployments known as "big game hunting." PINCHY SPIDER is the criminal group behind the development of the ransomware most commonly known as GandCrab, which has been active since January 2018. PINCHY SPIDER sells access to use GandCrab ransomware under a partnership program with a limited number of accounts. The program is operated with a 60-40 split in profits (60 percent to the customer), as is common among eCrime actors, but PINCHY SPIDER is also willing to negotiate up to a 70-30 split for "sophisticated" customers.

## ViceLeaker

In May 2018, we discovered a campaign targeting dozens of mobile Android devices belonging to Israeli citizens. Kaspersky spyware sensors caught the signal of an attack from the device of one of the victims; and a hash of the APK involved (Android application) was tagged in our sample feed for inspection. Once we looked into the file, we quickly found out that the inner-workings of the APK included a malicious payload, embedded in the original code of the application. This was an original spyware program, designed to exfiltrate almost all accessible information. During the course of our research, we noticed that we were not the only ones to have found the operation. Researchers from Bitdefender also released an analysis of one of the samples in a blogpost.

Although something had already been published, we decided to do something different with the data we acquired. The following month, we released a private report on our Threat Intelligence Portal to alert our clients about this newly discovered operation and began writing YARA rules in order to catch more samples. We decided to call the operation “ViceLeaker”, because of strings and variables in its code.

The tag is: *misp-galaxy:threat-actor="ViceLeaker"*

## SWEED

Cisco Talos recently identified a large number of ongoing malware distribution campaigns linked to a threat actor we’re calling “SWEED,” including such notable malware as Formbook, Lokibot and Agent Tesla. Based on our research, SWEED — which has been operating since at least 2017 — primarily targets their victims with stealers and remote access trojans. SWEED remains consistent across most of their campaigns in their use of spear-phishing emails with malicious attachments. While these campaigns have featured a myriad of different types of malicious documents, the actor primarily tries to infect its victims with a packed version of Agent Tesla — an information stealer that’s been around since at least 2014. The version of Agent Tesla that SWEED is using differs slightly from what we’ve seen in the past in the way that it is packed, as well as how it infects the system. In this post, we’ll run down each campaign we’re able to connect to SWEED, and talk about some of the actor’s tactics, techniques and procedures (TTPs).

The tag is: *misp-galaxy:threat-actor="SWEED"*

## TA428

Proofpoint researchers have identified a targeted APT campaign that utilized malicious RTF documents to deliver custom malware to unsuspecting victims. We dubbed this campaign “Operation LagTime IT” based on entities that were targeted and the distinctive domains registered to C&C IP infrastructure. Beginning in early 2019, these threat actors targeted a number of government agencies in East Asia overseeing government information technology, domestic affairs, foreign affairs, economic development, and political processes. We determined that the infection vector observed in this campaign was spear phishing, with emails originating from both free email accounts and compromised user accounts. Attackers relied on Microsoft Equation Editor exploit CVE-2018-0798 to deliver a custom malware that Proofpoint researchers have dubbed Cotx RAT. Additionally, this APT group utilizes Poison Ivy payloads that share overlapping command and control (C&C) infrastructure with the newly identified Cotx campaigns. Based on infrastructure overlaps, post-exploitation techniques, and historic TTPs utilized in this operation, Proofpoint

analysts attribute this activity to the Chinese APT group tracked internally as TA428. Researchers believe that this activity has an operational and tactical resemblance to the Maudi Surveillance Operation which was previously reported in 2013.

## Pirpi

Symantec has observed Buckeye activity dating back to 2009, involving attacks on various organizations in several regions. Buckeye used a remote access Trojan (Backdoor.Pirpi) in attacks against a US organization's network in 2009. The group delivered Backdoor.Pirpi through malicious attachments or links in convincing spear-phishing emails.

The tag is: `misp-galaxy:tool="Pirpi"`

Pirpi is also known as:

- Badey
- EXL

Pirpi has relationships with:

- similar: `misp-galaxy:mitre-malware="SHOTPUT - S0063"` with `estimative-language:likelihood-probability="likely"`

## RARSTONE

RARSTONE is a Remote Access Tool (RAT) discovered early 2013 by TrendMicro, it's characterized by a great affinity with the other RAT know as Plug is and was used in April for phishing campaigns that followed the dramatic attack to the Boston Marathon.

The tag is: `misp-galaxy:tool="RARSTONE"`

RARSTONE has relationships with:

- similar: `misp-galaxy:mitre-malware="RARSTONE - S0055"` with `estimative-language:likelihood-probability="likely"`

# Backspace

Backspace is a Backdoor that targets the Windows platform. This malware is reportedly associated with targeted attacks against Association of Southeast Asian Nations (ASEAN) members (APT30).

The tag is: *misp-galaxy:tool="Backspace"*

Backspace is also known as:

- Lecna

Backspace has relationships with:

- similar: *misp-galaxy:mitre-malware="BACKSPACE - S0031"* with *estimative-language:likelihood-probability="likely"*

*Table 5152. Table References*

# Neteagle

NETEAGLE is a backdoor developed by APT30 with compile dates as early as 2008. It has two main variants known as Scout and Norton.

The tag is: *misp-galaxy:tool="Neteagle"*

Neteagle is also known as:

- scout
- norton

*Table 5154. Table References*

## Agent.BTZ

In November 2014, the experts of the G DATA SecurityLabs published an article about ComRAT, the Agent.BTZ successor. We explained that this case is linked to the Uroburos rootkit.

The tag is: *misp-galaxy:tool="Agent.BTZ"*

Agent.BTZ is also known as:

- ComRat

Agent.BTZ has relationships with:

- similar: *misp-galaxy:rat="ComRAT"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:mitre-malware="ComRAT - S0126"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="Agent.BTZ"* with *estimative-language:likelihood-probability="likely"*

## Heseber BOT

RAT bundle with standard VNC (to avoid/limit A/V detection).

The tag is: *misp-galaxy:tool="Heseber BOT"*

## Agent.dne

The tag is: *misp-galaxy:tool="Agent.dne"*

## Wipbot

Waterbug is the name given to the actors who use the malware tools Trojan.Wipbot (also known as Tavdig and Epic Turla)

The tag is: *misp-galaxy:tool="Wipbot"*

Wipbot is also known as:

- Tavdig

- Epic Turla
- WorldCupSec
- TadjMakhal

Wipbot has relationships with:

- similar: `misp-galaxy:mitre-malware="Epic - S0091"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:malpedia="Wipbot"` with `estimative-language:likelihood-probability="likely"`

Table 5156. Table References

## Turla

Family of related sophisticated backdoor software - Name comes from Microsoft detection signature – anagram of Ultra (Ultra3) was a name of the fake driver). A macOS version exists but appears incomplete and lacking features...for now!

The tag is: `misp-galaxy:tool="Turla"`

Turla is also known as:

- Snake
- Uroburos
- Urouros

Turla has relationships with:

- similar: `misp-galaxy:mitre-malware="Uroburos - S0022"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:malpedia="Uroburos (Windows)"` with `estimative-language:likelihood-probability="likely"`

## Winexe

The tag is: *misp-galaxy:tool="Winexe"*

Winexe has relationships with:

- similar: *misp-galaxy:mitre-tool="Winexe - S0191"* with *estimative-language:likelihood-probability="likely"*

## Dark Comet

RAT initially identified in 2011 and still actively used.

The tag is: *misp-galaxy:tool="Dark Comet"*

Dark Comet has relationships with:

- similar: *misp-galaxy:rat="DarkComet"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="DarkComet"* with *estimative-language:likelihood-probability="likely"*

## Cadelspy

The tag is: *misp-galaxy:tool="Cadelspy"*

Cadelspy is also known as:

- WinSpy

## CMStar

The tag is: *misp-galaxy:tool="CMStar"*

## Gh0st Rat

Gh0st Rat is a well-known Chinese remote access trojan which was originally made by C.Rufus Security Team several years ago.

The tag is: *misp-galaxy:tool="Gh0st Rat"*

Gh0st Rat is also known as:

- Gh0stRat, GhostRat

Gh0st Rat has relationships with:

- used-by: *misp-galaxy:threat-actor="Anchor Panda"* with *estimative-language:likelihood-probability="likely"*

*Table 5160. Table References*

## EVILTOSS

backdoor used by apt28

Sedreco serves as a spying backdoor; its functionalities can be extended with dynamically loaded plugins. It is made up of two distinct components: a dropper and the persistent payload installed by this dropper. We have not seen this component since April 2016.

The tag is: `misp-galaxy:tool="EVILTOSS"`

EVILTOSS is also known as:

- Sedreco
- AZZY
- ADVSTORESHELL
- NETUI

EVILTOSS has relationships with:

- similar: `misp-galaxy:mitre-malware="ADVSTORESHELL - S0045"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:malpedia="Sedreco"` with `estimative-language:likelihood-probability="likely"`

# Regin

Regin (also known as Prax or WarriorPride) is a sophisticated malware toolkit revealed by Kaspersky Lab, Symantec, and The Intercept in November 2014. The malware targets specific users of Microsoft Windows-based computers and has been linked to the US intelligence gathering agency NSA and its British counterpart, the GCHQ. The Intercept provided samples of Regin for download including malware discovered at Belgian telecommunications provider, Belgacom. Kaspersky Lab says it first became aware of Regin in spring 2012, but that some of the earliest samples date from 2003. The name Regin is first found on the VirusTotal website on 9 March 2011.

The tag is: *misp-galaxy:tool="Regin"*

Regin is also known as:

- Prax
- WarriorPride

Regin has relationships with:

- similar: *misp-galaxy:mitre-malware="Regin - S0019"* with *estimative-language:likelihood-probability="likely"*

## Htran

HUC Packet Transmitter (HTran) is a proxy tool, used to intercept and redirect Transmission Control Protocol (TCP) connections from the local host to a remote host. This makes it possible to obfuscate an attacker's communications with victim networks. The tool has been freely available on the internet since at least 2009. HTran facilitates TCP connections between the victim and a hop point controlled by an attacker. Malicious cyber actors can use this technique to redirect their packets through multiple compromised hosts running HTran, to gain greater access to hosts in a network

The tag is: *misp-galaxy:tool="Htran"*

Htran is also known as:

- HUC Packet Transmitter
- HTran

# X-Agent

APT28's second-stage persistent macOS backdoor. This backdoor component is known to have a modular structure featuring various espionage functionalities, such as key-logging, screen grabbing and file exfiltration. This component is available for OSX, Windows, Linux and iOS operating systems.

Xagent is a modular backdoor with spying functionalities such as keystroke logging and file exfiltration. Xagent is the group's flagship backdoor and heavily used in their operations. Early versions for Linux and Windows were seen years ago, then in 2015 an iOS version came out. One year later, an Android version was discovered and finally, in the beginning of 2017, an Xagent sample for OS X was described.

The tag is: *misp-galaxy:tool="X-Agent"*

X-Agent is also known as:

- XAgent

X-Agent has relationships with:

- similar: *misp-galaxy:mitre-malware="CHOPSTICK - S0023"* with *estimative-language:likelihood-probability="likely"*

## Odinaff

Odinaff is typically deployed in the first stage of an attack, to gain a foothold onto the network, providing a persistent presence and the ability to install additional tools onto the target network.

These additional tools bear the hallmarks of a sophisticated attacker which has plagued the financial industry since at least 2013–Carbanak. This new wave of attacks has also used some infrastructure that has previously been used in Carbanak campaigns.

The tag is: *misp-galaxy:tool="Odinaff"*

Odinaff has relationships with:

- similar: `misp-galaxy:malpedia="Odinaff"` with `estimative-language:likelihood-probability="likely"`

*Table 5217. Table References*

## Hworm

Unit 42 has observed a new version of Hworm (or Houdini) being used within multiple attacks. This blog outlines technical details of this new Hworm version and documents an attack campaign making use of the backdoor. Of the samples used in this attack, the first we observed were June 2016, while as-of publication we were still seeing attacks as recently as mid-October, suggesting that this is likely an active, ongoing campaign.

The tag is: *misp-galaxy:tool="Hworm"*

Hworm is also known as:

- Houdini

Hworm has relationships with:

- similar: `misp-galaxy:malpedia="Hworm"` with `estimative-language:likelihood-probability="likely"`

## Adwind

Adwind is a backdoor written purely in Java that targets system supporting the Java runtime environment. Commands that can be used, among other things, to display messages on the system, open URLs, update the malware, download/execute files, and download/load plugins. A significant amount of additional functionality can be provided through downloadable plugins, including such things as remote control options and shell command execution.

The tag is: *misp-galaxy:tool="Adwind"*

Adwind is also known as:

- AlienSpy
- Frutas
- Unrecom
- Sockrat
- JSocket
- jRat
- Backdoor:Java/Adwind

Adwind has relationships with:

# Empire

Empire is a pure PowerShell post-exploitation agent built on cryptologically-secure communications and a flexible architecture. Empire implements the ability to run PowerShell agents without needing powershell.exe, rapidly deployable post-exploitation modules ranging from key loggers to Mimikatz, and adaptable communications to evade network detection, all wrapped up in a usability-focused framework

The tag is: *misp-galaxy:tool="Empire"*

Empire has relationships with:

- similar: misp-galaxy:exploit-kit="Empire" with estimative-language:likelihood-probability="likely"

Table 5226. Table References

Links
<a href="https://github.com/adaptivethreat/Empire">https://github.com/adaptivethreat/Empire</a>

# Explosive

Beginning in late 2012, a carefully orchestrated attack campaign we call Volatile Cedar has been targeting individuals, companies and institutions worldwide. This campaign, led by a persistent attacker group, has successfully penetrated a large number of targets using various attack techniques, and specifically, a custom-made malware implant codenamed Explosive.

The tag is: *misp-galaxy:tool="Explosive"*

Table 5227. Table References

## Tartine

Delphi RAT used by Sofacy.

The tag is: *misp-galaxy:tool="Tartine"*

## Mirai

Mirai (Japanese for "the future") is malware that turns computer systems running Linux into remotely controlled "bots", that can be used as part of a botnet in large-scale network attacks. It primarily targets online consumer devices such as remote cameras and home routers. The Mirai botnet has been used in some of the largest and most disruptive distributed denial of service (DDoS) attacks, including an attack on 20 September 2016 on computer security journalist Brian Krebs's web site, an attack on French web host OVH and the October 2016 Dyn cyberattack.

The tag is: *misp-galaxy:tool="Mirai"*

Mirai is also known as:

- Linux/Mirai

Mirai has relationships with:

- similar: *misp-galaxy:botnet="Mirai"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="Mirai (ELF)"* with *estimative-language:likelihood-probability="likely"*
- variant-of: *misp-galaxy:botnet="Owari"* with *estimative-language:likelihood-probability="likely"*
- variant-of: *misp-galaxy:botnet="Sora"* with *estimative-language:likelihood-probability="likely"*

## BASHLITE

The tag is: *misp-galaxy:tool="BASHLITE"*

## BlackEnergy

BlackEnergy is a trojan which has undergone significant functional changes since it was first publicly analysed by Arbor Networks in 2007. It has evolved from a relatively simple DDoS trojan into a relatively sophisticated piece of modern malware with a modular architecture, making it a suitable tool for sending spam and for online bank fraud, as well as for targeted attacks. BlackEnergy version 2, which featured rootkit techniques, was documented by SecureWorks in 2010. The targeted attacks recently discovered are proof that the trojan is still alive and kicking in 2014. We provide a technical analysis of the BlackEnergy family, focusing on novel functionality

and the differences introduced by new lite variants. We describe the most notable aspects of the malware, including its techniques for bypassing UAC, defeating the signed driver requirement in Windows and a selection of BlackEnergy2 plug-ins used for parasitic file infections, network discovery and remote code execution and data collection.

The tag is: *misp-galaxy:tool="BlackEnergy"*

BlackEnergy has relationships with:

- similar: *misp-galaxy:mitre-malware="BlackEnergy - S0089"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="BlackEnergy"* with *estimative-language:likelihood-probability="likely"*

# Shifu

Shifu is a Banking Trojan first discovered in 2015. Shifu is based on the Shiz source code which incorporated techniques used by Zeus. Attackers use Shifu to steal credentials for online banking websites around the world, starting in Russia but later including the UK, Italy, and others.

The tag is: *misp-galaxy:tool="Shifu"*

Shifu has relationships with:

- similar: *misp-galaxy:malpedia="Shifu"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:tool="Shiz"* with *estimative-language:likelihood-probability="likely"*

# MM Core

Also known as “BaneChant”, MM Core is a file-less APT which is executed in memory by a downloader component. It was first reported in 2013 under the version number “2.0-LNK” where it used the tag “BaneChant” in its command-and-control (C2) network request. A second version “2.1-LNK” with the network tag “StrangeLove” was discovered shortly after.

The tag is: *misp-galaxy:tool="MM Core"*

MM Core is also known as:

- MM Core backdoor
- BigBoss
- SillyGoose

- BaneChant
- StrangeLove

MM Core has relationships with:

- similar: `misp-galaxy:malpedia="MM Core"` with `estimative-language:likelihood-probability="likely"`

## Shamoon

Shamoon,[a] also known as Disttrack, is a modular computer virus discovered by Seculert[1] in 2012, targeting recent NT kernel-based versions of Microsoft Windows. The virus has been used for cyber espionage in the energy sector.[2][3][4] Its discovery was announced on 16 August 2012 by Symantec,[3] Kaspersky Lab,[5] and Seculert.[6] Similarities have been highlighted by Kaspersky Lab and Seculert between Shamoon and the Flame malware.[5][6]

The tag is: `misp-galaxy:tool="Shamoon"`

Shamoon is also known as:

- DistTrack

Shamoon has relationships with:

- similar: `misp-galaxy:mitre-malware="Shamoon - S0140"` with `estimative-language:likelihood-probability="likely"`

Table 5240. Table References

## GhostAdmin

According to MalwareHunterTeam and other researchers that have looked at the malware's source code, GhostAdmin seems to be a reworked version of CrimeScene, another botnet malware family that was active around 3-4 years ago.

The tag is: `misp-galaxy:tool="GhostAdmin"`

GhostAdmin has relationships with:

- similar: `misp-galaxy:malpedia="GhostAdmin"` with `estimative-language:likelihood-`

probability="likely"

Table 5241. Table References

Links

## EyePyramid Malware

Two Italians referred to as the “Occhionero brothers” have been arrested and accused of using malware and a carefully-prepared spear-phishing scheme to spy on high-profile politicians and businessmen. This case has been called “EyePyramid”, which we first discussed last week. (Conspiracy theories aside, the name came from a domain name and directory path that was found during the research.)

The tag is: *misp-galaxy:tool="EyePyramid Malware"*

Table 5242. Table References

Links

<http://blog.trendmicro.com/trendlabs-security-intelligence/uncovering-inner-workings-eyepyramid/>

## LuminosityLink

LuminosityLink is a malware family costing \$40 that purports to be a system administration utility

The tag is: *misp-galaxy:tool="LuminosityLink"*

Table 5243. Table References

Links

<http://researchcenter.paloaltonetworks.com/2016/07/unit42-investigating-the-luminositylink-remote-access-trojan-configuration/>

## Flokibot

Floki Bot, described recently by Dr. Peter Stephenson from SC Magazine, is yet another bot based on the leaked Zeus code. However, the author came up with various custom modifications that makes it more interesting.

The tag is: *misp-galaxy:tool="Flokibot"*

Flokibot is also known as:

- Floki Bot
- Floki

Table 5244. Table References

Links

## ZeroT

Most recently, we have observed the same group targeting military and aerospace interests in Russia and Belarus. Since the summer of 2016, this group began using a new downloader known as ZeroT to install the PlugX remote access Trojan (RAT) and added Microsoft Compiled HTML Help (.chm) as one of the initial droppers delivered in spear-phishing emails.

The tag is: *misp-galaxy:tool="ZeroT"*

ZeroT has relationships with:

- similar: *misp-galaxy:mitre-malware="ZeroT - S0230"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="ZeroT"* with *estimative-language:likelihood-probability="likely"*

## StreamEx

Cylance dubbed this family of malware StreamEx, based upon a common exported function used across all samples 'stream', combined with the dropper functionality to append 'ex' to the DLL file name. The StreamEx family has the ability to access and modify the user's file system, modify the registry, create system services, enumerate process and system information, enumerate network resources and drive types, scan for security tools such as firewall products and antivirus products, change browser security settings, and remotely execute commands. The malware documented in this post was predominantly 64-bit, however, there are 32-bit versions of the malware in the wild.

The tag is: *misp-galaxy:tool="StreamEx"*

StreamEx has relationships with:

- similar: *misp-galaxy:mitre-malware="StreamEx - S0142"* with *estimative-language:likelihood-probability="likely"*

## PupyRAT

Pupy is an opensource, cross-platform (Windows, Linux, OSX, Android) remote administration and post-exploitation tool mainly written in python.

The tag is: *misp-galaxy:tool="PupyRAT"*

Table 5280. Table References

Links

<https://github.com/n1nj4sec/pupy>

## ELF\_IMEIJ

Linux Arm malware spread via RFIs in cgi-bin scripts. This backdoor executes commands from a remote malicious user, effectively compromising the affected system. It connects to a website to send and receive information.

The tag is: *misp-galaxy:tool="ELF\_IMEIJ"*

Table 5281. Table References

Links

[https://www.trendmicro.com/vinfo/us/threat-encyclopedia/malware/elf\\_imeij.a](https://www.trendmicro.com/vinfo/us/threat-encyclopedia/malware/elf_imeij.a)

## KHRAT

KHRAT is a small backdoor that has three exports (functions), namely, K1, K2, and K3. K1 checks if the current user is an administrator. If not, it uninstalls itself by calling the K2 function.

The tag is: *misp-galaxy:tool="KHRAT"*

KHRAT has relationships with:

- similar: *misp-galaxy:malpedia="KHRAT"* with *estimative-language:likelihood-probability="likely"*

Table 5282. Table References

## Trochilus

The Trochilus RAT is a threatening RAT (Remote Access Trojan) that may evade many anti-virus programs. The Trochilus RAT is currently being used as part of an extended threat campaign in South East Asia. The first appearance of the Trochilus RAT in this campaign, which has been active since August of 2015, was first detected in the summer of 2015. The Trochilus RAT is currently being used against civil society organizations and government computers in the South East Asia region, particularly in attacks directed towards the government of Myanmar.

The tag is: *misp-galaxy:tool="Trochilus"*

Trochilus has relationships with:

- similar: *misp-galaxy:rat="Trochilus"* with *estimative-language:likelihood-probability="likely"*

Table 5283. Table References

# MoonWind

The MoonWind sample used for this analysis was compiled with a Chinese compiler known as BlackMoon, the same compiler used for the BlackMoon banking Trojan. While a number of attributes match the BlackMoon banking Trojan, the malware is not the same. Both malware families were simply compiled using the same compiler, and it was the BlackMoon artifacts that resulted in the naming of the BlackMoon banking Trojan. But because this new sample is different from the BlackMoon banking Trojan,

The tag is: *misp-galaxy:tool="MoonWind"*

MoonWind has relationships with:

## AURIGA

The AURIGA malware family shares a large amount of functionality with the BANGAT backdoor. The malware family contains functionality for keystroke logging, creating and killing processes, performing file system and registry modifications, spawning interactive command shells, performing process injection, logging off the current user or shutting down the local machine. The AURIGA malware contains a driver component which is used to inject the malware DLL into other processes. This driver can also perform process and IP connection hiding. The malware family will create a copy of cmd.exe to perform its C2 activity, and replace the "Microsoft corp" strings in the cmd.exe binary with different values. The malware family typically maintains persistence through installing itself as a service.

The tag is: *misp-galaxy:tool="AURIGA"*

*Table 5287. Table References*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## BANGAT

The BANGAT malware family shares a large amount of functionality with the AURIGA backdoor. The malware family contains functionality for keylogging, creating and killing processes, performing filesystem and registry modifications, spawning interactive command shells, performing process injection, logging off the current user or shutting down the local machine. In addition, the malware also implements a custom VNC like protocol which sends screenshots of the desktop to the C2 server and accepts keyboard and mouse input. The malware communicates to its C2 servers using SSL, with self signed SSL certificates. The malware family will create a copy of

cmd.exe to perform its C2 activity, and replace the "Microsoft corp" strings in the cmd.exe binary with different values. The malware family typically maintains persistence through installing itself as a service.

The tag is: *misp-galaxy:tool="BANGAT"*

Table 5288. Table References

<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## BISCUIT

BISCUIT provides attackers with full access to an infected host. BISCUIT capabilities include launching an interactive command shell, enumerating servers on a Windows network, enumerating and manipulating process, and transferring files. BISCUIT communicates using a custom protocol, which is then encrypted using SSL. Once installed BISCUIT will attempt to beacon to its command/control servers approximately every 10 or 30 minutes. It will beacon its primary server first, followed by a secondary server. All communication is encrypted with SSL (OpenSSL 0.9.8i).

The tag is: *misp-galaxy:tool="BISCUIT"*

BISCUIT has relationships with:

- similar: *misp-galaxy:mitre-malware="BISCUIT - S0017"* with *estimative-language:likelihood-probability="likely"*

Table 5289. Table References

## BOUNCER

BOUNCER will load an extracted DLL into memory, and then will call the DLL's dump export. The dump export is called with the parameters passed via the command line to the BOUNCER executable. It requires at least two arguments, the IP and port to send the password dump information. It can accept at most five arguments, including a proxy IP, port and an x.509 key for SSL authentication. The DLL backdoor has the capability to execute arbitrary commands, collect database and server information, brute force SQL login credentials, launch arbitrary programs, create processes and threads, delete files, and redirect network traffic.

The tag is: *misp-galaxy:tool="BOUNCER"*

## CALENDAR

This family of malware uses Google Calendar to retrieve commands and send results. It retrieves event feeds associated with Google Calendar, where each event contains commands from the attacker for the malware to perform. Results are posted back to the event feed. The malware authenticates with Google using the hard coded email address and passwords. The malware uses the deprecated ClientLogin authentication API from Google. The malware is registered as a service dll as a persistence mechanism. Artifacts of this may be found in the registry.

The tag is: *misp-galaxy:tool="CALENDAR"*

CALENDAR has relationships with:

- similar: *misp-galaxy:mitre-malware="CALENDAR - S0025"* with *estimative-language:likelihood-probability="likely"*

## COMBOS

The COMBOS malware family is an HTTP based backdoor. The backdoor is capable of file upload, file download, spawning a interactive reverse shell, and terminating its own process. The backdoor may decrypt stored Internet Explorer credentials from the local system and transmit the credentials to the C2 server. The COMBOS malware family does not have any persistence mechanisms built into itself.

The tag is: *misp-galaxy:tool="COMBOS"*

*Table 5292. Table References*

<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## COOKIEBAG

This family of malware is a backdoor capable of file upload and download as well as providing remote interactive shell access to the compromised machine. Communication with the Command & Control (C2) servers uses a combination of single-byte XOR and Base64 encoded data in the Cookie and Set-Cookie HTTP header fields. Communication with the C2 servers is over port 80. Some variants install a registry key as means of a persistence mechanism. The hardcoded strings cited include a string of a command in common with several other APT1 families.

The tag is: *misp-galaxy:tool="COOKIEBAG"*

COOKIEBAG is also known as:

- TROJAN.COOKIE

<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## GDOCUPLOAD

This family of malware is a utility designed to upload files to Google Docs. Nearly all communications with docs.google.com are SSL encrypted. The malware does not use Google's published API to interact with their services. The malware does not currently work with Google Docs. It does not detect HTTP 302 redirections and will get caught in an infinite loop attempting to parse results from Google that are not present.

The tag is: *misp-galaxy:tool="GDOCUPLOAD"*

Table 5296. Table References

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

# GLOOXMAIL

GLOOXMAIL communicates with Google's Jabber/XMPP servers and authenticates with a hard-coded username and password. The malware can accept commands over XMPP that includes file upload and download, provide a remote shell, sending process listings, and terminating specified processes. The malware makes extensive use of the open source gloox library (<http://camaya.net/gloox/>, version 0.9.9.12) to communicate using the Jabber/XMPP protocol. All communications with the Google XMPP server are encrypted.

The tag is: *misp-galaxy:tool="GLOOXMAIL"*

GLOOXMAIL is also known as:

- TROJAN.GTALK

GLOOXMAIL has relationships with:

- similar: *misp-galaxy:mitre-malware="GLOOXMAIL - S0026" with estimative-language:likelihood-probability="likely"*

*Table 5297. Table References*

<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

# GOGGLES

A family of downloader malware, that retrieves an encoded payload from a fixed location, usually in the form of a file with the .jpg extension. Some variants have just an .exe that acts as a downloader, others have an .exe launcher that runs as a service and then loads an associated .dll of the same name that acts as the downloader. This IOC is targeted at the downloaders only. After downloading the file, the malware decodes the downloaded payload into an .exe file and launches it. The malware usually stages the files it uses in the %TEMP% directory or the %WINDIR%\Temp directory.

The tag is: *misp-galaxy:tool="GOGGLES"*

GOGGLES is also known as:

- TROJAN.FOXY

*Table 5298. Table References*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

# GREENCAT

Members of this family are full featured backdoors that communicates with a Web-based Command & Control (C2) server over SSL. Features include interactive shell, gathering system info, uploading

and downloading files, and creating and killing processes, Malware in this family usually communicates with a hard-coded domain using SSL on port 443. Some members of this family rely on launchers to establish persistence mechanism for them. Others contains functionality that allows it to install itself, replacing an existing Windows service, and uninstall itself. Several variants use %SystemRoot%\Tasks or %WinDir%\Tasks as working directories, additional malware artifacts may be found there.

The tag is: *misp-galaxy:tool="GREENCAT"*

*Table 5299. Table References*

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## HACKFASE

This family of malware is a backdoor that provides reverse shell, process creation, system statistics collection, process enumeration, and process termination capabilities. This family is designed to be a service DLL and does not contain an installation mechanism. It usually communicates over port 443. Some variants use their own encryption, others use SSL.

The tag is: *misp-galaxy:tool="HACKFASE"*

*Table 5300. Table References*

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## HELAUTO

This family of malware is designed to operate as a service and provides remote command execution and file transfer capabilities to a fixed IP address or domain name. All communication with the C2 server happens over port 443 using SSL. This family can be installed as a service DLL. Some variants allow for uninstallation.

The tag is: *misp-galaxy:tool="HELAUTO"*

*Table 5301. Table References*

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## KURTON

This family of malware is a backdoor that tunnels its connection through a preconfigured proxy. The malware communicates with a remote command and control server over HTTPS via the proxy.

The malware installs itself as a Windows service with a service name supplied by the attacker but defaults to IPRIP if no service name is provided during install.

The tag is: *misp-galaxy:tool="KURTON"*

*Table 5302. Table References*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## LIGHTBOLT

LIGHTBOLT is a utility with the ability to perform HTTP GET requests for a list of user-specified URLs. The responses of the HTTP requests are then saved as MHTML files, which are added to encrypted RAR files. LIGHTBOLT has the ability to use software certificates for authentication.

The tag is: *misp-galaxy:tool="LIGHTBOLT"*

*Table 5303. Table References*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## LIGHTDART

LIGHTDART is a tool used to access a pre-configured web page that hosts an interface to query a database or data set. The tool then downloads the results of a query against that web page to an encrypted RAR file. This RAR file (1.rar) is renamed and uploaded to an attacker controlled FTP server, or uploaded via an HTTP POST with a .jpg extension. The malware will execute this search once a day. The target webpage usually contains information useful to the attacker, which is updated on a regular basis. Examples of targeted information include weather information or ship coordinates.

The tag is: *misp-galaxy:tool="LIGHTDART"*

*Table 5304. Table References*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## LONGRUN

LONGRUN is a backdoor designed to communicate with a hard-coded IP address and provide the attackers with a custom interactive shell. It supports file uploads and downloads, and executing arbitrary commands on the compromised machine. When LONGRUN executes, it first loads configuration data stored as an obfuscated string inside the PE resource section. The distinctive string thequickbrownfxjmpszvalzyd is used as part of the input to the decoding algorithm. When the configuration data string is decoded it is parsed and treated as an IP and port number. The malware then connects to the host and begins interacting with it over a custom protocol.

The tag is: *misp-galaxy:tool="LONGRUN"*

*Table 5305. Table References*

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## MANITSME

This family of malware will beacon out at random intervals to the remote attacker. The attacker can run programs, execute arbitrary commands, and easily upload and download files. This IOC looks for both the dropper file and the backdoor.

The tag is: *misp-galaxy:tool="MANITSME"*

*Table 5306. Table References*

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## MAPIGET

This malware utility is a set of two files that operate in conjunction to extract email messages and attachments from an Exchange server. In order to operate successfully, these programs require authentication credentials for a user on the Exchange server, and must be run from a machine joined to the domain that has Microsoft Outlook installed (or equivalent software that provides the Microsoft 'Messaging API' (MAPI) service).

The tag is: *misp-galaxy:tool="MAPIGET"*

*Table 5307. Table References*

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

<http://contagiodump.blogspot.com/2010/06/these-days-i-see-spike-in-number-of.html>

## MINIASP

This family of malware consists of backdoors that attempt to fetch encoded commands over HTTP. The malware is capable of downloading a file, downloading and executing a file, executing arbitrary shell commands, or sleeping a specified interval.

The tag is: *misp-galaxy:tool="MINIASP"*

*Table 5308. Table References*

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## NEWSREELS

The NEWSREELS malware family is an HTTP based backdoor. When first started, NEWSREELS decodes two strings from its resources section. These strings are both used as C2 channels, one URL is used as a beacon URL (transmitting) and the second URL is used to get commands (receiving). The NEWSREELS malware family is capable of performing file uploads, downloads, creating processes or creating an interactive reverse shell.

The tag is: *misp-galaxy:tool="NEWSREELS"*

*Table 5309. Table References*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## SEASALT

The SEASALT malware family communicates via a custom binary protocol. It is capable of gathering some basic system information, file system manipulation, file upload and download, process creation and termination, and spawning an interactive reverse shell. The malware maintains persistence by installing itself as a service.

The tag is: *misp-galaxy:tool="SEASALT"*

*Table 5310. Table References*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## STARSYPOUND

STARSYPOUND provides an interactive remote shell over an obfuscated communications channel. When it is first run, it loads a string (from the executable PE resource section) containing the beacon IP address and port. The malware sends the beacon string "(SY)# <HOSTNAME>" **to the remote system, where <HOSTNAME> is the hostname of the victim system. The remote host responds with a packet that also begins with the string "(SY)# cmd".** This causes the malware to launch a new cmd.exe child process. Further communications are forwarded to the cmd.exe child process to execute. The commands sent to the shell and their responses are obfuscated when sent over the network.

The tag is: *misp-galaxy:tool="STARSYPOUND"*

*Table 5311. Table References*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

# SWORD

This family of malware provides a backdoor over the network to the attackers. It is configured to connect to a single host and offers file download over HTTP, program execution, and arbitrary execution of commands through a cmd.exe instance.

The tag is: *misp-galaxy:tool="SWORD"*

Table 5312. Table References

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

# TABMSGSQL

This malware family is a full-featured backdoor capable of file uploading and downloading, arbitrary execution of programs, and providing a remote interactive command shell. All communications with the C2 server are sent over HTTP to a static URL, appending various URL parameters to the request. Some variants use a slightly different URL.

The tag is: *misp-galaxy:tool="TABMSGSQL"*

TABMSGSQL is also known as:

- TROJAN LETSGO

Table 5313. Table References

<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

# TARSIP-ECLIPSE

The TARSIP malware family is a backdoor which communicates over encoded information in HTTPS headers. Typical TARSIP malware samples will only beacon out to their C2 servers if the C2 DNS address resolves to a specific address. The capability of TARSIP backdoors includes file uploading, file downloading, interactive command shells, process enumeration, process creation, process termination. The TARSIP-ECLIPSE family is distinguished by the presence of 'eclipse' in .pdb debug strings present in the malware samples. It does not provide a built in mechanism to maintain persistence.

The tag is: *misp-galaxy:tool="TARSIP-ECLIPSE"*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## TARSIP-MOON

The TARSIP malware family is a backdoor which communicates over encoded information in HTTPS headers. Typical TARSIP malware samples will only beacon out to their C2 servers if the C2 DNS address resolves to a specific address. The capability of TARSIP backdoors includes file uploading, file downloading, interactive command shells, process enumeration, process creation, process termination. The TARSIP-MOON family is distinguished by the presence of 'moon' in .pdb debug strings present in the malware samples. It does not provide a built in mechanism to maintain persistence.

The tag is: *misp-galaxy:tool="TARSIP-MOON"*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## WARP

The WARP malware family is an HTTP based backdoor written in C++, and the majority of its code base is borrowed from source code available in the public domain. Network communications are implemented using the same WWW client library (w3c.cpp) available from [www.dankrusi.com/file\\_69653F3336383837.html](http://www.dankrusi.com/file_69653F3336383837.html). The malware has system survey functionality (collects hostname, current user, system uptime, CPU speed, etc.) taken directly from the BO2K backdoor available from [www.bo2k.com](http://www.bo2k.com). It also contains the hard disk identification code found at [www.winsim.com/diskid32/diskid32.cpp](http://www.winsim.com/diskid32/diskid32.cpp). When the WARP executing remote commands, the malware creates a copy of the `?%SYSTEMROOT%\system32\cmd.exe?` file as `'%USERPROFILE%\Temp\~ISUN32.EXE'`. The version signature information of the duplicate executable is zeroed out. Some WARP variants maintain persistence through the use of DLL search order hijacking.

The tag is: *misp-galaxy:tool="WARP"*

*Table 5316. Table References*

<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## WEBC2-ADSPACE

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This family of malware is capable of downloading and executing a file. All variants represented here are the same file with different MD5 signatures. This malware attempts to contact its C2 once a week (Thursday at 10:00 AM). It looks for commands inside a set of HTML tags, part of which are in the File Strings indicator term below.

The tag is: *misp-galaxy:tool="WEBC2-ADSPACE"*

Table 5317. Table References

## WEBC2-AUSOV

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This malware family is only a downloader which operates over the HTTP protocol with a hard-coded URL. If directed, it has the capability to download, decompress, and execute compressed binaries.

The tag is: *misp-galaxy:tool="WEBC2-AUSOV"*

Table 5318. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## WEBC2-BOLID

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This family of malware is a backdoor capable of downloading files and updating its configuration. Communication with the command and control (C2) server uses a combination of single-byte XOR and Base64 encoded data wrapped in standard HTML tags. The malware family installs a registry key as a persistence mechanism.

The tag is: *misp-galaxy:tool="WEBC2-BOLID"*

Table 5319. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## WEBC2-CLOVER

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The family of malware provides the attacker with an interactive command shell, the ability to upload and download files, execute commands on the system, list processes and DLLs, kill processes, and ping hosts on the local network. Responses to these commands are encrypted and compressed before being POSTed to the server. Some variants copy cmd.exe to Updatasched.exe in a temporary directory, and then may launch that in a process if an interactive shell is called. On initial invocation, the malware also attempts to delete previous copies of the

Updatasched.exe file.

The tag is: *misp-galaxy:tool="WEBC2-CLOVER"*

*Table 5320. Table References*

## WEBC2-CSON

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. Members of this family of malware act only as downloaders and droppers for other malware. They communicate with a hard-coded C2 server, reading commands embedded in HTML comment fields. Some variants are executables which act upon execution, others are DLLs which can be attached to services or loaded through search order hijacking.

The tag is: *misp-galaxy:tool="WEBC2-CSON"*

*Table 5321. Table References*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## WEBC2-DIV

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-DIV variant searches for the strings "div safe:" and "balance" to delimit encoded C2 information. If the decoded string begins with the letter "J" the malware will parse additional arguments in the decoded string to specify the sleep interval to use. WEBC2-DIV is capable of downloading a file, downloading and executing a file, or sleeping a specified interval.

The tag is: *misp-galaxy:tool="WEBC2-DIV"*

*Table 5322. Table References*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## WEBC2-GREENCAT

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This malware is a variant on the GREENCAT family, using a fixed web C2. This family is a full featured backdoor which provides remote command execution, file transfer, process and service enumeration and manipulation. It installs itself persistently through the

current user's registry Run key.

The tag is: *misp-galaxy:tool="WEBC2-GREENCAT"*

Table 5323. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## WEBC2-HEAD

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-HEAD variant communicates over HTTPS, using the system's SSL implementation to encrypt all communications with the C2 server. WEBC2-HEAD first issues an HTTP GET to the host, sending the Base64-encoded string containing the name of the compromised machine running the malware.

The tag is: *misp-galaxy:tool="WEBC2-HEAD"*

Table 5324. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## WEBC2-KT3

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-KT3 variant searches for commands in a specific comment tag. Network traffic starting with `*!Kt3+v|` may indicate WEBC2-KT3 activity.

The tag is: *misp-galaxy:tool="WEBC2-KT3"*

Table 5325. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## WEBC2-QBP

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-QBP variant will search for two strings in a HTML comment. The first will be "2010QBP " followed by " 2010QBP/--". Inside these tags will be a DES-encrypted string.

The tag is: *misp-galaxy:tool="WEBC2-QBP"*

Table 5326. Table References

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## WEBC2-RAVE

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This family of malware will set itself up as a service and connect out to a hardcoded web page and read a modified base64 string from this webpage. The later versions of this malware supports three commands (earlier ones are just downloaders or reverse shells). The first commands will sleep the malware for N number of hours. The second command will download a binary from the encoded HTML comment and execute it on the infected host. The third will spawn an encoded reverse shell to an attacker specified location and port.

The tag is: *misp-galaxy:tool="WEBC2-RAVE"*

Table 5327. Table References

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## WEBC2-TABLE

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-TABLE variant looks for web pages containing 'background', 'align', and 'bgcolor' tags to be present in the requested Web page. If the data in these tags are formatted correctly, the malware will decode a second URL and a filename. This URL is then retrieved, written to the decoded filename and executed.

The tag is: *misp-galaxy:tool="WEBC2-TABLE"*

Table 5328. Table References

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## WEBC2-TOCK

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-TABLE variant looks for web pages containing 'background', 'align', and 'bgcolor' tags to be present in the requested Web page. If the data in these tags are formatted correctly, the malware will decode a second URL and a filename. This URL is then retrieved, written to the decoded filename and executed.

The tag is: *misp-galaxy:tool="WEBC2-TOCK"*

<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## WEBC2-UGX

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. Members of this family of malware provide remote command shell and remote file download and execution capabilities. The malware downloads a web page containing a crafted HTML comment that subsequently contains an encoded command. The contents of this command tell the malware whether to download and execute a program, launch a reverse shell to a specific host and port number, or to sleep for a period of time.

The tag is: *misp-galaxy:tool="WEBC2-UGX"*

Table 5330. Table References

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## WEBC2-Y21K

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. Members of this family of backdoor malware talk to specific Web-based Command & Control (C2) servers. The backdoor has a limited command set, depending on version. It is primarily a downloader, but it classified as a backdoor because it can accept a limited command set, including changing local directories, downloading and executing additional files, sleeping, and connecting to a specific IP & port not initially included in the instruction set for the malware. Each version of the malware has at least one hardcoded URL to which it connects to receive its initial commands. This family of malware installs itself as a service, with the malware either being the executable run by the service, or the service DLL loaded by a legitimate service. The same core code is seen recompiled on different dates or with different names, but the same functionality. Key signatures include a specific set of functions (some of which can be used with the OS-provided rundll32.exe tool to install the malware as a service), and hardcoded strings used in communication with C2 servers to issue commands to the implant.

The tag is: *misp-galaxy:tool="WEBC2-Y21K"*

Table 5331. Table References

<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## WEBC2-YAHOO

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-YAHOO variant enters a loop where every ten minutes it attempts to download a web page that may contain an encoded URL. The encoded URL will be found in the pages returned inside an attribute named 'sb' or 'ex' within a tag named 'yahoo'. The embedded link can direct the malware to download and execute files.

The tag is: *misp-galaxy:tool="WEBC2-YAHOO"*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## HAYMAKER

HAYMAKER is a backdoor that can download and execute additional payloads in the form of modules. It also conducts basic victim profiling activity, collecting the computer name, running process IDs, %TEMP% directory path and version of Internet Explorer. It communicates encoded system information to a single hard coded command and control (C2) server, using the system's default User-Agent string.

The tag is: *misp-galaxy:tool="HAYMAKER"*

HAYMAKER has relationships with:

- similar: *misp-galaxy:mitre-malware="ChChes - S0144"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="ChChes"* with *estimative-language:likelihood-probability="likely"*

## BUGJUICE

BUGJUICE is a backdoor that is executed by launching a benign file and then hijacking the search order to load a malicious dll into it. That malicious dll then loads encrypted shellcode from the binary, which is decrypted and runs the final BUGJUICE payload. BUGJUICE defaults to TCP using a custom binary protocol to communicate with the C2, but can also use HTTP and HTTPS if directed by the C2. It has the capability to find files, enumerate drives, exfiltrate data, take screenshots and provide a reverse shell.

The tag is: *misp-galaxy:tool="BUGJUICE"*

BUGJUICE has relationships with:

- similar: misp-galaxy:rat="RedLeaves" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:mitre-malware="RedLeaves - S0153" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:malpedia="RedLeaves" with estimative-language:likelihood-probability="likely"

## SNUGRIDE

SNUGRIDE is a backdoor that communicates with its C2 server through HTTP requests. Messages are encrypted using AES with a static key. The malware's capabilities include taking a system survey, access to the filesystem, executing commands and a reverse shell. Persistence is maintained through a Run registry key.

The tag is: *misp-galaxy:tool="SNUGRIDE"*

SNUGRIDE has relationships with:

- similar: misp-galaxy:mitre-malware="SNUGRIDE - S0159" with estimative-language:likelihood-probability="likely"

## QUASARRAT

QUASARRAT is an open-source RAT available at <https://github.com/quasar/QuasarRat> . The versions used by APT10 (1.3.4.0, 2.0.0.0, and 2.0.0.1) are not available via the public GitHub page, indicating that APT10 has further customized the open source version. The 2.0 versions require a dropper to decipher and launch the AES encrypted QUASARRAT payload. QUASARRAT is a fully functional .NET backdoor that has been used by multiple cyber espionage groups in the past.

The tag is: *misp-galaxy:tool="QUASARRAT"*

# da Vinci RCS

Hacking Team's "DaVinci" Remote Control System is able, the company says, to break encryption and allow law enforcement agencies to monitor encrypted files and emails (even ones encrypted with PGP), Skype and other Voice over IP or chat communication. It allows identification of the target's location and relationships. It can also remotely activate microphones and cameras on a computer and works worldwide. Hacking Team claims that its software is able to monitor hundreds of thousands of computers at once, all over the country. Trojans are available for Windows, Mac, Linux, iOS, Android, Symbian and Blackberry.

The tag is: *misp-galaxy:tool="da Vinci RCS"*

da Vinci RCS is also known as:

- DaVinci
- Morcut

# FlexSpy

covert surveillance tools

The tag is: *misp-galaxy:tool="FlexSpy"*

## feodo

Unfortunately, it is time to meet 'Feodo'. Since august of this year when FireEye's MPS devices detected this malware in the field, we have been monitoring this banking trojan very closely. In many ways, this malware looks similar to other famous banking trojans like Zbot and SpyEye. Although my analysis says that this malware is not a toolkit and is in the hands of a single criminal group.

The tag is: *misp-galaxy:tool="feodo"*

*Table 5370. Table References*

Links
<a href="https://www.fireeye.com/blog/threat-research/2010/10/feodosoff-a-new-botnet-on-the-rise.html">https://www.fireeye.com/blog/threat-research/2010/10/feodosoff-a-new-botnet-on-the-rise.html</a>

## Cardinal RAT

Palo Alto Networks has discovered a previously unknown remote access Trojan (RAT) that has been active for over two years. It has a very low volume in this two-year period, totaling roughly 27 total samples. The malware is delivered via an innovative and unique technique: a downloader we are calling Carp uses malicious macros in Microsoft Excel documents to compile embedded C# (C Sharp) Programming Language source code into an executable that in turn is run to deploy the Cardinal RAT malware family. These malicious Excel files use a number of different lures, providing evidence of what attackers are using to entice victims into executing them.

The tag is: *misp-galaxy:tool="Cardinal RAT"*

Cardinal RAT has relationships with:

- similar: *misp-galaxy:tool="EVILNUM"* with *estimative-language:likelihood-probability="likely"*

*Table 5371. Table References*

<a href="http://researchcenter.paloaltonetworks.com/2017/04/unit42-cardinal-rat-active-two-years/">http://researchcenter.paloaltonetworks.com/2017/04/unit42-cardinal-rat-active-two-years/</a>

## REDLEAVES

The REDLEAVES implant consists of three parts: an executable, a loader, and the implant shellcode. The REDLEAVES implant is a remote administration Trojan (RAT) that is built in Visual C++ and makes heavy use of thread generation during its execution. The implant contains a number of functions typical of RATs, including system enumeration and creating a remote shell back to the C2.

The tag is: *misp-galaxy:tool="REDLEAVES"*

Table 5372. Table References

Links
<a href="https://www.us-cert.gov/ncas/alerts/TA17-117A">https://www.us-cert.gov/ncas/alerts/TA17-117A</a>

## Kazuar

Kazuar is a fully featured backdoor written using the .NET Framework and obfuscated using the open source packer called ConfuserEx. Unit 42 researchers have uncovered a backdoor Trojan used in an espionage campaign. The developers refer to this tool by the name Kazuar, which is a Trojan written using the Microsoft .NET Framework that offers actors complete access to compromised systems targeted by its operator. Kazuar includes a highly functional command set, which includes the ability to remotely load additional plugins to increase the Trojan's capabilities. During our analysis of this malware we uncovered interesting code paths and other artifacts that may indicate a Mac or Unix variant of this same tool also exists. Also, we discovered a unique feature within Kazuar: it exposes its capabilities through an Application Programming Interface (API) to a built-in webserver. We suspect the Kazuar tool may be linked to the Turla threat actor group (also known as Uroburos and Snake), who have been reported to have compromised embassies, defense contractors, educational institutions, and research organizations across the globe. A hallmark of Turla operations is iterations of their tools and code lineage in Kazuar can be traced back to at least 2005. If the hypothesis is correct and the Turla threat group is using Kazuar, we believe they may be using it as a replacement for Carbon and its derivatives. Of the myriad of tools observed in use by Turla Carbon and its variants were typically deployed as a second stage backdoor within targeted environments and we believe Kazuar may now hold a similar role for Turla operations.

The tag is: *misp-galaxy:tool="Kazuar"*

Kazuar has relationships with:

- similar: *misp-galaxy:malpedia="Kazuar"* with *estimative-language:likelihood-probability="likely"*

## Hackshit

Netskope Threat Research Labs recently discovered a Phishing-as-a-Service (PhaaS) platform named Hackshit, that records the credentials of the phished bait victims. The phished bait pages are packaged with base64 encoding and served from secure (HTTPS) websites with “.moe” top level domain (TLD) to evade traditional scanners. “.moe” TLD is intended for the purpose of ‘The marketing of products or services deemed’. The victim’s credentials are sent to the Hackshit PhaaS platform via websockets. The Netskope Active Platform can proactively protect customers by creating custom applications and a policy to block all the activities related to Hackshit PhaaS.

## Loki Bot

Loki Bot is a commodity malware sold on underground sites which is designed to steal private data from infected machines, and then submit that info to a command and control host via HTTP POST. This private data includes stored passwords, login credential information from Web browsers, and a variety of cryptocurrency wallets.

The tag is: *misp-galaxy:tool="Loki Bot"*

Table 5381. Table References

Links
<a href="https://phishme.com/loki-bot-malware/">https://phishme.com/loki-bot-malware/</a>

## KONNI

Talos has discovered an unknown Remote Administration Tool that we believe has been in use for

over 3 years. During this time it has managed to avoid scrutiny by the security community. The current version of the malware allows the operator to steal files, keystrokes, perform screenshots, and execute arbitrary code on the infected host. Talos has named this malware KONNI. Throughout the multiple campaigns observed over the last 3 years, the actor has used an email attachment as the initial infection vector. They then use additional social engineering to prompt the target to open a .scr file, display a decoy document to the users, and finally execute the malware on the victim's machine. The malware infrastructure of the analysed samples was hosted by a free web hosting provider: 000webhost. The malware has evolved over time. In this article, we will analyse this evolution:

The tag is: *misp-galaxy:tool="KONNI"*

KONNI has relationships with:

## NOKKI

Beginning in early 2018, Unit 42 observed a series of attacks using a previously unreported malware family, which we have named 'NOKKI'. The malware in question has ties to a previously reported malware family named KONNI, however, after careful consideration, we believe enough differences are present to introduce a different malware family name. To reflect the close relationship with KONNI, we chose NOKKI, swapping KONNI's Ns and Ks. Because of code overlap found within both malware families, as well as infrastructure overlap, we believe the threat actors responsible for KONNI are very likely also responsible for NOKKI. Previous reports stated it was likely KONNI had been in use for over three years in multiple campaigns with a heavy interest in the Korean peninsula and surrounding areas. As of this writing, it is not certain if the KONNI or NOKKI operators are related to known adversary groups operating in the regions of interest, although there is evidence of a tenuous relationship with a group known as Reaper.

The tag is: *misp-galaxy:tool="NOKKI"*

---

## TwoFace

While investigating a recent security incident, Unit 42 found a webshell that we believe was used by the threat actor to remotely access the network of a targeted Middle Eastern organization. The construction of the webshell was interesting by itself, as it was actually two separate webshells: an initial webshell that was responsible for saving and loading the second fully functional webshell. It is this second webshell that enabled the threat actor to run a variety of commands on the compromised server. Due to these two layers, we use the name TwoFace to track this webshell. During our analysis, we extracted the commands executed by the TwoFace webshell from the server logs on the compromised server. Our analysis shows that the commands issued by the threat actor date back to June 2016; this suggests that the actor had access to this shell for almost an entire year. The commands issued show the actor was interested in gathering credentials from the compromised server using the Mimikatz tool. We also saw the attacker using the TwoFace webshell to move laterally through the network by copying itself and other webshells to other servers.

The tag is: *misp-galaxy:tool="TwoFace"*

*Table 5387. Table References*

---

## IntrudingDivisor

Like TwoFace, the IntrudingDivisor webshell requires the threat actor to authenticate before issuing commands. To authenticate, the actor must provide two pieces of information, first an integer that is divisible by 5473 and a string whose MD5 hash is "9A26A0E7B88940DAA84FC4D5E6C61AD0". Upon successful authentication, the webshell has a command handler that uses integers within the request to determine the command to execute - To complete

## ShadowPad

ShadowPad is a modular cyber-attack platform that attackers deploy in victim networks to gain flexible remote control capabilities. The platform is designed to run in two stages. The first stage is a shellcode that was embedded in a legitimate `nssock2.dll` used by Xshell, Xmanager and other software packages produced by NetSarang. This stage is responsible for connecting to “validation” command and control (C&C) servers and getting configuration information including the location of the real C&C server, which may be unique per victim. The second stage acts as an orchestrator for five main modules responsible for C&C communication, working with the DNS protocol, loading and injecting additional plugins into the memory of other processes.

The tag is: *misp-galaxy:tool="ShadowPad"*

ShadowPad has relationships with:

## Silence

In September 2017, we discovered a new targeted attack on financial institutions. Victims are mostly Russian banks but we also found infected organizations in Malaysia and Armenia. The attackers were using a known but still very effective technique for cybercriminals looking to make money: gaining persistent access to an internal banking network for a long period of time, making video recordings of the day to day activity on bank employees' PCs, learning how things works in their target banks, what software is being used, and then using that knowledge to steal as much money as possible when ready. We saw that technique before in Carbanak, and other similar cases worldwide. The infection vector is a spear-phishing email with a malicious attachment. An interesting point in the Silence attack is that the cybercriminals had already compromised banking infrastructure in order to send their spear-phishing emails from the addresses of real bank employees and look as unsuspecting as possible to future victims.

The tag is: *misp-galaxy:tool="Silence"*

Silence has relationships with:

## Volgmer

Volgmer is a backdoor Trojan designed to provide covert access to a compromised system. Since at least 2013, HIDDEN COBRA actors have been observed using Volgmer malware in the wild to target the government, financial, automotive, and media industries. It is suspected that spear phishing is the primary delivery mechanism for Volgmer infections; however, HIDDEN COBRA actors use a suite of custom tools, some of which could also be used to initially compromise a system. Therefore, it is possible that additional HIDDEN COBRA malware may be present on network infrastructure compromised with Volgmer

The tag is: *misp-galaxy:tool="Volgmer"*

Volgmer has relationships with:

- similar: *misp-galaxy:mitre-malware="Volgmer - S0180"* with *estimative-language:likelihood-*

probability="likely"

- similar: `misp-galaxy:rat="FALLCHILL"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:mitre-malware="FALLCHILL - S0181"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:malpedia="Volgmer"` with `estimative-language:likelihood-probability="likely"`

## Nymaim

Nymaim is a 2-year-old strain of malware most closely associated with ransomware. We have seen recent attacks spreading it using an established email marketing service provider to avoid blacklists and detection tools. But instead of ransomware, the malware is now being used to distribute banking Trojans

The tag is: `misp-galaxy:tool="Nymaim"`

Nymaim has relationships with:

- similar: `misp-galaxy:malpedia="Nymaim"` with `estimative-language:likelihood-probability="likely"`

Table 5400. Table References

## GootKit

As was the case earlier, the bot Gootkit is written in NodeJS, and is downloaded to a victim computer via a chain of downloaders. The main purpose of the bot also remained the same – to steal banking data. The new Gootkit version, detected in September, primarily targets clients of European banks, including those in Germany, France, Italy, the Netherlands, Poland, etc.

The tag is: `misp-galaxy:tool="GootKit"`

GootKit is also known as:

- Gootkit

GootKit has relationships with:

- similar: `misp-galaxy:malpedia="GootKit"` with `estimative-language:likelihood-probability="likely"`

Table 5401. Table References

<https://www.welivesecurity.com/2017/12/08/strongpity-like-spyware-replaces-finfisher/>

## wp-vcd

WordPress site owners should be on the lookout for a malware strain tracked as wp-vcd that hides in legitimate WordPress files and that is used to add a secret admin user and grant attackers control over infected sites. The malware was first spotted online over the summer by Italian security researcher Manuel D’Orso. The initial version of this threat was loaded via an include call for the wp-vcd.php file —hence the malware’s name— and injected malicious code into WordPress core files such as functions.php and class.wp.php. This was not a massive campaign, but attacks continued throughout the recent months.

The tag is: *misp-galaxy:tool="wp-vcd"*

*Table 5405. Table References*

# SSHDoor

The Secure Shell Protocol (SSH) is a very popular protocol used for secure data communication. It is widely used in the Unix world to manage remote servers, transfer files, etc. The modified SSH daemon described here, Linux/SSHDoor.A, is designed to steal usernames and passwords and allows remote access to the server via either an hardcoded password or SSH key.

The tag is: *misp-galaxy:tool="SSHDoor"*

SSHDoor has relationships with:

- similar: *misp-galaxy:malpedia="SSHDoor" with estimative-language:likelihood-probability="likely"*

*Table 5408. Table References*

<a href="https://www.welivesecurity.com/2013/01/24/linux-sshdoor-a-backdoored-ssh-daemon-that-steals-passwords/">https://www.welivesecurity.com/2013/01/24/linux-sshdoor-a-backdoored-ssh-daemon-that-steals-passwords/</a>

# TRISIS

(Dragos Inc.) The team identifies this malware as TRISIS because it targets Schneider Electric's Triconex safety instrumented system (SIS) enabling the replacement of logic in final control elements. TRISIS is highly targeted and likely does not pose an immediate threat to other Schneider Electric customers, let alone other SIS products. (FireEye Inc.) This malware, which we call TRITON,

is an attack framework built to interact with Triconex Safety Instrumented System (SIS) controllers. We have not attributed the incident to a threat actor, though we believe the activity is consistent with a nation state preparing for an attack. TRITON is one of a limited number of publicly identified malicious software families targeted at industrial control systems (ICS). It follows Stuxnet which was used against Iran in 2010 and Industroyer which we believe was deployed by Sandworm Team against Ukraine in 2016.

The tag is: *misp-galaxy:tool="TRISIS"*

TRISIS is also known as:

- TRITON

## Satori

According to a report Li shared with Bleeping Computer today, the Mirai Satori variant is quite different from all previous pure Mirai variants. Previous Mirai versions infected IoT devices and then downloaded a Telnet scanner component that attempted to find other victims and infect them with the Mirai bot. The Satori variant does not use a scanner but uses two embedded exploits that will try to connect to remote devices on ports 37215 and 52869. Effectively, this makes Satori an IoT worm, being able to spread by itself without the need for separate components.

The tag is: `misp-galaxy:tool="Satori"`

Satori is also known as:

- Okiru

Satori has relationships with:

- similar: misp-galaxy:botnet="Satori" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:malpedia="Satori" with estimative-language:likelihood-probability="likely"

Table 5414. Table References

<a href="https://blog.fortinet.com/2017/12/12/rise-of-one-more-mirai-worm-variant">https://blog.fortinet.com/2017/12/12/rise-of-one-more-mirai-worm-variant</a>

## PowerSpritz

PowerSpritz is a Windows executable that hides both its legitimate payload and malicious PowerShell command using a non-standard implementation of the already rarely used Spritz encryption algorithm (see the Attribution section for additional analysis of the Spritz implementation). This malicious downloader has been observed being delivered via spearphishing attacks using the TinyCC link shortener service to redirect to likely attacker-controlled servers hosting the malicious PowerSpritz payload.

The tag is: *misp-galaxy:tool="PowerSpritz"*

Table 5415. Table References

Links
<a href="https://www.proofpoint.com/sites/default/files/pfpt-us-wp-north-korea-bitten-by-bitcoin-bug.pdf">https://www.proofpoint.com/sites/default/files/pfpt-us-wp-north-korea-bitten-by-bitcoin-bug.pdf</a>

## PowerRatankba

PowerRatankba is used for the same purpose as Ratankba: as a first stage reconnaissance tool and for the deployment of further stage implants on targets that are deemed interesting by the actor. Similar to its predecessor, PowerRatankba utilizes HTTP for its C&C communication.

The tag is: *misp-galaxy:tool="PowerRatankba"*

PowerRatankba has relationships with:

- similar: misp-galaxy:malpedia="PowerRatankba" with estimative-language:likelihood-probability="likely"

Table 5416. Table References

# Ratankba

In one instance we observed, one of the initial malware delivered to the victim, RATANKBA, connects to a legitimate but compromised website from which a hack tool (nbt\_scan.exe) is also downloaded. The domain also serves as one of the campaign's platform for C&C communication. The threat actor uses RATANKBA to survey the lay of the land as it looks into various aspects of the host machine where it has been initially downloaded—the machine that has been victim of the watering hole attack. Information such as the running tasks, domain, shares, user information, if the host has default internet connectivity, and so forth.

The tag is: *misp-galaxy:tool="Ratankba"*

## MacDownloader

Iranian macOS exfiltration agent, targeting the 'defense industrial base' and human rights advocates.

The tag is: *misp-galaxy:tool="MacDownloader"*

MacDownloader is also known as:

- iKitten

MacDownloader has relationships with:

- similar: `misp-galaxy:malpedia="MacDownloader"` with `estimative-language:likelihood-probability="likely"`

Table 5422. Table References

Links
<a href="https://objective-see.com/blog/blog_0x25.html#MacDownloader">https://objective-see.com/blog/blog_0x25.html#MacDownloader</a>

## Empyre

The open-source macOS backdoor, 'Empyre', maliciously packaged into a macro'd Word document

The tag is: `misp-galaxy:tool="Empyre"`

Empyre is also known as:

- Empye

Table 5423. Table References

Links
<a href="https://objective-see.com/blog/blog_0x25.html#Empyre">https://objective-see.com/blog/blog_0x25.html#Empyre</a>

## Proton

A fully-featured macOS backdoor, designed to collect and exfiltrate sensitive user data such as 1Password files, browser login data, and keychains.

The tag is: `misp-galaxy:tool="Proton"`

Table 5424. Table References

Links
<a href="https://objective-see.com/blog/blog_0x25.html#Proton">https://objective-see.com/blog/blog_0x25.html#Proton</a>

## Mughthesec

Adware which hijacks a macOS user's homepage to redirect search queries.

The tag is: `misp-galaxy:tool="Mughthesec"`

Mughthesec has relationships with:

- similar: `misp-galaxy:malpedia="Mughthesec"` with `estimative-language:likelihood-probability="likely"`

Table 5425. Table References

Links
<a href="https://objective-see.com/blog/blog_0x25.html">https://objective-see.com/blog/blog_0x25.html</a>

# Pwnet

A macOS crypto-currency miner, distributed via a trojaned 'CS-GO' hack.

The tag is: *misp-galaxy:tool="Pwnet"*

Pwnet has relationships with:

- similar: misp-galaxy:malpedia="Pwnet" with estimative-language:likelihood-probability="likely"

Table 5426. Table References

Links
<a href="https://objective-see.com/blog/blog_0x25.html">https://objective-see.com/blog/blog_0x25.html</a>

# CpuMeaner

A macOS crypto-currency mining trojan.

The tag is: *misp-galaxy:tool="CpuMeaner"*

CpuMeaner has relationships with:

- similar: misp-galaxy:malpedia="CpuMeaner" with estimative-language:likelihood-probability="likely"

Table 5427. Table References

Links
<a href="https://objective-see.com/blog/blog_0x25.html">https://objective-see.com/blog/blog_0x25.html</a>

# Travle

The Travle sample found during our investigation was a DLL with a single exported function (MSOProtect). The malware name Travle was chosen given a string found in early samples of this family: "Travle Path Failed!". This typo was replaced with correct word "Travel" in newer releases. We believe that Travle could be a successor to the NetTraveler family.

The tag is: *misp-galaxy:tool="Travle"*

Travle is also known as:

- PYLOT

Table 5428. Table References

Links
<a href="https://securelist.com/travle-aka-pylot-backdoor-hits-russian-speaking-targets/83455/">https://securelist.com/travle-aka-pylot-backdoor-hits-russian-speaking-targets/83455/</a>

# Digmine

Digmine is coded in AutoIt, and sent to would-be victims posing as a video file but is actually an AutoIt executable script. If the user's Facebook account is set to log in automatically, Digmine will manipulate Facebook Messenger in order to send a link to the file to the account's friends. The abuse of Facebook is limited to propagation for now, but it wouldn't be implausible for attackers to hijack the Facebook account itself down the line. This functionality's code is pushed from the command-and-control (C&C) server, which means it can be updated.

The tag is: *misp-galaxy:tool="Digmine"*

Table 5429. Table References

Links
<a href="https://blog.trendmicro.com/trendlabs-security-intelligence/digmine-cryptocurrency-miner-spreading-via-facebook-messenger/">https://blog.trendmicro.com/trendlabs-security-intelligence/digmine-cryptocurrency-miner-spreading-via-facebook-messenger/</a>

# TSCookie

TSCookie itself only serves as a downloader. It expands functionality by downloading modules from C&C servers. The sample that was examined downloaded a DLL file which has exfiltrating function among many others (hereafter "TSCookieRAT"). Downloaded modules only runs on memory.

The tag is: *misp-galaxy:tool="TSCookie"*

TSCookie has relationships with:

- similar: *misp-galaxy:malpedia="PLEAD"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:tool="PLEAD"* with *estimative-language:likelihood-probability="likely"*

## Rotinom

W32.Rotinom is a worm that spreads by copying itself to removable drives.

The tag is: *misp-galaxy:tool="Rotinom"*

Table 5432. Table References

Links
<a href="https://www.symantec.com/security_response/writeup.jsp?docid=2011-011117-0057-99">https://www.symantec.com/security_response/writeup.jsp?docid=2011-011117-0057-99</a>

## Aurora

You probably have heard the recent news about a widespread attack that was carried out using a 0-Day exploit for Internet Explorer as one of the vectors. This exploit is also known as the "Aurora Exploit". The code has recently gone public and it was also added to the Metasploit framework. This exploit was used to deliver a malicious payload, known by the name of Trojan.Hydraq, the main purpose of which was to steal information from the compromised computer and report it back to the attackers. The exploit code makes use of known techniques to exploit a vulnerability that exists in the way Internet Explorer handles a deleted object. The final purpose of the exploit itself is to access an object that was previously deleted, causing the code to reference a memory location over which the attacker has control and in which the attacker dropped his malicious code.

The tag is: *misp-galaxy:tool="Aurora"*

Aurora is also known as:

- Hydraq

Aurora has relationships with:

- similar: *misp-galaxy:mitre-malware="Hydraq - S0203"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="9002 RAT"* with *estimative-language:likelihood-probability="likely"*

## Cheshire Cat

Oldest Cheshire Cat malware compiled in 2002. It's a very old family of malware. The time stamps

may be forged but the malware does have support for very old operating systems. The 2002 implant retrieves a handle for an asr2892 drives that they never got their hands on. It checks for a NE header which is a header type used before PE headers even existed. References to 16bit or DOS on a non 9x platform. This malware implant IS REALLY for old systems. The malware is for espionage - it's very carefully made to stay hidden. Newer versions install as icon handler shell extension for .lnk files. Shell in this case means the program manager because windows explorer was not yet a thing. It sets up COM server objects. It looks like it was written in pure C, but made to look like C++. A sensitive implant as well: it checks for all kinds of old MS platforms including Windows NT, win95, win98, winME and more. It checks the patch level as well. A lot of effort was put into adapting this malware to a lot of different operating systems with very granular decision chains.

The tag is: *misp-galaxy:tool="Cheshire Cat"*

## miniFlame

Newly discovered spying malware designed to steal data from infected systems was likely built from the same cyber-weaponry factory that produced two other notorious cyberespionage software Flame and Gauss, a security vendor says. Kaspersky Lab released a technical paper Monday outlining the discovery of the malware the vendor has dubbed "miniFlame." While capable of working with Flame and Gauss, miniFlame is a "small, fully functional espionage module designed for data theft and direct access to infected systems," Kaspersky said.

The tag is: *misp-galaxy:tool="miniFlame"*

## Neuron

Neuron consists of both client and server components. The Neuron client and Neuron service are written using the .NET framework with some codebase overlaps. The Neuron client is used to infect victim endpoints and extract sensitive information from local client machines. The Neuron server is used to infect network infrastructure such as mail and web servers, and acts as local Command & Control (C2) for the client component. Establishing a local C2 limits interaction with the target network and remote hosts. It also reduces the log footprint of actor infrastructure and enables client interaction to appear more convincing as the traffic is contained within the target network.

The tag is: *misp-galaxy:tool="Neuron"*

Neuron has relationships with:

- similar: *misp-galaxy:malpedia="Neuron"* with *estimative-language:likelihood-probability="likely"*

*Table 5439. Table References*

### Links

## Nautilus

Nautilus is very similar to Neuron both in the targeting of mail servers and how client communications are performed. This malware is referred to as Nautilus due to its embedded internal DLL name “nautilus-service.dll”, again sharing some resemblance to Neuron. The Nautilus service listens for HTTP requests from clients to process tasking requests such as executing commands, deleting files and writing files to disk

The tag is: *misp-galaxy:tool="Nautilus"*

Nautilus has relationships with:

- similar: *misp-galaxy:malpedia="Nautilus"* with *estimative-language:likelihood-probability="likely"*

*Table 5440. Table References*

## Gamut Botnet

Gamut was found to be downloaded by a Trojan Downloader that arrives as an attachment from a spam email message. The bot installation is quite simple. After the malware binary has been downloaded, it launches itself from its current directory, usually the Windows %Temp% folder and installs itself as a Windows service. The malware utilizes an anti-VM (virtual machine) trick and terminates itself if it detects that it is running in a virtual machine environment. The bot uses INT 03h trap sporadically in its code, an anti-debugging technique which prevents its code from running within a debugger environment. It can also determine if it is being debugged by using the Kernel32 API - IsDebuggerPresent function.

The tag is: *misp-galaxy:tool="Gamut Botnet"*

# DOGCALL

DOGCALL is a backdoor commonly distributed as an encoded binary file downloaded and decrypted by shellcode following the exploitation of weaponized documents. DOGCALL is capable of capturing screenshots, logging keystrokes, evading analysis with anti-virtual machine detections, and leveraging cloud storage APIs such as Cloud, Box, Dropbox, and Yandex. DOGCALL was used to target South Korean Government and military organizations in March and April 2017. The malware is typically dropped using an HWP exploit in a lure document. The wiper tool, RUHAPPY, was found on some of the systems targeted by DOGCALL. While DOGCALL is primarily an espionage tool, RUHAPPY is a destructive wiper tool meant to render systems inoperable.

The tag is: *misp-galaxy:tool="DOGCALL"*

DOGCALL is also known as:

- FE\_APT\_RAT\_DOGCALL
- FE\_APT\_Backdoor\_Win32\_DOGCALL\_1
- APT.Backdoor.Win.DOGCALL

DOGCALL has relationships with:

- similar: *misp-galaxy:mitre-malware="DOGCALL - S0213"* with *estimative-language:likelihood-probability="likely"*

# GELCAPSULE

GELCAPSULE is a downloader traditionally dropped or downloaded by an exploit document. GELCAPSULE has been observed downloading SLOWDRIFT to victim systems.

The tag is: *misp-galaxy:tool="GELCAPSULE"*

GELCAPSULE is also known as:

- FE\_APT\_Downloader\_Win32\_GELCAPSULE\_1

*Table 5444. Table References*

Links
<a href="https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf">https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf</a>

# HAPPYWORK

HAPPYWORK is a malicious downloader that can download and execute a second-stage payload, collect system information, and beacon it to the command and control domains. The collected system information includes: computer name, user name, system manufacturer via registry, IsDebuggerPresent state, and execution path. In November 2016, HAPPYWORK targeted government and financial targets in South Korea.

The tag is: *misp-galaxy:tool="HAPPYWORK"*

HAPPYWORK is also known as:

- FE\_APT\_Downloader\_HAPPYWORK
- FE\_APT\_Exploit\_HWP\_Happy
- Downloader.APT.HAPPYWORK

HAPPYWORK has relationships with:

- similar: *misp-galaxy:mitre-malware="HAPPYWORK - S0214"* with *estimative-language:likelihood-probability="likely"*

*Table 5445. Table References*

Links
<a href="https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf">https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf</a>

# KARAE

Karae backdoors are typically used as first-stage malware after an initial compromise. The backdoors can collect system information, upload and download files, and may be used to retrieve a second-stage payload. The malware uses public cloud-based storage providers for command and control. In March 2016, KARAE malware was distributed through torrent file-sharing websites for South Korean users. During this campaign, the malware used a YouTube video downloader application as a lure.

The tag is: *misp-galaxy:tool="KARAE"*

KARAE is also known as:

- FE\_APT\_Backdoor\_Karae\_enc
- FE\_APT\_Backdoor\_Karae
- Backdoor.APT.Karae

KARAE has relationships with:

- similar: *misp-galaxy:mitre-malware="KARAE - S0215"* with *estimative-language:likelihood-probability="likely"*

*Table 5446. Table References*

Links

## MILKDROP

MILKDROP is a launcher that sets a persistence registry key and launches a backdoor.

The tag is: *misp-galaxy:tool="MILKDROP"*

MILKDROP is also known as:

- FE\_Trojan\_Win32\_MILKDROP\_1

*Table 5447. Table References*

Links

[https://www2.fireeye.com/rs/848-DID-242/images/rpt\\_APT37.pdf](https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf)

## POORAIM

POORAIM malware is designed with basic backdoor functionality and leverages AOL Instant Messenger for command and control communications. POORAIM includes the following capabilities: System information enumeration, File browsing, manipulation and exfiltration, Process enumeration, Screen capture, File execution, Exfiltration of browser favorites, and battery status. Exfiltrated data is sent via files over AIM. POORAIM has been involved in campaigns against South Korean media organizations and sites relating to North Korean refugees and defectors since early 2014. Compromised sites have acted as watering holes to deliver newer variants of POORAIM.

The tag is: *misp-galaxy:tool="POORAIM"*

POORAIM is also known as:

- Backdoor.APT.POORAIM

POORAIM has relationships with:

- similar: *misp-galaxy:mitre-malware="POORAIM - S0216"* with *estimative-language:likelihood-probability="likely"*

*Table 5448. Table References*

Links

[https://www2.fireeye.com/rs/848-DID-242/images/rpt\\_APT37.pdf](https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf)

## RICECURRY

RICECURRY is a Javascript based profiler used to fingerprint a victim's web browser and deliver malicious code in return. Browser, operating system, and Adobe Flash version are detected by RICECURRY, which may be a modified version of PluginDetect.

The tag is: *misp-galaxy:tool="RICECURRY"*

RICECURRY is also known as:

- Exploit.APT.RICECURRY

*Table 5449. Table References*

<a href="https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf">https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf</a>

## RUHAPPY

RUHAPPY is a destructive wiper tool seen on systems targeted by DOGCALL. It attempts to overwrite the MBR, causing the system not to boot. When victims' systems attempt to boot, the string 'Are you Happy?' is displayed. The malware is believed to be tied to the developers of DOGCALL and HAPPYWORK based on similar PDB paths in all three.

The tag is: *misp-galaxy:tool="RUHAPPY"*

RUHAPPY is also known as:

- FE\_APT\_Trojan\_Win32\_RUHAPPY\_1

*Table 5450. Table References*

Links
<a href="https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf">https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf</a>

## SHUTTERSPEED

SHUTTERSPEED is a backdoor that can collect system information, acquire screenshots, and download/execute an arbitrary executable. SHUTTERSPEED typically requires an argument at runtime in order to execute fully. Observed arguments used by SHUTTERSPEED include: 'help', 'console', and 'sample'. The spear phishing email messages contained documents exploiting RTF vulnerability CVE-2017-0199. Many of the compromised domains in the command and control infrastructure are linked to South Korean companies. Most of these domains host a fake webpage pertinent to targets.

The tag is: *misp-galaxy:tool="SHUTTERSPEED"*

SHUTTERSPEED is also known as:

- FE\_APT\_Backdoor\_SHUTTERSPEED
- APT.Backdoor.SHUTTERSPEED

SHUTTERSPEED has relationships with:

- similar: *misp-galaxy:mitre-malware="SHUTTERSPEED - S0217"* with *estimative-language:likelihood-probability="likely"*

Table 5451. Table References

Links
<a href="https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf">https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf</a>

## SLOWDRIFT

SLOWDRIFT is a launcher that communicates via cloud based infrastructure. It sends system information to the attacker command and control and then downloads and executes additional payloads. Lure documents distributing SLOWDRIFT were not tailored for specific victims, suggesting that TEMP.Reaper is attempting to widen its target base across multiple industries and in the private sector. SLOWDRIFT was seen being deployed against academic and strategic targets in South Korea using lure emails with documents leveraging the HWP exploit. Recent SLOWDRIFT samples were uncovered in June 2017 with lure documents pertaining to cyber crime prevention and news stories. These documents were last updated by the same actor who developed KARAE, POORAIM and ZUMKONG.

The tag is: *misp-galaxy:tool="SLOWDRIFT"*

SLOWDRIFT is also known as:

- FE\_APT\_Downloader\_Win\_SLOWDRIFT\_1
- FE\_APT\_Downloader\_Win\_SLOWDRIFT\_2
- APT.Downloader.SLOWDRIFT

SLOWDRIFT has relationships with:

- similar: misp-galaxy:mitre-malware="SLOWDRIFT - S0218" with estimative-language:likelihood-probability="likely"

[https://www2.fireeye.com/rs/848-DID-242/images/rpt\\_APT37.pdf](https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf)

## WINERACK

WINERACK is backdoor whose primary features include user and host information gathering, process creation and termination, filesystem and registry manipulation, as well as the creation of a reverse shell that utilizes statically-linked Wine cmd.exe code to emulate Windows command prompt commands. Other capabilities include the enumeration of files, directories, services, active windows and processes.

The tag is: *misp-galaxy:tool="WINERACK"*

WINERACK is also known as:

- FE\_APT\_Backdoor\_WINERACK
- Backdoor.APT.WINERACK

WINERACK has relationships with:

- similar: *misp-galaxy:mitre-malware="WINERACK - S0219"* with *estimative-language:likelihood-probability="likely"*

## RoyalCli

The RoyalCli backdoor appears to be an evolution of BS2005 and uses familiar encryption and

encoding routines. The name RoyalCli was chosen by us due to a debugging path left in the binary: 'c:\users\wizard\documents\visual studio 2010\Projects\RoyalCli\Release\RoyalCli.pdb' RoyalCli and BS2005 both communicate with the attacker's command and control (C2) through Internet Explorer (IE) by using the COM interface IWebBrowser2. Due to the nature of the technique, this results in C2 data being cached to disk by the IE process; we'll get to this later.

The tag is: *misp-galaxy:tool="RoyalCli"*

RoyalCli has relationships with:

- similar: misp-galaxy:malpedia="RoyalCli" with estimative-language:likelihood-probability="likely"

*Table 5456. Table References*

## KillDisk Wiper

KillDisk, along with the multipurpose, cyberespionage-related BlackEnergy, was used in cyberattacks in late December 2015 against Ukraine's energy sector as well as its banking, rail, and mining industries. The malware has since metamorphosed into a threat used for digital extortion, affecting Windows and Linux platforms. The note accompanying the ransomware versions, like in

the case of Petya, was a ruse: Because KillDisk also overwrites and deletes files (and don't store the encryption keys on disk or online), recovering the scrambled files was out of the question. The new variant we found, however, does not include a ransom note.

The tag is: *misp-galaxy:tool="KillDisk Wiper"*

KillDisk Wiper is also known as:

- KillDisk

KillDisk Wiper has relationships with:

- similar: *misp-galaxy:malpedia="KillDisk"* with *estimative-language:likelihood-probability="likely"*

## UselessDisk

A new MBR bootlocker called DiskWriter, or UselessDisk, has been discovered that overwrites the MBR of a victim's computer and then displays a ransom screen on reboot instead of booting into Windows. This ransom note asks for \$300 in bitcoins in order to gain access to Windows again. Might be a wiper.

The tag is: *misp-galaxy:tool="UselessDisk"*

UselessDisk is also known as:

- DiskWriter

*Table 5460. Table References*

Links
<a href="https://www.bleepingcomputer.com/news/security/the-diskwriter-or-uselessdisk-bootlocker-may-be-a-wiper/">https://www.bleepingcomputer.com/news/security/the-diskwriter-or-uselessdisk-bootlocker-may-be-a-wiper/</a>

## GoScanSSH

During a recent Incident Response (IR) engagement, Talos identified a new malware family that was being used to compromise SSH servers exposed to the internet. This malware, which we have named GoScanSSH, was written using the Go programming language, and exhibited several interesting characteristics. This is not the first malware family that Talos has observed that was written using Go. However, it is relatively uncommon to see malware written in this programming language. In this particular case, we also observed that the attacker created unique malware binaries for each host that was infected with the GoScanSSH malware. Additionally, the GoScanSSH command and control (C2) infrastructure was observed leveraging the Tor2Web proxy service in an

attempt to make tracking the attacker-controlled infrastructure more difficult and resilient to takedowns.

The tag is: *misp-galaxy:tool="GoScanSSH"*

Table 5461. Table References

Links
<a href="http://blog.talosintelligence.com/2018/03/goscanssh-analysis.html">http://blog.talosintelligence.com/2018/03/goscanssh-analysis.html</a>

## Kwampirs

Once Orangethrow has infiltrated a victim's network, they deploy Trojan.Kwampirs, a backdoor Trojan that provides the attackers with remote access to the compromised computer. When executed, Kwampirs decrypts and extracts a copy of its main DLL payload from its resource section. Before writing the payload to disk, it inserts a randomly generated string into the middle of the decrypted payload in an attempt to evade hash-based detections.

The tag is: *misp-galaxy:tool="Kwampirs"*

Kwampirs has relationships with:

- similar: *misp-galaxy:malpedia="Kwampirs"* with *estimative-language:likelihood-probability="likely"*

## Rubella Macro Builder

A crimeware kit dubbed the Rubella Macro Builder has recently been gaining popularity among members of a top-tier Russian hacking forum. Despite being relatively new and unsophisticated, the kit has a clear appeal for cybercriminals: it's cheap, fast, and can defeat basic static antivirus detection.

The tag is: *misp-galaxy:tool="Rubella Macro Builder"*

## Maikspy

We discovered a malware family called Maikspy — a multi-platform spyware that can steal users' private data. The spyware targets Windows and Android users, and first posed as an adult game named after a popular U.S.-based adult film actress. Maikspy, which is an alias that combines the name of the adult film actress and spyware, has been around since 2016.

The tag is: *misp-galaxy:tool="Maikspy"*

# FacexWorm

Facebook, Chrome, and cryptocurrency users should be on the lookout for a new malware strain named FacexWorm that infects victims for the purpose of stealing passwords, stealing cryptocurrency funds, running cryptojacking scripts, and spamming Facebook users. This new strain was spotted in late April by Trend Micro researchers and appears to be related to two other Facebook Messenger spam campaigns, one that took place last August, and another one from December 2017, the latter spreading the Digmine malware. Researchers say FacexWorm's modus operandi is similar to the previous two campaigns, but with the addition of new techniques aimed at cryptocurrency users.

## Brambul

Brambul malware is a malicious Windows 32-bit SMB worm that functions as a service dynamic link library file or a portable executable file often dropped and installed onto victims' networks by dropper malware. When executed, the malware attempts to establish contact with victim systems and IP addresses on victims' local subnets. If successful, the application attempts to gain unauthorized access via the SMB protocol (ports 139 and 445) by launching brute-force password attacks using a list of embedded passwords. Additionally, the malware generates random IP addresses for further attacks.

The tag is: *misp-galaxy:tool="Brambul"*

Brambul has relationships with:

## BabaYaga

The group behind BabaYaga —believed to be Russian-speaking hackers— uses this malware to inject sites with special keyboards to drive SEO traffic to hidden pages on compromised sites. These pages are then used to redirect users to affiliate marketing links, where if the user purchases advertised goods, the hackers also make a profit. The malware per-se is comprised of two modules —one that injects the spam content inside the compromised sites, and a backdoor module that gives attackers control over an infected site at any time. The intricacies of both modules are detailed in much more depth in this 26-page report authored by Defiant (formerly known as WordFence), the security firm which dissected the malware's more recent versions. "[BabaYaga] is relatively well-written, and it demonstrates that the author has some understanding of software development challenges, like code deployment, performance and management," Defiant researchers say. "It can also infect Joomla and Drupal sites, or even generic PHP sites, but it is most fully developed around Wordpress."

The tag is: `misp-galaxy:tool="BabaYaga"`

## InvisiMole

Except for the malware's binary file, very little is known of who's behind it, how it spreads, or in what types of campaigns has this been used.

"Our telemetry indicates that the malicious actors behind this malware have been active at least since 2013, yet the cyber-espionage tool was never analyzed nor detected until discovered by ESET products on compromised computers in Ukraine and Russia," said ESET researcher Zuzana Hromcová, who recently penned an in-depth report about this new threat.

"All infection vectors are possible, including installation facilitated by physical access to the machine," Hromcová added.

Typical to malware used in highly-targeted attacks, the malware has been stripped of most clues that could lead researchers back to its author. With the exception of one file (dating to October 13, 2013), all compilation dates have been stripped and replaced with zeros, giving little clues regarding its timeline and lifespan.

Furthermore, the malware is some clever piece of coding in itself, as it's comprised of two modules, both with their own set of spying features, but which can also help each other in exfiltrating data.

The tag is: *misp-galaxy:tool="InvisiMole"*

InvisiMole has relationships with:

- similar: *misp-galaxy:malpedia="InvisiMole"* with *estimative-language:likelihood-probability="likely"*

## Roaming Mantis

Roaming Mantis malware is designed for distribution through a simple, but very efficient trick based on a technique known as DNS hijacking. When a user attempts to access any website via a compromised router, they will be redirected to a malicious website. For example, if a user were to navigate to [www.securelist.com](http://www.securelist.com) using a web browser, the browser would be redirected to a rogue server which has nothing to do with the security research blog. As long as the browser displays the original URL, users are likely to believe the website is genuine. The web page from the rogue server displays the popup message: To better experience the browsing, update to the latest chrome version.

## Olympic Destroyer

The Winter Olympics this year is being held in Pyeongchang, South Korea. The Guardian, a UK Newspaper reported an article that suggested the Olympic computer systems suffered technical issues during the opening ceremony. Officials at the games confirmed some technical issues to non-critical systems and they completed recovery within around 12 hours. Sunday 11th February the Olympic games officials confirmed a cyber attack occurred but did not comment or speculate further. Talos have identified the samples, with moderate confidence, used in this attack. The infection vector is currently unknown as we continue to investigate. The samples identified, however, are not from adversaries looking for information from the games but instead they are aimed to disrupt the games. The samples analysed appear to perform only destructive functionality. There does not appear to be any exfiltration of data. Analysis shows that actors are again favouring legitimate pieces of software as PsExec functionality is identified within the sample. The destructive

nature of this malware aims to render the machine unusable by deleting shadow copies, event logs and trying to use PsExec & WMI to further move through the environment. This is something we have witnessed previously with BadRabbit and Nyetya.

The tag is: *misp-galaxy:tool="Olympic Destroyer"*

Olympic Destroyer has relationships with:

## DDKONG

The malware in question is configured with the following three exported functions: ServiceMain, Rundll32Call, DllEntryPoint. The ServiceMain exported function indicates that this DLL is expected to be loaded as a service. If this function is successfully loaded, it will ultimately spawn a new instance of itself with the Rundll32Call export via a call to rundll32.exe. The Rundll32Call exported function begins by creating a named event named 'RunOnce'. This event ensures that only a single instance of DDKong is executed at a given time. If this is the only instance of DDKong running at the time, the malware continues. If it's not, it dies. This ensures that only a single instance of DDKong is executed at a given time. DDKong attempts to decode an embedded configuration using a single byte XOR key of 0xC3. After this configuration is decoded and parsed, DDKONG proceeds to send a beacon to the configured remote server via a raw TCP connection. The packet has a header of length 32 and an optional payload. In the beacon, no payload is provided, and as such, the length of this packet is set to zero. After it sends the beacon, the malware expects a response command of either 0x4 or 0x6. Both responses instruct the malware to download and load a remote plugin. In the event 0x4 is specified, the malware is instructed to load the exported 'InitAction' function. If 0x6 is specified, the malware is instructed to load the exported 'KernelDllCmdAction' function. Prior to downloading the plugin, the malware downloads a buffer that is concatenated with the embedded configuration and ultimately provided to the plugin at runtime. As we can see in the above text, two full file paths are included in this buffer, providing us with insight into the original malware family's name, as well as the author. After this buffer is collected, the malware downloads the plugin and loads the appropriate function. This plugin provides the attacker with the ability to both list files and download/upload files on the victim machine.

The tag is: *misp-galaxy:tool="DDKONG"*

DDKONG has relationships with:

- similar: *misp-galaxy:malpedia="DDKONG"* with *estimative-language:likelihood-probability="likely"*

Table 5484. Table References

<a href="https://researchcenter.paloaltonetworks.com/2018/06/unit42-rancor-targeted-attacks-south-east-asia-using-plaintee-ddkong-malware-families/">https://researchcenter.paloaltonetworks.com/2018/06/unit42-rancor-targeted-attacks-south-east-asia-using-plaintee-ddkong-malware-families/</a>

## PLAINTEE

This sample is configured with three exported functions: Add, Sub, DllEntryPoint. The DLL expects the export named 'Add' to be used when initially loaded. When this function is executed PLAINTEE executes a command in a new process to add persistence. Next, the malware calls the 'Sub' function which begins by spawning a mutex named 'microsoftfuckedupb' to ensure only a single instance is running at a given time. In addition, PLAINTEE will create a unique GUID via a call to CoCreateGuid() to be used as an identifier for the victim. The malware then proceeds to collect general system enumeration data about the infected machine and enters a loop where it will decode an embedded config blob and send an initial beacon to the C2 server. The configuration blob is encoded using a simple single-byte XOR scheme. The first byte of the string is used as the XOR key to in turn decode the remainder of the data. The malware then proceeds to beacon to the configured port via a custom UDP protocol. The network traffic is encoded in a similar fashion, with a random byte being selected as the first byte, which is then used to decode the remainder of the packet via XOR. This beacon is continuously sent out until a valid response is obtained from the C2 server (there is no sleep timer set). After the initial beacon, there is a two second delay in between all other requests made. This response is expected to have a return command of 0x66660002 and to contain the same GUID that was sent to the C2 server. Once this response is received, the malware spawns several new threads, with different Command parameters, with the overall objective of loading and executing a new plugin that is to be received from the C2 server. During a file analysis of PLAINTEE in WildFire, we observed the attackers download and execute a plugin during the runtime for that sample. PLAINTEE expects the downloaded plugin to be a DLL with an export function of either 'shell' or 'file'. The plugin uses the same network protocol as PLAINTEE and so we were able to trivially decode further commands that were sent. The following commands were observed: tasklist, ipconfig /all. The attacker performed these two commands 33 seconds apart. As automated commands are typically performed more quickly this indicates that they may have been sent manually by the attacker.

The tag is: *misp-galaxy:tool="PLAINTEE"*

PLAINTEE has relationships with:

# Bisonal

In early May, Unit 42 discovered an attack campaign against at least one defense company in Russia and one unidentified organization in South Korea delivering a variant of Bisonal malware. While not previously publicly documented, the variant has been in the wild since at least 2014. There are three primary differences between it and older Bisonal malware including a different cipher and encryption for C2 communication, and a large rewrite of the code for both network communication and maintaining persistence. To date, we have only collected 14 samples of this variant, indicating it may be sparingly used. The adversary behind these attacks lured the targets into launching the Microsoft Windows executable malware by masquerading it as a PDF file (using a fake PDF icon) and reusing publicly available data for the decoy PDF file's contents. Attacks using Bisonal have been blogged about in the past. In 2013, both COSEINC and FireEye revealed attacks using Bisonal against Japanese organizations . In October 2017, AhnLab published a report called "Operation Bitter Biscuit," an attack campaign against South Korea, Japan, India and Russia using Bisonal and its successors, Bioazih and Dexbia.

The tag is: *misp-galaxy:tool="Bisonal"*

Bisonal has relationships with:

- similar: misp-galaxy:malpedia="Korlia" with estimative-language:likelihood-probability="likely"

<a href="https://camal.coseinc.com/publish/2013Bisonal.pdf">https://camal.coseinc.com/publish/2013Bisonal.pdf</a>

# Sekur

Sekur has been CARBON SPIDER's primary tool for several years, although usage over the last year appears to have declined. It contains all the functionality you would expect from a RAT, allowing the adversary to execute commands, manage the file system, manage processes, and collect data. In addition, it can record videos of victim sessions, log keystrokes, enable remote desktop, or install Ammy Admin or VNC modules. From July 2014 on, samples were compiled with the capability to target Epicor POS systems and to collect credit card data.

The tag is: *misp-galaxy:tool="Sekur"*

Table 5488. Table References

Links
<a href="https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/">https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/</a>

# Agent ORM

Agent ORM began circulating alongside Skeur in campaigns throughout the second half of 2015. The malware collects basic system information and is able to take screenshots of victim systems. It is used to download next-stage payloads when systems of interest are identified. It is strongly suspected that Agent ORM has been deprecated in favor of script-based first-stage implants (VB Flash, JS Flash, and Bateleur).

The tag is: *misp-galaxy:tool="Agent ORM"*

Agent ORM is also known as:

- Tosliph
- DRIFTPIN

Table 5489. Table References

Links
<a href="https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/">https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/</a>

# VB Flash

VB Flash was first observed being deployed alongside Agent ORM in September 2015. It is likely that this was developed as a replacement to Agent ORM and contained similar capabilities. The first observed instance of VB Flash included comments and was easy to analyze—later versions soon began to integrate multiple layers of obfuscation. Several versions of VB Flash were developed including ones that utilized Google Forms, Google Macros, and Google Spreadsheets together to make a command-and-control (C2) channel. This variant would POST victim data to a specified Google form, then make a request to a Google macro script, receiving an address for a Google Spreadsheet from which to request commands.

The tag is: *misp-galaxy:tool="VB Flash"*

VB Flash is also known as:

- HALFBAKED

VB Flash has relationships with:

- similar: `misp-galaxy:mitre-malware="HALFBAKED - S0151"` with `estimative-language:likelihood-probability="likely"`

Table 5490. Table References

Links
<a href="https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/">https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/</a>

## JS Flash

JS Flash capabilities closely resemble those of VB Flash and leverage interesting techniques in deployment via batch scripts embedded as OLE objects in malicious documents. Many iterations of JS Flash were observed being tested before deployment, containing minor changes to obfuscation and more complex additions, such as the ability to download TinyMet (a cutdown of the Metasploit Meterpreter payload). PowerShell was also used heavily for the execution of commands and arbitrary script execution. No JS Flash samples were observed being deployed after November 2017.

The tag is: `misp-galaxy:tool="JS Flash"`

JS Flash is also known as:

- JavaScript variant of HALFBAKED

Table 5491. Table References

Links
<a href="https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/">https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/</a>

## Bateleur

Bateleur deployments began not long after JS Flash and were also written in JavaScript. Deployments were more infrequent and testing was not observed. It is likely that Bateleur was run in parallel as an alternative tool and eventually replaced JS Flash as CARBON SPIDER's first stage tool of choice. Although much simpler in design than JS Flash, all executing out of a single script with more basic obfuscation, Bateleur has a wealth of capabilities—including the ability to download arbitrary scripts and executables, deploy TinyMet, execute commands via PowerShell, deploy a credential stealer, and collect victim system information such as screenshots.

The tag is: `misp-galaxy:tool="Bateleur"`

Bateleur has relationships with:

## KEYMARBLE

This Malware Analysis Report (MAR) is the result of analytic efforts between Department of Homeland Security (DHS) and the Federal Bureau of Investigation (FBI). Working with U.S. Government partners, DHS and FBI identified Trojan malware variants used by the North Korean government. This malware variant has been identified as KEYMARBLE. The U.S. Government refers to malicious cyber activity by the North Korean government as HIDDEN COBRA. For more information on HIDDEN COBRA activity.

The tag is: *misp-galaxy:tool="KEYMARBLE"*

KEYMARBLE has relationships with:

- similar: *misp-galaxy:malpedia="KEYMARBLE"* with *estimative-language:likelihood-probability="likely"*

## MagentoCore Malware

A Dutch security researcher has lifted the veil on a massive website hacking campaign that has infected 7,339 Magento stores with a script that collects payment card data from people shopping on the sites. The script is what industry experts call a "payment card scraper" or "skimmer." Hackers breach sites and modify their source code to load the script along with its legitimate files. The script usually loads on store checkout pages and secretly records payment card details entered in payment forms, data that it later sends to a server under the hacker's control.

The tag is: *misp-galaxy:tool="MagentoCore Malware"*

*Table 5507. Table References*

## NotPetya

Threat actors deploy a tool, called NotPetya, with the purpose of encrypting data on victims' machines and rendering it unusable. The malware was spread through tax software that companies and individuals require for filing taxes in Ukraine. Australia, Estonia, Denmark, Lithuania, Ukraine, the United Kingdom, and the United States issued statements attributing NotPetya to Russian state-sponsored actors. In June 2018, the United States sanctioned Russian organizations believed to have assisted the Russian state-sponsored actors with the operation.

The tag is: *misp-galaxy:tool="NotPetya"*

NotPetya is also known as:

- Not Petya

NotPetya has relationships with:

- similar: `misp-galaxy:ransomware="Bad Rabbit"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:malpedia="EternalPetya"` with `estimative-language:likelihood-probability="likely"`

## Xbash

Xbash is a malware family that is targeting Linux and Microsoft Windows servers. We can tie this malware, which we have named Xbash, to the Iron Group, a threat actor group known for previous ransomware attacks. Xbash was developed using Python and converted into self-contained Linux ELF executables by abusing the legitimate tool PyInstaller for distribution. Xbash aimed on discovering unprotected services, deleting victim's MySQL, PostgreSQL and MongoDB databases, and ransom for Bitcoins. Linux based systems are targeted for ransomware and botnet capabilities. The ransomware targets and deletes linux databases and there is no evidence of any functionality that makes recovery even possible by payment the ransom. Where as, windows based systems are targeted for coinmining & self-propagating capabilities. Xbash spreads by attacking weak passwords and unpatched vulnerabilities.

The tag is: `misp-galaxy:tool="Xbash"`

# Chainshot

The new piece of malware, which received the name Chainshot, is used in the early stages of an attack to activate a downloader for the final payload in a malicious chain reaction.

The tag is: *misp-galaxy:tool="Chainshot"*

Table 5511. Table References

Links
<a href="https://www.bleepingcomputer.com/news/security/new-chainshot-malware-found-by-cracking-512-bit-rsa-key/">https://www.bleepingcomputer.com/news/security/new-chainshot-malware-found-by-cracking-512-bit-rsa-key/</a>

# CroniX

The researchers named this campaign CroniX, a moniker that derives from the malware's use of Cron to achieve persistence and Xhide to launch executables with fake process names. The cryptocurrency minted on victim's computers is Monero (XMR), the coin of choice in cryptojacking activities. To make sure that rival activity does not revive, CroniX deletes the binaries of other cryptominers present on the system. Another action CroniX takes to establish supremacy on the machine is to check the names of the processes and kill those that swallow 60% of the CPU or more.

The tag is: *misp-galaxy:tool="CroniX"*

# FASTCash

Treasury has identified a sophisticated cyber-enabled ATM cash out campaign we are calling FASTCash. FASTCash has been active since late 2016 targeting banks in Africa and Asia to remotely compromise payment switch application servers within banks to facilitate fraudulent transactions, primarily involving ATMs, to steal cash equivalent to tens of millions of dollars. FBI has attributed malware used in this campaign to the North Korean government. We expect FASTCash to continue targeting retail payment systems vulnerable to remote exploitation.

The tag is: *misp-galaxy:tool="FASTCash"*

# Zebrocy

Zebrocy is a tool used by APT28, which has been observed since late 2015. The communications module used by Zebrocy transmits using HTTP. The implant has key logging and file exfiltration functionality and utilises a file collection capability that identifies files with particular extensions.

The tag is: *misp-galaxy:tool="Zebrocy"*

Zebrocy is also known as:

- Zekapab

Table 5513. Table References

## CoalaBot

The tag is: *misp-galaxy:tool="CoalaBot"*

## DanderSpritz

DanderSpritz consists entirely of plugins to gather intelligence, use exploits and examine already controlled machines. It is written in Java and provides a graphical windows interface similar to botnets administrative panels as well as a Metasploit-like console interface. It also includes its own backdoors and plugins for not-FuzzBunch-controlled victims DanderSpritz is the framework for controlling infected machines, different from FuZZbuNch as the latter provides a limited toolkit for the post-exploitation stage with specific functions such as DisableSecurity and EnableSecurity for DarkPulsar. For DanderSpritz works for a larger range of backdoors, using PeedleCheap in the victim to enable operators launching plugins. PeddleCheap is a plugin of DanderSpritz which can be used to configure implants and connect to infected machines. Once a connection is established all DanderSpritz post-exploitation features become available.

The tag is: *misp-galaxy:tool="DanderSpritz"*

DanderSpritz is also known as:

- Dander Spritz

Links

<https://github.com/misterch0c/shadowbroker>

## GhostMiner

GhostMiner is a new cryptocurrency mining malware. By the end of March 2018, a new variant of mining malware was detected targeting MSSQL, phpMyAdmin, and Oracle WebLogic servers. The sample uses Powershell to execute code with volatile resources and scans the server's processes to detect and stop other miners that might have been running prior to execution. The fileless malware has become more popular in the last years. The malicious code runs directly in main memory without writing any file on disk, where an antivirus engine could detect it.

The tag is: *misp-galaxy:tool="GhostMiner"*

## Rotexy

A mobile spyware that turned into a banking trojan with ransomware capabilities managed to launch over 70,000 attacks in the course of just three months.

The tag is: *misp-galaxy:tool="Rotexy"*

Rotexy is also known as:

- SMSThief

*Table 5527. Table References*

Links

<https://www.bleepingcomputer.com/news/security/rotexy-mobile-trojan-launches-70k-attacks-in-three-months/>

## KingMiner

A recently discovered cryptomining operation forces access to Windows servers to use their CPU cycles for mining Monero coins. Detected six months ago, the activity went through multiple stages of evolution. Since it was spotted in mid-June, the malware received two updates and the number of attacks keeps increasing. The researchers at CheckPoint analyzed the new threat and gave it the name KingMiner. They found that it targets Microsoft IIS and SQL Servers in particular and runs a brute-force attack to gain access. Once in, the malware determines the CPU architecture and checks for older versions of itself to remove them.

The tag is: *misp-galaxy:tool="KingMiner"*

# SpicyOmelette

In 2018, CTU researchers observed several GOLD KINGSWOOD campaigns involving SpicyOmelette, a tool used by the group during initial exploitation of an organization. This sophisticated JavaScript remote access tool is generally delivered via phishing, and it uses multiple defense evasion techniques to hinder prevention and detection activities. GOLD KINGSWOOD delivered SpicyOmelette through a phishing email containing a shortened link that appeared to be a PDF document attachment. When clicked, the link used the Google AppEngine to redirect the system to a GOLD KINGSWOOD-controlled Amazon Web Services (AWS) URL that installed a signed JavaScript file, which was SpicyOmelette.

The tag is: *misp-galaxy:tool="SpicyOmelette"*

# LamePyre

When LamePyre runs on the system, users see the generic Automator icon in the menu bar, which is typical for any script of this sort. The script decodes a payload written in Python and runs it on the victim host. It then starts to take pictures and upload them to the attacker's command and control (C2) server.

The tag is: *misp-galaxy:tool="LamePyre"*

LamePyre is also known as:

- OSX.LamePyre

## OSX/Shlayer

The initial Trojan horse infection (the fake Flash Player installer) component of OSX/Shlayer leverages shell scripts to download additional malware or adware onto the infected system. The primary goal of OSX/Shlayer is to download and install adware onto an infected Mac. Although "adware" may not sound like a big deal, it can be a lot more harmful than the name implies; be sure to watch our aforementioned interview with Amit Serper to learn more about one particular example of malicious Mac adware. At least one variant of the malware also appears to exhibit an interesting behavior: It checks whether one of several Mac anti-virus products is installed.

The tag is: *misp-galaxy:tool="OSX/Shlayer"*

## BabyShark

BabyShark is a relatively new malware. The earliest sample we found from open source repositories and our internal data sets was seen in November 2018. The malware is launched by executing the first stage HTA from a remote location, thus it can be delivered via different file types including PE files as well as malicious documents. It exfiltrates system information to C2 server, maintains persistence on the system, and waits for further instruction from the operator.

## StealthWorker

Hackers are running a new campaign which drops the StealthWorker brute-force malware on Windows and Linux machines that end up being used to brute force other computers in a series of distributed brute force attacks. As unearthed by FortiGuard Labs' Rommel Joven, the StealthWorker Golang-based brute forcer (also known as GoBrut) discovered by Malwarebytes at the end of February is actively being used to target and compromise multiple platforms. StealthWorker was previously connected to a number of compromised Magento-powered e-commerce websites on which attackers infiltrated skimmers designed to exfiltrate both payment and personal information. As later discovered, the malware is capable of exploiting a number of vulnerabilities in to infiltrate Magento, phpMyAdmin, and cPanel Content Management Systems (CMSs), as well as brute force its way in if everything else fails.

## SLUB Backdoor

The SLUB backdoor is a custom one written in the C++ programming language, statically linking curl library to perform multiple HTTP requests. Other statically-linked libraries are boost (for extracting commands from gist snippets) and JsonCpp (for parsing slack channel communication).

The tag is: *misp-galaxy:tool="SLUB Backdoor"*

SLUB Backdoor has relationships with:

- similar: *misp-galaxy:backdoor="SLUB" with estimative-language:likelihood-probability="likely"*

## Carp Downloader

In 2017, Unit 42 reported on and analyzed a low-volume malware family called Cardinal RAT. This malware family had remained undetected for over two years and was delivered via a unique downloader named Carp Downloader.

The tag is: *misp-galaxy:tool="Carp Downloader"*

Table 5541. Table References

## Brushaloader

Brushaloader also leverages a combination of VBScript and PowerShell to create a Remote Access Trojan (RAT) that allows persistent command execution on infected systems.

## Karkoff

In addition to increased reports of threat activity, we have also discovered new evidence that the threat actors behind the DNSpionage campaign continue to change their tactics, likely in an attempt to improve the efficacy of their operations. In February, we discovered some changes to the actors' tactics, techniques and procedures (TTPs), including the use of a new reconnaissance phase that selectively chooses which targets to infect with malware. In April 2019, we also discovered the actors using a new malware, which we are calling Karkoff.

The tag is: *misp-galaxy:tool="Karkoff"*

## KimJongRAT

We conclude that this RAT/stealer is efficient and was also really interesting to analyse. Furthermore, the creator made efforts to look Korean, for example the author of the .pdf file is Kim Song Chol. He is the brother of Kim Jong-un, the leader of North Korea. We identified that the author of a variant of this stealer is another brother of Kim Jong-un. Maybe the author named every variant with the name of each brother. After some searches using Google, we identified an old variant of this malware here: <http://contagiodump.blogspot.ca/2010/10/oct-08-cve-2010-2883-pdf-nuclear.html>. The code of the malware available on the blog is close to our case but with fewer features. In 2010, the password of the Gmail account was futurekimkim. Three years ago, the author was already fixated on the Kim family... The language of the resource stored in the .dll file is Korean (LANG\_KOREAN). The owner of the gmail mailbox is laoshi135.zhang and the secret question of this account is in Korean too. We don't know if the malware truly comes from Korea. However, thanks to these factors, we decided to name this sample KimJongRAT/Stealer.

The tag is: *misp-galaxy:tool="KimJongRAT"*

## Cowboy

Based on our research, it appears the malware author calls the encoded secondary payload “Cowboy” regardless of what malware family is delivered.

## JasperLoader

JasperLoader employs a multi-stage infection process that features several obfuscation techniques that make analysis more difficult. It appears that this loader was designed with resiliency and flexibility in mind, as evidenced in later stages of the infection process.

The tag is: *misp-galaxy:tool="JasperLoader"*

## Scranos

The malware Scranos infects with rootkit capabilities, burying deep into vulnerable Windows computers to gain persistent access — even after the computer restarts. Scranos only emerged in recent months, according to Bitdefender with new research out Tuesday, but the number of its infections has rocketed in the months since it was first identified in November.

# Reaver

Unit 42 has discovered a new malware family we've named "Reaver" with ties to attackers who use SunOrcal malware. SunOrcal activity has been documented to at least 2013, and based on metadata surrounding some of the C2s, may have been active as early as 2010. The new family appears to have been in the wild since late 2016 and to date we have only identified 10 unique samples, indicating it may be sparingly used. Reaver is also somewhat unique in the fact that its final payload is in the form of a Control panel item, or CPL file. To date, only 0.006% of all malware seen by Palo Alto Networks employs this technique, indicating that it is in fact fairly rare.

The tag is: *misp-galaxy:tool="Reaver"*

Reaver has relationships with:

- similar: *misp-galaxy:tool="SunOrcal"* with *estimative-language:likelihood-probability="roughly-even-chance"*
- similar: *misp-galaxy:tool="SURTR"* with *estimative-language:likelihood-probability="roughly-even-chance"*

# SURTR

The Citizen Lab analyzed a malicious email sent to Tibetan organizations in June 2013. The email in question purported to be from a prominent member of the Tibetan community and repurposed content from a community mailing list. Attached to the email were what appeared to be three Microsoft Word documents (.doc), but which were trojaned with a malware family we call "Surtr".1 All three attachments drop the exact same malware. We have seen the Surtr malware family used in attacks on Tibetan groups dating back to November 2012.

The tag is: *misp-galaxy:tool="SURTR"*

SURTR has relationships with:

- similar: *misp-galaxy:tool="Reaver"* with *estimative-language:likelihood-probability="roughly-even-chance"*
- similar: *misp-galaxy:tool="SunOrcal"* with *estimative-language:likelihood-probability="roughly-even-chance"*

## SunOrcal

SunOrcal is a trojan malware family whose activity dates back to at least 2013. A version discovered in November 2017 incorporates steganography techniques and can collect C2 information via GitHub, obscuring its C2 infrastructure and evading detection using the legitimate site for its first beacon. The threat actors have targeted users in the Vietnam area, spreading phishing emails containing malicious documents purportedly regarding South China Sea disputes. The new SunOrcal version has also been used with the recently discovered Reaver trojan and the original SunOrcal version. Some of the recent activity also incorporates the use of the Surtr malware.

The tag is: *misp-galaxy:tool="SunOrcal"*

SunOrcal has relationships with:

- similar: *misp-galaxy:tool="Reaver"* with *estimative-language:likelihood-probability="roughly-even-chance"*
- similar: *misp-galaxy:tool="SURTR"* with *estimative-language:likelihood-probability="roughly-even-chance"*

## Bookworm

Threat actors have delivered Bookworm as a payload in attacks on targets in Thailand. Readers who are interested in this campaign should start with our first blog that lays out the overall functionality of the malware and introduces its many components. Unit 42 does not have detailed targeting information for all known Bookworm samples, but we are aware of attempted attacks on at least two branches of government in Thailand. We speculate that other attacks delivering Bookworm were also targeting organizations in Thailand based on the contents of the associated decoys documents, as well as several of the dynamic DNS domain names used to host C2 servers that contain the words “Thai” or “Thailand”. Analysis of compromised systems seen communicating with Bookworm C2 servers also confirms our speculation on targeting with a majority of systems existing within Thailand.

The tag is: *misp-galaxy:tool="Bookworm"*

## Amavaldo

We named the malware family described in the rest of this blog post Amavaldo. This family is still in active development – the latest version we have observed (10.7) has a compilation timestamp of June 10th, 2019.

The tag is: *misp-galaxy:tool="Amavaldo"*
