## NotPetya - S0368

[NotPetya](<https://attack.mitre.org/software/S0368>) is malware that was used by [Sandworm Team](<https://attack.mitre.org/groups/G0034>) in a worldwide attack starting on June 27, 2017. While [NotPetya](<https://attack.mitre.org/software/S0368>) appears as a form of ransomware, its main purpose was to destroy data and disk structures on compromised systems; the attackers never intended to make the encrypted data recoverable. As such, [NotPetya](<https://attack.mitre.org/software/S0368>) may be more appropriately thought of as a form of wiper malware. [NotPetya](<https://attack.mitre.org/software/S0368>) contains worm-like features to spread itself across a computer network using the SMBv1 exploits EternalBlue and EternalRomance.(Citation: Talos Nyetya June 2017)(Citation: US-CERT NotPetya 2017)(Citation: ESET Telebots June 2017)(Citation: US District Court Indictment GRU Unit 74455 October 2020)

## Ebury - S0377

[Ebury](<https://attack.mitre.org/software/S0377>) is an SSH backdoor targeting Linux operating systems. Attackers require root-level access, which allows them to replace SSH binaries (ssh, sshd, ssh-add, etc) or modify a shared library used by OpenSSH (libkeyutils).(Citation: ESET Ebury Feb 2014)(Citation: BleepingComputer Ebury March 2017)(Citation: ESET Ebury Oct 2017)

## Lokibot - S0447

[Lokibot](<https://attack.mitre.org/software/S0447>) is a widely distributed information stealer that was first reported in 2015. It is designed to steal sensitive information such as usernames, passwords, cryptocurrency wallets, and other credentials. [Lokibot](<https://attack.mitre.org/software/S0447>) can also create a backdoor into infected systems to allow an attacker to install additional payloads.(Citation: Infoblox Lokibot January 2019)(Citation: Morphisec Lokibot April 2020)(Citation: CISA Lokibot September 2020)

## Maze - S0449

[Maze](<https://attack.mitre.org/software/S0449>) ransomware, previously known as "ChaCha", was discovered in May 2019. In addition to encrypting files on victim machines for impact, [Maze](<https://attack.mitre.org/software/S0449>) operators conduct information stealing campaigns prior to encryption and post the information online to extort affected companies.(Citation: FireEye Maze May 2020)(Citation: McAfee Maze March 2020)(Citation: Sophos Maze VM September 2020)

## BendyBear - S0574

[BendyBear](<https://attack.mitre.org/software/S0574>) is an x64 shellcode for a stage-zero implant designed to download malware from a C2 server. First discovered in August 2020, [BendyBear](<https://attack.mitre.org/software/S0574>) shares a variety of features with [Waterbear](<https://attack.mitre.org/software/S0579>), malware previously attributed to the Chinese cyber espionage group [BlackTech](<https://attack.mitre.org/groups/G0098>). ## Mandrake - S0485

[Mandrake](<https://attack.mitre.org/software/S0485>) is a sophisticated Android espionage platform that has been active in the wild since at least 2016. [Mandrake](<https://attack.mitre.org/software/S0485>) is very actively maintained, with sophisticated features and attacks that are executed with surgical precision.

[Mandrake](<https://attack.mitre.org/software/S0485>) has gone undetected for several years by

providing legitimate, ad-free applications with social media and real reviews to back the apps. The malware is only activated when the operators issue a specific command.(Citation: Bitdefender Mandrake)

## Turian - S0647

[Turian](<https://attack.mitre.org/software/S0647>) is a backdoor that has been used by [BackdoorDiplomacy](<https://attack.mitre.org/groups/G0135>) to target Ministries of Foreign Affairs, telecommunication companies, and charities in Africa, Europe, the Middle East, and Asia. First reported in 2021, [Turian](<https://attack.mitre.org/software/S0647>) is likely related to Quarian, an older backdoor that was last observed being used in 2013 against diplomatic targets in Syria and the United States.(Citation: ESET BackdoorDiplomacy Jun 2021)

# REvil - S0496

[REvil](<https://attack.mitre.org/software/S0496>) is a ransomware family that has been linked to the [GOLD SOUTHFIELD](<https://attack.mitre.org/groups/G0115>) group and operated as ransomware-as-a-service (RaaS) since at least April 2019. [REvil](<https://attack.mitre.org/software/S0496>), which has been used against organizations in the manufacturing, transportation, and electric sectors, is highly configurable and shares code similarities with the GandCrab RaaS.(Citation: Secureworks REvil September 2019)(Citation: Intel 471 REvil March 2020)(Citation: Group IB Ransomware May 2020)

# Conti - S0575

[Conti](<https://attack.mitre.org/software/S0575>) is a Ransomware-as-a-Service (RaaS) that was first observed in December 2019. [Conti](<https://attack.mitre.org/software/S0575>) has been deployed via [TrickBot](<https://attack.mitre.org/software/S0266>) and used against major corporations and government agencies, particularly those in North America. As with other ransomware families, actors using [Conti](<https://attack.mitre.org/software/S0575>) steal sensitive files and information from compromised networks, and threaten to publish this data unless the ransom is paid.(Citation: Cybereason Conti Jan 2021)(Citation: CarbonBlack Conti July 2020)(Citation: Cybleinc Conti January 2020)

## ThiefQuest - S0595

[ThiefQuest](<https://attack.mitre.org/software/S0595>) is a virus, data stealer, and wiper that presents itself as ransomware targeting macOS systems. [ThiefQuest](<https://attack.mitre.org/software/S0595>) was first seen in 2020 distributed via trojanized pirated versions of popular macOS software on Russian forums sharing torrent links.(Citation: Reed thiefquest fake ransom) Even though [ThiefQuest](<https://attack.mitre.org/software/S0595>) presents itself as ransomware, since the dynamically generated encryption key is never sent to the attacker it may be more appropriately thought of as a form of wiper malware.(Citation: wardle evilquest partii)(Citation: reed thiefquest ransomware analysis)

## ThreatNeedle - S0665

[ThreatNeedle](<https://attack.mitre.org/software/S0665>) is a backdoor that has been used by [Lazarus Group](<https://attack.mitre.org/groups/G0032>) since at least 2019 to target cryptocurrency, defense, and mobile gaming organizations. It is considered to be an advanced cluster of [Lazarus Group](<https://attack.mitre.org/groups/G0032>)'s Manuscript (a.k.a. NukeSped) malware family.(Citation: Kaspersky ThreatNeedle Feb 2021)

# Diavol - S0659

[Diavol](<https://attack.mitre.org/software/S0659>) is a ransomware variant first observed in June 2021 that is capable of prioritizing file types to encrypt based on a pre-configured list of extensions defined by the attacker. [Diavol](<https://attack.mitre.org/software/S0659>) has been deployed by [Bazar](<https://attack.mitre.org/software/S0534>) and is thought to have potential ties to [Wizard Spider](<https://attack.mitre.org/groups/G0102>). (Citation: Fortinet Diavol July 2021)(Citation: FBI Flash Diavol January 2022)(Citation: DFIR Diavol Ransomware December 2021)

## SUPERNOVA - S0578

[SUPERNOVA](<https://attack.mitre.org/software/S0578>) is an in-memory web shell written in .NET C#. It was discovered in November 2020 during the investigation of [APT29](<https://attack.mitre.org/groups/G0016>)'s SolarWinds cyber operation but determined to be unrelated. Subsequent analysis suggests [SUPERNOVA](<https://attack.mitre.org/software/S0578>) may have been used by the China-based threat group SPIRAL.(Citation: Guidepoint SUPERNOVA Dec 2020)(Citation: Unit42 SUPERNOVA Dec 2020)(Citation: SolarWinds Advisory Dec 2020)(Citation: CISA Supernova Jan 2021)(Citation: Microsoft Analyzing Solorigate Dec 2020)

## GoldFinder - S0597

[GoldFinder](<https://attack.mitre.org/software/S0597>) is a custom HTTP tracer tool written in Go that logs the route a packet takes between a compromised network and a C2 server. It can be used to inform threat actors of potential points of discovery or logging of their actions, including C2 related to other malware. [GoldFinder](<https://attack.mitre.org/software/S0597>) was discovered in early 2021 during an investigation into the SolarWinds cyber intrusion by [APT29](<https://attack.mitre.org/groups/G0016>). ## GoldMax - S0588

[GoldMax](<https://attack.mitre.org/software/S0588>) is a second-stage C2 backdoor written in Go with Windows and Linux variants that are nearly identical in functionality. [GoldMax](<https://attack.mitre.org/software/S0588>) was discovered in early 2021 during the investigation into the SolarWinds intrusion, and has likely been used by [APT29](<https://attack.mitre.org/groups/G0016>) since at least mid-2019. [GoldMax](<https://attack.mitre.org/software/S0588>) uses multiple defense evasion techniques, including avoiding virtualization execution and masking malicious traffic.(Citation: MSTIC NOBELIUM Mar 2021)(Citation: FireEye SUNSHUTTLE Mar 2021)(Citation: CrowdStrike StellarParticle January 2022)

## KOCTOPUS - S0669

[KOCTOPUS](<https://attack.mitre.org/software/S0669>)'s batch variant is loader used by [LazyScripter](<https://attack.mitre.org/groups/G0140>) since 2018 to launch [Octopus](<https://attack.mitre.org/software/S0340>) and [Koadic](<https://attack.mitre.org/software/S0250>) and, in some cases, [QuasarRAT](<https://attack.mitre.org/software/S0262>). [KOCTOPUS](<https://attack.mitre.org/software/S0669>) also has a VBA variant that has the same functionality as the batch version.(Citation: MalwareBytes LazyScripter Feb 2021)

## Invoke-PSImage - S0231

[Invoke-PSImage](<https://attack.mitre.org/software/S0231>) takes a PowerShell script and embeds the bytes of the script into the pixels of a PNG image. It generates a one liner for executing either from a file or from the web. Example of usage is embedding the PowerShell code from the Invoke-Mimikatz module and embed it into an image file. By calling the image file from a macro for example, the macro will download the picture and execute the PowerShell code, which in this case will dump the passwords. (Citation: GitHub Invoke-PSImage)

## Net - S0039

The [Net](<https://attack.mitre.org/software/S0039>) utility is a component of the Windows operating system. It is used in command-line operations for control of users, groups, services, and network connections. (Citation: Microsoft Net Utility)

[Net](<https://attack.mitre.org/software/S0039>) has a great deal of functionality, (Citation: Savill 1999) much of which is useful for an adversary, such as gathering system and network information for Discovery, moving laterally through [SMB/Windows Admin Shares](<https://attack.mitre.org/techniques/T1021/002>) using `net use` commands, and interacting with services. The net1.exe utility is executed for certain functionality when net.exe is run and can be used directly in commands such as `net1 user`.

## MailSniper - S0413

MailSniper is a penetration testing tool for searching through email in a Microsoft Exchange environment for specific terms (passwords, insider intel, network architecture information, etc.). It can be used by a non-administrative user to search their own email, or by an Exchange administrator to search the mailboxes of every user in a domain.(Citation: GitHub MailSniper)

## Tor - S0183

[Tor](<https://attack.mitre.org/software/S0183>) is a software suite and network that provides increased anonymity on the Internet. It creates a multi-hop proxy network and utilizes multilayer encryption to protect both the message and routing information. [Tor](<https://attack.mitre.org/software/S0183>) utilizes "Onion Routing," in which messages are encrypted with multiple layers of encryption; at each step in the proxy network, the topmost layer is decrypted and the contents

forwarded on to the next node until it reaches its destination. (Citation: Dingedline Tor The Second-Generation Onion Router)

## Empire - S0363

[Empire](<https://attack.mitre.org/software/S0363>) is an open source, cross-platform remote administration and post-exploitation framework that is publicly available on GitHub. While the tool itself is primarily written in Python, the post-exploitation agents are written in pure [PowerShell](<https://attack.mitre.org/techniques/T1059/001>) for Windows and Python for Linux/macOS. [Empire](<https://attack.mitre.org/software/S0363>) was one of five tools singled out by a joint report on public hacking tools being widely used by adversaries.(Citation: NCSC Joint Report Public Tools)(Citation: Github PowerShell Empire)(Citation: GitHub ATTACK Empire)

## RawDisk - S0364

[RawDisk](<https://attack.mitre.org/software/S0364>) is a legitimate commercial driver from the EldoS Corporation that is used for interacting with files, disks, and partitions. The driver allows for direct modification of data on a local computer's hard drive. In some cases, the tool can enact these raw disk modifications from user-mode processes, circumventing Windows operating system security features.(Citation: EldoS RawDisk ITpro)(Citation: Novetta Blockbuster Destructive Malware)

## ShimRatReporter - S0445

[ShimRatReporter](<https://attack.mitre.org/software/S0445>) is a tool used by suspected Chinese adversary [Mofang](<https://attack.mitre.org/groups/G0103>) to automatically conduct initial discovery. The details from this discovery are used to customize follow-on payloads (such as [ShimRat](<https://attack.mitre.org/software/S0444>)) as well as set up faux infrastructure which mimics the adversary's targets. [ShimRatReporter](<https://attack.mitre.org/software/S0445>) has been used in campaigns targeting multiple countries and sectors including government, military, critical infrastructure, automobile, and weapons development.(Citation: FOX-IT May 2016 Mofang)

## Jaff

We recently observed several large scale email campaigns that were attempting to distribute a new variant of ransomware that has been dubbed "Jaff". Interestingly we identified several characteristics that we have previously observed being used during Dridex and Locky campaigns. In a short period of time, we observed multiple campaigns featuring high volumes of malicious spam emails being distributed, each using a PDF attachment with an embedded Microsoft Word

document functioning as the initial downloader for the Jaff ransomware.

## SynAck

The ransomware does not use a customized desktop wallpaper to signal its presence, and the only way to discover that SynAck has infected your PC is by the ransom notes dropped on the user's desktop, named in the format: RESTORE\_INFO-[id].txt. For example: RESTORE\_INFO-4ABFA0EF.txt. In addition, SynAck also appends its own extension at the end of all files it encrypted. This file extensions format is ten random alpha characters for each file. For example: test.jpg.XbMiJQiuh. Experts believe the group behind SynAck uses RDP brute-force attacks to access remote computers and manually download and install the ransomware.

The tag is: *misp-galaxy:ransomware="SynAck"*

## Bad Rabbit

On October 24, 2017, Cisco Talos was alerted to a widescale ransomware campaign affecting organizations across eastern Europe and Russia. As was the case in previous situations, we quickly mobilized to assess the situation and ensure that customers remain protected from this and other threats as they emerge across the threat landscape. There have been several large scale ransomware campaigns over the last several months. This appears to have some similarities to Nyetya in that it is also based on Petya ransomware. Major portions of the code appear to have been rewritten. The distribution does not appear to have the sophistication of the supply chain attacks we have seen recently.

The tag is: *misp-galaxy:ransomware="Bad Rabbit"*

## StorageCrypt

Recently BleepingComputer has received a flurry of support requests for a new ransomware being named StorageCrypt that is targeting NAS devices such as the Western Digital My Cloud. Victims have been reporting that their files have been encrypted and a note left with a ransom demand of between .4 and 2 bitcoins to get their files back. User's have also reported that each share on their NAS device contains a Autorun.inf file and a Windows executable named Beauty and the beast.exe, which translates to Beauty and the beast. From the samples BleepingComputer has received, this Autorun.inf is an attempt to spread the Beauty and the beast.exe file to other computers that open the folders on the NAS devices.

The tag is: *misp-galaxy:ransomware="StorageCrypt"*

## HC7

A new ransomware called HC7 is infecting victims by hacking into Windows computers that are running publicly accessible Remote Desktop services. Once the developers gain access to the hacked computer, the HC7 ransomware is then installed on all accessible computers on the network. Originally released as HC6, victims began posting about it in the BleepingComputer forums towards the end of November. As this is a Python-to-exe executable, once the script was extracted ID Ransomware creator Michael Gillespie was able determine that it was decryptable and released a

decryptor. Unfortunately, a few days later, the ransomware developers released a new version called HC7 that was not decryptable. This is because they removed the hard coded encryption key and instead switched to inputting the key as a command line argument when the attackers run the ransomware executable. Thankfully, there may be a way to get around that as well so that victims can recover their keys.

The tag is: *misp-galaxy:ransomware="HC7"*

# Scarab

The Scarab ransomware is a relatively new ransomware strain that was first spotted by security researcher Michael Gillespie in June this year. Written in Delphi, the first version was simplistic and was recognizable via the ".scarab" extension it appended after the names of encrypted files. Malwarebytes researcher Marcelo Rivera spotted a second version in July that used the ".scorpio" extension. The version spotted with the Necurs spam today has reverted back to using the .scarab extension. The current version of Scarab encrypts files but does not change original file names as previous versions. This Scarab version appends each file's name with the "[suupport@protonmail.com].scarab" extension. Scarab also deletes shadow volume copies and drops a ransom note named "IF YOU WANT TO GET ALL YOUR FILES BACK, PLEASE READ THIS.TXT" on users' computers, which it opens immediately.

The tag is: *misp-galaxy:ransomware="Scarab"*

## File Spider

A new ransomware called File Spider is being distributed through spam that targets victims in Bosnia and Herzegovina, Serbia, and Croatia. These spam emails contains malicious Word documents that will download and install the File Spider ransomware onto a victims computer. File Spider is currently being distributed through malspam that appears to be targeting countries such as Croatia, Bosnia and Herzegovina, and Serbia. The spam start with subjects like "Potrazivanje

dugovanja", which translates to "Debt Collection" and whose message, according to Google Translate, appear to be in Serbian.

The tag is: *misp-galaxy:ransomware="File Spider"*

File Spider is also known as:

- Spider

## ShurL0ckr

Security researchers uncovered a new ransomware named ShurL0ckr (detected by Trend Micro as

RANSOM\_GOSHIFR.B) that reportedly bypasses detection mechanisms of cloud platforms. Like Cerber and Satan, ShurLOckr's operators further monetize the ransomware by peddling it as a turnkey service to fellow cybercriminals, allowing them to earn additional income through a commission from each victim who pays the ransom.

The tag is: *misp-galaxy:ransomware="ShurLOckr"*

## Qwerty Ransomware

A new ransomware has been discovered that utilizes the legitimate GnuPG, or GPG, encryption program to encrypt a victim's files. Currently in the wild, this ransomware is called Qwerty Ransomware and will encrypt a victims files, overwrite the originals, and the append the .qwerty extension to an encrypted file's name.

The tag is: *misp-galaxy:ransomware="Qwerty Ransomware"*

*Table 5813. Table References*

## Zenis Ransomware

A new ransomware was discovered this week by MalwareHunterTeam called Zenis Ransomware. While it is currently unknown how Zenis is being distributed, multiple victims have already become infected with this ransomware. What is most disturbing about Zenis is that it not encrypts your files, but also purposely deletes your backups.

The tag is: *misp-galaxy:ransomware="Zenis Ransomware"*

Table 5814. Table References

## Black Ruby

A new ransomware was discovered this week by MalwareHunterTeam called Black Ruby. This ransomware will encrypt the files on a computer, scramble the file name, and then append the BlackRuby extension. To make matters worse, Black Ruby will also install a Monero miner on the computer that utilizes as much of the CPU as it can. Discovered on February 6, 2018. May have been distributed through unknown vectors. Will not encrypt a machine if its IP address is identified as coming from Iran; this feature enables actors to avoid a particular Iranian cybercrime law that prohibits Iran-based actors from attacking Iranian victims. Encrypts files on the infected machine, scrambles files, and appends the .BlackRuby extension to them. Installs a Monero miner on the infected computer that utilizes the machine's maximum CPU power. Delivers a ransom note in English asking for US\$650 in Bitcoins. Might be installed via Remote Desktop Services.

The tag is: *misp-galaxy:ransomware="Black Ruby"*

Black Ruby is also known as:

- BlackRuby

## WhiteRose

A new ransomware has been discovered by MalwareHunterTeam that is based off of the InfiniteTear ransomware family, of which BlackRuby and Zenis are members. When this ransomware infects a computer it will encrypt the files, scramble the filenames, and append the .WHITEROSE extension to them.

The tag is: *misp-galaxy:ransomware="WhiteRose"*

## PUBG Ransomware

In what could only be a joke, a new ransomware has been discovered called "PUBG Ransomware" that will decrypt your files if you play the game called PlayerUnknown's Battlegrounds. Discovered by MalwareHunterTeam, when the PUBG Ransomware is launched it will encrypt a user's files and folders on the user's desktop and append the .PUBG extension to them. When it has finished encrypting the files, it will display a screen giving you two methods that you can use to decrypt the encrypted files.

The tag is: *misp-galaxy:ransomware="PUBG Ransomware"*

## LockCrypt

LockCrypt is an example of yet another simple ransomware created and used by unsophisticated attackers. Its authors ignored well-known guidelines about the proper use of cryptography. The internal structure of the application is also unprofessional. Sloppy, unprofessional code is pretty

commonplace when ransomware is created for manual distribution. Authors don't take much time preparing the attack or the payload. Instead, they're rather focused on a fast and easy gain, rather than on creating something for the long run. Because of this, they could easily be defeated.

The tag is: *misp-galaxy:ransomware="LockCrypt"*

## Reveton ransomware

A ransomware family that targets users from certain countries or regions. It locks the computer and displays a location-specific webpage that covers the desktop and demands that the user pay a fine for the supposed possession of illicit material. The Reveton ransomware is one of the first screen-locking ransomware strains, and it appeared when Bitcoin was still in its infancy, and before it became the cryptocurrency of choice in all ransomware operations. Instead, Reveton operators asked victims to buy GreenDot MoneyPak vouchers, take the code on the voucher and enter it in the Reveton screen locker.

The tag is: *misp-galaxy:ransomware="Reveton ransomware"*

## Fusob

Fusob is one of the major mobile ransomware families. Between April 2015 and March 2016, about 56 percent of accounted mobile ransomware was Fusob. Like a typical mobile ransomware, it employs scare tactics to extort people to pay a ransom. The program pretends to be an accusatory authority, demanding the victim to pay a fine from \$100 to \$200 USD or otherwise face a fictitious charge. Rather surprisingly, Fusob suggests using iTunes gift cards for payment. Also, a timer clicking down on the screen adds to the users' anxiety as well. In order to infect devices, Fusob masquerades as a pornographic video player. Thus, victims, thinking it is harmless, unwittingly download Fusob. When Fusob is installed, it first checks the language used in the device. If it uses Russian or certain Eastern European languages, Fusob does nothing. Otherwise, it proceeds on to lock the device and demand ransom. Among victims, about 40% of them are in Germany with the United Kingdom and the United States following with 14.5% and 11.4% respectively. Fusob has lots in common with Small, which is another major family of mobile ransomware. They represented over 93% of mobile ransoms between 2015 and 2016.

## NMCRYPT Ransomware

The NMCRYPT Ransomware is a generic file encryption Trojan that was detected in the middle of April 2018. The NMCRYPT Ransomware is a file encoder Trojan that is designed to make data unreadable and convince users to pay a fee for unlocking content on the infected computers. The NMCRYPT Ransomware is nearly identical to hundreds of variants of the HiddenTear open-source ransomware and compromised users are unable to use the Shadow Volume snapshots made by Windows to recover. Unfortunately, the NMCRYPT Ransomware disables the native recovery features on Windows, and you need third-party applications to rebuild your data.

The tag is: *misp-galaxy:ransomware="NMCRYPT Ransomware"*

## Iron

It is currently unknown if Iron is indeed a new variant by the same creators of Maktub, or if it was simply inspired by the latter, by copying the design for the payment portal for example. We know the Iron ransomware has mimicked at least three ransomware families: Maktub (payment portal

design) DMA Locker (Iron Unlocker, decryption tool) Satan (exclusion list)

The tag is: *misp-galaxy:ransomware="Iron"*

## Unnamed ransomware 1

A new in-development ransomware was discovered that has an interesting characteristic. Instead of the distributed executable performing the ransomware functionality, the executables compiles an embedded encrypted C# program at runtime and launches it directly into memory.

The tag is: *misp-galaxy:ransomware="Unnamed ransomware 1"*

Table 5833. Table References

Links
<a href="https://www.bleepingcomputer.com/news/security/new-c-ransomware-compiles-itself-at-runtime/">https://www.bleepingcomputer.com/news/security/new-c-ransomware-compiles-itself-at-runtime/</a>

## HPE iLO 4 Ransomware

Attackers are targeting Internet accessible HPE iLO 4 remote management interfaces, supposedly encrypting the hard drives, and then demanding Bitcoins to get access to the data again. According to the victim, the attackers are demanding 2 bitcoins to gain access to the drives again. The attackers will also provide a bitcoin address to the victim that should be used for payment. These bitcoin addresses appear to be unique per victim as the victim's was different from other reported ones. An interesting part of the ransom note is that the attackers state that the ransom price is not negotiable unless the victim's are from Russia. This is common for Russian based attackers, who in many cases tries to avoid infecting Russian victims. Finally, could this be a decoy/wiper rather than an actual true ransomware attack? Ransomware attacks typically provide a unique ID to the victim in order to distinguish one victim from another. This prevents a victim from "stealing" another victim's payment and using it to unlock their computer. In a situation like this, where no unique ID is given to identify the encrypted computer and the email is publicly accessible, it could be a case

where the main goal is to wipe a server or act as a decoy for another attack.

The tag is: *misp-galaxy:ransomware="HPE iLO 4 Ransomware"*

## Sigrun Ransomware

When Sigrun is executed it will first check "HKEY\_CURRENT\_USER\Keyboard Layout\Preload" to see if it is set to the Russian layout. If the computer is using a Russian layout, it will not encrypt the computer and just delete itself. Otherwise Sigrun will scan a computer for files to encrypt and skip any that match certain extensions, filenames, or are located in particular folders.

## Aurora Ransomware

Typical ransom software, Aurora virus plays the role of blackmailing PC operators. It encrypts files and the encryption cipher it uses is pretty strong. After encryption, the virus attaches .aurora at the end of the file names that makes it impossible to open the data. Thereafter, it dispatches the ransom note totaling 6 copies, without any change to the main objective i.e., victims must write an electronic mail addressed to [anonimus.mr@yahoo.com](mailto:anonimus.mr@yahoo.com) while stay connected until the criminals reply telling the ransom amount.

The tag is: *misp-galaxy:ransomware="Aurora Ransomware"*

Aurora Ransomware is also known as:

- Zorro Ransomware

## DBGer Ransomware

The authors of the Satan ransomware have rebranded their "product" and they now go by the name of DBGer ransomware, according to security researcher MalwareHunter, who spotted this new version earlier today. The change was not only in name but also in the ransomware's modus operandi. According to the researcher, whose discovery was later confirmed by an Intezer code similarity analysis, the new (Satan) DBGer ransomware now also incorporates Mimikatz, an open-source password-dumping utility. The purpose of DBGer incorporating Mimikatz is for lateral movement inside compromised networks. This fits a recently observed trend in Satan's modus operandi.

The tag is: *misp-galaxy:ransomware="DBGer Ransomware"*

## TYRANT

DUMB variant discovered on November 16, 2017. Disguised itself as a popular virtual private network (VPN) in Iran known as Psiphon and infected Iranian users. Included Farsi-language ransom note, decryptable in the same way as previous DUMB-based variants. Message requested only US\$15 for unlock key. Advertised two local and Iran-based payment processors: exchange.ir and webmoney.ir. Shared unique and specialized indicators with RASTAKHIZ; iDefense threat intelligence analysts believe this similarity confirms that the same actor was behind the repurposing of both types of ransomware.

The tag is: *misp-galaxy:ransomware="TYRANT"*

TYRANT is also known as:

- Crypto Tyrant

## CryptoNar

When the CryptoNar, or Crypto Nar, Ransomware encrypts a victims files it will perform the encryption differently depending on the type of file being encrypted. If the targeted file has a .txt or .md extension, it will encrypt the entire file and append the .fully.cryptoNar extension to the encrypted file's name. All other files will only have the first 1,024 bytes encrypted and will have the .partially.cryptoNar extensions appended to the file's name.

The tag is: *misp-galaxy:ransomware="CryptoNar"*

[View relationships graph](#)

CryptoNar has relationships with:

- similar: *misp-galaxy:ransomware="CryptoJoker"* with *estimative-language:likelihood-probability="likely"*

## Crypt0saur

The tag is: *misp-galaxy:ransomware="Crypt0saur"*

## Mongo Lock

An attack called Mongo Lock is targeting remotely accessible and unprotected MongoDB databases, wiping them, and then demanding a ransom in order to get the contents back. While this new campaign is using a name to identify itself, these types of attacks are not new and MongoDB databases have been targeted for a while now. These hijacks work by attackers scanning the Internet or using services such as Shodan.io to search for unprotected MongoDB servers. Once connected, the attackers may export the databases, delete them, and then create a ransom note explaining how to get the databases back.

The tag is: *misp-galaxy:ransomware="Mongo Lock"*

*Table 5867. Table References*

Links

<https://www.bleepingcomputer.com/news/security/mongo-lock-attack-ransoming-deleted-mongodb-databases/>

## Kraken Cryptor Ransomware

The Kraken Cryptor Ransomware is a newer ransomware that was released in August 2018. A new version, called Kraken Cryptor 1.5, was recently released that is masquerading as the legitimate SuperAntiSpyware anti-malware program in order to trick users into installing it.

The tag is: *misp-galaxy:ransomware="Kraken Cryptor Ransomware"*

*Table 5868. Table References*

<a href="https://twitter.com/demonslay335/status/1072907748155842565">https://twitter.com/demonslay335/status/1072907748155842565</a>

## Ryuk ransomware

Similar to Samas and BitPaymer, Ryuk is specifically used to target enterprise environments. Code comparison between versions of Ryuk and Hermes ransomware indicates that Ryuk was derived from the Hermes source code and has been under steady development since its release. Hermes is commodity ransomware that has been observed for sale on forums and used by multiple threat actors. However, Ryuk is only used by GRIM SPIDER and, unlike Hermes, Ryuk has only been used to target enterprise environments. Since Ryuk's appearance in August, the threat actors operating it have netted over 705.80 BTC across 52 transactions for a total current value of \$3,701,893.98 USD.

The tag is: *misp-galaxy:ransomware="Ryuk ransomware"*

*Table 5896. Table References*

<https://www.crowdstrike.com/blog/big-game-hunting-with-ryuk-another-lucrative-targeted-ransomware/>

<https://www.cert.ssi.gouv.fr/uploads/CERTFR-2019-ACT-005.pdf>

## BitPaymer

In August 2017, a new ransomware variant identified as BitPaymer was reported to have ransomed the U.K.'s National Health Service (NHS), with a high ransom demand of 53 BTC (approximately \$200,000 USD). The targeting of an organization rather than individuals, and the high ransom demands, made BitPaymer stand out from other contemporary ransomware at the time. Though the encryption and ransom functionality of BitPaymer was not technically sophisticated, the malware contained multiple anti-analysis features that overlapped with Dridex. Later technical analysis of BitPaymer indicated that it had been developed by INDRIK SPIDER, suggesting the group had expanded its criminal operation to include ransomware as a monetization strategy.

The tag is: *misp-galaxy:ransomware="BitPaymer"*

BitPaymer is also known as:

- FriedEx
- IEncrypt

*Table 5897. Table References*

# Princess Evolution

We have been observing a malvertising campaign via Rig exploit kit delivering a cryptocurrency-mining malware and the GandCrab ransomware since July 25. On August 1, we found Rig's traffic stream dropping a then-unknown ransomware. Delving into this seemingly new ransomware, we checked its ransom payment page in the Tor network and saw it was called Princess Evolution (detected by Trend Micro as RANSOM\_PRINCESSLOCKER.B), and was actually a new version of the Princess Locker ransomware that emerged in 2016. Based on its recent advertisement in underground forums, it appears that its operators are peddling Princess Evolution as a ransomware as a service (RaaS) and are looking for affiliates. The new malvertising campaign we observed since July 25 is notable in that the malvertisements included Coinhive (COINMINER\_MALXMR.TIDBF). Even if users aren't diverted to the exploit kit and infected with the ransomware, the cybercriminals can still earn illicit profit through cryptocurrency mining. Another characteristic of this new campaign is that they hosted their malvertisement page on a free web hosting service and used domain name system canonical name (DNS CNAME) to map their advertisement domain on a malicious webpage on the service.

The tag is: *misp-galaxy:ransomware="Princess Evolution"*

Princess Evolution is also known as:

- PrincessLocker Evolution

*Table 5899. Table References*

Links
<a href="https://blog.trendmicro.com/trendlabs-security-intelligence/ransomware-as-a-service-princess-evolution-looking-for-affiliates/">https://blog.trendmicro.com/trendlabs-security-intelligence/ransomware-as-a-service-princess-evolution-looking-for-affiliates/</a>

# Jokeroo

A new Ransomware-as-a-Service called Jokeroo is being promoted on underground hacking sites and via Twitter that allows affiliates to allegedly gain access to a fully functional ransomware and payment server. According to a malware researcher named Damian, the Jokeroo RaaS first started promoting itself as a GandCrab Ransomware RaaS on the underground hacking forum Exploit.in.

The tag is: *misp-galaxy:ransomware="Jokeroo"*

Jokeroo is also known as:

- Fake GandCrab

<a href="https://www.bleepingcomputer.com/news/security/jokeroo-ransomware-as-a-service-offers-multiple-membership-packages/">https://www.bleepingcomputer.com/news/security/jokeroo-ransomware-as-a-service-offers-multiple-membership-packages/</a>

# GlobeImposter

During December 2017, a new variant of the GlobeImposter Ransomware was detected for the first time and reported on malware-traffic-analysis. At first sight this ransomware looks very similar to other ransomware samples and uses common techniques such as process hollowing. However, deeper inspection showed that like LockPoS, which was analyzed by CyberBit, GlobeImposter too bypasses user-mode hooks by directly invoking system calls. Given this evasion technique is being leveraged by new malware samples may indicate that this is a beginning of a trend aiming to bypass user-mode security products.

The tag is: *misp-galaxy:ransomware="GlobeImposter"*

*Table 5901. Table References*

Links

<https://www.fortinet.com/blog/threat-research/analysis-of-new-globeimposter-ransomware-variant.html>

# BlackWorm

BlackWorm Ransomware is a malicious computer infection that encrypts your files, and then does everything it can to prevent you from restoring them. It needs you to pay \$200 for the decryption key, but there is no guarantee that the people behind this infection would really issue the decryption tool for you.

The tag is: *misp-galaxy:ransomware="BlackWorm"*

*Table 5902. Table References*

Links

<https://spyware-techie.com/blackworm-ransomware-removal-guide>

# Tellyouthepass

Tellyouthepass is a ransomware that alters system files, registry entries and encodes personal photos, documents, and servers or archives. Army-grade encryption algorithms get used to change the original code of the file and make the data useless.

The tag is: *misp-galaxy:ransomware="Tellyouthepass"*

*Table 5903. Table References*

Links

<https://malware.wikia.org/wiki/Tellyouthepass>

# BigBobRoss

BigBobRoss ransomware is the cryptovirus that requires a ransom in Bitcoin to return encrypted

files marked with .obfuscated appendix.

The tag is: *misp-galaxy:ransomware="BigBobRoss"*

*Table 5904. Table References*

## Sodinokibi

Attackers are actively exploiting a recently disclosed vulnerability in Oracle WebLogic to install a new variant of ransomware called "Sodinokibi." Sodinokibi attempts to encrypt data in a user's directory and delete shadow copy backups to make data recovery more difficult. Oracle first patched the issue on April 26, outside of their normal patch cycle, and assigned it CVE-2019-2725. This vulnerability is easy for attackers to exploit, as anyone with HTTP access to the WebLogic server could carry out an attack. Because of this, the bug has a CVSS score of 9.8/10. Attackers have

been making use of this exploit in the wild since at least April 17. Cisco's Incident Response (IR) team, along with Cisco Talos, are actively investigating these attacks and Sodinokibi.

The tag is: *misp-galaxy:ransomware="Sodinokibi"*

Sodinokibi is also known as:

- REvil
- Revil

## Nodera Ransomware

Nodera is a ransomware family that uses the Node.js framework and was discovered by Quick Heal researchers. The infection chain starts with a VBS script embedded with multiple JavaScript files. Upon execution, a directory is created and both the main node.exe program and several required NodeJS files are downloaded into the directory. Additionally, a malicious JavaScript payload that performs the encryption process is saved in this directory. After checking that it has admin privileges and setting applicable variables, the malicious JavaScript file enumerates the drives to create a list of targets. Processes associated with common user file types are stopped and volume shadow copies are deleted. Finally, all user-specific files on the C: drive and all files on other drives are encrypted and are appended with a .encrypted extension. The ransom note containing instructions on paying the Bitcoin ransom are provided along with a batch script to be used for decryption after obtaining the private key. Some mistakes in the ransom note identified by the researchers include the fact that it mentions a 2048-bit RSA public key instead of 4096-bit (the size that was actually used), a hard-coded private key destruction time dating back almost 2 years ago, and a lack of instructions for how the private key will be obtained after the ransom is paid. These are signs that the ransomware may be in the development phase and was likely written by an amateur. For more information, see the QuickHeal blog post in the Reference section below.

The tag is: *misp-galaxy:ransomware="Nodera Ransomware"*

Nodera Ransomware is also known as:

- Nodera

## Bart ransomware

Bart ransomware is distributed by the same Russian Cyber Mafia behind Dridex 220 and Locky. Bart doesn't communicate with a command and control (C&C) server, so it can encrypt files without being connected to a computer. Bart is spread to end users via phishing emails containing .zip attachments with JavaScript Code and use social engineering to trick users into opening the 'photo' attachments. The zipped files are obfuscated to make it more hard to tell what actions they are performing. See screenshot above for an example of what they look like. If opened, these attachments download and install the intermediary loader RockLoader which downloads Bart onto the machine over HTTPS. Once executed, it will first check the language on the infected computer. If the malware detects Russian, Belorussian, or Ukrainian, the ransomware will terminate and will not proceed with the infection. If it's any other language, it will start scanning the computer for certain file extensions to encrypt. Because Bart does not require communication with C&C infrastructure prior to encrypting files, Bart could possibly encrypt machines sitting behind corporate firewalls that would otherwise block such traffic. Thus, organizations need to ensure that Bart is blocked at the email gateway using rules that block zipped executables.

The tag is: *misp-galaxy:ransomware="Bart ransomware"*

Bart ransomware is also known as:

- Locky Bart

## Razor

Razor was discovered by dnwls0719, it is a part of Garrandydecrypt ransomware family. Like many other programs of this type, Razor is designed to encrypt files (make them unusable/inaccessible), change their filenames, create a ransom note and change victim's desktop wallpaper. Razor renames files by appending the ".razor" extension to their filenames. For example, it renames "1.jpg" to "1.jpg.razor", and so on. It creates a ransom note which is a text file named "**RECOVERY**.txt", this file contains instructions on how to contact Razor's developers (cyber criminals) and other details. As stated in the "**RECOVERY**.txt" file, this ransomware encrypts all files and information about how to purchase a decryption tool can be received by contacting Razor's developers. Victims supposed to contact them via [razor2020@protonmail.ch](mailto:razor2020@protonmail.ch), Jabber client ([razor2020@jxmpp.jp](xmpp:razor2020@jxmpp.jp)) or ICQ client (@razor2020) and wait for further instructions. It is very likely that they will name a price of a decryption tool and/or key and provide cryptocurrency wallet's address that should be used to make a transaction. However, it is never a good idea to trust (pay) any cyber criminals/ransomware developers. It is common that they do not provide decryption tools even after a payment. Another problem is that ransomware-type programs encrypt files with strong encryption algorithms and their developers are the only ones who have tools that can decrypt files encrypted by their ransomware. In most cases victims have the only free and safe option: to restore files from a backup. Also, it is worth mentioning that files remain encrypted even after uninstallation of ransomware, its removal only prevents it from causing further encryptions.

The tag is: *misp-galaxy:ransomware="Razor"*

# CoronaVirus

A new ransomware called CoronaVirus has been distributed through a fake web site pretending to promote the system optimization software and utilities from WiseCleaner. With the increasing fears and anxiety of the Coronavirus (COVID-19) outbreak, an attacker has started to build a campaign to distribute a malware cocktail consisting of the CoronaVirus Ransomware and the Kpot information-stealing Trojan. This new ransomware was discovered by MalwareHunterTeam and after further digging into the source of the file, we have been able to determine how the threat actor plans on distributing the ransomware and possible clues suggesting that it may actually be a wiper.

# Snake Ransomware

Snake ransomware first attracted the attention of malware analysts in January 2020 when they observed the crypto-malware family targeting entire corporate networks. Shortly after this discovery, the threat quieted down. It produced few new detected infections in the wild for the next few months. That was until May 4, when ID Ransomware registered a sudden spike in submissions for the ransomware.

The tag is: *misp-galaxy:ransomware="Snake Ransomware"*

# eCh0raix

Anomali researchers have observed a new ransomware family, dubbed eCh0raix, targeting QNAP Network Attached Storage (NAS) devices. QNAP devices are created by the Taiwanese company QNAP Systems, Inc., and contain device storage and media player functionality, amongst others. The devices appear to be compromised by brute forcing weak credentials and exploiting known vulnerabilities in targeted attacks. The malicious payload encrypts the targeted file extensions on the NAS using AES encryption and appends .encrypt extension to the encrypted files. The ransom

note created by the ransomware has the form shown below. eCh0raix was first seen in June 2019, after victims began reporting ransomware attacks in a forum topic on BleepingComputer. On June 1st, 2020, there has been a sudden surge of eCh0raix victims seeking help in our forums and submissions to the ransomware identification site ID-Ransomware.

The tag is: `misp-galaxy:ransomware="eCh0raix"`

<a href="https://www.anomali.com/blog/the-ech0raix-ransomware">https://www.anomali.com/blog/the-ech0raix-ransomware</a>

## Egregor

The threat group behind this malware seems to operate by hacking into companies, stealing sensitive data, and then running Egregor to encrypt all the files. According to the ransom note, if the ransom is not paid by the company within 3 days, and aside from leaking part of the stolen data, they will distribute via mass media where the company's partners and clients will know that the company was attacked.

The tag is: `misp-galaxy:ransomware="Egregor"`

[View relationships graph](#)

Egregor has relationships with:

- variant-of: `misp-galaxy:ransomware="Sekhmet"` with `estimative-language:likelihood-probability="likely"`

## SunCrypt

SunCrypt ransomware was discovered in October 2019 and in August 2020 it was added to Maze ransomware's cartel. It also follows some of Maze's tactics, techniques, and procedures. SunCrypt is launched and installed using an obfuscated PowerShell script. Infected email attachments (macros), torrent websites, malicious ads act as carriers for this ransomware.

The tag is: *misp-galaxy:ransomware="SunCrypt"*

SunCrypt is also known as:

- Sun
- Suncrypt

## LockBit

LockBit operators tend to be very indiscriminate and opportunistic in their targeting. Actors behind this attack will use a variety of methods to gain initial access, up to and including basic methods such as brute force. After gaining initial access the actor follows a fairly typical escalation, lateral movement and ransomware execution playbook. LockBit operators tend to have a very brief dwell time, executing the final ransomware payload as quickly as they are able to. LockBit ransomware has the built-in lateral movement features; given adequate permissions throughout the targeted environment.

The tag is: *misp-galaxy:ransomware="LockBit"*

*Table 5937. Table References*

<a href="https://usa.kaspersky.com/resource-center/threats/lockbit-ransomware">https://usa.kaspersky.com/resource-center/threats/lockbit-ransomware</a>

## WastedLocker

WastedLocker primarily targets corporate networks. Upon initial compromise, often using a fake browser update containing SocGhosh, the actor then takes advantage of dual-use and LoLBin tools in an attempt to evade detection. Key observations include lateral movement and privilege escalation. The WastedLocker ransomware has been tied back to EvilCorp.

The tag is: *misp-galaxy:ransomware="WastedLocker"*

## Babuk Ransomware

Since this is the first detection of this malware in the wild, it's not surprising that Babuk is not obfuscated at all. Overall, it's a pretty standard ransomware that utilizes some of the new techniques we see such as multi-threading encryption as well as abusing the Windows Restart Manager similar to Conti and REvil. For encryption scheme, Babuk uses its own implementation of SHA256 hashing, ChaCha8 encryption, and Elliptic-curve Diffie–Hellman (ECDH) key generation and exchange algorithm to protect its keys and encrypt files. Like many ransomware that came before, it also has the ability to spread its encryption through enumerating the available network resources.

The tag is: *misp-galaxy:ransomware="Babuk Ransomware"*

## Darkside

Darkside, the latest ransomware operation to emerge has been attacking organizations beginning earlier this month. Darkside's customized attacks on companies have already garnered them million-dollar payouts. Through their "press release", these threat actors have claimed to be affiliated with prior ransomware operations making millions of dollars. They stated that they created this new product to match their needs, as prior products didn't. Darkside explains that they only target companies they know that can pay the specified ransom. They have allegedly promised that they will not attack the following sectors. They include medicine, education, non-profit organizations, and the government sector.

The tag is: *misp-galaxy:ransomware="Darkside"*

## RansomEXX

We recently discovered a new file-encrypting Trojan built as an ELF executable and intended to encrypt data on machines controlled by Linux-based operating systems. After the initial analysis we noticed similarities in the code of the Trojan, the text of the ransom notes and the general approach to extortion, which suggested that we had in fact encountered a Linux build of the previously known ransomware family RansomEXX. This malware is notorious for attacking large organizations and was most active earlier this year. RansomEXX is a highly targeted Trojan. Each sample of the malware contains a hardcoded name of the victim organization. Moreover, both the encrypted file extension and the email address for contacting the extortionists make use of the victim's name.

The tag is: *misp-galaxy:ransomware="RansomEXX"*

RansomEXX is also known as:

- Ransom X
- Defray777
- Defray-777
- Defray 2018

## CovidLock

Mobile ransomware. The Zscaler ThreatLabZ team recently came across a URL named [hxxp://coronavirusapp\[.\]site/mobile.html](https://coronavirusapp[.]site/mobile.html), which portrays itself as a download site for an Android app that tracks the coronavirus spread across the globe. In reality, the app is Android ransomware, which locks out the victim and asks for ransom to unlock the device. The app portrays itself as a Coronavirus Tracker. As soon as it starts running, it asks the user for several authorizations, including admin rights. In fact, this ransomware does not encrypt nor steal anything and only lock the device with an hard coded code.

## Tycoon

This malware is written in Java and is named after references in the code. Tycoon has been in the wild since December 2019 and has targeted organizations in the education, SMBs, and software industries. Tycoon is a multi-platform Java ransomware that targets Windows and Linux systems. This ransomware denies access to the system administrator following an attack on the domain controller and file servers. The initial intrusion occurs through an internet-facing remote desktop protocol (RDP) jump-server.

## BlackCat

BlackCat (ALPHV) is ransomware written in Rust. The ransomware makes heavy use of plaintext JSON configuration files to specify the ransomware functionality. BlackCat has many advanced capabilities like escalating privileges and bypassing UAC make use of AES and ChaCha20 or Salsa encryption, may use the Restart Manager, can delete volume shadow copies, can enumerate disk volumes and network shares automatically, and may kill specific processes and services. The ransomware exists for both Windows, Linux, and ESXi systems. Multiple extortion techniques are used by the BlackCat gang, such as exfiltrating victim data before the ransomware deployment, threats to release data if the ransomw is not paid, and distributed denial-of-service (DDoS) attacks.

## Back Orifice 2000

Back Orifice 2000 (often shortened to BO2k) is a computer program designed for remote system administration. It enables a user to control a computer running the Microsoft Windows operating system from a remote location. The name is a pun on Microsoft BackOffice Server software. Back Orifice 2000 is a new version of the famous Back Orifice backdoor trojan (hacker's remote access tool). It was created by the Cult of Dead Cow hackers group in July 1999. Originally the BO2K was released as a source code and utilities package on a CD-ROM. There are reports that some files on that CD-ROM were infected with CIH virus, so the people who got that CD might get infected and spread not only the compiled backdoor, but also the CIH virus.

The tag is: *misp-galaxy:rat="Back Orifice 2000"*

Back Orifice 2000 is also known as:

- BO2k

## DarkRat

In March 2017, Fujitsu Cyber Threat Intelligence uncovered a newly developed remote access tool referred to by its developer as ‘Dark RAT’ – a tool used to steal sensitive information from victims. Offered as a Fully Undetectable build (FUD) the RAT has a tiered price model including 24/7 support and an Android version. Android malware has seen a significant rise in interest and in 2015 this resulted in the arrests of a number of suspects involved in the infamous DroidJack malware.

The tag is: *misp-galaxy:rat="DarkRat"*

DarkRat is also known as:

- DarkRAT

# LuxNET

Just saying that this is a very badly coded RAT by the biggest skid in this world, that is XilluX. The connection is very unstable, the GUI is always flickering because of the bad Multi-Threading and many more bugs.

The tag is: *misp-galaxy:rat="LuxNET"*

*Table 5985. Table References*

Links
-------

## NJRat

NJRat is a remote access trojan (RAT), first spotted in June 2013 with samples dating back to November 2012. It was developed and is supported by Arabic speakers and mainly used by cybercrime groups against targets in the Middle East. In addition to targeting some governments in the region, the trojan is used to control botnets and conduct other typical cybercrime activity. It infects victims via phishing attacks and drive-by downloads and propagates through infected USB keys or networked drives. It can download and execute additional malware, execute shell commands, read and write registry keys, capture screenshots, log keystrokes, and spy on webcams.

The tag is: *misp-galaxy:rat="NJRat"*

NJRat is also known as:

- Njw0rm

## Dendroid

Dendroid is malware that affects Android OS and targets the mobile platform. It was first discovered in early of 2014 by Symantec and appeared in the underground for sale for \$300. Some things were noted in Dendroid, such as being able to hide from emulators at the time. When first discovered in 2014 it was one of the most sophisticated Android remote administration tools known at that time. It was one of the first Trojan applications to get past Google's Bouncer and caused researchers to warn about it being easier to create Android malware due to it. It also seems to have follow in the footsteps of Zeus and SpyEye by having simple-to-use command and control panels. The code appeared to be leaked somewhere around 2014. It was noted that an apk binder was included in the leak, which provided a simple way to bind Dendroid to legitimate applications.

## Kiler RAT

This remote access trojan (RAT) has capabilities ranging from manipulating the registry to opening a reverse shell. From stealing credentials stored in browsers to accessing the victims webcam. Through the Command & Control (CnC) server software, the attacker has capabilities to create and configure the malware to spread utilizing physic devices, such as USB drives, but also to use the victim as a pivot point to gain more access laterally throughout the network. This remote access trojan could be classified as a variant of the well known njrat, as they share many similar features such as their display style, several abilities and a general template for communication methods . However, where njrat left off KilerRat has taken over. KilerRat is a very feature rich RAT with an active development force that is rapidly gaining in popularity amongst the middle eastern community and the world.

The tag is: *misp-galaxy:rat="Kiler RAT"*

Kiler RAT is also known as:

- Njw0rm

## DameWare Mini Remote Control

Affordable remote control software for all your customer support and help desk needs.

The tag is: *misp-galaxy:rat="DameWare Mini Remote Control"*

DameWare Mini Remote Control is also known as:

- dameware

Table 6052. Table References

Links

<http://www.dameware.com/dameware-mini-remote-control>

## Remote Utilities

Remote Utilities is a free remote access program with some really great features. It works by pairing two remote computers together with what they call an "Internet ID." You can control a total of 10 PCs with Remote Utilities.

The tag is: *misp-galaxy:rat="Remote Utilities"*

Table 6053. Table References

Links
<a href="https://www.remoteutilities.com/">https://www.remoteutilities.com/</a>

## Ammyy Admin

Ammyy Admin is a completely portable remote access program that's extremely simple to setup. It works by connecting one computer to another via an ID supplied by the program.

The tag is: *misp-galaxy:rat="Ammyy Admin"*

Ammyy Admin is also known as:

- Ammyy

Table 6054. Table References

Links
<a href="http://ammyy-admin.soft32.com/">http://ammyy-admin.soft32.com/</a>

## Ultra VNC

UltraVNC works a bit like Remote Utilities, where a server and viewer is installed on two PCs, and the viewer is used to control the server.

The tag is: *misp-galaxy:rat="Ultra VNC"*

Table 6055. Table References

Links
<a href="http://www.uvnc.com/">http://www.uvnc.com/</a>

## AeroAdmin

AeroAdmin is probably the easiest program to use for free remote access. There are hardly any settings, and everything is quick and to the point, which is perfect for spontaneous support.

The tag is: *misp-galaxy:rat="AeroAdmin"*

Table 6056. Table References

Links
<a href="http://www.aeroadmin.com/en/">http://www.aeroadmin.com/en/</a>

## Windows Remote Desktop

Windows Remote Desktop is the remote access software built into the Windows operating system.

No additional download is necessary to use the program.

The tag is: *misp-galaxy:rat="Windows Remote Desktop"*

## RemotePC

RemotePC, for good or bad, is a more simple free remote desktop program. You're only allowed one connection (unless you upgrade) but for many of you, that'll be just fine.

The tag is: *misp-galaxy:rat="RemotePC"*

*Table 6057. Table References*

Links
<a href="https://www.remotepc.com/">https://www.remotepc.com/</a>

## Seecreen

Seecreen (previously called Firnass) is an extremely tiny (500 KB), yet powerful free remote access program that's absolutely perfect for on-demand, instant support.

The tag is: *misp-galaxy:rat="Seecreen"*

Seecreen is also known as:

- Firnass

*Table 6058. Table References*

Links
<a href="http://seecreen.com/">http://seecreen.com/</a>

## Chrome Remote Desktop

Chrome Remote Desktop is an extension for the Google Chrome web browser that lets you setup a computer for remote access from any other Chrome browser.

The tag is: *misp-galaxy:rat="Chrome Remote Desktop"*

*Table 6059. Table References*

Links
<a href="https://chrome.google.com/webstore/detail/chrome-remote-desktop/gbchcmhahfdphkhkmpfmihenigmpp?hl=en">https://chrome.google.com/webstore/detail/chrome-remote-desktop/gbchcmhahfdphkhkmpfmihenigmpp?hl=en</a>

## AnyDesk

AnyDesk is a remote desktop program that you can run portably or install like a regular program.

The tag is: *misp-galaxy:rat="AnyDesk"*

*Table 6060. Table References*

Links
-------

<a href="https://anydesk.com/remote-desktop">https://anydesk.com/remote-desktop</a>
---

## LiteManager

LiteManager is another remote access program, and it's strikingly similar to Remote Utilities, which I explain on the first page of this list. However, unlike Remote Utilities, which can control a total of only 10 PCs, LiteManager supports up to 30 slots for storing and connecting to remote computers, and also has lots of useful features.

The tag is: *misp-galaxy:rat="LiteManager"*

*Table 6061. Table References*

Links
-------

<a href="http://www.litemanager.com/">http://www.litemanager.com/</a>
---

## Comodo Unite

Comodo Unite is another free remote access program that creates a secure VPN between multiple computers. Once a VPN is established, you can remotely have access to applications and files through the client software.

The tag is: *misp-galaxy:rat="Comodo Unite"*

*Table 6062. Table References*

# NanoCore

In September of 2015, a DigiTrust client visited a web link that was providing an Adobe Flash Player update. The client, an international retail organization, attempted to download and run what appeared to be a regular update. The computer trying to download this update was a back office system that processed end of day credit card transactions. This system also had the capability of connecting to the corporate network which contained company sales reports. DigiTrust experts were alerted to something malicious and blocked the download. The investigation found that what appeared to be an Adobe Flash Player update, was a Remote Access Trojan called NanoCore. If installation had been successful, customer credit card data, personal information, and internal sales information could have been captured and monetized. During the analysis of NanoCore, our experts found that there was much more to this RAT than simply being another Remote Access Trojan.

The tag is: *misp-galaxy:rat="NanoCore"*

## Xsser

Xsser mRAT is a piece of malware that targets iOS devices that have software limitations removed. The app is installed via a rogue repository on Cydia, the most popular third-party application store for jailbroken iPhones. Once the malicious bundle has been installed and executed, it gains persistence - preventing the user from deleting it. The mRAT then makes server-side checks and proceeds to steal data from the user's device and executes remote commands as directed by its command-and-control (C2) server.

The tag is: *misp-galaxy:rat="Xsser"*

Xsser is also known as:

- mRAT

## Quaverse

Quaverse RAT or QRAT is a fairly new Remote Access Tool (RAT) introduced in May 2015. This RAT is marketed as an undetectable Java RAT. As you might expect from a RAT, the tool is capable of

grabbing passwords, key logging and browsing files on the victim's computer. On a regular basis for the past several months, we have observed the inclusion of QRAT in a number of spam campaigns.

The tag is: *misp-galaxy:rat="Quaverse"*

Quaverse is also known as:

- QRAT

## Heseber

The tag is: *misp-galaxy:rat="Heseber"*

## Cardinal

Cardinal is a remote access trojan (RAT) discovered by Palo Alto Networks in 2017 and has been active for over two years. It is delivered via a downloader, known as Carp, and uses malicious macros in Microsoft Excel documents to compile embedded C# programming language source code into an executable that runs and deploys the Cardinal RAT. The malicious Excel files use different tactics to get the victims to execute it.

## Trochilus

Trochilus is a remote access trojan (RAT) first identified in October 2015 when attackers used it to infect visitors of a Myanmar website. It was then used in a 2016 cyber-espionage campaign, dubbed "the Seven Pointed Dagger," managed by another group, "Group 27," who also uses the PlugX trojan. Trochilus is primarily spread via emails with a malicious .RAR attachment containing the malware. The trojan's functionality includes a shellcode extension, remote uninstall, a file manager, and the ability to download and execute, upload and execute, and access the system information. Once present on a system, Trochilus can move laterally in the network for better access. This trojan operates in memory only and does not write to the disk, helping it evade detection.

The tag is: *misp-galaxy:rat="Trochilus"*

# Matryoshka

Their most commonly used initial attack vector is a simple, yet alarmingly effective, spearphishing attack, infecting unsuspecting victims via a malicious email attachment (usually an executable that has been disguised as something else). From there, Matryoshka runs second stage malware via a dropper and covertly installs a Remote Access Toolkit (RAT). This is done using a reflective loader technique that allows the malware to run in process memory, rather than being written to disk. This not only hides the install of the RAT but also ensures that the RAT will be 'reinstalled' after system restart.

The tag is: `misp-galaxy:rat="Matryoshka"`

# Mangit

First discovered by Trend Micro in June, Mangit is a new malware family being marketed on both the Dark web and open internet. Users have the option to rent the trojan's infrastructure for about \$600 per 10-day period or buy the source code for about \$8,800. Mangit was allegedly developed by "Ric", a Brazilian hacker, who makes himself available via Skype to discuss rental agreements. Once the malware is rented or purchased, the user controls a portion of the Mangit botnet, the trojan, the dropper, an auto-update system, and the server infrastructure to run their attacks. Mangit contains support for nine Brazillian banks including Citibank, HSBC, and Santander. The malware can also be used to steal user PayPal credentials. Mangit has the capability to collect banking credentials, receive SMS texts when a victim is accessing their bank account, and take over victim's browsers. To circumvent two-factor authentication, attackers can use Mangit to lock victim's browsers and push pop-ups to the victim asking for the verification code they just received.

The tag is: `misp-galaxy:rat="Mangit"`

## Revenge-RAT

Revenge v0.1 was a simple tool, according to a researcher known as Rui, who says the malware's author didn't bother obfuscating the RAT's source code. This raised a question mark with the researchers, who couldn't explain why VirusTotal scanners couldn't pick it up as a threat right away. Revenge, which was written in Visual Basic, also didn't feature too many working features, compared to similar RATs. Even Napoleon admitted that his tool was still in the early development stages, a reason why he provided the RAT for free.

## rokrat

ROKRAT is a remote access trojan (RAT) that leverages a malicious Hangual Word Processor (HWP) document sent in spearphishing emails to infect hosts. The HWP document contains an embedded Encapsulated PostScript (EPS) object. The object exploits an EPS buffer overflow vulnerability and downloads a binary disguised as a .JPG file. The file is then decoded and the ROKRAT executable is initiated. The trojan uses legitimate Twitter, Yandex, and Mediafire websites for its command and control communications and exfiltration platforms, making them difficult to block globally. Additionally, the platforms use HTTPS connections, making it more difficult to gather additional data on its activities. Cisco's Talos Group identified two email campaigns. In one, attackers send potential victims emails from an email server of a private university in Seoul, South Korea with a

sender email address of "[kgf2016@yonsei.ac.kr](mailto:kgf2016@yonsei.ac.kr)," the contact email for the Korea Global Forum, adding a sense of legitimacy to the email. It is likely that the email address was compromised and used by the attackers in this campaign. The second is less sophisticated and sends emails claiming to be from a free Korean mail service with a the subject line, "Request Help" and attached malicious HWP filename, "I'm a munchon person in Gangwon-do, North Korea." The ROKRAT developer uses several techniques to hinder analysis, including identifying tools usually used by malware analysts or within sandbox environments. Once it has infected a device, this trojan can execute commands, move a file, remove a file, kill a process, download and execute a file, upload documents, capture screenshots, and log keystrokes. Researchers believe the developer is a native Korean speaker and the campaign is currently targeting Korean-speakers.

The tag is: *misp-galaxy:rat="rokrat"*

rokrat is also known as:

## RATAttack

RATAttack is a remote access trojan (RAT) that uses the Telegram protocol to support encrypted communication between the victim's machine and the attacker. The Telegram protocol also provides a simple method to communicate to the target, negating the need for port forwarding. Before using RATAttack, the attacker must create a Telegram bot and embed the bot's Telegram token into the trojan's configuration file. When a system is infected with RATAttack, it connects to the bot's Telegram channel. The attacker can then connect to the same channel and manage the RATAttack clients on the infected host machines. The trojan's code was available on GitHub then was taken down by the author on April 19, 2017.

The tag is: *misp-galaxy:rat="RATAttack"*

## Socket23

SOCKET23 was launched from his web site and immediately infected major French corporations between August and October 1998. The virus (distributing the Trojan) was known as W32/HLLP.DeTroie.A (alias W32/Cheval.TCV). Never had a virus so disrupted French industry. The author quickly offered his own remover and made his apologies on his web site (now suppressed). Jean-Christophe X (18) was arrested on Tuesday 15 June 1999 in the Paris area and placed under judicial investigation for 'fraudulent intrusion of data in a data processing system, suppression and fraudulent modification of data'

## DNSMessenger

Talos recently analyzed an interesting malware sample that made use of DNS TXT record queries and responses to create a bidirectional Command and Control (C2) channel. This allows the attacker to use DNS communications to submit new commands to be run on infected machines and return the results of the command execution to the attacker. This is an extremely uncommon and evasive way of administering a RAT. The use of multiple stages of Powershell with various stages being completely fileless indicates an attacker who has taken significant measures to avoid detection.

# htpRAT

On November 8, 2016 a non-disclosed entity in Laos was spear-phished by a group closely related to known Chinese adversaries and most likely affiliated with the Chinese government. The attackers utilized a new kind of Remote Access Trojan (RAT) that has not been previously observed or reported. The new RAT extends the capabilities of traditional RATs by providing complete remote execution of custom commands and programming. htpRAT, uncovered by RiskIQ cyber investigators, is the newest weapon in the Chinese adversary's arsenal in a campaign against Association of Southeast Asian Nations (ASEAN). Most RATs can log keystrokes, take screenshots, record audio and video from a webcam or microphone, install and uninstall programs and manage files. They support a fixed set of commands operators can execute using different command IDs —'file download' or 'file upload,' for example—and must be completely rebuilt to have different functionality. htpRAT, on the other hand, serves as a conduit for operators to do their job with greater precision and effect. On the Command and Control (C2) server side, threat actors can build new functionality in commands, which can be sent to the malware to execute. This capability makes htpRAT a small, agile, and incredibly dynamic piece of malware. Operators can change functionality, such as searching for a different file on the victim's network, simply by wrapping commands.

The tag is: *misp-galaxy:rat="htpRAT"*

# FALLCHILL

According to trusted third-party reporting, HIDDEN COBRA actors have likely been using FALLCHILL malware since 2016 to target the aerospace, telecommunications, and finance industries. The malware is a fully functional RAT with multiple commands that the actors can issue from a command and control (C2) server to a victim's system via dual proxies. FALLCHILL typically infects a system as a file dropped by other HIDDEN COBRA malware or as a file downloaded unknowingly by users when visiting sites compromised by HIDDEN COBRA actors. HIDDEN COBRA actors use an external tool or dropper to install the FALLCHILL malware-as-a-service to establish persistence. Because of this, additional HIDDEN COBRA malware may be present on systems compromised with FALLCHILL.

The tag is: *misp-galaxy:rat="FALLCHILL"*

## BONDUPDATER

BONDUPDATER is a PowerShell-based Trojan first discovered by FireEye in mid-November 2017, when OilRig targeted a different Middle Eastern governmental organization. The BONDUPDATER Trojan contains basic backdoor functionality, allowing threat actors to upload and download files, as well as the ability to execute commands. BONDUPDATER, like other OilRig tools, uses DNS tunneling to communicate with its C2 server. During the past month, Unit 42 observed several attacks against a Middle Eastern government leveraging an updated version of the BONDUPDATER malware, which now includes the ability to use TXT records within its DNS tunneling protocol for its C2 communications.

The tag is: *misp-galaxy:rat="BONDUPDATER"*

---

## H-worm

H-worm is a VBS (Visual Basic Script) based RAT written by an individual going by the name Houdini. We believe the author is based in Algeria and has connections to njq8, the author of njw0rm [1] and njRAT/LV [2] through means of a shared or common code base. We have seen the H-worm RAT being employed in targeted attacks against the international energy industry; however, we also see it being employed in a wider context as run of the mill attacks through spammed email attachments and malicious links.

The tag is: *misp-galaxy:rat="H-worm"*

---

## Caesar RAT

Caesar is an HTTP-based RAT that allows you to remotely control devices directly from your browser.

The tag is: *misp-galaxy:rat="Caesar RAT"*

*Table 6164. Table References*

Links
-------

## FlawedAmmy

During the month of October, Check Point researchers discovered a widespread malware campaign spreading a remote access trojan (dubbed “FlawedAmmy”) that allows attackers to take over victims’ computers and data. The campaign was the latest and most widespread delivering the ‘FlawedAmmy’ RAT, following a number of campaigns that have spread this malware in recent months. The Trojan allows attackers to gain full access to the machine’s camera and microphone, collect screen grabs, steal credentials and sensitive files, and intrusively monitor the victims’ actions. As a result, FlawedAmmy is the first RAT to enter the Global Threat Index’s top 10 ranking.

The tag is: *misp-galaxy:rat="FlawedAmmy"*

*Table 6165. Table References*

Links

<https://www.helpnetsecurity.com/2018/11/14/flawedammy-most-wanted-malware-list/>

## Felipe

The Zscaler ThreatLabZ team came across a new strain of infostealer Trojan called Felipe, which silently installs itself onto a user’s system and connects to a command-and-control (C&C) server to send system information from the compromised system. This malware is compiled for both 32-bit and 64-bit Windows operating systems. Felipe basically steals the victim’s debit and credit card information and sends it, along with other personal information, to the remote C&C server. It also sets a date and time to perform other malicious activity upon successful infection of the victim machine.

The tag is: *misp-galaxy:rat="Felipe"*

*Table 6166. Table References*

*Table 6171. Table References*

Links
<a href="https://warzone.pw">https://warzone.pw</a>

# SDBbot

SDBbot is a new remote access Trojan (RAT) written in C++ that has been delivered by the Get2 downloader in recent TA505 campaigns. Its name is derived from the debugging log file (sdb.log.txt) and DLL name (BotDLL[.dll]) used in the initial analyzed sample. It also makes use of application shimming [1] for persistence. SDBbot is composed of three pieces: an installer, a loader, and a RAT component.

The tag is: *misp-galaxy:rat="SDBbot"*

SDBbot is also known as:

- SDB bot

# Sepulcher

A China-based APT has been sending organizations spear-phishing emails that distribute a never-before-seen intelligence-collecting RAT dubbed Sepulcher.

Researchers discovered the new malware being distributed over the past six months through two separate campaigns. The first, in March, targeted European diplomatic and legislative bodies, non-profit policy research organizations and global organizations dealing with economic affairs. The second, in July, targeted Tibetan dissidents. They tied the campaigns to APT group TA413, which researchers say has been associated with Chinese state interests and is known for targeting the Tibetan community.

“Based on the use of publicly known sender addresses associated with Tibetan dissident targeting and the delivery of Sepulcher malware payloads, [we] have attributed both campaigns to the APT actor TA413,” said Proofpoint researchers in a Wednesday analysis. “The usage of publicly known Tibetan-themed sender accounts to deliver Sepulcher malware demonstrates a short-term realignment of TA413’s targets of interest.”

The tag is: *misp-galaxy:rat="Sepulcher"*

*Table 6173. Table References*

## Guildma

The campaign spreads via phishing emails posing as invoices, tax reports, invitations and similar types of messages containing a ZIP archive attachment with a malicious LNK file. When a user opens the malicious LNK file, it abuses the Windows Management Instrumentation Command-line tool and silently downloads a malicious XSL file. The XSL file downloads all of Guildma's modules and executes a first stage loader, which loads the rest of the modules. The malware is then active and waits for commands from the C&C server and/or specific user interactions, such as opening a webpage of one of the targeted banks.

The tag is: *misp-galaxy:rat="Guildma"*

Guildma is also known as:

*Table 6174. Table References*

Links
<a href="https://www.securityweek.com/guildma-malware-expands-targets-beyond-brazil">https://www.securityweek.com/guildma-malware-expands-targets-beyond-brazil</a>

## Milan

Milan is a 32-bit RAT written in Visual C++ and .NET. Milan is loaded and persists using tasks. An encoded routine waits for three to four seconds between executing the first task, deleting this task, and setting a second scheduled task for persistence.

The tag is: *misp-galaxy:rat="Milan"*

Milan is also known as:

- James

## DarkWatchman

In late November, Prevailion's Adversarial Counterintelligence Team (PACT) identified what appeared to be a malicious javascript-based Remote Access Trojan (RAT) that uses a robust Domain Generation Algorithm (DGA) to identify its Command and Control (C2) infrastructure and that utilizes novel methods for fileless persistence, on-system activity, and dynamic run-time capabilities like self-updating and recompilation. This RAT, which PACT refers to by its internal codename "DarkWatchman", has been observed being distributed by email and represents an evolution in fileless malware techniques, as it uses the registry for nearly all temporary and permanent storage and therefore never writes anything to disk, allowing it to operate beneath or around the detection threshold of most security tools. PACT has reverse engineered the DGA, dynamically analyzed the malware, investigated the Threat Actor's (TA) web-based infrastructure,

and consolidated the results of our analysis into the following report.

The tag is: *misp-galaxy:rat="DarkWatchman"*

DarkWatchman is also known as:

Table 6176. Table References

Links

Intrusions:Application Compromise has relationships with:

- similar: *misp-galaxy:mitre-attack-pattern="Exploit Public-Facing Application - T1190"* with *estimative-language:likelihood-probability="likely"*

## **Intrusions:System Compromise**

Compromise of a system, e.g. unauthorised logins or commands. This includes compromising attempts on honeypot systems.

The tag is: *misp-galaxy:rsit="Intrusions:System Compromise"*

## **Intrusions:Burglary**

Physical intrusion, e.g. into corporate building or data-centre.

The tag is: *misp-galaxy:rsit="Intrusions:Burglary"*

## **Availability:Denial of Service**

Denial of Service attack, e.g. sending specially crafted requests to a web application which causes the application to crash or slow down.

The tag is: *misp-galaxy:rsit="Availability:Denial of Service"*

[View relationships graph](#)

Availability:Denial of Service has relationships with:

- similar: *misp-galaxy:mitre-attack-pattern="Network Denial of Service - T1498"* with *estimative-language:likelihood-probability="likely"*

## **Availability:Distributed Denial of Service**

Distributed Denial of Service attack, e.g. SYN-Flood or UDP-based reflection/amplification attacks.

The tag is: *misp-galaxy:rsit="Availability:Distributed Denial of Service"*

[View relationships graph](#)

Availability:Distributed Denial of Service has relationships with:

- similar: *misp-galaxy:mitre-attack-pattern="Network Denial of Service - T1498"* with *estimative-language:likelihood-probability="likely"*

## Availability: Misconfiguration

Software misconfiguration resulting in service availability issues, e.g. DNS server with outdated DNSSEC Root Zone KSK.

The tag is: *misp-galaxy:rsit="Availability: Misconfiguration"*

## Availability: Sabotage

Physical sabotage, e.g. cutting wires or malicious arson.

The tag is: *misp-galaxy:rsit="Availability: Sabotage"*

## Availability: Outage

Outage caused e.g. by air condition failure or natural disaster.

The tag is: *misp-galaxy:rsit="Availability: Outage"*

## Information Content Security: Unauthorised access to information

Unauthorised access to information, e.g. by abusing stolen login credentials for a system or application, intercepting traffic or gaining access to physical documents.

The tag is: *misp-galaxy:rsit="Information Content Security: Unauthorised access to information"*

## Information Content Security: Unauthorised modification of information

Unauthorised modification of information, e.g. by an attacker abusing stolen login credentials for a system or application or a ransomware encrypting data. Also includes defacements.

The tag is: *misp-galaxy:rsit="Information Content Security: Unauthorised modification of information"*

[View relationships graph](#)

Information Content Security: Unauthorised modification of information has relationships with:

- similar: *misp-galaxy:mitre-attack-pattern="Data Manipulation - T1565"* with *estimative-language:likelihood-probability="likely"*

## Information Content Security: Data Loss

Loss of data, e.g. caused by harddisk failure or physical theft.

The tag is: *misp-galaxy:rsit="Information Content Security: Data Loss"*

## Information Content Security:Leak of confidential information

Leaked confidential information like credentials or personal data.

The tag is: *misp-galaxy:rsit="Information Content Security:Leak of confidential information"*

## Fraud:Unauthorised use of resources

Using resources for unauthorised purposes including profit-making ventures, e.g. the use of e-mail to participate in illegal profit chain letters or pyramid schemes.

The tag is: *misp-galaxy:rsit="Fraud:Unauthorised use of resources"*

## Fraud:Copyright

Offering or Installing copies of unlicensed commercial software or other copyright protected materials (Warez).

The tag is: *misp-galaxy:rsit="Fraud:Copyright"*

## Fraud:Masquerade

Type of attack in which one entity illegitimately impersonates the identity of another in order to benefit from it.

The tag is: *misp-galaxy:rsit="Fraud:Masquerade"*

## Fraud:Phishing

Masquerading as another entity in order to persuade the user to reveal private credentials. This IOC most often refers to a URL, which is used to phish user credentials.

The tag is: *misp-galaxy:rsit="Fraud:Phishing"*

[View relationships graph](#)

Fraud:Phishing has relationships with:

- similar: `misp-galaxy:mitre-attack-pattern="Phishing - T1566"` with `estimative-language:likelihood-probability="likely"`

## Vulnerable:Weak crypto

Publicly accessible services offering weak crypto, e.g. web servers susceptible to POODLE/FREAK attacks.

The tag is: *misp-galaxy:rsit="Vulnerable:Weak crypto"*

## **Vulnerable:DDoS amplifier**

Publicly accessible services that can be abused for conducting DDoS reflection/amplification attacks, e.g. DNS open-resolvers or NTP servers with monlist enabled.

The tag is: *misp-galaxy:rsit="Vulnerable:DDoS amplifier"*

[View relationships graph](#)

Vulnerable:DDoS amplifier has relationships with:

- similar: misp-galaxy:mitre-attack-pattern="Network Denial of Service - T1498" with estimative-language:likelihood-probability="likely"

## **Vulnerable:Potentially unwanted accessible services**

Potentially unwanted publicly accessible services, e.g. Telnet, RDP or VNC.

The tag is: *misp-galaxy:rsit="Vulnerable:Potentially unwanted accessible services"*

## **Vulnerable:Information disclosure**

Publicly accessible services potentially disclosing sensitive information, e.g. SNMP or Redis.

The tag is: *misp-galaxy:rsit="Vulnerable:Information disclosure"*

## **Vulnerable:Vulnerable system**

A system which is vulnerable to certain attacks. Example: misconfigured client proxy settings (example: WPAD), outdated operating system version, XSS vulnerabilities, etc.

The tag is: *misp-galaxy:rsit="Vulnerable:Vulnerable system"*

## **Other:Uncategorised**

All incidents which don't fit in one of the given categories should be put into this class or the incident is not categorised.

The tag is: *misp-galaxy:rsit="Other:Uncategorised"*

## **Other:Undetermined**

The categorisation of the incident is unknown/undetermined.

The tag is: *misp-galaxy:rsit="Other:Undetermined"*

## Test:Test

Meant for testing.

The tag is: *misp-galaxy:rsit="Test:Test"*

## Sector

Activity sectors.

Sector is a cluster galaxy available in JSON format at [this location](#) The JSON format can be freely reused in your application or automatically enabled in [MISP](#).

## Nocturnal Stealer

It is designed to steal data found within multiple Chromium and Firefox based browsers, it can also steal many popular cryptocurrency wallets as well as any saved FTP passwords within FileZilla. Nocturnal Stealer uses several anti-VM and anti-analysis techniques, which include but are not limited to: environment fingerprinting, checking for debuggers and analyzers, searching for known virtual machine registry keys, and checking for emulation software.

The tag is: *misp-galaxy:stealer="Nocturnal Stealer"*

## Kape Technologies

Kape Technologies is better known by the name under which they were formerly incorporated - "Crossrider" but make no mistake they are the same company which became notorious as an adware/malware producer. Kape Technologies was originally known as Crossrider until the name change in 2018. The reason for that was, as CEO Ido Erlichman put it, "strong association to the past activities of the company." Perhaps that refers to infecting users' devices with malware and

adware, considered “high-risk” by Symantec and Malwarebytes. If that wasn’t enough, Crossrider’s Founder and first CEO Koby Menachemi, was part of Unit 8200 – something that can be called Israel’s NSA. Another key person, Teddy Sagi, who is the main investor in both Crossrider and Kape Technologies, is mentioned in the Panama Papers.

The tag is: *misp-galaxy:surveillance-vendor="Kape Technologies"*

Kape Technologies is also known as:

- Kape
- Crossrider

## NSO group

NSO Group Technologies is an Israeli technology firm known for its Pegasus spyware enabling the remote surveillance of smartphones. It was founded in 2010 by Niv Carmi, Omri Lavie, and Shalev Hulio. It reportedly employed almost 500 people as of 2017, and is based in Herzliya, near Tel Aviv.

The tag is: *misp-galaxy:surveillance-vendor="NSO group"*

Table 6204. Table References

<a href="https://en.wikipedia.org/wiki/NSO_Group">https://en.wikipedia.org/wiki/NSO_Group</a>

## Hacking Team

HackingTeam is a Milan-based information technology company that sells offensive intrusion and surveillance capabilities to governments, law enforcement agencies and corporations. Its "Remote Control Systems" enable governments and corporations to monitor the communications of internet users, decipher their encrypted files and emails, record Skype and other Voice over IP communications, and remotely activate microphones and camera on target computers. The company has been criticized for providing these capabilities to governments with poor human rights records, though HackingTeam states that they have the ability to disable their software if it is used unethically. The Italian government has restricted their license to do business with countries outside Europe. HackingTeam employs around 40 people in its Italian office, and has subsidiary branches in Annapolis, Washington, D.C., and Singapore. Its products are in use in dozens of countries across six continents.

The tag is: *misp-galaxy:surveillance-vendor="Hacking Team"*

Hacking Team is also known as:

- Memento Labs

Table 6205. Table References

## FlexiSPY

Flexispy is an application that can be considered as a trojan, based on Symbian. The program sends all information received and sent from the smartphone to a Flexispy server. It was originally created to protect children and spy on adulterous spouses.

The tag is: *misp-galaxy:surveillance-vendor="FlexiSPY"*

## mSpy

mSpy is probably the most popular monitoring software on the market today. It is designed for parents who want to track their children's online activity. Using mSpy is easy — just download and install a hidden app on your child's phone and let it do its thing in the background. mSpy is available for iOS and Android, and has a web-based control panel that allows you to remotely monitor activity on your child's device, including texts, instant messages, phone calls and social media use on Snapchat or Facebook. It also allows you to track the location of your child's device on a map. The best thing about mSpy is that it works on non-jailbroken iPhones. Do note that some of its features, including email tracking and instant messenger monitoring, are only available on a rooted Android smartphone. If you don't know how to root an Android device, you might want to consider using a spy app like Highster Mobile. This app lets you spy on Android phone without rooting.

The tag is: *misp-galaxy:surveillance-vendor="mSpy"*

Table 6207. Table References

Links

<https://www.bestphonespy.com/mspy-review/>

## Highster Mobile

Highster Mobile is a cell phone spy and monitoring software that allows you to secretly monitor your children, employees, or loved ones without them ever knowing it. The app is available for both Android and iOS devices and is developed by ILF Mobile Apps, a company based in Bohemia, New York, that specializes in mobile security.

The tag is: *misp-galaxy:surveillance-vendor="Highster Mobile"*

## Mobile Spy

Mobile Spy is a cell phone monitoring application for iOS, Android and BlackBerry developed by Retina-X Studios. It allows you to monitor the smartphone activity of your children. You'll be able to see text messages, track GPS locations, monitor social media activities, view call details and more inside a secure online account. Monitoring made easy. Login anytime you wish from any location to see the recorded data without needing access to the monitored phone. The hidden version of Mobile Spy is no longer available due to legal issues.

The tag is: *misp-galaxy:surveillance-vendor="Mobile Spy"*

Table 6209. Table References

Links

<https://www.bestphonespy.com/mobile-spy-review/>

## Hoverwatch

Hoverwatch is a computer and mobile monitoring software developed by Refog. It is available for Android, Windows and macOS. It runs silently in the background, recording all activities performed by the user such as messages sent and received, phone calls made and received, web sites visited, and every keystroke typed. All recorded data is sent to an online account.

The tag is: *misp-galaxy:surveillance-vendor="Hoverwatch"*

Table 6210. Table References

Links

<https://www.bestphonespy.com/hoverwatch-review/>

## MobiStealth

MobiStealth is a popular spy software that comes with a simple web-based console and powerful monitoring features. It is developed by Infowise Pty Ltd, a private company headquartered in Sydney, Australia. They have been making high quality monitoring solutions since 2009. In November 2015, they launched a “Non-Jailbreak” feature, letting users spy on all iOS devices without needing to jailbreak them. Just like many other spy software, MobiStealth allows you to spy on a cell phone or computer via a web interface called StealthClub. As its name implies, it is a stealth application that runs in the background without the owner’s knowledge.

The tag is: *misp-galaxy:surveillance-vendor="MobiStealth"*

<a href="https://www.bestphonespy.com/mobistealth-review/">https://www.bestphonespy.com/mobistealth-review/</a>

## Spyera

Spyera develops and sells computer and mobile spy software. Based in Hong Kong, Spyera’s products work in all languages and all countries. The company’s phone and PC monitoring products are useful tools for any parent or company, although they are quite expensive in comparison to other products. Spyera comes in three different versions — a mobile version for iPhone and Android smartphones, a tablet version for iPad and Android tablets, and a desktop version for Mac and Windows. The mobile version of Spyera is actually very similar to the FlexiSPY Extreme, which I reviewed a few weeks ago. It has everything you’d expect from a cell phone spy software: live call listening, call recording, and location tracking.

The tag is: *misp-galaxy:surveillance-vendor="Spyera"*

<a href="https://www.bestphonespy.com/spyera-review/">https://www.bestphonespy.com/spyera-review/</a>

## StealthGenie

StealthGenie is a powerful cell phone spy software created by InvoCode Ltd in 2010 that can be used to spy on cheating spouses and monitor children’s activities. In September 2014, Hammad Akbar, founder of StealthGenie, was arrested in Los Angeles and charged with selling mobile device spyware. StealthGenie was officially discontinued on 26 September 2014.

The tag is: *misp-galaxy:surveillance-vendor="StealthGenie"*

<a href="https://www.bestphonespy.com/stealthgenie-review/">https://www.bestphonespy.com/stealthgenie-review/</a>

# SpyBubble

SpyBubble is a spy app that lets you secretly spy on someone's phone. This spy app is compatible with a variety of mobile devices, including iPhone, Android, BlackBerry and Symbian, and it offers logging features for most cell phone activity. SpyBubble doesn't provide the blocking and restricting features that you will find in several similar applications. However, it has many useful features, and its monitoring features are excellent. Spybubble cell phone spy software was discontinued due to legal reasons

The tag is: *misp-galaxy:surveillance-vendor="SpyBubble"*

Table 6214. Table References

Links
<a href="https://www.bestphonespy.com/spybubble-review/">https://www.bestphonespy.com/spybubble-review/</a>

# Cytrox

Cytrox's Israeli companies were founded in 2017 as Cytrox EMEA Ltd. and Cytrox Software Ltd. Perhaps taking a page from Candiru's corporate obfuscation playbook, both of those companies were renamed in 2019 to Balinese Ltd. and Peterbald Ltd., respectively. We also observed one entity in Hungary, Cytrox Holdings Zrt, which was also formed in 2017.

The tag is: *misp-galaxy:surveillance-vendor="Cytrox"*

Cytrox is also known as:

- Cytrox EMEA Ltd.
- Cytrox Software Ltd.
- Balinese Ltd.
- Peterbald Ltd.
- Cytrox Holdings Zrt

# Nitro

These attackers were the subject of an extensive report by Symantec in 2011, which termed the attackers Nitro and stated: 'The goal of the attackers appears to be to collect intellectual property such as design documents, formulas, and manufacturing processes. In addition, the same attackers appear to have a lengthy operation history including attacks on other industries and organizations. Attacks on the chemical industry are merely their latest attack wave. As part of our investigations, we were also able to identify and contact one of the attackers to try and gain insights into the motivations behind these attacks.' Palo Alto Networks reported on continued activity by the attackers in 2014.

## DarkHotel

Kaspersky described DarkHotel in a 2014 report as: '... DarkHotel drives its campaigns by spear-phishing targets with highly advanced Flash zero-day exploits that effectively evade the latest

Windows and Adobe defenses, and yet they also imprecisely spread among large numbers of vague targets with peer-to-peer spreading tactics. Moreover, this crew's most unusual characteristic is that for several years the DarkHotel APT has maintained a capability to use hotel networks to follow and hit selected targets as they travel around the world.'

## APT 16

Between November 26, 2015, and December 1, 2015, known and suspected China-based APT groups launched several spear-phishing attacks targeting Japanese and Taiwanese organizations in the

high-tech, government services, media and financial services industries. Each campaign delivered a malicious Microsoft Word document exploiting the aforementioned EPS dict copy use-after-free vulnerability, and the local Windows privilege escalation vulnerability CVE-2015-1701. The successful exploitation of both vulnerabilities led to the delivery of either a downloader that we refer to as IRONHALO, or a backdoor that we refer to as ELMER.

The tag is: *misp-galaxy:threat-actor="APT 16"*

APT 16 is also known as:

- APT16
- SVCMONDR

## Hurricane Panda

We have investigated their intrusions since 2013 and have been battling them nonstop over the last year at several large telecommunications and technology companies. The determination of this China-based adversary is truly impressive: they are like a dog with a bone. HURRICANE PANDA's preferred initial vector of compromise and persistence is a China Chopper webshell – a tiny and easily obfuscated 70 byte text file that consists of an 'eval()' command, which is then used to provide full command execution and file upload/download capabilities to the attackers. This script is typically uploaded to a web server via a SQL injection or WebDAV vulnerability, which is often trivial to uncover in a company with a large external web presence. Once inside, the adversary immediately moves on to execution of a credential theft tool such as Mimikatz (repacked to avoid AV detection). If they are lucky to have caught an administrator who might be logged into that web server at the time, they will have gained domain administrator credentials and can now roam your network at will via 'net use' and 'wmic' commands executed through the webshell terminal.

# Anchor Panda

PLA Navy Anchor Panda is an adversary that CrowdStrike has tracked extensively over the last year targeting both civilian and military maritime operations in the green/brown water regions primarily in the area of operations of the South Sea Fleet of the PLA Navy. In addition to maritime operations in this region, Anchor Panda also heavily targeted western companies in the US, Germany, Sweden, the UK, and Australia, and other countries involved in maritime satellite systems, aerospace companies, and defense contractors. Not surprisingly, embassies and diplomatic missions in the region, foreign intelligence services, and foreign governments with space programs were also targeted.

The tag is: *misp-galaxy:threat-actor="Anchor Panda"*

Anchor Panda is also known as:

- APT14
- APT 14
- QAZTeam
- ALUMINUM

## Violin Panda

We've uncovered some new data and likely attribution regarding a series of APT watering hole attacks this past summer. Watering hole attacks are an increasingly popular component of APT campaigns, as many people are more aware of spear phishing and are less likely to open documents or click on links in unsolicited emails. Watering hole attacks offer a much better chance of success because they involve compromising legitimate websites and installing malware intended to compromise website visitors. These are often popular websites frequented by people who work in specific industries or have political sympathies to which the actors want to gain access. In contrast to many other APT campaigns, which tend to rely heavily on spear phishing to gain victims, "th3bug" is known for compromising legitimate websites their intended visitors are likely to frequent. Over the summer they compromised several sites, including a well-known Uyghur website written in that native language.

The tag is: `misp-galaxy:threat-actor="Violin Panda"`

Violin Panda is also known as:

- APT20
- APT 20
- TH3Bug
- Twivy

## Temper Panda

China-based cyber threat group. It has previously used newsworthy events as lures to deliver malware and has primarily targeted organizations involved in financial, economic, and trade policy, typically using publicly available RATs such as PoisonIvy, as well as some non-public backdoors. This threat actor targets prodemocratic activists and organizations in Hong Kong, European and international financial institutions, and a U.S.-based think tank.

# Cutting Kitten

While tracking a suspected Iran-based threat group known as Threat Group-2889[1] (TG-2889), Dell SecureWorks Counter Threat Unit™ (CTU) researchers uncovered a network of fake LinkedIn profiles. These convincing profiles form a self-referenced network of seemingly established LinkedIn users. CTU researchers assess with high confidence the purpose of this network is to target potential victims through social engineering. Most of the legitimate LinkedIn accounts associated with the fake accounts belong to individuals in the Middle East, and CTU researchers assess with medium confidence that these individuals are likely targets of TG-2889. One of the threat actors responsible for the denial of service attacks against U.S in 2012–2013. Three individuals associated with the group—believed to be have been working on behalf of Iran’s Islamic Revolutionary Guard Corps—were indicted by the Justice Department in 2016.

The tag is: *misp-galaxy:threat-actor="Cutting Kitten"*

Cutting Kitten is also known as:

## Sands Casino

The tag is: *misp-galaxy:threat-actor="Sands Casino"*

## Rebel Jackal

This is a pro-Islamist organization that generally conducts attacks motivated by real world events in which its members believe that members of the Muslim faith were wronged. Its attacks generally involve website defacements; however, the group did develop a RAT that it refers to as Fallaga RAT, but which appears to simply be a fork of the njRAT malware popular amongst hackers in the Middle East/North Africa region.

## APT 29

A 2015 report by F-Secure describe APT29 as: "The Dukes are a well-resourced, highly dedicated and organized cyberespionage group that we believe has been working for the Russian Federation since at least 2008 to collect intelligence in support of foreign and security policy decision-making. The Dukes show unusual confidence in their ability to continue successfully compromising their targets, as well as in their ability to operate with impunity. The Dukes primarily target Western governments and related organizations, such as government ministries and agencies, political think tanks, and governmental subcontractors. Their targets have also included the governments of members of the Commonwealth of Independent States; Asian, African, and Middle Eastern governments; organizations associated with Chechen extremism; and Russian speakers engaged in the illicit trade of controlled substances and drugs. The Dukes are known to employ a vast arsenal of malware toolsets, which we identify as MiniDuke, CosmicDuke, OnionDuke, CozyDuke, CloudDuke, SeaDuke, HammerDuke, PinchDuke, and GeminiDuke. In recent years, the Dukes have engaged in apparently biannual large - scale spear - phishing campaigns against hundreds or even thousands of recipients associated with governmental institutions and affiliated organizations. These campaigns utilize a smash - and - grab approach involving a fast but noisy breakin followed by the rapid collection and exfiltration of as much data as possible. If the compromised target is discovered to be of value, the Dukes will quickly switch the toolset used and move to using stealthier tactics focused on persistent compromise and long - term intelligence gathering. This threat actor targets government ministries and agencies in the West, Central Asia, East Africa, and

the Middle East; Chechen extremist groups; Russian organized crime; and think tanks. It is suspected to be behind the 2015 compromise of unclassified networks at the White House, Department of State, Pentagon, and the Joint Chiefs of Staff. The threat actor includes all of the Dukes tool sets, including MiniDuke, CosmicDuke, OnionDuke, CozyDuke, SeaDuke, CloudDuke (aka MiniDionis), and HammerDuke (aka Hammertoss).'

The tag is: *misp-galaxy:threat-actor="APT 29"*

## Turla Group

A 2014 Guardian article described Turla as: 'Dubbed the Turla hackers, initial intelligence had indicated western powers were key targets, but it was later determined embassies for Eastern Bloc nations were of more interest. Embassies in Belgium, Ukraine, China, Jordan, Greece, Kazakhstan, Armenia, Poland, and Germany were all attacked, though researchers from Kaspersky Lab and Symantec could not confirm which countries were the true targets. In one case from May 2012, the office of the prime minister of a former Soviet Union member country was infected, leading to 60 further computers being affected, Symantec researchers said. There were some other victims, including the ministry for health of a Western European country, the ministry for education of a Central American country, a state electricity provider in the Middle East and a medical organisation in the US, according to Symantec. It is believed the group was also responsible for a much - documented 2008 attack on the US Central Command. The attackers - who continue to operate - have ostensibly sought to carry out surveillance on targets and pilfer data, though their use of encryption across their networks has made it difficult to ascertain exactly what the hackers took. Kaspersky Lab, however, picked up a number of the attackers searches through their victims emails, which included terms such as Nato and EU energy dialogue. Though attribution is difficult to substantiate, Russia has previously been suspected of carrying out the attacks and Symantec's Gavin O' Gorman told the Guardian a number of the hackers appeared to be using Russian names and language in their notes for their malicious code. Cyrillic was also seen in use.'

## Energetic Bear

A Russian group that collects intelligence on the energy industry.

The tag is: *misp-galaxy:threat-actor="Energetic Bear"*

Energetic Bear is also known as:

- Beserk Bear
- ALLANITE
- CASTLE
- DYMALLOY
- TG-4192
- Dragonfly
- Crouching Yeti

- Group 24
- Havex
- CrouchingYeti
- Koala Team
- IRON LIBERTY

## Sandworm

This threat actor targets industrial control systems, using a tool called Black Energy, associated with

electricity and power generation for espionage, denial of service, and data destruction purposes. Some believe that the threat actor is linked to the 2015 compromise of the Ukrainian electrical grid and a distributed denial of service prior to the Russian invasion of Georgia. Believed to be responsible for the 2008 DDoS attacks in Georgia and the 2015 Ukraine power grid outage

The tag is: `misp-galaxy:threat-actor="Sandworm"`

Sandworm is also known as:

- Sandworm Team
- Black Energy
- BlackEnergy
- Quedagh
- Voodoo Bear
- TEMP.Noble
- Iron Viking

## TeleBots

We will refer to the gang behind the malware as TeleBots. However it's important to say that these attackers, and the toolset used, share a number of similarities with the BlackEnergy group, which conducted attacks against the energy industry in Ukraine in December 2015 and January 2016. In fact, we think that the BlackEnergy group has evolved into the TeleBots group. TeleBots appear to be associated with Sandworm Team, Iron Viking, Voodoo Bear.

## TeamSpy Crew

Researchers have uncovered a long-term cyber-espionage campaign that used a combination of legitimate software packages and commodity malware tools to target a variety of heavy industry, government intelligence agencies and political activists. Known as the TeamSpy crew because of its affinity for using the legitimate TeamViewer application as part of its toolset, the attackers may have been active for as long as 10 years, researchers say. The attack appears to be a years-long espionage campaign, but experts who have analyzed the victim profile, malware components and command-and-control infrastructure say that it's not entirely clear what kind of data the attackers are going after. What is clear, though, is that the attackers have been at this for a long time and that they have specific people in mind as targets. Researchers at the CrySyS Lab in Hungary were alerted by the Hungarian National Security Authority to an attack against a high-profile target in the country and began looking into the campaign. They quickly discovered that some of the infrastructure being used in the attack had been in use for some time and that the target they were investigating was by no means the only one.

The tag is: *misp-galaxy:threat-actor="TeamSpy Crew"*

TeamSpy Crew is also known as:

- TeamSpy
- Team Bear
- Berserk Bear
- Anger Bear
- IRON LYRIC

## BuhTrap

Buhtrap has been active since 2014, however their first attacks against financial institutions were only detected in August 2015. Earlier, the group had only focused on targeting banking clients. At the moment, the group is known to target Russian and Ukrainian banks. From August 2015 to February 2016 Buhtrap managed to conduct 13 successful attacks against Russian banks for a total amount of 1.8 billion rubles (\$25.7 mln). The number of successful attacks against Ukrainian banks has not been identified. Buhtrap is the first hacker group using a network worm to infect the overall bank infrastructure that significantly increases the difficulty of removing all malicious functions from the network. As a result, banks have to shut down the whole infrastructure which provokes delay in servicing customers and additional losses. Malicious programs intentionally scan for machines with an automated Bank-Customer system of the Central Bank of Russia (further referred to as BCS CBR). We have not identified incidents of attacks involving online money transfer systems, ATM machines or payment gates which are known to be of interest for other criminal groups.

## Boulder Bear

First observed activity in December 2013.

The tag is: *misp-galaxy:threat-actor="Boulder Bear"*

## SHARK SPIDER

This group's activity was first observed in November 2013. It leverages a banking Trojan more

commonly known as Shylock which aims to compromise online banking credentials and credentials related to Bitcoin wallets.

The tag is: *misp-galaxy:threat-actor="SHARK SPIDER"*

## UNION SPIDER

Adversary targeting manufacturing and industrial organizations.

The tag is: *misp-galaxy:threat-actor="UNION SPIDER"*

## Lazarus Group

Since 2009, HIDDEN COBRA actors have leveraged their capabilities to target and compromise a range of victims; some intrusions have resulted in the exfiltration of data while others have been disruptive in nature. Commercial reporting has referred to this activity as Lazarus Group and Guardians of Peace. Tools and capabilities used by HIDDEN COBRA actors include DDoS botnets, keyloggers, remote access tools (RATs), and wiper malware. Variants of malware and tools used by HIDDEN COBRA actors include Destover, Duuzer, and Hangman.

The tag is: *misp-galaxy:threat-actor="Lazarus Group"*

Lazarus Group is also known as:

- Operation DarkSeoul
- Dark Seoul
- Hidden Cobra
- Hastati Group
- Andariel
- Unit 121
- Bureau 121
- NewRomanic Cyber Army Team
- Bluenoroff
- Subgroup: Bluenoroff
- Group 77
- Labyrinth Chollima
- Operation Troy
- Operation GhostSecret
- Operation AppleJeus
- APT38
- APT 38
- Stardust Chollima
- Whois Hacking Team
- Zinc
- Appleworm
- Nickel Academy
- APT-C-26
- NICKEL GLADSTONE
- COVELLITE

## VICEROY TIGER

VICEROY TIGER is an adversary with a nexus to India that has historically targeted entities throughout multiple sectors. Older activity targeted multiple sectors and countries; however, since 2015 this adversary appears to focus on entities in Pakistan with a particular focus on government and security organizations. This adversary consistently leverages spear phishing emails containing malicious Microsoft Office documents, malware designed to target the Android mobile platform, and phishing activity designed to harvest user credentials. In March 2017, the 360 Chasing Team found a sample of targeted attacks that confirmed the previously unknown sample of APT’s attack actions, which the organization can now trace back at least in April 2016. The chasing team named the attack organization APT-C-35. In June 2017, the 360 Threat Intelligence Center discovered the organization’s new attack activity, confirmed and exposed the gang’s targeted attacks against Pakistan, and analyzed in detail. The unique EHDevel malicious code framework used by the organization.

The tag is: *misp-galaxy:threat-actor="VICEROY TIGER"*

VICEROY TIGER is also known as:

- OPERATION HANGOVER
- Donot Team
- APT-C-35
- SectorE02

## SNOWGLOBE

In 2014, researchers at Kaspersky Lab discovered and reported on three zero-days that were being used in cyberattacks in the wild. Two of these zero-day vulnerabilities are associated with an advanced threat actor we call Animal Farm. Over the past few years, Animal Farm has targeted a wide range of global organizations. The group has been active since at least 2009 and there are signs that earlier malware versions were developed as far back as 2007.

The tag is: *misp-galaxy:threat-actor="SNOWGLOBE"*

SNOWGLOBE is also known as:

- Animal Farm
- Snowglobe

## Deadeye Jackal

The Syrian Electronic Army (SEA) is a group of computer hackers which first surfaced online in 2011 to support the government of Syrian President Bashar al-Assad. Using spamming, website defacement, malware, phishing, and denial of service attacks, it has targeted political opposition groups, western news organizations, human rights groups and websites that are seemingly neutral to the Syrian conflict. It has also hacked government websites in the Middle East and Europe, as well as US defense contractors. As of 2011 the SEA has been **the first Arab country to have a public Internet Army hosted on its national networks to openly launch cyber attacks on its enemies**. The precise nature of SEA's relationship with the Syrian government has changed over time and is unclear

The tag is: *misp-galaxy:threat-actor="Deadeye Jackal"*

Deadeye Jackal is also known as:

- SyrianElectronicArmy
- SEA

## Scarlet Mimic

Scarlet Mimic is a threat group that has targeted minority rights activists. This group has not been directly linked to a government source, but the group's motivations appear to overlap with those of

the Chinese government. While there is some overlap between IP addresses used by Scarlet Mimic and Putter Panda, APT 2, it has not been concluded that the groups are the same. The attacks began over four years ago and their targeting pattern suggests that this adversary's primary mission is to gather information about minority rights activists. We do not have evidence directly linking these attacks to a government source, but the information derived from these activities supports an assessment that a group or groups with motivations similar to the stated position of the Chinese government in relation to these targets is involved. The attacks we attribute to Scarlet Mimic have primarily targeted Uyghur and Tibetan activists as well as those who are interested in their causes. Both the Tibetan community and the Uyghurs, a Turkic Muslim minority residing primarily in northwest China, have been targets of multiple sophisticated attacks in the past decade. Both also have history of strained relationships with the government of the People's Republic of China (PRC), though we do not have evidence that links Scarlet Mimic attacks to the PRC. Scarlet Mimic attacks have also been identified against government organizations in Russia and India, who are responsible for tracking activist and terrorist activities. While we do not know the precise target of each of the Scarlet Mimic attacks, many of them align to the patterns described above.

The tag is: *misp-galaxy:threat-actor="Scarlet Mimic"*

## ProjectSauron

ProjectSauron is the name for a top level modular cyber-espionage platform, designed to enable and manage long-term campaigns through stealthy survival mechanisms coupled with multiple exfiltration methods. Technical details show how attackers learned from other extremely advanced actors in order to avoid repeating their mistakes. As such, all artifacts are customized per given target, reducing their value as indicators of compromise for any other victim. Usually APT campaigns have a geographical nexus, aimed at extracting information within a specific region or from a given industry. That usually results in several infections in countries within that region, or in the targeted industry around the world. Interestingly, ProjectSauron seems to be dedicated to just a couple of countries, focused on collecting high value intelligence by compromising almost all key entities it could possibly reach within the target area. The name, ProjectSauron reflects the fact that the code authors refer to 'Sauron' in the Lua scripts.

The tag is: *misp-galaxy:threat-actor="ProjectSauron"*

## OilRig

OilRig is an Iranian threat group operating primarily in the Middle East by targeting organizations in this region that are in a variety of different industries; however, this group has occasionally targeted organizations outside of the Middle East as well. It also appears OilRig carries out supply chain attacks, where the threat group leverages the trust relationship between organizations to attack their primary targets.

OilRig is an active and organized threat group, which is evident based on their systematic targeting of specific organizations that appear to be carefully chosen for strategic purposes. Attacks attributed to this group primarily rely on social engineering to exploit the human rather than software vulnerabilities; however, on occasion this group has used recently patched vulnerabilities in the delivery phase of their attacks. The lack of software vulnerability exploitation does not necessarily suggest a lack of sophistication, as OilRig has shown maturity in other aspects of their operations. Such maturities involve:

-Organized evasion testing used the during development of their tools. -Use of custom DNS Tunneling protocols for command and control (C2) and data exfiltration. -Custom web-shells and backdoors used to persistently access servers.

OilRig relies on stolen account credentials for lateral movement. After OilRig gains access to a system, they use credential dumping tools, such as Mimikatz, to steal credentials to accounts logged into the compromised system. The group uses these credentials to access and to move laterally to other systems on the network. After obtaining credentials from a system, operators in this group prefer to use tools other than their backdoors to access the compromised systems, such as remote desktop and putty. OilRig also uses phishing sites to harvest credentials to individuals at targeted organizations to gain access to internet accessible resources, such as Outlook Web Access.

Since at least 2014, an Iranian threat group tracked by FireEye as APT34 has conducted reconnaissance aligned with the strategic interests of Iran. The group conducts operations primarily in the Middle East, targeting financial, government, energy, chemical, telecommunications and other industries. Repeated targeting of Middle Eastern financial, energy and government organizations leads FireEye to assess that those sectors are a primary concern of APT34. The use of infrastructure tied to Iranian operations, timing and alignment with the national interests of Iran also lead FireEye to assess that APT34 acts on behalf of the Iranian government.

## Volatile Cedar

Beginning in late 2012, a carefully orchestrated attack campaign we call Volatile Cedar has been targeting individuals, companies and institutions worldwide. This campaign, led by a persistent attacker group, has successfully penetrated a large number of targets using various attack techniques, and specifically, a custom-made malware implant codenamed Explosive .

The tag is: *misp-galaxy:threat-actor="Volatile Cedar"*

Volatile Cedar is also known as:

- Reuse team
- Malware reusers
- Dancing Salome
- Lebanese Cedar

## Malware reusers

Threat Group conducting cyber espionage while re-using tools from other teams; like those of Hacking Team, and vmprotect to obfuscate.

The tag is: *misp-galaxy:threat-actor="Malware reusers"*

Malware reusers is also known as:

- Reuse team
- Dancing Salome

## TERBIUM

Microsoft Threat Intelligence identified similarities between this recent attack and previous 2012

attacks against tens of thousands of computers belonging to organizations in the energy sector. Microsoft Threat Intelligence refers to the activity group behind these attacks as TERBIUM, following our internal practice of assigning rogue actors chemical element names.

The tag is: *misp-galaxy:threat-actor="TERBIUM"*

## Molerats

In October 2012, malware attacks against Israeli government targets grabbed media attention as officials temporarily cut off Internet access for its entire police force and banned the use of USB memory sticks. Security researchers subsequently linked these attacks to a broader, yearlong campaign that targeted not just Israelis but Palestinians as well. and as discovered later, even the U.S. and UK governments. Further research revealed a connection between these attacks and members of the so-called “Gaza Hackers Team.” We refer to this campaign as “Molerats.”

The tag is: *misp-galaxy:threat-actor="Molerats"*

Molerats is also known as:

- Gaza Hackers Team
- Gaza cybergang
- Gaza Cybergang
- Operation Molerats
- Extreme Jackal
- Moonlight
- ALUMINUM SARATOGA

## PROMETHIUM

PROMETHIUM is an activity group that has been active as early as 2012. The group primarily uses Truvasys, a first-stage malware that has been in circulation for several years. Truvasys has been involved in several attack campaigns, where it has masqueraded as one of server common computer utilities, including WinUtils, TrueCrypt, WinRAR, or SanDisk. In each of the campaigns, Truvasys malware evolved with additional features—this shows a close relationship between the activity groups behind the campaigns and the developers of the malware.

The tag is: *misp-galaxy:threat-actor="PROMETHIUM"*

PROMETHIUM is also known as:

- StrongPity

## Packrat

A threat group that has been active for at least seven years has used malware, phishing and disinformation tactics to target activists, journalists, politicians and public figures in various Latin American countries. The threat actor, dubbed Packrat based on its preference for remote access Trojans (RATs) and because it has used the same infrastructure for several years, has been analyzed by Citizen Lab researchers John Scott-Railton, Morgan Marquis-Boire, and Claudio Guarnieri, and Cyphort researcher Marion Marschalek, best known for her extensive analysis of state-sponsored threats.

The tag is: *misp-galaxy:threat-actor="Packrat"*

## Cadelle

Symantec telemetry identified Cadelle and Chafer activity dating from as far back as July 2014, however, it's likely that activity began well before this date. Command-and-control (C&C) registrant information points to activity possibly as early as 2011, while executable compilation times suggest early 2012. Their attacks continue to the present day. Symantec estimates that each team is made up of between 5 and 10 people.

## PassCV

The PassCV group continues to be one of the most successful and active threat groups that leverage a wide array of stolen Authenticode-signing certificates. Snorre Fagerland of Blue Coat Systems first coined the term PassCV in a blog post. His post provides a good introduction to the group and covers some of the older infrastructure, stolen code-signing certificate reuse, and other connections associated with the PassCV malware. There are several clues alluding to the possibility that multiple groups may be utilizing the same stolen signing certificates, but at this time SPEAR believes the current attacks are more likely being perpetrated by a single group employing multiple publicly available Remote Administration Tools (RATs). The PassCV group has been operating with continued success and has already started to expand their malware repertoire into different off-the-shelf RATs and custom code. SPEAR identified eighteen previously undisclosed stolen Authenticode certificates. These certificates were originally issued to companies and individuals scattered across China, Taiwan, Korea, Europe, the United States and Russia. In this post we expand the usage of the term 'PassCV' to encompass the malware mentioned in the Blue Coat Systems report, as well as the APT group behind the larger C2 infrastructure and stolen Authenticode certificates. We'd like to share some of our findings as they pertain to the stolen certificates, command and control infrastructure, and some of the newer custom RATs they've begun development on.

The tag is: *misp-galaxy:threat-actor="PassCV"*

## Sath-ı Müdafaa

A Turkish hacking group, Sath-ı Müdafaa, is encouraging individuals to join its DDoS-for-Points platform that features points and prizes for carrying out distributed denial-of-service (DDoS) attacks against a list of predetermined targets. Their DDoS tool also contains a backdoor to hack the hackers. So the overarching motivation and allegiance of the group is not entirely clear.

The tag is: *misp-galaxy:threat-actor="Sath-ı Müdafaa"*

## Aslan Neferler Tim

Turkish nationalist hacktivist group that has been active for roughly one year. According to Domaintools, the group's site has been registered since December 2015, with an active Twitter account since January 2016. The group carries out distributed denial-of-service (DDoS) attacks and defacements against the sites of news organizations and governments perceived to be critical of Turkey's policies or leadership, and purports to act in defense of Islam

The tag is: *misp-galaxy:threat-actor="Aslan Neferler Tim"*

Aslan Neferler Tim is also known as:

- Lion Soldiers Team
- Phantom Turk

## Ayyıldız Tim

Ayyıldız (Crescent and Star) Tim is a nationalist hacking group founded in 2002. It performs defacements and DDoS attacks against the websites of governments that it considers to be repressing Muslim minorities or engaged in Islamophobic policies.

The tag is: *misp-galaxy:threat-actor="Ayyıldız Tim"*

Ayyıldız Tim is also known as:

- Crescent and Star

## TurkHackTeam

Founded in 2004, Turkhackteam is one of Turkey's oldest and most high-profile hacking collectives. According to a list compiled on Turkhackteam's forum, the group has carried out almost 30 highly publicized hacking campaigns targeting foreign government and commercial websites, including websites of international corporations.

The tag is: *misp-galaxy:threat-actor="TurkHackTeam"*

TurkHackTeam is also known as:

- Turk Hack Team

# Equation Group

The Equation Group is a highly sophisticated threat actor described by its discoverers at Kaspersky Labs as one of the most sophisticated cyber attack groups in the world, operating alongside but always from a position of superiority with the creators of Stuxnet and Flame

The tag is: *misp-galaxy:threat-actor="Equation Group"*

Equation Group is also known as:

- Tilded Team
- Lamberts
- EQGRP
- Longhorn
- PLATINUM TERMINAL

## Gamaredon Group

Unit 42 threat researchers have recently observed a threat group distributing new, custom developed malware. We have labelled this threat group the Gamaredon Group and our research shows that the Gamaredon Group has been active since at least 2013. In the past, the Gamaredon Group has relied heavily on off-the-shelf tools. Our new research shows the Gamaredon Group have made a shift to custom-developed malware. We believe this shift indicates the Gamaredon Group have improved their technical capabilities.

The tag is: `misp-galaxy:threat-actor="Gamaredon Group"`

Gamaredon Group is also known as:

- Primitive Bear
- Shuckworm
- ACTINIUM

## Infy

Infy is a group of suspected Iranian origin. Since early 2013, we have observed activity from a unique threat actor group, which we began to investigate based on increased activities against human right activists in the beginning of 2015. In line with other research on the campaign, released prior to publication of this document, we have adopted the name “Infy”, which is based on labels used in the infrastructure and its two families of malware agents. Thanks to information we have been able to collect during the course of our research, such as characteristics of the group’s malware and development cycle, our research strongly supports the claim that the Infy group is of Iranian origin and potentially connected to the Iranian state. Amongst a backdrop of other incidents, Infy became one of the most frequently observed agents for attempted malware attacks against Iranian civil society beginning in late 2014, growing in use up to the February 2016 parliamentary election in Iran. After the conclusion of the parliamentary election, the rate of attempted intrusions and new compromises through the Infy agent slowed, but did not end. The trends witnessed in reports from recipients are reinforced through telemetry provided by design failures in more recent versions of the Infy malware.

## Sima

Sima is a group of suspected Iranian origin targeting Iranians in diaspora. In February 2016, Iran-focused individuals received messages purporting to be from Human RightsWatch's (HRW) Emergencies Director, requesting that they read an article about Iran pressing Afghan refugees to fight in Syria. While referencing a real report published by HRW, the links provided for the Director's biography and article directed the recipient to malware hosted elsewhere. These spear-phishing attempts represent an evolution of Iranian actors based on their social engineering tactics and narrow targeting. Although the messages still had minor grammatical and stylistic errors that would be obvious to a native speaker, the actors demonstrated stronger English-language proficiency than past intrusion sets and a deeper investment in background research prior to the attempt. The actors appropriated a real identity that would be expected to professionally interact with the subject, then offered validation through links to their biography and social media, the former of which itself was malware as well. The bait documents contained a real article relevant to their interests and topic referenced, and the message attempted to address to how it aligned with their professional research or field of employment. The referenced documents sent were malware binaries posing as legitimate files using the common right-to-left filenames tactic in order to conceal the actual file extension. All of these techniques, while common pretexting mechanisms,

are a refinement compared to a tendency amongst other groups to simply continually send different forms of generic malware or phishing, in the hopes that one would eventually be successful.

## Longhorn

Longhorn has been active since at least 2011. It has used a range of back door Trojans in addition to zero-day vulnerabilities to compromise its targets. Longhorn has infiltrated governments and internationally operating organizations, in addition to targets in the financial, telecoms, energy, aerospace, information technology, education, and natural resources sectors. All of the

organizations targeted would be of interest to a nation-state attacker. Longhorn has infected 40 targets in at least 16 countries across the Middle East, Europe, Asia, and Africa. On one occasion a computer in the United States was compromised but, following infection, an uninstaller was launched within hours, which may indicate this victim was infected unintentionally. According to cfr, this threat actor compromises governments, international organizations, academic institutions, and financial, telecommunications, energy, aerospace, information technology, and natural resource industries for espionage purposes. Some of the tools used by this threat actor were released by Wikileaks under the name "Vault 7."

## WildNeutron

A corporate espionage group has compromised a string of major corporations over the past three years in order to steal confidential information and intellectual property. The gang, which Symantec calls Butterfly, is not-state sponsored, rather financially motivated. It has attacked multi-billion dollar companies operating in the internet, IT software, pharmaceutical, and commodities sectors. Twitter, Facebook, Apple, and Microsoft are among the companies who have publicly acknowledged attacks. Butterfly is technically proficient and well resourced. The group has developed a suite of custom malware tools capable of attacking both Windows and Apple computers, and appears to have used at least one zero-day vulnerability in its attacks. It keeps a low profile and maintains good operational security. After successfully compromising a target organization, it cleans up after itself before moving on to its next target. This group operates at a much higher level than the average cybercrime gang. It is not interested in stealing credit card details or customer databases and is instead focused on high-level corporate information. Butterfly may be selling this information to the highest bidder or may be operating as hackers for hire. Stolen information could also be used for insider-trading purposes.

The tag is: *misp-galaxy:threat-actor="WildNeutron"*

WildNeutron is also known as:

- Butterfly
- Morpho
- Sphinx Moth

## PLATINUM

PLATINUM has been targeting its victims since at least as early as 2009, and may have been active for several years prior. Its activities are distinctly different not only from those typically seen in untargeted attacks, but from many targeted attacks as well. A large share of targeted attacks can be characterized as opportunistic: the activity group changes its target profiles and attack geographies based on geopolitical seasons, and may attack institutions all over the world. Like many such groups, PLATINUM seeks to steal sensitive intellectual property related to government interests, but its range of preferred targets is consistently limited to specific governmental organizations, defense institutes, intelligence agencies, diplomatic institutions, and telecommunication providers in South and Southeast Asia. The group's persistent use of spear phishing tactics (phishing attempts aimed at specific individuals) and access to previously undiscovered zero-day exploits have made it a highly resilient threat.

# RASPITE

Dragos has identified a new activity group targeting access operations in the electric utility sector. We call this activity group RASPITE. Analysis of RASPITE tactics, techniques, and procedures (TTPs) indicate the group has been active in some form since early- to mid-2017. RASPITE targeting includes entities in the US, Middle East, Europe, and East Asia. Operations against electric utility organizations appear limited to the US at this time. RASPITE leverages strategic website compromise to gain initial access to target networks. RASPITE uses the same methodology as DYMALLOY and ALLANITE in embedding a link to a resource to prompt an SMB connection, from which it harvests Windows credentials. The group then deploys install scripts for a malicious service to beacon back to RASPITE-controlled infrastructure, allowing the adversary to remotely access the victim machine.

The tag is: *misp-galaxy:threat-actor="RASPITE"*

RASPITE is also known as:

- LeafMiner
- Raspite

## APT5

We have observed one APT group, which we call APT5, particularly focused on telecommunications and technology companies. More than half of the organizations we have observed being targeted or breached by APT5 operate in these sectors. Several times, APT5 has targeted organizations and personnel based in Southeast Asia. APT5 has been active since at least 2007. It appears to be a large threat group that consists of several subgroups, often with distinct tactics and infrastructure. APT5 has targeted or breached organizations across multiple industries, but its focus appears to be on telecommunications and technology companies, especially information about satellite communications. APT5 targeted the network of an electronics firm that sells products for both industrial and military applications. The group subsequently stole communications related to the firm's business relationship with a national military, including inventories and memoranda about specific products they provided. In one case in late 2014, APT5 breached the network of an international telecommunications company. The group used malware with keylogging capabilities to monitor the computer of an executive who manages the company's relationships with other telecommunications companies

## Tick

Tick is a cyber espionage group with likely Chinese origins that has been active since at least 2008. The group appears to have close ties to the Chinese National University of Defense and Technology, which is possibly linked to the PLA. This threat actor targets organizations in the critical infrastructure, heavy industry, manufacturing, and international relations sectors for espionage purposes. The attacks appear to be centered on political, media, and engineering sectors. STALKER PANDA has been observed conducting targeted attacks against Japan, Taiwan, Hong Kong, and the United States.

## Madi

Kaspersky Lab and Seculert worked together to sinkhole the Madi Command & Control (C&C) servers to monitor the campaign. Kaspersky Lab and Seculert identified more than 800 victims located in Iran, Israel and select countries across the globe connecting to the C&Cs over the past eight months. Statistics from the sinkhole revealed that the victims were primarily business people working on Iranian and Israeli critical infrastructure projects, Israeli financial institutions, Middle Eastern engineering students, and various government agencies communicating in the Middle East. Common applications and websites that were spied on include accounts on Gmail, Hotmail, Yahoo! Mail, ICQ, Skype, Google+, and Facebook. Surveillance is also performed over integrated ERP/CRM systems, business contracts, and financial management systems.

## Snake Wine

While investigating some of the smaller name servers that APT28/Sofacy routinely use to host their infrastructure, Cylance discovered another prolonged campaign that appeared to exclusively target Japanese companies and individuals that began around August 2016. The later registration style was eerily close to previously registered APT28 domains, however, the malware used in the attacks did not seem to line up at all. During the course of our investigation, JPCERT published this analysis of one of the group's backdoors. Cylance tracks this threat group internally as 'Snake Wine'. The Snake Wine group has proven to be highly adaptable and has continued to adopt new tactics in order to establish footholds inside victim environments. The exclusive interest in Japanese government, education, and commerce will likely continue into the future as the group is just starting to build and utilize their existing current attack infrastructure.

## Careto

This threat actor targets governments, diplomatic missions, private companies in the energy sector, and academics for espionage purposes. The Mask is an advanced threat actor that has been involved in cyber-espionage operations since at least 2007. The name "Mask" comes from the Spanish slang word "Careto" ("Ugly Face" or "Mask") which the authors included in some of the malware modules. More than 380 unique victims in 31 countries have been observed to date. What makes "The Mask" special is the complexity of the toolset used by the attackers. This includes an extremely sophisticated malware, a rootkit, a bootkit, 32-and 64-bit Windows versions, Mac OS X and Linux versions and possibly versions for Android and iPad/iPhone (Apple iOS).

## Group 27

Arbor's ASERT team is now reporting that, after looking deeper at that particular campaign, and by exposing a new trail in the group's activities, they managed to identify a new RAT that was undetectable at that time by most antivirus vendors. Named Trochilus, this new RAT was part of Group 27's malware portfolio that included six other malware strains, all served together or in different combinations, based on the data that needed to be stolen from each victim. This collection of malware, dubbed the Seven Pointed Dagger by ASERT experts, included two different PlugX versions, two different Trochilus RAT versions, one version of the 3012 variant of the 9002 RAT, one EvilGrab RAT version, and one unknown piece of malware, which the team has not entirely declassified just yet.

## APT 6

The FBI issued a rare bulletin admitting that a group named Advanced Persistent Threat 6 (APT6) hacked into US government computer systems as far back as 2011 and for years stole sensitive data. The FBI alert was issued in February and went largely unnoticed. Nearly a month later, security experts are now shining a bright light on the alert and the mysterious group behind the attack. “This is a rare alert and a little late, but one that is welcomed by all security vendors as it offers a chance to mitigate their customers and also collaborate further in what appears to be an ongoing FBI investigation,” said Deepen Desai, director of security research at the security firm Zscaler in an email to Threatpost. Details regarding the actual attack and what government systems were infected are scant. Government officials said they knew the initial attack occurred in 2011, but are unaware of who specifically is behind the attacks. “Given the nature of malware payload involved and the duration of this compromise being unnoticed – the scope of lateral movement inside the compromised network is very high possibly exposing all the critical systems,” Deepen said.

## White Bear

As a part of our Kaspersky APT Intelligence Reporting subscription, customers received an update in mid-February 2017 on some interesting APT activity that we called WhiteBear. Much of the contents of that report are reproduced here. WhiteBear is a parallel project or second stage of the Skipper Turla cluster of activity documented in another private intelligence report “Skipper Turla – the White Atlas framework” from mid-2016. Like previous Turla activity, WhiteBear leverages compromised websites and hijacked satellite connections for command and control (C2) infrastructure. As a matter of fact, WhiteBear infrastructure has overlap with other Turla campaigns, like those deploying Kopiluwak, as documented in “KopiLuwak – A New JavaScript Payload from Turla” in December 2016. WhiteBear infected systems maintained a dropper (which was typically signed) as well as a complex malicious platform which was always preceded by WhiteAtlas module deployment attempts. However, despite the similarities to previous Turla campaigns, we believe that WhiteBear is a distinct project with a separate focus. We note that this observation of delineated target focus, tooling, and project context is an interesting one that also can be repeated across broadly labeled Turla and Sofacy activity. From February to September 2016, WhiteBear activity was narrowly focused on embassies and consular operations around the world. All of these early WhiteBear targets were related to embassies and diplomatic/foreign affair organizations. Continued WhiteBear activity later shifted to include defense-related organizations into June 2017. When compared to WhiteAtlas infections, WhiteBear deployments are relatively rare and represent a departure from the broader Skipper Turla target set. Additionally, a comparison of the WhiteAtlas framework to WhiteBear components indicates that the malware is the product of separate development efforts. WhiteBear infections appear to be preceded by a condensed spearphishing dropper, lack Firefox extension installer payloads, and contain several new components signed with a new code signing digital certificate, unlike WhiteAtlas incidents and modules.

# MoneyTaker

In less than two years, this group has conducted over 20 successful attacks on financial institutions and legal firms in the USA, UK and Russia. The group has primarily been targeting card processing systems, including the AWS CBR (Russian Interbank System) and purportedly SWIFT (US). Given the wide usage of STAR in LATAM, financial institutions in LATAM could have particular exposure to a potential interest from the MoneyTaker group.

The tag is: *misp-galaxy:threat-actor="MoneyTaker"*

# Microcin

We're already used to the fact that complex cyberattacks use 0-day vulnerabilities, bypassing digital signature checks, virtual file systems, non-standard encryption algorithms and other tricks. Sometimes, however, all of this may be done in much simpler ways, as was the case in the malicious campaign that we detected a while ago – we named it 'Microcin' after microini, one of the malicious components used in it.

The tag is: *misp-galaxy:threat-actor="Microcin"*

Microcin is also known as:

- SixLittleMonkeys

## Leviathan

Leviathan is an espionage actor targeting organizations and high-value targets in defense and government. Active since at least 2014, this actor has long-standing interest in maritime industries, naval defense contractors, and associated research institutions in the United States and Western

Europe.

The tag is: `misp-galaxy:threat-actor="Leviathan"`

Leviathan is also known as:

- TEMP.Periscope
- TEMP.Jumper
- APT 40
- APT40
- BRONZE MOHAWK
- GADOLINIUM
- Kryptonite Panda

[View relationships graph](#)

Leviathan has relationships with:

- similar: `misp-galaxy:mitre-intrusion-set="Leviathan - G0065"` with `estimative-language:likelihood-probability="likely"`

## APT35

FireEye has identified APT35 operations dating back to 2014. APT35, also known as the Newscaster Team, is a threat group sponsored by the Iranian government that conducts long term, resource-intensive operations to collect strategic intelligence. APT35 typically targets U.S. and the Middle Eastern military, diplomatic and government personnel, organizations in the media, energy and defense industrial base (DIB), and engineering, business services and telecommunications sectors.

The tag is: *misp-galaxy:threat-actor="APT35"*

APT35 is also known as:

- APT 35
- Newscaster Team

## Orangeworm

Symantec has identified a previously unknown group called Orangeworm that has been observed installing a custom backdoor called Trojan.Kwampirs within large international corporations that operate within the healthcare sector in the United States, Europe, and Asia. First identified in January 2015, Orangeworm has also conducted targeted attacks against organizations in related industries as part of a larger supply-chain attack in order to reach their intended victims. Known victims include healthcare providers, pharmaceuticals, IT solution providers for healthcare and equipment manufacturers that serve the healthcare industry, likely for the purpose of corporate espionage.

The tag is: *misp-galaxy:threat-actor="Orangeworm"*

## ALLANITE

Adversaries abusing ICS (based on Dragos Inc adversary list). ALLANITE accesses business and industrial control (ICS) networks, conducts reconnaissance, and gathers intelligence in United States and United Kingdom electric utility sectors. Dragos assesses with moderate confidence that ALLANITE operators continue to maintain ICS network access to: (1) understand the operational environment necessary to develop disruptive capabilities, (2) have ready access from which to disrupt electric utilities. ALLANITE uses email phishing campaigns and compromised websites called watering holes to steal credentials and gain access to target networks, including collecting and distributing screenshots of industrial control systems. ALLANITE operations limit themselves to information gathering and have not demonstrated any disruptive or damaging capabilities. ALLANITE conducts malware-less operations primarily leveraging legitimate and available tools in the Windows operating system.

The tag is: *misp-galaxy:threat-actor="ALLANITE"*

ALLANITE is also known as:

- Palmetto Fusion
- Allanite

## CHRYSENE

Adversaries abusing ICS (based on Dragos Inc adversary list). This threat actor targets organizations involved in oil, gas, and electricity production, primarily in the Gulf region, for espionage purposes. According to one cybersecurity company, the threat actor “compromises a target machine and passes it off to another threat actor for further exploitation.”

The tag is: *misp-galaxy:threat-actor="CHRYSENE"*

CHRYSENE is also known as:

- OilRig
- Greenbug

The tag is: *misp-galaxy:threat-actor="XENOTIME"*

XENOTIME is also known as:

*Table 6385. Table References*

Links

<https://dragos.com/adversaries.html>

## ZooPark

ZooPark is a cyberespionage operation that has been focusing on Middle Eastern targets since at least June 2015. The threat actors behind ZooPark infect Android devices using several generations of malware we label from v1-v4, with v4 being the most recent version deployed in 2017.

The tag is: *misp-galaxy:threat-actor="ZooPark"*

*Table 6386. Table References*

Links

<https://securelist.com/whos-who-in-the-zoo/85394/>

## RANCOR

The Rancor group's attacks use two primary malware families which are naming DDKONG and PLAINTEE. DDKONG is used throughout the campaign and PLAINTEE appears to be new addition to these attackers' toolkit. Countries Unit 42 has identified as targeted by Rancor with these malware families include, but are not limited to Singapore and Cambodia.

The tag is: *misp-galaxy:threat-actor="RANCOR"*

RANCOR is also known as:

- Rancor group
- Rancor
- Rancor Group

*Table 6387. Table References*

<https://attack.mitre.org/groups/G0075/>

## The Big Bang

While it is not clear exactly what the attacker is looking for, what is clear is that once he finds it, a second stage of the attack awaits, fetching additional modules and/or malware from the Command and Control server. This then is a surveillance attack in progress and has been dubbed ‘Big Bang’ due to the attacker’s fondness for the ‘Big Bang Theory’ TV show, after which some of the malware’s modules are named.

The tag is: *misp-galaxy:threat-actor="The Big Bang"*

## Subaat

In mid-July, Palo Alto Networks Unit 42 identified a small targeted phishing campaign aimed at a government organization. While tracking the activities of this campaign, we identified a repository of additional malware, including a web server that was used to host the payloads used for both this attack as well as others.

The tag is: *misp-galaxy:threat-actor="Subaat"*

*Table 6389. Table References*

## Links

<https://researchcenter.paloaltonetworks.com/2017/10/unit42-tracking-subaat-targeted-phishing-attacks-point-leader-threat-actors-repository/>

## The Gorgon Group

Unit 42 researchers have been tracking Subaat, an attacker, since 2017. Recently Subaat drew our attention due to renewed targeted attack activity. Part of monitoring Subaat included realizing the actor was possibly part of a larger crew of individuals responsible for carrying out targeted attacks against worldwide governmental organizations. Technical analysis on some of the attacks as well as attribution links with Pakistan actors have been already depicted by 360 and Tuisec, in which they found interesting connections to a larger group of attackers Unit 42 researchers have been tracking, which we are calling Gorgon Group.

The tag is: *misp-galaxy:threat-actor="The Gorgon Group"*

The Gorgon Group is also known as:

- Gorgon Group
- Subaat

## DarkHydrus

In July 2018, Unit 42 analyzed a targeted attack using a novel file type against at least one government agency in the Middle East. It was carried out by a previously unpublished threat group we track as DarkHydrus. Based on our telemetry, we were able to uncover additional artifacts leading us to believe this adversary group has been in operation with their current playbook since early 2016. This attack diverged from previous attacks we observed from this group as it involved spear-phishing emails sent to targeted organizations with password protected RAR archive attachments that contained malicious Excel Web Query files (.iqy).

The tag is: *misp-galaxy:threat-actor="DarkHydrus"*

DarkHydrus is also known as:

- LazyMeerkat

## RedAlpha

Recorded Future's Insikt Group has identified two new cyberespionage campaigns targeting the Tibetan Community over the past two years. The campaigns, which we are collectively naming RedAlpha, combine light reconnaissance, selective targeting, and diverse malicious tooling. We discovered this activity as the result of pivoting off of a new malware sample observed targeting the Tibetan community based in India.

The tag is: *misp-galaxy:threat-actor="RedAlpha"*

## TempTick

This threat actor targets organizations in the finance, defense, aerospace, technology, health-care, and automotive sectors and media organizations in East Asia for the purpose of espionage. Believed to be responsible for the targeting of South Korean actors prior to the meeting of Donald J. Trump and Kim Jong-un

The tag is: *misp-galaxy:threat-actor="TempTick"*

Table 6393. Table References

Links
<a href="https://www.cfr.org/interactive/cyber-operations/temptick">https://www.cfr.org/interactive/cyber-operations/temptick</a>

## Operation Parliament

This threat actor uses spear-phishing techniques to target parliaments, government ministries, academics, and media organizations, primarily in the Middle East, for the purpose of espionage. Based on our findings, we believe the attackers represent a previously unknown geopolitically motivated threat actor. The campaign started in 2017, with the attackers doing just enough to achieve their goals. They most likely have access to additional tools when needed and appear to have access to an elaborate database of contacts in sensitive organizations and personnel worldwide, especially of vulnerable and non-trained staff. The victim systems range from personal desktop or laptop systems to large servers with domain controller roles or similar. The nature of the targeted ministries varied, including those responsible for telecommunications, health, energy, justice, finance and so on. Operation Parliament appears to be another symptom of escalating tensions in the Middle East region. The attackers have taken great care to stay under the radar, imitating another attack group in the region. They have been particularly careful to verify victim devices before proceeding with the infection, safeguarding their command and control servers. The targeting seems to have slowed down since the beginning of 2018, probably winding down when the desired data or access was obtained. The targeting of specific victims is unlike previously seen

behavior in regional campaigns by Gaza Cybergang or Desert Falcons and points to an elaborate information-gathering exercise that was carried out before the attacks (physical and/or digital). With deception and false flags increasingly being employed by threat actors, attribution is a hard and complicated task that requires solid evidence, especially in complex regions such as the Middle East.

The tag is: *misp-galaxy:threat-actor="Operation Parliament"*

## Winnti Umbrella

This threat actor targets software companies and political organizations in the United States, China,

Japan, and South Korea. It primarily acts to support cyber operations conducted by other threat actors affiliated with Chinese intelligence services. Believed to be associated with the Axiom, APT 17, and Mirage threat actors. Believed to share the same tools and infrastructure as the threat actors that carried out Operation Aurora, the 2015 targeting of video game companies, the 2015 targeting of the Thai government, and the 2017 targeting of Chinese-language news websites

Links
<a href="https://www.cfr.org/interactive/cyber-operations/henbox">https://www.cfr.org/interactive/cyber-operations/henbox</a>

## Mustang Panda

This threat actor targets nongovernmental organizations using Mongolian-themed lures for espionage purposes. In April 2017, CrowdStrike Falcon Intelligence observed a previously unattributed actor group with a Chinese nexus targeting a U.S.-based think tank. Further analysis revealed a wider campaign with unique tactics, techniques, and procedures (TTPs). This adversary targets non-governmental organizations (NGOs) in general, but uses Mongolian language decoys and themes, suggesting this actor has a specific focus on gathering intelligence on Mongolia. These campaigns involve the use of shared malware like Poison Ivy or PlugX. Recently, Falcon Intelligence observed new activity from MUSTANG PANDA, using a unique infection chain to target likely Mongolia-based victims. This newly observed activity uses a series of redirections and fileless, malicious implementations of legitimate tools to gain access to the targeted systems. Additionally, MUSTANG PANDA actors reused previously-observed legitimate domains to host files.

The tag is: *misp-galaxy:threat-actor="Mustang Panda"*

Mustang Panda is also known as:

- BRONZE PRESIDENT
- HoneyMyte
- Red Lich

## PowerPool

Malware developers have started to use the zero-day exploit for Task Scheduler component in Windows, two days after proof-of-concept code for the vulnerability appeared online.

A security researcher who uses the online name SandboxEscaper on August 27 released the source code for exploiting a security bug in the Advanced Local Procedure Call (ALPC) interface used by Windows Task Scheduler.

More specifically, the problem is with the SchRpcSetSecurity API function, which fails to properly check user's permissions, allowing write privileges on files in C:\Windows\Task.

The vulnerability affects Windows versions 7 through 10 and can be used by an attacker to escalate their privileges to all-access SYSTEM account level.

A couple of days after the exploit code became available (source and binary), malware researchers at ESET noticed its use in active malicious campaigns from a threat actor they call PowerPool, because of their tendency to use tools mostly written in PowerShell for lateral movement.

The group appears to have a small number of victims in the following countries: Chile, Germany, India, the Philippines, Poland, Russia, the United Kingdom, the United States, and Ukraine.

The researchers say that PowerPool developers did not use the binary version of the exploit, deciding instead to make some subtle changes to the source code before recompiling it.

The tag is: *misp-galaxy:threat-actor="PowerPool"*

PowerPool is also known as:

- IAmTheKing

## FASTCash

Treasury has identified a sophisticated cyber-enabled ATM cash out campaign we are calling FASTCash. FASTCash has been active since late 2016 targeting banks in Africa and Asia to remotely compromise payment switch application servers within banks to facilitate fraudulent transactions, primarily involving ATMs, to steal cash equivalent to tens of millions of dollars. FBI has attributed malware used in this campaign to the North Korean government. We expect FASTCash to continue targeting retail payment systems vulnerable to remote exploitation.

The tag is: *misp-galaxy:threat-actor="FASTCash"*

## Roaming Mantis

According to new research by Kaspersky's GREAT team, the online criminal activities of the Roaming Mantis Group have continued to evolve since they were first discovered in April 2018. As

part of their activities, this group hacks into exploitable routers and changes their DNS configuration. This allows the attackers to redirect the router user's traffic to malicious Android apps disguised as Facebook and Chrome or to Apple phishing pages that were used to steal Apple ID credentials. Recently, Kaspersky has discovered that this group is testing a new monetization scheme by redirecting iOS users to pages that contain the Coinhive in-browser mining script rather than the normal Apple phishing page. When users are redirected to these pages, they will be shown a blank page in the browser, but their CPU utilization will jump to 90% or higher.

The tag is: *misp-galaxy:threat-actor="Roaming Mantis"*

Roaming Mantis is also known as:

- Roaming Mantis Group

## The Shadow Brokers

The Shadow Brokers (TSB) is a hacker group who first appeared in the summer of 2016. They published several leaks containing hacking tools from the National Security Agency (NSA, including several zero-day exploits.[1] Specifically, these exploits and vulnerabilities targeted enterprise firewalls, antivirus software, and Microsoft products. The Shadow Brokers originally attributed the leaks to the Equation Group threat actor, who have been tied to the NSA's Tailored Access Operations unit.

The tag is: *misp-galaxy:threat-actor="The Shadow Brokers"*

The Shadow Brokers is also known as:

- The ShadowBrokers
- TSB
- Shadow Brokers

## INDRIK SPIDER

INDRIK SPIDER is a sophisticated eCrime group that has been operating Dridex since June 2014. In 2015 and 2016, Dridex was one of the most prolific eCrime banking trojans on the market and, since 2014, those efforts are thought to have netted INDRIK SPIDER millions of dollars in criminal profits. Throughout its years of operation, Dridex has received multiple updates with new modules developed and new anti-analysis features added to the malware. In August 2017, a new ransomware variant identified as BitPaymer was reported to have ransomed the U.K.'s National Health Service (NHS), with a high ransom demand of 53 BTC (approximately \$200,000 USD). The targeting of an organization rather than individuals, and the high ransom demands, made BitPaymer stand out from other contemporary ransomware at the time. Though the encryption and ransom functionality of BitPaymer was not technically sophisticated, the malware contained multiple anti-analysis features that overlapped with Dridex. Later technical analysis of BitPaymer indicated that it had been developed by INDRIK SPIDER, suggesting the group had expanded its criminal operation to include ransomware as a monetization strategy.

The tag is: *misp-galaxy:threat-actor="INDRIK SPIDER"*

## DNSpionage

Cisco Talos recently discovered a new campaign targeting Lebanon and the United Arab Emirates (UAE) affecting .gov domains, as well as a private Lebanese airline company. Based on our research, it's clear that this adversary spent time understanding the victims' network infrastructure in order

to remain under the radar and act as inconspicuous as possible during their attacks. Based on this actor's infrastructure and TTPs, we haven't been able to connect them with any other campaign or actor that's been observed recently. This particular campaign utilizes two fake, malicious websites containing job postings that are used to compromise targets via malicious Microsoft Office documents with embedded macros. The malware utilized by this actor, which we are calling "DNSpionage," supports HTTP and DNS communication with the attackers. In a separate campaign, the attackers used the same IP to redirect the DNS of legitimate .gov and private company domains. During each DNS compromise, the actor carefully generated Let's Encrypt certificates for the redirected domains. These certificates provide X.509 certificates for TLS free of charge to the user. We don't know at this time if the DNS redirections were successful. In this post, we will break down the attackers' methods and show how they used malicious documents to attempt to trick users into opening malicious websites that are disguised as "help wanted" sites for job seekers. Additionally, we will describe the malicious DNS redirection and the timeline of the events.

The tag is: *misp-galaxy:threat-actor="DNSpionage"*

DNSpionage is also known as:

- COBALT EDGEWATER

# Operation Poison Needles

What's noteworthy is that according to the introduction on the compromised website of the polyclinic (<http://www.p2f.ru>), the institution was established in 1965 and it was founded by the Presidential Administration of Russia. The multidisciplinary outpatient institution mainly serves the civil servants of the highest executive, legislative, judicial authorities of the Russian Federation, as well as famous figures of science and art. Since it is the first detection of this APT attack by 360 Security on a global scale, we code-named it as "Operation Poison Needles", considering that the target was a medical institution. Currently, the attribution of the attacker is still under investigation. However, the special background of the polyclinic and the sensitiveness of the group it served both indicate the attack is highly targeted. Simultaneously, the attack occurred at a very sensitive timing of the Kerch Strait Incident, so it also aroused the assumption on the political attribution of the attack.

## Operation Sharpshooter

The McAfee Advanced Threat Research team and McAfee Labs Malware Operations Group have discovered a new global campaign targeting nuclear, defense, energy, and financial companies, based on McAfee® Global Threat Intelligence. This campaign, Operation Sharpshooter, leverages an in-memory implant to download and retrieve a second-stage implant—which we call Rising Sun—for further exploitation. According to our analysis, the Rising Sun implant uses source code from the Lazarus Group’s 2015 backdoor Trojan Duuzer in a new framework to infiltrate these key industries. Operation Sharpshooter’s numerous technical links to the Lazarus Group seem too obvious to immediately draw the conclusion that they are responsible for the attacks, and instead indicate a potential for false flags. Our research focuses on how this actor operates, the global impact, and how to detect the attack. We shall leave attribution to the broader security community.

## TA505

TA505, the name given by Proofpoint, has been in the cybercrime business for at least four years. This is the group behind the infamous Dridex banking trojan and Locky ransomware, delivered through malicious email campaigns via Necurs botnet. Other malware associated with TA505 include Philadelphia and GlobeImposter ransomware families.

The tag is: *misp-galaxy:threat-actor="TA505"*

TA505 is also known as:

- SectorJ04 Group
- GRACEFUL SPIDER
- GOLD TAHOE
- Dudear
- TEMP.Warlock

## GRIM SPIDER

GRIM SPIDER is a sophisticated eCrime group that has been operating the Ryuk ransomware since August 2018, targeting large organizations for a high-ransom return. This methodology, known as “big game hunting,” signals a shift in operations for WIZARD SPIDER, a criminal enterprise of which GRIM SPIDER appears to be a cell. The WIZARD SPIDER threat group, known as the Russia-based operator of the TrickBot banking malware, had focused primarily on wire fraud in the past. Similar to Samas and BitPaymer, Ryuk is specifically used to target enterprise environments. Code comparison between versions of Ryuk and Hermes ransomware indicates that Ryuk was derived from the Hermes source code and has been under steady development since its release. Hermes is commodity ransomware that has been observed for sale on forums and used by multiple threat actors. However, Ryuk is only used by GRIM SPIDER and, unlike Hermes, Ryuk has only been used to target enterprise environments. Since Ryuk’s appearance in August, the threat actors operating it have netted over 705.80 BTC across 52 transactions for a total current value of \$3,701,893.98 USD. Grim Spider is reportedly associated with Lunar Spider and Wizard Spider.

The tag is: *misp-galaxy:threat-actor="GRIM SPIDER"*

GRIM SPIDER is also known as:

- GOLD ULRICK

## WIZARD SPIDER

Wizard Spider is reportedly associated with Grim Spider and Lunar Spider. The WIZARD SPIDER

threat group is the Russia-based operator of the TrickBot banking malware. This group represents a growing criminal enterprise of which GRIM SPIDER appears to be a subset. The LUNAR SPIDER threat group is the Eastern European-based operator and developer of the commodity banking malware called BokBot (aka IcedID), which was first observed in April 2017. The BokBot malware provides LUNAR SPIDER affiliates with a variety of capabilities to enable credential theft and wire fraud, through the use of webinjects and a malware distribution function. GRIM SPIDER is a sophisticated eCrime group that has been operating the Ryuk ransomware since August 2018, targeting large organizations for a high-ransom return. This methodology, known as “big game hunting,” signals a shift in operations for WIZARD SPIDER, a criminal enterprise of which GRIM SPIDER appears to be a cell. The WIZARD SPIDER threat group, known as the Russia-based operator of the TrickBot banking malware, had focused primarily on wire fraud in the past.

The tag is: *misp-galaxy:threat-actor="WIZARD SPIDER"*

# MUMMY SPIDER

MUMMY SPIDER is a criminal entity linked to the core development of the malware most commonly known as Emotet or Geodo. First observed in mid-2014, this malware shared code with the Bugat (aka Feodo) banking Trojan. However, MUMMY SPIDER swiftly developed the malware's capabilities to include an RSA key exchange for command and control (C2) communication and a modular architecture. MUMMY SPIDER does not follow typical criminal behavioral patterns. In particular, MUMMY SPIDER usually conducts attacks for a few months before ceasing operations for a period of between three and 12 months, before returning with a new variant or version. After a 10 month hiatus, MUMMY SPIDER returned Emotet to operation in December 2016 but the latest variant is not deploying a banking Trojan module with web injects, it is currently acting as a 'loader' delivering other malware packages. The primary modules perform reconnaissance on victim machines, drop freeware tools for credential collection from web browsers and mail clients and a spam plugin for self-propagation. The malware is also issuing commands to download and execute other malware families such as the banking Trojans Dridex and Qakbot. MUMMY SPIDER advertised Emotet on underground forums until 2015, at which time it became private. Therefore, it is highly likely that Emotet is operate

The tag is: *misp-galaxy:threat-actor="MUMMY SPIDER"*

MUMMY SPIDER is also known as:

- TA542
- GOLD CRESTWOOD

## Silence group

a relatively new threat actor that’s been operating since mid-2016 Group-IB has exposed the attacks committed by Silence cybercriminal group. While the gang had previously targeted Russian banks, Group-IB experts also have discovered evidence of the group’s activity in more than 25 countries worldwide. Group-IB has published its first detailed report on tactics and tools employed by Silence. Group-IB security analysts' hypothesis is that at least one of the gang members appears to be a former or current employee of a cyber security company. The confirmed damage from Silence activity is estimated at 800 000 USD. Silence is a group of Russian-speaking hackers, based on their commands language, the location of infrastructure they used, and the geography of their targets (Russia, Ukraine, Belarus, Azerbaijan, Poland, and Kazakhstan). Although phishing emails were also sent to bank employees in Central and Western Europe, Africa, and Asia). Furthermore, Silence used Russian words typed on an English keyboard layout for the commands of the employed backdoor. The hackers also used Russian-language web hosting services.

The tag is: *misp-galaxy:threat-actor="Silence group"*

Silence group is also known as:

- Silence
- WHISPER SPIDER

## APT39

APT39 was created to bring together previous activities and methods used by this actor, and its activities largely align with a group publicly referred to as "Chafer." However, there are differences in what has been publicly reported due to the variances in how organizations track activity. APT39 primarily leverages the SEAWEED and CACHEMONEY backdoors along with a specific variant of the POWBAT backdoor. While APT39's targeting scope is global, its activities are concentrated in the Middle East. APT39 has prioritized the telecommunications sector, with additional targeting of the travel industry and IT firms that support it and the high-tech industry.

The tag is: *misp-galaxy:threat-actor="APT39"*

APT39 is also known as:

- Chafer
- REMIX KITTEN
- COBALT HICKMAN

## Siesta

FireEye recently looked deeper into the activity discussed in TrendMicro's blog and dubbed the "Siesta" campaign. The tools, modus operandi, and infrastructure used in the campaign present two possibilities: either the Chinese cyber-espionage unit APT1 is perpetrating this activity, or another

group is using the same tactics and tools as the legacy APT1. The Siesta campaign reinforces the fact that analysts and network defenders should remain on the lookout for known, public indicators and for shared attributes that allow security experts to detect multiple actors with one signature.

The tag is: *misp-galaxy:threat-actor="Siesta"*

## Gallmaker

Symantec researchers have uncovered a previously unknown attack group that is targeting government and military targets, including several overseas embassies of an Eastern European country, and military and defense targets in the Middle East. This group eschews custom malware and uses living off the land (LotL) tactics and publicly available hack tools to carry out activities that bear all the hallmarks of a cyber espionage campaign. The group, which we have given the name Gallmaker, has been operating since at least December 2017, with its most recent activity observed in June 2018.

The tag is: *misp-galaxy:threat-actor="Gallmaker"*

## PINCHY SPIDER

First observed in January 2018, GandCrab ransomware quickly began to proliferate and receive regular updates from its developer, PINCHY SPIDER, which over the course of the year established a RaaS operation with a dedicated set of affiliates. CrowdStrike Intelligence has recently observed PINCHY SPIDER affiliates deploying GandCrab ransomware in enterprise environments, using lateral movement techniques and tooling commonly associated with nation-state adversary groups and penetration testing teams. This change in tactics makes PINCHY SPIDER and its affiliates the latest eCrime adversaries to join the growing trend of targeted, low-volume/high-return ransomware deployments known as “big game hunting.” PINCHY SPIDER is the criminal group behind the development of the ransomware most commonly known as GandCrab, which has been active since January 2018. PINCHY SPIDER sells access to use GandCrab ransomware under a partnership program with a limited number of accounts. The program is operated with a 60-40 split in profits (60 percent to the customer), as is common among eCrime actors, but PINCHY SPIDER is also willing to negotiate up to a 70-30 split for “sophisticated” customers.

The tag is: *misp-galaxy:threat-actor="PINCHY SPIDER"*

## LUNAR SPIDER

According to CrowdStrike, this actor is using BokBok/IcedID, potentially buying distribution through Emotet infections. On March 17, 2019, CrowdStrike Intelligence observed the use of a new BokBot (developed and operated by LUNAR SPIDER) proxy module in conjunction with TrickBot (developed and operated by WIZARD SPIDER), which may provide WIZARD SPIDER with additional tools to steal sensitive information and conduct fraudulent wire transfers. This activity also provides further evidence to support the existence of a flourishing relationship between these two actors. Lunar Spider is reportedly associated with Grim Spider and Wizard Spider.

The tag is: *misp-galaxy:threat-actor="LUNAR SPIDER"*

LUNAR SPIDER is also known as:

- GOLD SWATHMORE

## RATPAK SPIDER

In July 2018, the source code of Pegasus, RATPAK SPIDER's malware framework, was anonymously leaked. This malware has been linked to the targeting of Russia's financial sector. Associated malware, Buhtrap, which has been leaked previously, was observed this year in connection with SWC campaigns that also targeted Russian users.

The tag is: *misp-galaxy:threat-actor="RATPAK SPIDER"*

## APT-C-36

Since April 2018, an APT group (Blind Eagle, APT-C-36) suspected coming from South America carried out continuous targeted attacks against Colombian government institutions as well as important corporations in financial sector, petroleum industry, professional manufacturing, etc.

The tag is: *misp-galaxy:threat-actor="APT-C-36"*

APT-C-36 is also known as:

- Blind Eagle

Table 6444. Table References

## IRIDIUM

Resecurity's research indicates that the attack on Parliament is a part of a multi-year cyberespionage campaign orchestrated by a nation-state actor whom we are calling IRIDIUM. This actor targets sensitive government, diplomatic, and military resources in the countries comprising the Five Eyes intelligence alliance (which includes Australia, Canada, New Zealand, the United Kingdom and the United States)

The tag is: *misp-galaxy:threat-actor="IRIDIUM"*

Table 6445. Table References

<https://hub.packtpub.com/resecurity-reports-iriduim-behind-citrix-data-breach-200-government-agencies-oil-and-gas-companies-and-technology-companies-also-targeted/>

## SandCat

SandCat, on the other hand, is a group that was discovered more recently by Kaspersky. One of the Windows vulnerabilities patched by Microsoft in December had been exploited by both FruityArmor and SandCat in attacks targeting the Middle East and Africa. SandCat has been using FinFisher/FinSpy spyware and CHAINSHOT, a piece of malware analyzed earlier this year by Palo Alto Networks. The group has also used the CVE-2018-8589 and CVE-2018-8611 Windows vulnerabilities in its attacks, both of which had a zero-day status when Microsoft released fixes.

The tag is: *misp-galaxy:threat-actor="SandCat"*

*Table 6446. Table References*

Links

<https://securelist.com/zero-day-in-windows-kernel-transaction-manager-cve-2018-8611/89253/>

## Operation Comando

Operation Comando is a pure cybercrime campaign, possibly with Brazilian origin, with a concrete and persistent focus on the hospitality sector, which proves how a threat actor can be successful in pursuing its objectives while maintaining a cheap budget. The use of DDNS services, publicly available remote access tools, and having a minimum knowledge on software development (in this case VB.NET) has been enough for running a campaign lasting month, and potentially gathering credit card information and other possible data.

The tag is: *misp-galaxy:threat-actor="Operation Comando"*

*Table 6447. Table References*

Links

<https://unit42.paloaltonetworks.com/operation-comando-or-how-to-run-a-cheap-and-effective-credit-card-business/>

## APT-C-27

On March 17, 2019, 360 Threat Intelligence Center captured a target attack sample against the Middle East by exploiting WinRAR vulnerability (CVE-2018-20250[6]), and it seems that the attack is carried out by the Goldmouse APT group (APT-C-27). There is a decoy Word document inside the archive regarding terrorist attacks to lure the victim into decompressing. When the archive gets decompressed on the vulnerable computer, the embedded njRAT backdoor (Telegram Desktop.exe) will be extracted to the startup folder and then triggered into execution if the victim restarts the computer or performs re-login. After that, the attacker is capable to control the compromised device.

The tag is: *misp-galaxy:threat-actor="APT-C-27"*

APT-C-27 is also known as:

- GoldMouse

## Operation ShadowHammer

Newly discovered supply chain attack that leveraged ASUS Live Update software. The goal of the attack was to surgically target an unknown pool of users, which were identified by their network adapters' MAC addresses. To achieve this, the attackers had hardcoded a list of MAC addresses in the trojanized samples and this list was used to identify the actual intended targets of this massive operation. We were able to extract more than 600 unique MAC addresses from over 200 samples used in this attack. Of course, there might be other samples out there with different MAC addresses in their list.

The tag is: *misp-galaxy:threat-actor="Operation ShadowHammer"*

Table 6449. Table References

## Whitefly

In July 2018, an attack on Singapore's largest public health organization, SingHealth, resulted in a reported 1.5 million patient records being stolen. Until now, nothing was known about who was responsible for this attack. Symantec researchers have discovered that this attack group, which we call Whitefly, has been operating since at least 2017, has targeted organizations based mostly in Singapore across a wide variety of sectors, and is primarily interested in stealing large amounts of sensitive information.

The tag is: *misp-galaxy:threat-actor="Whitefly"*

# Sea Turtle

This blog post discusses the technical details of a state-sponsored attack manipulating DNS systems. While this incident is limited to targeting primarily national security organizations in the Middle East and North Africa, and we do not want to overstate the consequences of this specific campaign, we are concerned that the success of this operation will lead to actors more broadly attacking the global DNS system. DNS is a foundational technology supporting the Internet. Manipulating that system has the potential to undermine the trust users have on the internet. That trust and the stability of the DNS system as a whole drives the global economy. Responsible nations should avoid targeting this system, work together to establish an accepted global norm that this system and the organizations that control it are off-limits, and cooperate in pursuing those actors who act irresponsibly by targeting this system.

The tag is: *misp-galaxy:threat-actor="Sea Turtle"*

# Silent Librarian

Last Friday, Deputy Attorney General Rod Rosenstein announced the indictment of nine Iranians who worked for an organization named the Mabna Institute. According to prosecutors, the defendants stole more than 31 terabytes of data from universities, companies, and government agencies around the world. The cost to the universities alone reportedly amounted to approximately \$3.4 billion. The information stolen from these universities was used by the Islamic Revolutionary Guard Corps (IRGC) or sold for profit inside Iran. PhishLabs has been tracking this same threat group since late-2017, designating them Silent Librarian. Since discovery, we have been working with the FBI, ISAC partners, and other international law enforcement agencies to help understand and mitigate these attacks.

The tag is: *misp-galaxy:threat-actor="Silent Librarian"*

Silent Librarian is also known as:

- COBALT DICKENS
- Mabna Institute
- TA407

## APT31

FireEye characterizes APT31 as an actor specialized on intellectual property theft, focusing on data and projects that make a particular organization competitive in its field. Based on available data (April 2016), FireEye assesses that APT31 conducts network operations at the behest of the Chinese Government. Also according to CrowdStrike, this adversary is suspected of continuing to target upstream providers (e.g., law firms and managed service providers) to support additional intrusions against high-profile assets. In 2018, CrowdStrike observed this adversary using spear-phishing, URL “web bugs” and scheduled tasks to automate credential harvesting.

The tag is: *misp-galaxy:threat-actor="APT31"*

APT31 is also known as:

- ZIRCONIUM
- JUDGMENT PANDA
- BRONZE VINEWOOD

## Blackgear

BLACKGEAR is an espionage campaign which has targeted users in Taiwan for many years. Multiple papers and talks have been released covering this campaign, which used the ELIRKS backdoor when it was first discovered in 2012. It is known for using blogs and microblogging services to hide the location of its actual command-and-control (C&C) servers. This allows an attacker to change the C&C server used quickly by changing the information in these posts. Like most campaigns, BLACKGEAR has evolved over time. Our research indicates that it has started targeting Japanese users. Two things led us to this conclusion: first, the fake documents that are used as part of its infection routines are now in Japanese. Secondly, it is now using blogging sites and microblogging services based in Japan for its C&C activity.

The tag is: *misp-galaxy:threat-actor="Blackgear"*

Blackgear is also known as:

- Topgear
- Connie

- BLACKGEAR

## BlackTech

BlackTech is a cyber espionage group operating against targets in East Asia, particularly Taiwan, and occasionally, Japan and Hong Kong. Based on the mutexes and domain names of some of their C&C servers, BlackTech's campaigns are likely designed to steal their target's technology. Following their activities and evolving tactics and techniques helped us uncover the proverbial red string of fate that connected three seemingly disparate campaigns: PLEAD, Shrouded Crossbow, and of late, Waterbear. PLEAD is an information theft campaign with a penchant for confidential documents. Active since 2012, it has so far targeted Taiwanese government agencies and private organizations. PLEAD's toolset includes the self-named PLEAD backdoor and the DRIGO exfiltration tool. PLEAD uses spear-phishing emails to deliver and install their backdoor, either as an attachment or through links to cloud storage services. Some of the cloud storage accounts used to deliver PLEAD are also used as drop off points for exfiltrated documents stolen by DRIGO. PLEAD actors use a router scanner tool to scan for vulnerable routers, after which the attackers will enable the router's VPN feature then register a machine as virtual server. This virtual server will be used either as a C&C server or an HTTP server that delivers PLEAD malware to their targets.

The tag is: *misp-galaxy:threat-actor="BlackTech"*

BlackTech is also known as:

- CIRCUIT PANDA
- Temp.Overboard
- HUAPI
- Palmerworm

## FIN5

FIN5 is a financially motivated threat group that has targeted personally identifiable information and payment card information. The group has been active since at least 2008 and has targeted the restaurant, gaming, and hotel industries. The group is made up of actors who likely speak Russian.

The tag is: *misp-galaxy:threat-actor="FIN5"*

Table 6457. Table References

Links
<a href="https://www.darkreading.com/analytics/prolific-cybercrime-gang-favors-legit-login-credentials/d/d-id/1322645?">https://www.darkreading.com/analytics/prolific-cybercrime-gang-favors-legit-login-credentials/d/d-id/1322645?</a>
<a href="https://attack.mitre.org/groups/G0053/">https://attack.mitre.org/groups/G0053/</a>

## FIN1

FireEye first identified this activity during a recent investigation at an organization in the financial industry. They identified the presence of a financially motivated threat group that they track as FIN1, whose activity at the organization dated back several years. The threat group deployed numerous malicious files and utilities, all of which were part of a malware ecosystem referred to as ‘Nemesis’ by the malware developer(s), and used this malware to access the victim environment and steal cardholder data. FIN1, which may be located in Russia or a Russian-speaking country based on language settings in many of their custom tools, is known for stealing data that is easily monetized from financial services organizations such as banks, credit unions, ATM operations, and

financial transaction processing and financial business services companies.

The tag is: *misp-galaxy:threat-actor="FIN1"*

Table 6458. Table References

Links
<a href="https://www.fireeye.com/blog/threat-research/2015/12/fin1-targets-boot-record.html">https://www.fireeye.com/blog/threat-research/2015/12/fin1-targets-boot-record.html</a>

## FIN10

FireEye has observed multiple targeted intrusions occurring in North America — predominately in Canada — dating back to at least 2013 and continuing through at least 2016, in which the attacker(s) have compromised organizations' networks and sought to monetize this illicit access by exfiltrating sensitive data and extorting victim organizations. In some cases, when the extortion demand was not met, the attacker(s) destroyed production Windows systems by deleting critical operating system files and then shutting down the impacted systems. Based on near parallel TTPs used by the attacker(s) across these targeted intrusions, we believe these clusters of activity are linked to a single, previously unobserved actor or group that we have dubbed FIN10.

The tag is: *misp-galaxy:threat-actor="FIN10"*

## GhostNet

Cyber espionage is an issue whose time has come. In this second report from the Information Warfare Monitor, we lay out the findings of a 10-month investigation of alleged Chinese cyber spying against Tibetan institutions. The investigation, consisting of fieldwork, technical scouting, and laboratory analysis, discovered a lot more. The investigation ultimately uncovered a network of over 1,295 infected hosts in 103 countries. Up to 30% of the infected hosts are considered high-value targets and include computers located at ministries of foreign affairs, embassies, international organizations, news media, and NGOs. The Tibetan computer systems we manually investigated, and from which our investigations began, were conclusively compromised by multiple infections that gave attackers unprecedented access to potentially sensitive information. Attacks on the Dalai Lama's Private Office The OHHDL started to suspect it was under surveillance while setting up meetings between His Holiness and foreign dignitaries. They sent an email invitation on behalf of His Holiness to a foreign diplomat, but before they could follow it up with a courtesy telephone call, the diplomat's office was contacted by the Chinese government and warned not to go ahead with the meeting. The Tibetans wondered whether a computer compromise might be the explanation; they called ONI Asia who called us. (Until May 2008, the first author was employed on a studentship funded by the OpenNet Initiative and the second author was a principal investigator for ONI.)

## GozNym

IBM X-Force Research uncovered a Trojan hybrid spawned from the Nymaim and Gozi ISFB malware. It appears that the operators of Nymaim have recompiled its source code with part of the Gozi ISFB source code, creating a combination that is being actively used in attacks against more than 24 U.S. and Canadian banks, stealing millions of dollars so far. X-Force named this new hybrid GozNym. The new GozNym hybrid takes the best of both the Nymaim and Gozi ISFB malware to create a powerful Trojan. From the Nymaim malware, it leverages the dropper's stealth and persistence; the Gozi ISFB parts add the banking Trojan's capabilities to facilitate fraud via infected Internet browsers. The end result is a new banking Trojan in the wild.

## Group5

A threat actor using Iranian-language tools, Iranian hosting companies, operating from the Iranian IP space at times was observed targeting the Syrian opposition in an elaborately staged malware operation, Citizen Lab researchers reveal. The operation was first noticed in late 2015, when a member of the Syrian opposition flagged a suspicious email containing a PowerPoint slideshow, which led researchers to a watering hole website with malicious programs, malicious PowerPoint files, and Android malware. The threat actor was targeting Windows and Android devices of well-connected individuals in the Syrian opposition, researchers discovered. They called the actor Group5, because it targets Syrian opposition after regime-linked malware groups, the Syrian

Electronic Army, ISIS (also known as the Islamic State or ISIL), and a group linked to Lebanon did the same in the past

## Honeybee

McAfee Advanced Threat Research analysts have discovered a new operation targeting humanitarian aid organizations and using North Korean political topics as bait to lure victims into opening malicious Microsoft Word documents. Our analysts have named this Operation Honeybee, based on the names of the malicious documents used in the attacks. Advanced Threat Research analysts have also discovered malicious documents authored by the same actor that indicate a tactical shift. These documents do not contain the typical lures by this actor, instead using Word compatibility messages to entice victims into opening them. The Advanced Threat Research team also observed a heavy concentration of the implant in Vietnam from January 15–17.

## Lucky Cat

A series of attacks, targeting both Indian military research and south Asian shipping organizations, demonstrate the minimum level of effort required to successfully compromise a target and steal sensitive information. The attackers use very simple malware, which required little development time or skills, in conjunction with freely available Web hosting, to implement a highly effective attack. It is a case of the attackers obtaining a maximum return on their investment. The attack shows how an intelligent attacker does not need to be particularly technically skilled in order to steal the information they are after. The attack begins, as is often the case, with an email sent to the victim. A malicious document is attached to the email, which, when loaded, activates the malware. The attackers use tailored emails to encourage the victim to open the email. For example, one email sent to an academic claimed to be a call for papers for a conference (CFP). The vast majority of the victims were based in India, with some in Malaysia. The victim industry was mostly military research and also shipping based in the Arabian and South China seas. In some instances the attackers appeared to have a clear goal, whereby specific files were retrieved from certain compromised computers. In other cases, the attackers used more of a ‘shotgun’ like approach,

copying every file from a computer. Military technologies were obviously the focus of one particular attack with what appeared to be source code stolen. 45 different attacker IP addresses were observed. Out of those, 43 were within the same IP address range based in Sichuan province, China. The remaining two were based in South Korea. The pattern of attacker connections implies that the IP addresses are being used as a VPN, probably in an attempt to render the attackers anonymous. The attacks have been active from at least April 2011 up to February 2012. The attackers are intelligent and focused, employing the minimum amount of work necessary for the maximum gain. They do not use zero day exploits or complicated threats, instead they rely on effective social engineering and lax security measures on the part of the victims.

## RTM

There are several groups actively and profitably targeting businesses in Russia. A trend that we have seen unfold before our eyes lately is these cybercriminals' use of simple backdoors to gain a foothold in their targets' networks. Once they have this access, a lot of the work is done manually, slowly getting to understand the network layout and deploying custom tools the criminals can use to steal funds from these entities. Some of the groups that best exemplify these trends are Buhtrap, Cobalt and Corkow. The group discussed in this white paper is part of this new trend. We call this new group RTM; it uses custom malware, written in Delphi, that we cover in detail in later sections. The first trace of this tool in our telemetry data dates back to late 2015. The group also makes use of several different modules that they deploy where appropriate to their targets. They are interested in users of remote banking systems (RBS), mainly in Russia and neighboring countries.

## Shadow Network

Shadows in the Cloud documents a complex ecosystem of cyber espionage that systematically compromised government, business, academic, and other computer network systems in India, the Offices of the Dalai Lama, the United Nations, and several other countries. The report also contains an analysis of data which were stolen from politically sensitive targets and recovered during the course of the investigation. These include documents from the Offices of the Dalai Lama and

agencies of the Indian national security establishment. Data containing sensitive information on citizens of numerous third-party countries, as well as personal, financial, and business information, were also exfiltrated and recovered during the course of the investigation. The report analyzes the malware ecosystem employed by the Shadows' attackers, which leveraged multiple redundant cloud computing systems, social networking platforms, and free web hosting services in order to maintain persistent control while operating core servers located in the People's Republic of China (PRC). Although the identity and motivation of the attackers remain unknown, the report is able to determine the location (Chengdu, PRC) as well as some of the associations of the attackers through circumstantial evidence. The investigation is the product of an eight month, collaborative activity between the Information Warfare Monitor (Citizen Lab and SecDev) and the Shadowserver Foundation. The investigation employed a fusion methodology, combining technical interrogation techniques, data analysis, and field research, to track and uncover the Shadow cyber espionage network.

## Slingshot

While analysing an incident which involved a suspected keylogger, we identified a malicious library able to interact with a virtual file system, which is usually the sign of an advanced APT actor. This turned out to be a malicious loader internally named 'Slingshot', part of a new, and highly sophisticated attack platform that rivals Project Sauron and Regin in complexity. While for most victims the infection vector for Slingshot remains unknown, we were able to find several cases where the attackers got access to MikroTik routers and placed a component downloaded by Winbox Loader, a management suite for MikroTik routers. In turn, this infected the administrator of the router. We believe this cluster of activity started in at least 2012 and was still active at the time of this analysis (February 2018).

## Taidoor

The Taidoor attackers have been actively engaging in targeted attacks since at least March 4, 2009. Despite some exceptions, the Taidoor campaign often used Taiwanese IP addresses as C&C servers and email addresses to send out socially engineered emails with malware as attachments. One of the primary targets of the Taidoor campaign appeared to be the Taiwanese government. The attackers spoofed Taiwanese government email addresses to send out socially engineered emails in the Chinese language that typically leveraged Taiwan-themed issues. The attackers actively sent out

malicious documents and maintained several IP addresses for command and control. As part of their social engineering ploy, the Taidoor attackers attach a decoy document to their emails that, when opened, displays the contents of a legitimate document but executes a malicious payload in the background. We were only able to gather a limited amount of information regarding the Taidoor attackers' activities after they have compromised a target. We did, however, find that the Taidoor malware allowed attackers to operate an interactive shell on compromised computers and to upload and download files. In order to determine the operational capabilities of the attackers behind the Taidoor campaign, we monitored a compromised honeypot. The attackers issued out some basic commands in an attempt to map out the extent of the network compromise but quickly realized that the honeypot was not an intended targeted and so promptly disabled the Taidoor malware running on it. This indicated that while Taidoor malware were more widely distributed compared with those tied to other targeted campaigns, the attackers could quickly assess their targets and distinguish these from inadvertently compromised computers and honeypots.

## WindShift

In August of 2018, DarkMatter released a report entitled "In the Trails of WINDSHIFT APT", which unveiled a threat actor with TTPs very similar to those of Bahamut. Subsequently, two additional

articles were released by Objective-See which provide an analysis of some validated WINDSHIFT samples targeting OSX systems. Pivoting on specific file attributes and infrastructure indicators, Unit 42 was able to identify and correlate additional attacker activity and can now provide specific details on a targeted WINDSHIFT attack as it unfolded at a Middle Eastern government agency.

## [Unnamed group]

Over the last few weeks, several significant leaks regarding a number of Iranian APTs took place. After analyzing and investigating the documents we conclude that they are authentic. Consequently, this causes considerable harm to the groups and their operation. The identity of the actor behind the leak is currently unknown, however based on the scope and the quality of the exposed documents and information, it appears that they are professional and highly capable. This leak will likely hamstring the groups' operation in the near future. Accordingly, in our assessment this will minimize the risk of potential attacks in the next few months and possibly even year. Note -most of the leaks are posted on Telegram channels that were created specifically for this purpose. Below are the three main Telegram groups on which the leaks were posted: Lab Dookhtegam pseudonym ("The people whose lips are stitched and sealed" –translation from Persian) –In this channel attack tools attributed to the group 'OilRig' were leaked; including a webshell that was inserted into the Technion, various tools that were used for DNS attacks, and more. Green Leakers–In this channel attack tools attributed to the group 'MuddyWatter' were leaked. The group's name and its symbol are identified with the "green movement", which led the protests in Iran after the Presidential elections in 2009. These protests were heavily repressed by the revolutionary guards (IRGC) Black Box–Unlike the previous two channels this has been around for a long time. On Friday May 5th, dozens of confidential documents labeled as "secret" (a high confidentiality level in Iran, one before the highest -top secret) were posted on this channel. The documents were related to Iranian attack groups' activity.

# DUNGEON SPIDER

DUNGEON SPIDER is a criminal group operating the ransomware most commonly known as Locky, which has been active since February 2016 and was last observed in late 2017. Locky is a ransomware tool that encrypts files using a combination of cryptographic algorithms: RSA with a key size of 2,048 bits, and AES with a key size of 128 bits. Locky targets a large number of file extensions and is able to encrypt data on shared network drives. In an attempt to further impact victims and prevent file recovery, Locky deletes all of the Shadow Volume Copies on the machine. DUNGEON SPIDER primarily relies on broad spam campaigns with malicious attachments for distribution. Locky is the community/industry name associated with this actor.

The tag is: *misp-galaxy:threat-actor="DUNGEON SPIDER"*

## Fxmsp

Throughout 2017 and 2018, Fxmsp established a network of trusted proxy resellers to promote their breaches on the criminal underground. Some of the known Fxmsp TTPs included accessing network environments via externally available remote desktop protocol (RDP) servers and exposed active directory. Most recently, the actor claimed to have developed a credential-stealing botnet capable of infecting high-profile targets in order to exfiltrate sensitive usernames and passwords. Fxmsp has claimed that developing this botnet and improving its capabilities for stealing information from secured systems is their main goal.

The tag is: *misp-galaxy:threat-actor="Fxmsp"*

## Gnosticplayers

The hacker said that he put up the data for sale mainly because these companies had failed to protect passwords with strong encryption algorithms like bcrypt. Most of the hashed passwords the hacker put up for sale today can be cracked with various levels of difficulty --but they can be cracked. "I got upset because I feel no one is learning," the hacker told ZDNet in an online chat earlier today. "I just felt upset at this particular moment, because seeing this lack of security in 2019 is making me angry." In a conversation with ZDNet last month, the hacker told us he wanted to hack and put up for sale more than one billion records and then retire and disappear with the money. But in a conversation today, the hacker says this is not his target anymore, as he learned that other hackers have already achieved the same goal before him. Gnosticplayers also revealed that not all the data

he obtained from hacked companies had been put up for sale. Some companies gave into extortion demands and paid fees so breaches would remain private. "I came to an agreement with some companies, but the concerned startups won't see their data for sale," he said. "I did it that's why I can't publish the rest of my databases or even name them."

## Hacking Team

The many 0-days that had been collected by Hacking Team and which became publicly available during the breach of their organization in 2015, have been used by several APT groups since. Since being founded in 2003, the Italian spyware vendor Hacking Team gained notoriety for selling surveillance tools to governments and their agencies across the world. The capabilities of its flagship product, the Remote Control System (RCS), include extracting files from a targeted device, intercepting emails and instant messaging, as well as remotely activating a device's webcam and microphone. The company has been criticized for selling these capabilities to authoritarian governments – an allegation it has consistently denied. When the tables turned in July 2015, with Hacking Team itself suffering a damaging hack, the reported use of RCS by oppressive regimes was confirmed. With 400GB of internal data – including the once-secret list of customers, internal communications, and spyware source code – leaked online, Hacking Team was forced to request its customers to suspend all use of RCS, and was left facing an uncertain future. Following the hack, the security community has been keeping a close eye on the company's efforts to get back on its feet. The first reports suggesting Hacking Team's resumed operations came six months later – a new sample of Hacking Team's Mac spyware was apparently in the wild. A year after the breach, an investment by a company named Tablem Limited brought changes to Hacking Team's shareholder structure, with Tablem Limited taking 20% of Hacking Team's shareholding. Tablem Limited is officially based in Cyprus; however, recent news suggests it has ties to Saudi Arabia.

## OurMine

OurMine is known for celebrity internet accounts, often causing cyber vandalism, to advertise their commercial services. (Trend Micro) In light of the recent report detailing its willingness to pay US\$250,000 in exchange for the 1.5 terabytes' worth of data swiped by hackers from its servers, HBO finds itself dealing with yet another security breach. Known for hijacking prominent social media accounts, the self-styled white hat hacking group OurMine took over a number of verified Twitter and Facebook accounts belonging to the cable network. These include accounts for HBO shows, such as "Game of Thrones," "Girls," and "Ballers." This is not the first time that OurMine has claimed responsibility for hacking high-profile social networking accounts. Last year, the group victimized Marvel, The New York Times, and even the heads of some of the biggest technology companies in the world. Mark Zuckerberg, Jack Dorsey, Sundar Pichai, and Daniel Ek — the CEOs of Facebook, Twitter, Google and Spotify, respectively — have also fallen victim to the hackers, dispelling the notion that a career in software and technology exempts one from being compromised.

## Pacha Group

Antd is a miner found in the wild on September 18, 2018. Recently we discovered that the authors from Antd are actively delivering newer campaigns deploying a broad number of components, most of them completely undetected and operating within compromised third party Linux servers. Furthermore, we have observed that some of the techniques implemented by this group are unconventional, and there is an element of sophistication to them. We believe the authors behind this malware are from Chinese origin. We have labeled the undetected Linux.Antd variants, Linux.GreedyAntd and classified the threat actor as Pacha Group.

The tag is: *misp-galaxy:threat-actor="Pacha Group"*

## [Vault 7/8]

An unnamed source leaked almost 10,000 documents describing a large number of 0-day vulnerabilities, methodologies and tools that had been collected by the CIA. This leaking was done through WikiLeaks, since March 2017. In weekly publications, the dumps were said to come from Vault 7 and later Vault 8, until his arrest in 2018. Most of the published vulnerabilities have since been fixed by the respective vendors, by many have been used by other threat actors. This actor turned out to be a former CIA software engineer. (WikiLeaks) Today, Tuesday 7 March 2017, WikiLeaks begins its new series of leaks on the U.S. Central Intelligence Agency. Code-named "Vault 7" by WikiLeaks, it is the largest ever publication of confidential documents on the agency. The first full part of the series, "Year Zero", comprises 8,761 documents and files from an isolated, high-security network situated inside the CIA's Center for Cyber Intelligence in Langley, Virginia. It follows an introductory disclosure last month of CIA targeting French political parties and candidates in the lead up to the 2012 presidential election. Recently, the CIA lost control of the majority of its hacking arsenal including malware, viruses, trojans, weaponized "zero day" exploits, malware remote control systems and associated documentation. This extraordinary collection, which amounts to more than several hundred million lines of code, gives its possessor the entire hacking capacity of the CIA. The archive appears to have been circulated among former U.S. government hackers and contractors in an unauthorized manner, one of whom has provided WikiLeaks with portions of the archive. "Year Zero" introduces the scope and direction of the CIA's global covert hacking program, its malware arsenal and dozens of "zero day" weaponized exploits against a wide range of U.S. and European company products, include Apple's iPhone, Google's Android and Microsoft's Windows and even Samsung TVs, which are turned into covert microphones.

## ZOMBIE SPIDER

On April 7, 2017, Pytor Levashov — who predominantly used the alias Severa or Peter Severa and whom Falcon Intelligence tracks as ZOMBIE SPIDER — was arrested in an international law enforcement operation led by the FBI. ZOMBIE SPIDER’s specialty was large-scale spam distribution, a fundamental component of cybercrime operations. Levashov was the primary threat actor behind a botnet known as Kelihos and its predecessors, Waledac and Storm. In addition to Levashov’s arrest, there was a technical operation conducted by Falcon Intelligence to seize control of the Kelihos botnet.

## ViceLeaker

In May 2018, we discovered a campaign targeting dozens of mobile Android devices belonging to Israeli citizens. Kaspersky spyware sensors caught the signal of an attack from the device of one of the victims; and a hash of the APK involved (Android application) was tagged in our sample feed for inspection. Once we looked into the file, we quickly found out that the inner-workings of the APK included a malicious payload, embedded in the original code of the application. This was an original spyware program, designed to exfiltrate almost all accessible information. During the course of our research, we noticed that we were not the only ones to have found the operation. Researchers from Bitdefender also released an analysis of one of the samples in a blogpost. Although something had already been published, we decided to do something different with the data we acquired. The following month, we released a private report on our Threat Intelligence Portal to alert our clients about this newly discovered operation and began writing YARA rules in order to catch more samples. We decided to call the operation “ViceLeaker”, because of strings and variables in its code.

## SWEED

Cisco Talos recently identified a large number of ongoing malware distribution campaigns linked to a threat actor we're calling "SWEED," including such notable malware as Formbook, Lokibot and Agent Tesla. Based on our research, SWEED — which has been operating since at least 2017 — primarily targets their victims with stealers and remote access trojans. SWEED remains consistent across most of their campaigns in their use of spear-phishing emails with malicious attachments. While these campaigns have featured a myriad of different types of malicious documents, the actor primarily tries to infect its victims with a packed version of Agent Tesla — an information stealer that's been around since at least 2014. The version of Agent Tesla that SWEED is using differs slightly from what we've seen in the past in the way that it is packed, as well as how it infects the system. In this post, we'll run down each campaign we're able to connect to SWEED, and talk about some of the actor's tactics, techniques and procedures (TTPs).

## TA428

Proofpoint researchers have identified a targeted APT campaign that utilized malicious RTF documents to deliver custom malware to unsuspecting victims. We dubbed this campaign "Operation LagTime IT" based on entities that were targeted and the distinctive domains registered to C&C IP infrastructure. Beginning in early 2019, these threat actors targeted a number of government agencies in East Asia overseeing government information technology, domestic affairs, foreign affairs, economic development, and political processes. We determined that the infection vector observed in this campaign was spear phishing, with emails originating from both free email accounts and compromised user accounts. Attackers relied on Microsoft Equation Editor exploit CVE-2018-0798 to deliver a custom malware that Proofpoint researchers have dubbed Cotx RAT. Additionally, this APT group utilizes Poison Ivy payloads that share overlapping command and control (C&C) infrastructure with the newly identified Cotx campaigns. Based on infrastructure overlaps, post-exploitation techniques, and historic TTPs utilized in this operation, Proofpoint analysts attribute this activity to the Chinese APT group tracked internally as TA428. Researchers believe that this activity has an operational and tactical resemblance to the Maudi Surveillance Operation which was previously reported in 2013.

The tag is: *misp-galaxy:threat-actor="TA428"*

TA428 is also known as:

- Temp.Hex

- Vicious Panda

## SectorJ04

SectorJ04 is a Russian-based cybercrime group that began operating about five years ago and conducted hacking activities for financial profit using malware such as banking trojans and ransomware against national and industrial sectors located across Europe, North America and West Africa. In 2019, the SectorJ04 group expanded its hacking activities to cover various industrial sectors located across Southeast Asia and East Asia, and is changing the pattern of their attacks from targeted attacks to searching for random victims. This report includes details related to the major hacking targets of the SectorJ04 group in 2019, how those targets were hacked, characteristics of their hacking activities this year and recent cases of the SectorJ04 group's hacking.

The tag is: *misp-galaxy:threat-actor="SectorJ04"*

## Tortoishell

A previously undocumented attack group is using both custom and off-the-shelf malware to target IT providers in Saudi Arabia in what appear to be supply chain attacks with the end goal of compromising the IT providers' customers. The group, which we are calling Tortoishell, has been active since at least July 2018. Symantec has identified a total of 11 organizations hit by the group, the majority of which are based in Saudi Arabia. In at least two organizations, evidence suggests that the attackers gained domain admin-level access.

The tag is: *misp-galaxy:threat-actor="Tortoishell"*

Tortoishell is also known as:

- IMPERIAL KITTEN

## POISON CARP

Between November 2018 and May 2019, senior members of Tibetan groups received malicious links in individually tailored WhatsApp text exchanges with operators posing as NGO workers, journalists, and other fake personas. The links led to code designed to exploit web browser vulnerabilities to install spyware on iOS and Android devices, and in some cases to OAuth phishing pages. This campaign was carried out by what appears to be a single operator that we call POISON CARP.

The tag is: *misp-galaxy:threat-actor="POISON CARP"*

POISON CARP is also known as:

- Evil Eye

## TA410

Early in August 2019, Proofpoint described what appeared to be state-sponsored activity targeting the US utilities sector with malware that we dubbed “Lookback”. Between August 21 and August 29, 2019, several spear phishing emails were identified targeting additional US companies in the utilities sector. The phishing emails originated from what appears to be an actor-controlled domain: globalenergycertification[.]net. This domain, like those used in previous campaigns, impersonated a licensing body related to the utilities sector. In this case, it masqueraded as the legitimate domain for Global Energy Certification (“GEC”). The emails include a GEC examination-themed body and a malicious Microsoft Word attachment that uses macros to install and run LookBack. (Note confusion between Malware, Campaign and ThreatActor)

The tag is: *misp-galaxy:threat-actor="TA410"*

## Calypso group

For the first time, the activity of the Calypso group was detected by specialists of PT Expert Security Center in March 2019, during the work to detect cyber threats. As a result, many malware samples of this group were obtained, affected organizations and control servers of intruders were identified. According to our data, the group has been active since at least September 2016. The main goal of the group is to steal confidential data, the main victims are government agencies from Brazil, India, Kazakhstan, Russia, Thailand, Turkey. Our data suggest that the group has Asian roots. Description translated from Russian.

The tag is: `misp-galaxy:threat-actor="Calypso group"`

## TA2101

Proofpoint researchers detected campaigns from a relatively new actor, tracked internally as TA2101, targeting German companies and organizations to deliver and install backdoor malware. The actor initiated their campaigns impersonating the Bundeszentralamt für Steuern, the German Federal Ministry of Finance, with lookalike domains, verbiage, and stolen branding in the emails.

For their campaigns in Germany, the actor chose Cobalt Strike, a commercially licensed software tool that is generally used for penetration testing and emulates the type of backdoor framework used by Metasploit, a similar penetration testing tool. Proofpoint researchers have also observed this actor distributing Maze ransomware, employing similar social engineering techniques to those it uses for Cobalt Strike, while also targeting organizations in Italy and impersonating the Agenzia Delle Entrate, the Italian Revenue Agency. We have also recently observed the actor targeting organizations in the United States using the IcedID banking Trojan while impersonating the United States Postal Service (USPS).

The tag is: *misp-galaxy:threat-actor="TA2101"*

TA2101 is also known as:

- Maze Team
- TWISTED SPIDER
- GOLD VILLAGE

## APT-C-34

As reported by ZDNet, Chinese cyber-security vendor Qihoo 360 published a report on 2019-11-29 exposing an extensive hacking operation targeting the country of Kazakhstan. Targets included individuals and organizations involving all walks of life, such as government agencies, military personnel, foreign diplomats, researchers, journalists, private companies, the educational sector, religious figures, government dissidents, and foreign diplomats alike. The campaign, Qihoo 360 said, was broad, and appears to have been carried by a threat actor with considerable resources, and one who had the ability to develop their private hacking tools, buy expensive spyware off the surveillance market, and even invest in radio communications interception hardware.

The tag is: *misp-galaxy:threat-actor="APT-C-34"*

APT-C-34 is also known as:

- Golden Falcon

Table 6493. Table References

<a href="https://www.systemtek.co.uk/2018/07/luoxk-malware-exploiting-cve-2018-2893/">https://www.systemtek.co.uk/2018/07/luoxk-malware-exploiting-cve-2018-2893/</a>

## BRONZE PRESIDENT

The activities of some non-governmental organizations (NGOs) challenge governments on politically sensitive issues such as social, humanitarian, and environmental policies. As a result, these organizations are often exposed to increased government-directed threats aimed at monitoring their activities, discrediting their work, or stealing their intellectual property. BRONZE PRESIDENT is a likely People's Republic of China (PRC)-based targeted cyberespionage group that uses both proprietary and publicly available tools to target NGO networks. Secureworks® Counter Threat Unit (CTU) researchers have observed BRONZE PRESIDENT activity since mid-2018 but identified artifacts suggesting that the threat actors may have been conducting network intrusions as far back as 2014.

The tag is: *misp-galaxy:threat-actor="BRONZE PRESIDENT"*

# Operation Wocao

Operation Wocao (窝草, “Wō cǎo”, used as “shit” or “damn”) is the name that Fox-IT uses to describe the hacking activities of a Chinese based hacking group. This report details the profile of a publicly underreported threat actor that Fox-IT has dealt with over the past two years. Fox-IT assesses with high confidence that the actor is a Chinese group and that they are likely working to support the interests of the Chinese government and are tasked with obtaining information for espionage purposes. With medium confidence, Fox-IT assesses that the tools, techniques and procedures are those of the actor referred to as APT20 by industry partners. We have identified victims of this actor in more than 10 countries, in government entities, managed service providers and across a wide variety of industries, including Energy, Health Care and High-Tech.

The tag is: *misp-galaxy:threat-actor="Operation Wocao"*

## ANTHROPOID SPIDER

Publicly known as 'EmpireMonkey', ANTHROPOID SPIDER conducted phishing campaigns in February and March 2019, spoofing French, Norwegian and Belizean financial regulators and institutions. These campaigns used macro-enabled Microsoft documents to deliver the PowerShell Empire post-exploitation framework. ANTHROPOID SPIDER likely enabled a breach that allegedly

involved fraudulent transfers over the SWIFT network.

The tag is: *misp-galaxy:threat-actor="ANTHROPOID SPIDER"*

ANTHROPOID SPIDER is also known as:

- Empire Monkey
- CobaltGoblin

## DOPPEL SPIDER

In June 2019, CrowdStrike Intelligence observed a source code fork of BitPaymer and began tracking the new ransomware strain as DoppelPaymer. Further technical analysis revealed an increasing divergence between two versions of Dridex, with the new version dubbed DoppelDridex. Based on this evidence, CrowdStrike Intelligence assessed with high confidence that a new group split off from INDRIK SPIDER to form the adversary DOPPEL SPIDER. Following DOPPEL SPIDER's inception, CrowdStrike Intelligence observed multiple BGH incidents attributed to the group, with the largest known ransomware demand being 250 BTC. Other demands were not nearly as high, suggesting that the group conducts network reconnaissance to determine the value of the victim organization.

The tag is: *misp-galaxy:threat-actor="DOPPEL SPIDER"*

DOPPEL SPIDER is also known as:

- GOLD HERON

## VENOM SPIDER

VENOM SPIDER is the developer of a large toolset that includes SKID, VenomKit and Taurus Loader. Under the moniker 'badbullzvenom', the adversary has been an active member of Russian underground forums since at least 2012, specializing in the identification of vulnerabilities and the subsequent development of tools for exploitation, as well as for gaining and maintaining access to victim machines and carding services. Recent advertisements for the malware indicate that VENOM SPIDER limits the sale and use of its tools, selling modules only to trusted affiliates. This preference can be seen in the fact that adversaries observed using the tools include the targeted criminal adversary COBALT SPIDER and BGH adversaries WIZARD SPIDER and PINCHY SPIDER.

The tag is: *misp-galaxy:threat-actor="VENOM SPIDER"*

VENOM SPIDER is also known as:

- badbullzvenom

## Operation Shadow Force

Operation Shadow Force is a group of malware that is representative of Shadow Force and Wgdrop from 2013 to 2020, and is a group activity that attacks Korean companies and organizations. The group's first confirmed attack was in March 2013, but considering the date of malware creation, it is likely to have been active before 2012. Since the malware used mainly by them is Shadow Force, it was named Operation Shadow Force, and it has not been confirmed whether the attacker is associated with a known group.

The tag is: *misp-galaxy:threat-actor="Operation Shadow Force"*

## Nazar

This actor was identified by Juan Andres Guerrero-Saade from the SIG37 cluster as published in the ShadowBrokers' 'Lost in Translation' leak. Earliest known sighting potentially dates back to as far as 2008 with a confirmed center of activity around 2010-2013. The actor name is derived from a PDB debug string fragment: 'khzer'. Victimology indicates targeting of Iran, assessed with low confidence based on VT file submission locations. Nazar employs a modular toolkit where a main dropper silently registers multiple DLLs as OLE controls in the Windows registry. Functionality includes keylogging, sound and screen grabbing, as well as traffic capture using the MicroOlap Packet Sniffer library.

The tag is: *misp-galaxy:threat-actor="Nazar"*

Nazar is also known as:

- SIG37

Table 6515. Table References

Links
<a href="https://www.epicturla.com/blog/the-lost-nazar">https://www.epicturla.com/blog/the-lost-nazar</a>

## Higaisa

The organization often uses important North Korean time nodes such as holidays and North Korea to conduct fishing activities. The bait includes New Year blessings, Lantern blessings, North Korean celebrations, and important news, overseas personnel contact lists and so on. In addition, the attack organization also has the attack capability of the mobile terminal. The targets of the attack also include diplomatic entities related to North Korea (such as embassy officials in various places), government officials, human rights organizations, North Korean residents abroad, and traders. The victim countries currently monitored include China, North Korea, Japan, Nepal, Singapore, Russia, Poland, Switzerland, etc.

The tag is: *misp-galaxy:threat-actor="Higaisa"*

## COBALT JUNO

COBALT JUNO has operated since at least 2013 and focused on targets located in the Middle East including Iran, Jordan, Egypt & Lebanon. COBALT JUNO custom spyware families SABER1 and SABER2, include surveillance functionality and masquerade as legitimate software utilities such as Adobe Updater, StickyNote and ASKDownloader. CTU researchers assess with moderate confidence that COBALT JUNO operated the ZooPark Android spyware since at least mid-2015. ZooPark was publicly exposed in 2018 in both vendor reporting and a high profile leak of C2 server data. COBALT JUNO is linked to a private security company in Iran and outsources aspects of tool development work to commercial software developers. CTU researchers have observed the group using strategic web compromises to deliver malware. CTU researchers' discovery of new C2 domains in 2019 suggest the group is still actively performing operations.

The tag is: *misp-galaxy:threat-actor="COBALT JUNO"*

COBALT JUNO is also known as:

- APT-C-38 (QiAnXin)
- SABER LION
- TG-2884 (SCWX CTU)

*Table 6517. Table References*

Links
<a href="https://www.secureworks.com/research/threat-profiles/cobalt-juno">https://www.secureworks.com/research/threat-profiles/cobalt-juno</a>

## COBALT KATANA

COBALT KATANA has been active since at least March 2018, and it focuses many of its operations on organizations based in or associated with Kuwait. The group has targeted government, logistics, and shipping organizations. The threat actors gain initial access to targets using DNS hijacking, strategic web compromise with SMB forced authentication, and password brute force attacks. COBALT KATANA operates a custom platform referred to as the Sakabota Framework, also referred to as Sakabota Core, with a complimentary set of modular backdoors and accessory tools including Gon, Hisoka, Hisoka Netero, Killua, Diezen, and Eye. The group has implemented DNS tunnelling in its malware and malicious scripts and also operates the HyphenShell web shell to strengthen post-intrusion access. CTU researchers assess with moderate confidence that COBALT KATANA operates on behalf of Iran, and elements of its operations such as overlapping infrastructure, use of DNS hijacking, implementation of DNS-based C2 channels in malware and web shell security mechanisms suggest connections to COBALT GYPSY and COBALT EDGEWATER.

The tag is: *misp-galaxy:threat-actor="COBALT KATANA"*

COBALT KATANA is also known as:

- Hive0081 (IBM)
- SectorD01 (NHSC)
- xHunt campaign (Palo Alto)

## Dark Basin

Dark Basin is a hack-for-hire group that has targeted thousands of individuals and hundreds of institutions on six continents. Targets include advocacy groups and journalists, elected and senior government officials, hedge funds, and multiple industries. Dark Basin extensively targeted American nonprofits, including organisations working on a campaign called #ExxonKnew, which asserted that ExxonMobil hid information about climate change for decades. We also identify Dark Basin as the group behind the phishing of organizations working on net neutrality advocacy, previously reported by the Electronic Frontier Foundation. We link Dark Basin with high confidence to an Indian company, BellTroX InfoTech Services, and related entities

The tag is: *misp-galaxy:threat-actor="Dark Basin"*

Table 6519. Table References

## TA413

Proofpoint researchers observed a phishing campaign impersonating the World Health Organization's (WHO) guidance on COVID-19 critical preparedness to deliver a new malware family that researchers have dubbed Sepulcher. This campaign targeted European diplomatic and legislative bodies, non-profit policy research organizations, and global organizations dealing with economic affairs. Additionally, a sender email identified in this campaign has been linked to historic Chinese APT targeting of the international Tibetan community using payloads linked to LuckyCat malware. Subsequently, a phishing campaign from July 2020 targeting Tibetan dissidents was identified delivering the same strain of Sepulcher malware. Operator email accounts identified in this campaign have been publicly linked to historic Chinese APT campaigns targeting the Tibetan community delivering ExileRAT malware. Based on the use of publicly known sender addresses associated with Tibetan dissident targeting and the delivery of Sepulcher malware payloads, Proofpoint researchers have attributed both campaigns to the APT actor TA413, which has previously been documented in association with ExileRAT. The usage of publicly known Tibetan-themed sender accounts to deliver Sepulcher malware demonstrates a short-term realignment of TA413's targets of interest. While best known for their campaigns against the Tibetan diaspora, this APT group associated with the Chinese state interest prioritized intelligence collection around Western economies reeling from COVID-19 in March 2020 before resuming more conventional targeting later this year.

The tag is: *misp-galaxy:threat-actor="TA413"*

## Evilnum

ESET has analyzed the operations of Evilnum, the APT group behind the Evilnum malware previously seen in attacks against financial technology companies. While said malware has been seen in the wild since at least 2018 and documented previously, little has been published about the group behind it and how it operates. The group's targets remain fintech companies, but its toolset and infrastructure have evolved and now consist of a mix of custom, homemade malware combined with tools purchased from Golden Chickens, a Malware-as-a-Service (MaaS) provider whose infamous customers include FIN6 and Cobalt Group.

The tag is: *misp-galaxy:threat-actor="Evilnum"*

Evilnum is also known as:

- DeathStalker

## Fox Kitten

PIONEER KITTEN is an Iran-based adversary that has been active since at least 2017 and has a suspected nexus to the Iranian government. This adversary appears to be primarily focused on gaining and maintaining access to entities possessing sensitive information of likely intelligence interest to the Iranian government. According to DRAGOS, they also targeted ICS-related entities using known VPN vulnerabilities. They are widely known to use open source penetration testing tools for reconnaissance and to establish encrypted communications.

The tag is: *misp-galaxy:threat-actor="Fox Kitten"*

Fox Kitten is also known as:

- PIONEER KITTEN
- PARISITE
- UNC757

## TRACER KITTEN

In April 2020, Crowstrike Falcon OverWatch discovered Iran-based adversary TRACER KITTEN conducting malicious interactive activity against multiple hosts at a telecommunications company in the Europe, Middle East and Africa (EMEA) region. The actor was found operating under valid user accounts, using custom backdoors in combination with SSH tunnels for C2. The adversary

leveraged their foothold to conduct a variety of reconnaissance activities, undertake credential harvesting and prepare for data exfiltration.

The tag is: *misp-galaxy:threat-actor="TRACER KITTEN"*

## FIN11

FIN11 is a well-established financial crime group that has recently focused its operations on ransomware and extortion. The group has been active since 2017 and has been tracked under UNC902 and later on as TEMP.Warlok. In some ways, FIN11 is reminiscent of APT1; they are notable not for their sophistication, but for their sheer volume of activity.(FireEye) Mandiant has also responded to numerous FIN11 intrusions, but we've only observed the group successfully monetize access in few instances. This could suggest that the actors cast a wide net during their phishing operations, then choose which victims to further exploit based on characteristics such as sector, geolocation or perceived security posture. Recently, FIN11 has deployed CLOP ransomware and threatened to publish exfiltrated data to pressure victims into paying ransom demands. The group's shifting monetization methods—from point-of-sale (POS) malware in 2018, to ransomware in 2019, and hybrid extortion in 2020—is part of a larger trend in which criminal actors have increasingly focused on post-compromise ransomware deployment and data theft extortion. Notably, FIN11 includes a subset of the activity security researchers call TA505, Graceful Spider, Gold Evergreen, but we do not attribute TA505's early operations to FIN11 and caution against using the names interchangeably. Attribution of both historic TA505 activity and more recent FIN11 activity is complicated by the actors' use of criminal service providers. Like most financially motivated actors, FIN11 doesn't operate in a vacuum. We believe that the group has used services that provide anonymous domain registration, bulletproof hosting, code signing certificates, and private or semi-private malware. Outsourcing work to these criminal service providers likely enables FIN11 to increase the scale and sophistication of their operations.

The tag is: *misp-galaxy:threat-actor="FIN11"*

FIN11 is also known as:

- TEMP.Warlock
- UNC902
- GRACEFUL SPIDER

## UNC1878

UNC1878 is a financially motivated threat actor that monetizes network access via the deployment of RYUK ransomware. Earlier this year, Mandiant published a blog on a fast-moving adversary deploying RYUK ransomware, UNC1878. Shortly after its release, there was a significant decrease in observed UNC1878 intrusions and RYUK activity overall almost completely vanishing over the summer. But beginning in early fall, Mandiant has seen a resurgence of RYUK along with TTP overlaps indicating that UNC1878 has returned from the grave and resumed their operations.

## Operation Skeleton Key

Throughout 2019, multiple companies in the Taiwan high-tech ecosystem were victims of an advanced persistent threat (APT) attack. Due to these APT attacks having similar behavior profiles (similar adversarial techniques, tactics, and procedures or TTP) with each other and previously documented cyberattacks, CyCraft assess with high confidence these new attacks were conducted by the same foreign threat actor. During their investigation, they dubbed this threat actor Chimera. “Chimera” stands for the synthesis of hacker tools that they’ve seen the group use, such as the skeleton key malware that contained code extracted from both Dumpert and Mimikatz — hence Chimera. Their operation — the entirety of the new attacks utilizing the Skeleton Key attack (described below) from late 2018 to late 2019, CyCraft have dubbed Operation Skeleton Key.

## UNC2452

Reporting regarding activity related to the SolarWinds supply chain injection has grown quickly since initial disclosure on 13 December 2020. A significant amount of press reporting has focused on the identification of the actor(s) involved, victim organizations, possible campaign timeline, and potential impact. The US Government and cyber community have also provided detailed information on how the campaign was likely conducted and some of the malware used. MITRE's ATT&CK team — with the assistance of contributors — has been mapping techniques used by the actor group, referred to as UNC2452/Dark Halo by FireEye and Volexity respectively, as well as SUNBURST and TEARDROP malware.

The tag is: `misp-galaxy:threat-actor="UNC2452"`

UNC2452 is also known as:

- DarkHalo
- StellarParticle
- NOBELIUM

[View relationships graph](#)

UNC2452 has relationships with:

# TeamTNT

In early February, 2021 TeamTNT launched a new campaign against Docker and Kubernetes environments. Using a collection of container images that are hosted in Docker Hub, the attackers are targeting misconfigured docker daemons, Kubeflow dashboards, and Weave Scope, exploiting these environments in order to steal cloud credentials, open backdoors, mine cryptocurrency, and launch a worm that is looking for the next victim. They're linked to the First Crypto-Mining Worm to Steal AWS Credentials and Hildegard Cryptojacking malware. TeamTNT is a relatively recent addition to a growing number of threats targeting the cloud. While they employ some of the same tactics as similar groups, TeamTNT stands out with their social media presence and penchant for self-promotion. Tweets from the TeamTNT's account are in both English and German although it is unknown if they are located in Germany.

# HAFNIUM

HAFNIUM primarily targets entities in the United States across a number of industry sectors, including infectious disease researchers, law firms, higher education institutions, defense contractors, policy think tanks, and NGOs. Microsoft Threat Intelligence Center (MSTIC) attributes this campaign with high confidence to HAFNIUM, a group assessed to be state-sponsored and operating out of China, based on observed victimology, tactics and procedures. HAFNIUM has previously compromised victims by exploiting vulnerabilities in internet-facing servers, and has used legitimate open-source frameworks, like Covenant, for command and control. Once they've gained access to a victim network, HAFNIUM typically exfiltrates data to file sharing sites like MEGA. In campaigns unrelated to these vulnerabilities, Microsoft has observed HAFNIUM interacting with victim Office 365 tenants. While they are often unsuccessful in compromising customer accounts, this reconnaissance activity helps the adversary identify more details about

their targets' environments. HAFNIUM operates primarily from leased virtual private servers (VPS) in the United States.

The tag is: `misp-galaxy:threat-actor="HAFNIUM"`

# GOLD DUPONT

GOLD DUPONT is a financially motivated cybercriminal threat group that specializes in post-intrusion ransomware attacks using 777 (aka Defray777 or RansomExx) malware. Active since November 2018, GOLD DUPONT establishes initial access into victim networks using stolen credentials to remote access services like virtual desktop infrastructure (VDI) or virtual private networks (VPN). From October 2019 to early 2020 the group used GOLD BLACKBURN's TrickBot malware as an initial access vector (IAV) during some intrusions. Since July 2020, the group has also used GOLD SWATHMORE's IcedID (Bokbot) malware as an IAV in some intrusions.

The tag is: *misp-galaxy:threat-actor="GOLD DUPONT"*

GOLD DUPONT is also known as:

- SPRITE SPIDER

## CIRCUS SPIDER

According to Crowdstrike, the NetWalker ransomware is being developed and maintained by a Russian-speaking actor designated as CIRCUS SPIDER. Initially discovered in September 2019 and having a compilation timestamp dating back to 28 August 2019, NetWalker has been found to be used in Big Game Hunting (BGH)-style operations while also being distributed via spam. CIRCUS SPIDER is advertising NetWalker as being a closed-affiliate program, and verifies applicants before they are being accepted as an affiliate. The requirements range from providing proof of previous revenue in similar affiliates programs, experience in the field and what type of industry the applicant is targeting.

The tag is: *misp-galaxy:threat-actor="CIRCUS SPIDER"*

## GOLD EVERGREEN

GOLD EVERGREEN was a financially motivated cybercriminal threat group that operated the Gameover Zeus (aka Mapp, P2P Zeus) botnet until June 2014. It encompasses an expansive and long running criminal conspiracy operated by a confederation of individuals calling themselves The Business Club from the mid 2000s until 2014. GOLD EVERGREEN's technical operation was facilitated primarily through botnets using the Zeus, JabberZeus, and eventually Gameover Zeus malware families. These malware families were designed and maintained by a Russian national Evgeniy Bogachev (aka 'slavik') who was indicted by the U.S. DOJ in 2014 and remains a fugitive.

## BOSON SPIDER

BOSON SPIDER is a cyber criminal group, which was first identified in 2015, recently and inexplicably went dark in the spring of 2016, appears to be a tightly knit group operating out of Eastern Europe. They have used a variety of distribution mechanisms such as the infamous (and now defunct) angler exploit kit, and obfuscated JavaScript to reduce the detection by antivirus solutions.

The tag is: *misp-galaxy:threat-actor="BOSON SPIDER"*

<a href="https://www.crowdstrike.com/blog/ecrime-ecosystem/">https://www.crowdstrike.com/blog/ecrime-ecosystem/</a>

## OVERLORD SPIDER

OVERLORD SPIDER, aka The Dark Overlord. Similar to ransomware operators today, OVERLORD SPIDER likely purchased RDP access to compromised servers on underground forums in order to exfiltrate data from corporate networks. The actor was known to attempt to “sell back” the data to the respective victims, threatening to sell the data to interested parties should the victim refuse to pay. There was at least one identified instance of OVERLORD SPIDER successfully selling victim data on an underground market.

The tag is: *misp-galaxy:threat-actor="OVERLORD SPIDER"*

## OUTLAW SPIDER

On May 7, 2019, Mayor Bernard “Jack” Young confirmed that the network for the U.S. City of Baltimore (CoB) was infected with ransomware, which was announced via Twitter<sup>1</sup>. This infection was later confirmed to be conducted by OUTLAW SPIDER, which is the actor behind the RobbinHood ransomware. The actor demanded to be paid 3 BTC (approximately \$17,600 USD at the time) per infected system, or 13 BTC (approximately \$76,500 USD at the time) for all infected systems to recover the city’s files.

The tag is: *misp-galaxy:threat-actor="OUTLAW SPIDER"*

## GOLD BURLAP

GOLD BURLAP is a group of financially motivated criminals responsible for the development of the Pysa ransomware, also referred to as Mespinoza. Pysa is a cross-platform ransomware with known versions written in C++ and Python. As of December 2020, approximately 50 organizations had reportedly been targeted in Pysa ransomware attacks. The operators leverage 'name and shame' tactics to apply additional pressure to victims. As of January 2021, CTU researchers had found no Pysa advertisements on underground forums, which likely indicates that it is not operated as ransomware as a service (RaaS).

The tag is: *misp-galaxy:threat-actor="GOLD BURLAP"*

Table 6551. Table References

Links
<a href="http://www.secureworks.com/research/threat-profiles/gold-burlap">http://www.secureworks.com/research/threat-profiles/gold-burlap</a>

## GOLD CABIN

GOLD CABIN is a financially motivated cybercriminal threat group operating a malware distribution service on behalf of numerous customers since 2018. GOLD CABIN uses malicious documents, often contained in password-protected archives, delivered through email to download and execute payloads. The second-stage payloads are most frequently Gozi ISFB (Ursnif) or IcedID (Bokbot), sometimes using intermediary malware like Valak. GOLD CABIN infrastructure relies on artificial appearing and frequently changing URLs created with a domain generation algorithm (DGA). The URLs host a PHP object that returns the malware as a DLL file.

The tag is: *misp-galaxy:threat-actor="GOLD CABIN"*

GOLD CABIN is also known as:

- Shakthak
- TA551

Table 6552. Table References

Links
<a href="https://www.secureworks.com/research/threat-profiles/gold-cabin">https://www.secureworks.com/research/threat-profiles/gold-cabin</a>

## GOLD FAIRFAX

GOLD FAIRFAX is a financially motivated cybercriminal threat group responsible for the creation, distribution, and operation of the Ramnit botnet. Ramnit, the phonetic spelling of RMNet, the internal name of the core module, began operation in April 2010 and became widespread in July 2010. A particularly virulent file-infecting component of early Ramnit variants that spreads by modifying executables and HTML files has resulted in the continued prevalence of those early variants. Currently, Ramnit remains an actively maintained and distributed threat. The intent of Ramnit is to intercept and manipulate online financial transactions through modification of web browser behavior ('man-in-the-browser').

The tag is: *misp-galaxy:threat-actor="GOLD FAIRFAX"*

Table 6553. Table References

Links
<a href="http://www.secureworks.com/research/threat-profiles/gold-fairfax">http://www.secureworks.com/research/threat-profiles/gold-fairfax</a>

## GOLD FLANDERS

GOLD FLANDERS is a financially motivated group responsible for distributed denial of service (DDOS) attacks linked to extortion emails demanding between 5 and 30 bitcoins. The attacks consist mostly of fragmented UDP packets (DNS and NTP reflection) as well as other traffic that can vary per victim. The arrival of the extortion email is timed to coincide with a DDOS attack consisting of traffic between 20 Gbps and 200 Gbps and 12-15 million packets per second, lasting between 20 and 70 minutes targeted at a particular Autonomous System Number (ASN) or group of IP addresses. In some cases victim organisations have replied to these extortion emails and received personal replies from GOLD FLANDERS operators within 20 minutes.

The tag is: *misp-galaxy:threat-actor="GOLD FLANDERS"*

Table 6554. Table References

Links
<a href="http://www.secureworks.com/research/threat-profiles/gold-flanders">http://www.secureworks.com/research/threat-profiles/gold-flanders</a>

## GOLD GALLEON

GOLD GALLEON is a financially motivated cybercriminal threat group comprised of at least 20 criminal associates that collectively carry out business email compromise (BEC) and spoofing (BES) campaigns. The group appears to specifically target maritime organizations and their customers. CTU researchers have observed GOLD GALLEON targeting firms in South Korea, Japan, Singapore, Philippines, Norway, U.S., Egypt, Saudi Arabia, and Colombia. The threat actors leverage tools, tactics, and procedures that are similar to those used by other BEC/BES groups CTU researchers have previously investigated, such as GOLD SKYLINE. The groups have used the same caliber of publicly available malware (inexpensive and commodity remote access trojans), crypters, and email lures.

The tag is: *misp-galaxy:threat-actor="GOLD GALLEON"*

Table 6555. Table References

<a href="http://www.secureworks.com/research/threat-profiles/gold-galleon">http://www.secureworks.com/research/threat-profiles/gold-galleon</a>

## GOLD GARDEN

GOLD GARDEN was a financially motivated cybercriminal threat group that authored and operated the GandCrab ransomware from January 2018 through May 2019. GandCrab was operated as a ransomware-as-a-service operation whereby numerous affiliates distributed the malware and split ransom payments with the core operators. GOLD GARDEN maintained exclusive control of the development of GandCrab and associated command and control (C2) infrastructure. Individual affiliates, of which there were frequently more than a dozen in operation simultaneously, coordinated the distribution of GandCrab through spam emails, web exploit kits, pay-per-install botnets, and scan-and-exploit style attacks. On May 31, 2019 the operators announced they have halted operations with no intent to resume for unknown reasons. In April 2019 the operators of GOLD GARDEN transferred the source code of GandCrab to GOLD SOUTHFIELD who used it as the foundation of the REvil ransomware operation. GOLD SOUTHFIELD operates a similar affiliate program comprised largely of former GandCrab users and other groups recruited from underground forums.

The tag is: *misp-galaxy:threat-actor="GOLD GARDEN"*

Table 6556. Table References

Links
<a href="http://www.secureworks.com/research/threat-profiles/gold-garden">http://www.secureworks.com/research/threat-profiles/gold-garden</a>

## GOLD MANSARD

GOLD MANSARD is a financially motivated cybercriminal threat group that operated the Nemty

ransomware from August 2019. The threat actor behind Nemty is known on Russian underground forums as 'jsworm'. Nemty was operated as a ransomware as a service (RaaS) affiliate program and featured a 'name and shame' website where exfiltrated victim data was leaked. In April 2020, jsworm appeared to acquire new partners and retired the Nemty ransomware. This was followed by the introduction of Nefilim ransomware, which does not operate as an affiliate model. Nefilim has been used in post-intrusion ransomware attacks against organizations in logistics, telecommunications, energy and other sectors.

The tag is: *misp-galaxy:threat-actor="GOLD MANSARD"*

Table 6557. Table References

Links
<a href="http://www.secureworks.com/research/threat-profiles/gold-mansard">http://www.secureworks.com/research/threat-profiles/gold-mansard</a>

## GOLD NORTHFIELD

Operational since at least October 2020, GOLD NORTHFIELD is a financially motivated cybercriminal threat group that leverages GOLD SOUTHFIELD's REvil ransomware in their attacks. To do this, the threat actors replace the configuration of the REvil ransomware binary with their own in an effort to repurpose the ransomware for their operations. GOLD NORTHFIELD has given this modified REvil ransomware variant the name 'LV ransomware'.

The tag is: *misp-galaxy:threat-actor="GOLD NORTHFIELD"*

Table 6558. Table References

## GOLD RIVERVIEW

GOLD RIVERVIEW was a financially motivated cybercriminal group that facilitated the distribution of malware- and scam-laden spam email on behalf of its customers. This threat group authored and sold the Necurs rootkit beginning in early 2014, including to GOLD EVERGREEN who integrated it into Gameover Zeus. GOLD RIVERVIEW also operated a global botnet that was colloquially known as Necurs (CraP2P) and was a major source of spam email from 2016 through 2018. Necurs distributed malware such as GOLD DRAKE's Dridex (Bugat v5), GOLD BLACKBURN's TrickBot, and other families like Locky and FlawedAmmy. Necurs also distributed a large volume of email pushing securities 'pump and dump' scams, rogue pharmacies, and fraudulent dating sites. On March 4, 2019 all three active segments of the Necurs botnet ceased operation and have not since resumed. On March 10, 2020 Microsoft took civil action against GOLD RIVERVIEW and made technical steps that would complicate the threat actors' ability to reconstitute the botnet.

The tag is: *misp-galaxy:threat-actor="GOLD RIVERVIEW"*

Table 6559. Table References

Links
<a href="http://www.secureworks.com/research/threat-profiles/gold-riverview">http://www.secureworks.com/research/threat-profiles/gold-riverview</a>

## GOLD SKYLINE

GOLD SKYLINE is a financially motivated cybercriminal threat group operating from Nigeria engaged in high-value wire fraud facilitated by business email compromise (BEC) and spoofing (BES). Also known as Wire-Wire Group 1 (WWG1), GOLD SKYLINE has been active since at least 2016 and relies heavily on compromised email accounts, social engineering, and increasingly malware to divert inter-organization funds transfers.

The tag is: *misp-galaxy:threat-actor="GOLD SKYLINE"*

Table 6560. Table References

Links
<a href="http://www.secureworks.com/research/threat-profiles/gold-skyline">http://www.secureworks.com/research/threat-profiles/gold-skyline</a>

## GOLD SOUTHFIELD

GOLD SOUTHFIELD is a financially motivated cybercriminal threat group that authors and operates the REvil (aka Sodinokibi) ransomware on behalf of various affiliated threat groups. Operational since April 2019, the group obtained the GandCrab source code from GOLD GARDEN, the operators of GandCrab that voluntarily withdrew their ransomware from underground markets in May 2019. GOLD SOUTHFIELD is responsible for authoring REvil and operating the backend infrastructure used by affiliates (also called partners) to create malware builds and to collect ransom payments from victims. CTU researchers assess with high confidence that GOLD SOUTHFIELD is a former GandCrab affiliate and continues to work with other former GandCrab affiliates.

The tag is: *misp-galaxy:threat-actor="GOLD SOUTHFIELD"*

Table 6561. Table References

<a href="https://www.secureworks.com/blog/revil-the-gandcrab-connection">https://www.secureworks.com/blog/revil-the-gandcrab-connection</a>

## GOLD SYMPHONY

GOLD SYMPHONY is a financially motivated cybercrime group, likely based in Russia, that is responsible for the development and sale on underground forums of the Buer Loader malware. First discovered around August 2019, Buer Loader is offered as a malware-as-a-service (MasS) and

has been advertised by a threat actor using the handle 'memeos'. Customers include GOLD BLACKBURN, the operators of the TrickBot malware. In addition to TrickBot, Buer Loader has been reported to download Cobalt Strike and other tools for use in post-intrusion ransomware attacks.

The tag is: *misp-galaxy:threat-actor="GOLD SYMPHONY"*

Table 6562. Table References

Links
<a href="http://www.secureworks.com/research/threat-profiles/gold-symphony">http://www.secureworks.com/research/threat-profiles/gold-symphony</a>

## GOLD WATERFALL

GOLD WATERFALL is a group of financially motivated cybercriminals responsible for the creation, distribution, and operation of the Darkside ransomware. Active since August 2020, GOLD WATERFALL uses a variety of tactics, techniques, and procedures (TTPs) to infiltrate and move laterally within targeted organizations to deploy Darkside ransomware to its most valuable resources. Among these TTPs are using malicious documents delivered by email to establish a foothold and using stolen credentials to access victims' remote access services. In November 2020, the 'darksupp' persona was observed advertising an affiliate program on several semi-exclusive underground forums, marking GOLD WATERFALL's entry into the ransomware-as-a-service (RaaS) landscape.

The tag is: *misp-galaxy:threat-actor="GOLD WATERFALL"*

## GOLD WINTER

GOLD WINTER are a financially motivated group, likely based in Russia, who operate the Hades ransomware. Hades activity was first identified in December 2020 and its lack of presence on underground forums and marketplaces leads CTU researchers to conclude that it is not operated under a ransomware as a service affiliate model. GOLD WINTER do employ name-and-shame tactics, where data is stolen and used as additional leverage over victims, but rather than a single centralized leak site CTU researchers have observed the group using Tor sites customized for each victim that include a Tox chat ID for communication, which also appears to be unique for each victim.

The tag is: *misp-galaxy:threat-actor="GOLD WINTER"*

## Gelsemium

The Gelsemium group has been active since at least 2014 and was described in the past by a few security companies. Gelsemium's name comes from one possible translation ESET found while reading a report from VenusTech who dubbed the group 000 for the first time. It's the name of a genus of flowering plants belonging to the family Gelsemiaceae, Gelsemium elegans is the species that contains toxic compounds like Gelsemine, Gelsenicine and Gelsevirine, which ESET choses as names for the three components of this malware family.

The tag is: *misp-galaxy:threat-actor="Gelsemium"*

Gelsemium is also known as:

- 000

# FIN13

Since 2017, Mandiant has been tracking FIN13, an industrious and versatile financially motivated threat actor conducting long-term intrusions in Mexico with an activity timeframe stretching back as early as 2016. Although their operations continue through the present day, in many ways FIN13's intrusions are like a time capsule of traditional financial cybercrime from days past. Instead of today's prevalent smash-and-grab ransomware groups, FIN13 takes their time to gather information to perform fraudulent money transfers. Rather than relying heavily on attack frameworks such as Cobalt Strike, the majority of FIN13 intrusions involve heavy use of custom passive backdoors and tools to lurk in environments for the long haul.

The tag is: *misp-galaxy:threat-actor="FIN13"*

*Table 6569. Table References*

Links
<a href="https://www.mandiant.com/resources/fin13-cybercriminal-mexico">https://www.mandiant.com/resources/fin13-cybercriminal-mexico</a>

## SideCopy

The SideCopy APT is a Pakistani threat actor that has been operating since at least 2019, mainly targeting South Asian countries and more specifically India and Afghanistan. Its name comes from its infection chain that tries to mimic that of the SideWinder APT. It has been reported that this actor has similarities with Transparent Tribe (APT36) and possibly is a subdivision of this actor. Cisco Talos and Seqrite have provided comprehensive reports on this actor's activities.

## AQUATIC PANDA

AQUATIC PANDA is a China-based targeted intrusion adversary with a dual mission of intelligence collection and industrial espionage. It has likely operated since at least May 2020. AQUATIC PANDA operations have primarily focused on entities in the telecommunications, technology and government sectors. AQUATIC PANDA relies heavily on Cobalt Strike, and its toolset includes the unique Cobalt Strike downloader tracked as FishMaster. AQUATIC PANDA has also been observed delivering njRAT payloads to targets.

The tag is: *misp-galaxy:threat-actor="AQUATIC PANDA"*

## Antlion

Antlion is a Chinese state-backed advanced persistent threat (APT) group, who has been targeting financial institutions in Taiwan. This persistent campaign has lasted over the course of at least 18 months.

The tag is: *misp-galaxy:threat-actor="Antlion"*

Table 6572. Table References

<a href="https://symantec-enterprise-blogs.security.com/blogs/threat-intelligence/china-apt-antlion-taiwan-financial-attacks">https://symantec-enterprise-blogs.security.com/blogs/threat-intelligence/china-apt-antlion-taiwan-financial-attacks</a>

## TA2541

Persistent cybercrime threat actor targeting aviation, aerospace, transportation, manufacturing, and defense industries for years. This threat actor consistently uses remote access trojans (RATs) that can be used to remotely control compromised machines. This threat actor uses consistent themes related to aviation, transportation, and travel. The threat actor has used similar themes and targeting since 2017.

The tag is: *misp-galaxy:threat-actor="TA2541"*

*Table 6573. Table References*

Links
<a href="https://www.proofpoint.com/us/blog/threat-insight/charting-ta2541s-flight">https://www.proofpoint.com/us/blog/threat-insight/charting-ta2541s-flight</a>

## TA516

This actor typically distributes instances of the SmokeLoader intermediate downloader, which, in turn, downloads additional malware of the actor's choice — often banking Trojans. Figure 3 shows a lure document from a November campaign in which TA516 distributed fake resumes with malicious macros that, if enabled, launch a PowerShell script that downloads SmokeLoader. In this instance, we observed SmokeLoader downloading a Monero coinminer. Since the middle of 2017, TA516 has used similar macro-laden documents as well as malicious JavaScript hosted on Google Drive to distribute both Panda Banker and a coinminer executable via SmokeLoader, often in the same campaigns.

The tag is: *misp-galaxy:threat-actor="TA516"*

## TA547

TA547 is responsible for many other campaigns since at least November 2017. The other campaigns by the actor were often localized to countries such as Australia, Germany, the United Kingdom, and Italy. Delivered malware included ZLoader (a.k.a. Terdot), Gootkit, Ursnif, Corebot, Panda Banker, Atmos, Mazar Bot, and Red Alert Android malware.

The tag is: *misp-galaxy:threat-actor="TA547"*

---

## TA554

Since May 2018, Proofpoint researchers have observed email campaigns using a new downloader called sLoad. sLoad is a PowerShell downloader that most frequently delivers Ramnit banker and includes noteworthy reconnaissance features. The malware gathers information about the infected system including a list of running processes, the presence of Outlook, and the presence of Citrix-related files. sLoad can also take screenshots and check the DNS cache for specific domains (e.g., targeted banks), as well as load external binaries. While initial versions of sLoad appeared in May 2018, we began tracking the campaigns from this actor (internally named TA554) since at least the beginning of 2017.

The tag is: *misp-galaxy:threat-actor="TA554"*

TA554 is also known as:

- TH-163

---

## TA555

Beginning in May 2018, Proofpoint researchers observed a previously undocumented downloader dubbed AdvisorsBot appearing in malicious email campaigns. The campaigns appear to primarily target hotels, restaurants, and telecommunications, and are distributed by an actor we track as TA555. To date, we have observed AdvisorsBot used as a first-stage payload, loading a fingerprinting module that, as with Marap, is presumably used to identify targets of interest to further infect with additional modules or payloads. AdvisorsBot is under active development and we have also observed another version of the malware completely rewritten in PowerShell and .NET.

The tag is: *misp-galaxy:threat-actor="TA555"*

---

## TA800

This attacker is an affiliate distributor of the The Trick, also known as Trickbot, and BazaLoader. (For more on how affiliates work, see the description of TA573). TA800 has targeted a wide range of

industries in North America, infecting victims with banking Trojans and malware loaders (malware designed to download other malware onto a compromised device). Malicious emails have often included recipients' names, titles and employers along with phishing pages designed to look like the targeted company. Lures have included hard-to-resist subjects such as related to payment, meetings, termination, bonuses and complaints in the subject line or body of the email.

The tag is: *misp-galaxy:threat-actor="TA800"*

## Pirpi

Symantec has observed Buckeye activity dating back to 2009, involving attacks on various organizations in several regions. Buckeye used a remote access Trojan (Backdoor.Pirpi) in attacks against a US organization's network in 2009. The group delivered Backdoor.Pirpi through malicious attachments or links in convincing spear-phishing emails.

The tag is: *misp-galaxy:tool="Pirpi"*

Pirpi is also known as:

- Badey
- EXL

[View relationships graph](#)

Pirpi has relationships with:

FireMalv has relationships with:

- similar: `misp-galaxy:malpedia="FireMalv"` with `estimative-language:likelihood-probability="likely"`

## Regin

Regin (also known as Prax or WarriorPride) is a sophisticated malware toolkit revealed by Kaspersky Lab, Symantec, and The Intercept in November 2014. The malware targets specific users of Microsoft Windows-based computers and has been linked to the US intelligence gathering agency NSA and its British counterpart, the GCHQ. The Intercept provided samples of Regin for download including malware discovered at Belgian telecommunications provider, Belgacom. Kaspersky Lab says it first became aware of Regin in spring 2012, but that some of the earliest samples date from 2003. The name Regin is first found on the VirusTotal website on 9 March 2011.

The tag is: `misp-galaxy:tool="Regin"`

Regin is also known as:

- Prax
- WarriorPride

## Htran

HUC Packet Transmitter (HTran) is a proxy tool, used to intercept and redirect Transmission Control Protocol (TCP) connections from the local host to a remote host. This makes it possible to obfuscate an attacker's communications with victim networks. The tool has been freely available on the internet since at least 2009. HTran facilitates TCP connections between the victim and a hop point controlled by an attacker. Malicious cyber actors can use this technique to redirect their packets through multiple compromised hosts running HTran, to gain greater access to hosts in a network

The tag is: `misp-galaxy:tool="Htran"`

Htran is also known as:

- HUC Packet Transmitter
- HTran

## X-Agent

APT28's second-stage persistent macOS backdoor. This backdoor component is known to have a modular structure featuring various espionage functionalities, such as key-logging, screen grabbing and file exfiltration. This component is available for OSX, Windows, Linux and iOS operating systems.

Xagent is a modular backdoor with spying functionalities such as keystroke logging and file exfiltration. Xagent is the group's flagship backdoor and heavily used in their operations. Early versions for Linux and Windows were seen years ago, then in 2015 an iOS version came out. One year later, an Android version was discovered and finally, in the beginning of 2017, an Xagent sample for OS X was described.

## Tartine

Delphi RAT used by Sofacy.

The tag is: `misp-galaxy:tool="Tartine"`

# Mirai

Mirai (Japanese for "the future") is malware that turns computer systems running Linux into remotely controlled "bots", that can be used as part of a botnet in large-scale network attacks. It primarily targets online consumer devices such as remote cameras and home routers. The Mirai botnet has been used in some of the largest and most disruptive distributed denial of service (DDoS) attacks, including an attack on 20 September 2016 on computer security journalist Brian Krebs's web site, an attack on French web host OVH and the October 2016 Dyn cyberattack.

The tag is: *misp-galaxy:tool="Mirai"*

Mirai is also known as:

- Linux/Mirai

# BASHLITE

The tag is: *misp-galaxy:tool="BASHLITE"*

## BlackEnergy

BlackEnergy is a trojan which has undergone significant functional changes since it was first publicly analysed by Arbor Networks in 2007. It has evolved from a relatively simple DDoS trojan into a relatively sophisticated piece of modern malware with a modular architecture, making it a suitable tool for sending spam and for online bank fraud, as well as for targeted attacks. BlackEnergy version 2, which featured rootkit techniques, was documented by SecureWorks in 2010. The targeted attacks recently discovered are proof that the trojan is still alive and kicking in 2014. We provide a technical analysis of the BlackEnergy family, focusing on novel functionality and the differences introduced by new lite variants. We describe the most notable aspects of the malware, including its techniques for bypassing UAC, defeating the signed driver requirement in Windows and a selection of BlackEnergy2 plug-ins used for parasitic file infections, network discovery and remote code execution and data collection.

## GhostAdmin

According to MalwareHunterTeam and other researchers that have looked at the malware's source code, GhostAdmin seems to be a reworked version of CrimeScene, another botnet malware family that was active around 3-4 years ago.

The tag is: *misp-galaxy:tool="GhostAdmin"*

## EyePyramid Malware

Two Italians referred to as the "Occhionero brothers" have been arrested and accused of using malware and a carefully-prepared spear-phishing scheme to spy on high-profile politicians and businessmen. This case has been called "EyePyramid", which we first discussed last week. (Conspiracy theories aside, the name came from a domain name and directory path that was found during the research.)

The tag is: *misp-galaxy:tool="EyePyramid Malware"*

## ZeroT

Most recently, we have observed the same group targeting military and aerospace interests in Russia and Belarus. Since the summer of 2016, this group began using a new downloader known as ZeroT to install the PlugX remote access Trojan (RAT) and added Microsoft Compiled HTML Help (.chm) as one of the initial droppers delivered in spear-phishing emails.

## StreamEx

Cylance dubbed this family of malware StreamEx, based upon a common exported function used across all samples ‘stream’, combined with the dropper functionality to append ‘ex’ to the DLL file name. The StreamEx family has the ability to access and modify the user’s file system, modify the registry, create system services, enumerate process and system information, enumerate network resources and drive types, scan for security tools such as firewall products and antivirus products, change browser security settings, and remotely execute commands. The malware documented in this post was predominantly 64-bit, however, there are 32-bit versions of the malware in the wild.

## AURIGA

The AURIGA malware family shares a large amount of functionality with the BANGAT backdoor. The malware family contains functionality for keystroke logging, creating and killing processes, performing file system and registry modifications, spawning interactive command shells, performing process injection, logging off the current user or shutting down the local machine. The AURIGA malware contains a driver component which is used to inject the malware DLL into other processes. This driver can also perform process and IP connection hiding. The malware family will create a copy of cmd.exe to perform its C2 activity, and replace the "Microsoft corp" strings in the cmd.exe binary with different values. The malware family typically maintains persistence through installing itself as a service.

The tag is: *misp-galaxy:tool="AURIGA"*

Table 6752. Table References

-------

## BANGAT

The BANGAT malware family shares a large amount of functionality with the AURIGA backdoor. The malware family contains functionality for keylogging, creating and killing processes, performing filesystem and registry modifications, spawning interactive command shells, performing process injection, logging off the current user or shutting down the local machine. In addition, the malware also implements a custom VNC like protocol which sends screenshots of the desktop to the C2 server and accepts keyboard and mouse input. The malware communicates to its C2 servers using SSL, with self signed SSL certificates. The malware family will create a copy of cmd.exe to perform its C2 activity, and replace the "Microsoft corp" strings in the cmd.exe binary with different values. The malware family typically maintains persistence through installing itself as a service.

The tag is: *misp-galaxy:tool="BANGAT"*

*Table 6753. Table References*

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## BISCUIT

BISCUIT provides attackers with full access to an infected host. BISCUIT capabilities include launching an interactive command shell, enumerating servers on a Windows network, enumerating and manipulating process, and transferring files. BISCUIT communicates using a custom protocol, which is then encrypted using SSL. Once installed BISCUIT will attempt to beacon to its command/control servers approximately every 10 or 30 minutes. It will beacon its primary server first, followed by a secondary server. All communication is encrypted with SSL (OpenSSL 0.9.8i).

The tag is: *misp-galaxy:tool="BISCUIT"*

[View relationships graph](#)

BISCUIT has relationships with:

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

# BOUNCER

BOUNCER will load an extracted DLL into memory, and then will call the DLL's dump export. The dump export is called with the parameters passed via the command line to the BOUNCER executable. It requires at least two arguments, the IP and port to send the password dump information. It can accept at most five arguments, including a proxy IP, port and an x.509 key for SSL authentication. The DLL backdoor has the capability to execute arbitrary commands, collect database and server information, brute force SQL login credentials, launch arbitrary programs, create processes and threads, delete files, and redirect network traffic.

The tag is: *misp-galaxy:tool="BOUNCER"*

*Table 6755. Table References*

<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

# CALENDAR

This family of malware uses Google Calendar to retrieve commands and send results. It retrieves event feeds associated with Google Calendar, where each event contains commands from the attacker for the malware to perform. Results are posted back to the event feed. The malware authenticates with Google using the hard coded email address and passwords. The malware uses the deprecated ClientLogin authentication API from Google. The malware is registered as a service dll as a persistence mechanism. Artifacts of this may be found in the registry.

The tag is: *misp-galaxy:tool="CALENDAR"*

[View relationships graph](#)

CALENDAR has relationships with:

# COMBOS

The COMBOS malware family is an HTTP based backdoor. The backdoor is capable of file upload, file download, spawning a interactive reverse shell, and terminating its own process. The backdoor may decrypt stored Internet Explorer credentials from the local system and transmit the credentials to the C2 server. The COMBOS malware family does not have any persistence mechanisms built into itself.

The tag is: *misp-galaxy:tool="COMBOS"*

Table 6757. Table References

<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## COOKIEBAG

his family of malware is a backdoor capable of file upload and download as well as providing remote interactive shell access to the compromised machine. Communication with the Command & Control (C2) servers uses a combination of single-byte XOR and Base64 encoded data in the Cookie and Set-Cookie HTTP header fields. Communication with the C2 servers is over port 80. Some variants install a registry key as means of a persistence mechanism. The hardcoded strings cited include a string of a command in common with several other APT1 families.

The tag is: *misp-galaxy:tool="COOKIEBAG"*

COOKIEBAG is also known as:

- TROJAN.COOKIEBAG

## GETMAIL

Members of this family of malware are utilities designed to extract email messages and attachments from Outlook PST files. One part of this utility set is an executable, one is a dll. The malware may create a registry artifact related to the executable.

The tag is: *misp-galaxy:tool="GETMAIL"*

Table 6760. Table References

Links
-------

## GDOCUPLOAD

This family of malware is a utility designed to upload files to Google Docs. Nearly all communications with docs.google.com are SSL encrypted. The malware does not use Google's published API to interact with their services. The malware does not currently work with Google Docs. It does not detect HTTP 302 redirections and will get caught in an infinite loop attempting to parse results from Google that are not present.

The tag is: *misp-galaxy:tool="GDOCUPLOAD"*

Table 6761. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## GLOOXMAIL

GLOOXMAIL communicates with Google's Jabber/XMPP servers and authenticates with a hard-coded username and password. The malware can accept commands over XMPP that includes file upload and download, provide a remote shell, sending process listings, and terminating specified processes. The malware makes extensive use of the open source gloox library (<http://camaya.net/gloox/>, version 0.9.9.12) to communicate using the Jabber/XMPP protocol. All communications with the Google XMPP server are encrypted.

The tag is: *misp-galaxy:tool="GLOOXMAIL"*

## GOGGLES

A family of downloader malware, that retrieves an encoded payload from a fixed location, usually in the form of a file with the .jpg extension. Some variants have just an .exe that acts as a downloader, others have an .exe launcher that runs as a service and then loads an associated .dll of

the same name that acts as the downloader. This IOC is targeted at the downloaders only. After downloading the file, the malware decodes the downloaded payload into an .exe file and launches it. The malware usually stages the files it uses in the %TEMP% directory or the %WINDIR%\Temp directory.

The tag is: *misp-galaxy:tool="GOGGLES"*

GOGGLES is also known as:

- TROJAN.FOXY

*Table 6763. Table References*

## GREENCAT

Members of this family are full featured backdoors that communicates with a Web-based Command & Control (C2) server over SSL. Features include interactive shell, gathering system info, uploading and downloading files, and creating and killing processes, Malware in this family usually communicates with a hard-coded domain using SSL on port 443. Some members of this family rely on launchers to establish persistence mechanism for them. Others contains functionality that allows it to install itself, replacing an existing Windows service, and uninstall itself. Several variants use %SystemRoot%\Tasks or %WinDir%\Tasks as working directories, additional malware artifacts may be found there.

The tag is: *misp-galaxy:tool="GREENCAT"*

## HACKFASE

This family of malware is a backdoor that provides reverse shell, process creation, system statistics collection, process enumeration, and process termination capabilities. This family is designed to be a service DLL and does not contain an installation mechanism. It usually communicates over port 443. Some variants use their own encryption, others use SSL.

The tag is: *misp-galaxy:tool="HACKFASE"*

*Table 6765. Table References*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## HELAUTO

This family of malware is designed to operate as a service and provides remote command execution and file transfer capabilities to a fixed IP address or domain name. All communication with the C2 server happens over port 443 using SSL. This family can be installed as a service DLL. Some variants allow for uninstallation.

The tag is: *misp-galaxy:tool="HELAUTO"*

*Table 6766. Table References*

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## KURTON

This family of malware is a backdoor that tunnels its connection through a preconfigured proxy. The malware communicates with a remote command and control server over HTTPS via the proxy. The malware installs itself as a Windows service with a service name supplied by the attacker but defaults to IPRIP if no service name is provided during install.

The tag is: *misp-galaxy:tool="KURTON"*

*Table 6767. Table References*

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## LIGHTBOLT

LIGHTBOLT is a utility with the ability to perform HTTP GET requests for a list of user-specified URLs. The responses of the HTTP requests are then saved as MHTML files, which are added to encrypted RAR files. LIGHTBOLT has the ability to use software certificates for authentication.

The tag is: *misp-galaxy:tool="LIGHTBOLT"*

*Table 6768. Table References*

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## LIGHTDART

LIGHTDART is a tool used to access a pre-configured web page that hosts an interface to query a database or data set. The tool then downloads the results of a query against that web page to an encrypted RAR file. This RAR file (1.rar) is renamed and uploaded to an attacker controlled FTP server, or uploaded via an HTTP POST with a .jpg extension. The malware will execute this search

once a day. The target webpage usually contains information useful to the attacker, which is updated on a regular basis. Examples of targeted information include weather information or ship coordinates.

The tag is: *misp-galaxy:tool="LIGHTDART"*

*Table 6769. Table References*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## LONGRUN

LONGRUN is a backdoor designed to communicate with a hard-coded IP address and provide the attackers with a custom interactive shell. It supports file uploads and downloads, and executing arbitrary commands on the compromised machine. When LONGRUN executes, it first loads configuration data stored as an obfuscated string inside the PE resource section. The distinctive string thequickbrownfxjimpsvalzydg is used as part of the input to the decoding algorithm. When the configuration data string is decoded it is parsed and treated as an IP and port number. The malware then connects to the host and begins interacting with it over a custom protocol.

The tag is: *misp-galaxy:tool="LONGRUN"*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## MANITSME

This family of malware will beacon out at random intervals to the remote attacker. The attacker can run programs, execute arbitrary commands, and easily upload and download files. This IOC looks for both the dropper file and the backdoor.

The tag is: *misp-galaxy:tool="MANITSME"*

*Table 6771. Table References*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## MAPIGET

This malware utility is a set of two files that operate in conjunction to extract email messages and attachments from an Exchange server. In order to operate successfully, these programs require authentication credentials for a user on the Exchange server, and must be run from a machine joined to the domain that has Microsoft Outlook installed (or equivalent software that provides the Microsoft 'Messaging API' (MAPI) service).

The tag is: *misp-galaxy:tool="MAPIGET"*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>
<a href="http://contagiodump.blogspot.com/2010/06/these-days-i-see-spike-in-number-of.html">http://contagiodump.blogspot.com/2010/06/these-days-i-see-spike-in-number-of.html</a>

## MINIASP

This family of malware consists of backdoors that attempt to fetch encoded commands over HTTP. The malware is capable of downloading a file, downloading and executing a file, executing arbitrary shell commands, or sleeping a specified interval.

The tag is: *misp-galaxy:tool="MINIASP"*

Table 6773. Table References

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## NEWSREELS

The NEWSREELS malware family is an HTTP based backdoor. When first started, NEWSREELS decodes two strings from its resources section. These strings are both used as C2 channels, one URL is used as a beacon URL (transmitting) and the second URL is used to get commands (receiving). The NEWSREELS malware family is capable of performing file uploads, downloads, creating processes or creating an interactive reverse shell.

The tag is: *misp-galaxy:tool="NEWSREELS"*

Table 6774. Table References

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## SEASALT

The SEASALT malware family communicates via a custom binary protocol. It is capable of gathering some basic system information, file system manipulation, file upload and download, process creation and termination, and spawning an interactive reverse shell. The malware maintains persistence by installing itself as a service.

The tag is: *misp-galaxy:tool="SEASALT"*

Table 6775. Table References

Links
-------

## STARSYPOUND

STARSYPOUND provides an interactive remote shell over an obfuscated communications channel. When it is first run, it loads a string (from the executable PE resource section) containing the beacon IP address and port. The malware sends the beacon string "(SY)# <HOSTNAME>" to the remote system, where <HOSTNAME> is the hostname of the victim system. The remote host responds with a packet that also begins with the string "(SY)# cmd". This causes the malware to launch a new cmd.exe child process. Further communications are forwarded to the cmd.exe child process to execute. The commands sent to the shell and their responses are obfuscated when sent over the network.

The tag is: *misp-galaxy:tool="STARSYPOUND"*

Table 6776. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## SWORD

This family of malware provides a backdoor over the network to the attackers. It is configured to connect to a single host and offers file download over HTTP, program execution, and arbitrary execution of commands through a cmd.exe instance.

The tag is: *misp-galaxy:tool="SWORD"*

Table 6777. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## TABMSGSQL

This malware family is a full-featured backdoor capable of file uploading and downloading, arbitrary execution of programs, and providing a remote interactive command shell. All communications with the C2 server are sent over HTTP to a static URL, appending various URL parameters to the request. Some variants use a slightly different URL.

The tag is: *misp-galaxy:tool="TABMSGSQL"*

TABMSGSQL is also known as:

- TROJAN LETSGO

Table 6778. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## TARSIP-ECLIPSE

The TARSIP malware family is a backdoor which communicates over encoded information in HTTPS headers. Typical TARSIP malware samples will only beacon out to their C2 servers if the C2 DNS address resolves to a specific address. The capability of TARSIP backdoors includes file uploading, file downloading, interactive command shells, process enumeration, process creation, process termination. The TARSIP-ECLIPSE family is distinguished by the presence of 'eclipse' in .pdb debug strings present in the malware samples. It does not provide a built in mechanism to maintain persistence.

The tag is: *misp-galaxy:tool="TARSIP-ECLIPSE"*

Table 6779. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## TARSIP-MOON

The TARSIP malware family is a backdoor which communicates over encoded information in HTTPS headers. Typical TARSIP malware samples will only beacon out to their C2 servers if the C2 DNS address resolves to a specific address. The capability of TARSIP backdoors includes file uploading, file downloading, interactive command shells, process enumeration, process creation, process termination. The TARSIP-MOON family is distinguished by the presence of 'moon' in .pdb debug strings present in the malware samples. It does not provide a built in mechanism to maintain persistence.

The tag is: *misp-galaxy:tool="TARSIP-MOON"*

## WARP

The WARP malware family is an HTTP based backdoor written in C++, and the majority of its code base is borrowed from source code available in the public domain. Network communications are implemented using the same WWW client library (w3c.cpp) available from [www.dankrusi.com/file\\_69653F3336383837.html](http://www.dankrusi.com/file_69653F3336383837.html). The malware has system survey functionality (collects hostname, current user, system uptime, CPU speed, etc.) taken directly from the BO2K backdoor available from [www.bo2k.com](http://www.bo2k.com). It also contains the hard disk identification code found at [www.winsim.com/diskid32/diskid32.cpp](http://www.winsim.com/diskid32/diskid32.cpp). When the WARP executing remote commands, the

malware creates a copy of the `?%SYSTEMROOT%\system32\cmd.exe?` file as `'%USERPROFILE%\Temp\~ISUN32.EXE'`. The version signature information of the duplicate executable is zeroed out. Some WARP variants maintain persistence through the use of DLL search order hijacking.

The tag is: *misp-galaxy:tool="WARP"*

*Table 6781. Table References*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## WEBC2-ADSPACE

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This family of malware is capable of downloading and executing a file. All variants represented here are the same file with different MD5 signatures. This malware attempts to contact its C2 once a week (Thursday at 10:00 AM). It looks for commands inside a set of HTML tags, part of which are in the File Strings indicator term below.

The tag is: *misp-galaxy:tool="WEBC2-ADSPACE"*

*Table 6782. Table References*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## WEBC2-AUSOV

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This malware family is a only a downloader which operates over the HTTP protocol with a hard-coded URL. If directed, it has the capability to download, decompress, and execute compressed binaries.

The tag is: *misp-galaxy:tool="WEBC2-AUSOV"*

*Table 6783. Table References*

Links
<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>

## WEBC2-BOLID

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This family of malware is a backdoor capable of downloading files and updating its configuration. Communication with the command and control (C2) server uses a combination of single-byte XOR and Base64 encoded data wrapped in standard HTML tags. The malware family installs a registry key as a persistence mechanism.

The tag is: *misp-galaxy:tool="WEBC2-BOLID"*

*Table 6784. Table References*

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## WEBC2-CLOVER

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The family of malware provides the attacker with an interactive command shell, the ability to upload and download files, execute commands on the system, list processes and DLLs, kill processes, and ping hosts on the local network. Responses to these commands are encrypted and compressed before being POSTed to the server. Some variants copy cmd.exe in a temporary directory, and then may launch that in a process if an interactive shell is called. On initial invocation, the malware also attempts to delete previous copies of the Updatasched.exe file.

The tag is: *misp-galaxy:tool="WEBC2-CLOVER"*

*Table 6785. Table References*

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## WEBC2-CSON

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. Members of this family of malware act only as downloaders and droppers for other malware. They communicate with a hard-coded C2 server, reading commands embedded in HTML comment fields. Some variants are executables which act upon execution, others are DLLs which can be attached to services or loaded through search order hijacking.

The tag is: *misp-galaxy:tool="WEBC2-CSON"*

*Table 6786. Table References*

Links

## WEBC2-DIV

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-DIV variant searches for the strings "div safe:" and "balance" to delimit encoded C2 information. If the decoded string begins with the letter "J" the malware will parse additional arguments in the decoded string to specify the sleep interval to use. WEBC2-DIV is capable of downloading a file, downloading and executing a file, or sleeping a specified interval.

The tag is: *misp-galaxy:tool="WEBC2-DIV"*

*Table 6787. Table References*

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## WEBC2-GREENCAT

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This malware is a variant on the GREENCAT family, using a fixed web C2. This family is a full featured backdoor which provides remote command execution, file transfer, process and service enumeration and manipulation. It installs itself persistently through the current user's registry Run key.

The tag is: *misp-galaxy:tool="WEBC2-GREENCAT"*

*Table 6788. Table References*

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

## WEBC2-HEAD

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-HEAD variant communicates over HTTPS, using the system's SSL implementation to encrypt all communications with the C2 server. WEBC2-HEAD first issues an HTTP GET to the host, sending the Base64-encoded string containing the name of the compromised machine running the malware.

The tag is: *misp-galaxy:tool="WEBC2-HEAD"*

*Table 6789. Table References*

Links
-------

<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>
---

## WEBC2-KT3

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-KT3 variant searches for commands in a specific comment tag. Network traffic starting with `*!Kt3+v|` may indicate WEBC2-KT3 activity.

The tag is: `misp-galaxy:tool="WEBC2-KT3"`

*Table 6790. Table References*

-------

<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>
---

## WEBC2-QBP

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-QBP variant will search for two strings in a HTML comment. The first will be "2010QBP " followed by " 2010QBP/--". Inside these tags will be a DES-encrypted string.

The tag is: `misp-galaxy:tool="WEBC2-QBP"`

*Table 6791. Table References*

-------

<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>
---

## WEBC2-RAVE

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This family of malware will set itself up as a service and connect out to a hardcoded web page and read a modified base64 string from this webpage. The later versions of this malware supports three commands (earlier ones are just downloaders or reverse shells). The first commands will sleep the malware for N number of hours. The second command will download a binary from the encoded HTML comment and execute it on the infected host. The third will spawn an encoded reverse shell to an attacker specified location and port.

The tag is: `misp-galaxy:tool="WEBC2-RAVE"`

*Table 6792. Table References*

Links
-------

## WEBC2-TABLE

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-TABLE variant looks for web pages containing 'background', 'align', and 'bgcolor' tags to be present in the requested Web page. If the data in these tags are formatted correctly, the malware will decode a second URL and a filename. This URL is then retrieved, written to the decoded filename and executed.

The tag is: *misp-galaxy:tool="WEBC2-TABLE"*

*Table 6793. Table References*

Links
-------

<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>
---

## WEBC2-TOCK

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-TABLE variant looks for web pages containing 'background', 'align', and 'bgcolor' tags to be present in the requested Web page. If the data in these tags are formatted correctly, the malware will decode a second URL and a filename. This URL is then retrieved, written to the decoded filename and executed.

The tag is: *misp-galaxy:tool="WEBC2-TOCK"*

*Table 6794. Table References*

Links
-------

<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>
---

## WEBC2-UGX

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. Members of this family of malware provide remote command shell and remote file download and execution capabilities. The malware downloads a web page containing a crafted HTML comment that subsequently contains an encoded command. The contents of this command tell the malware whether to download and execute a program, launch a reverse shell to a specific host and port number, or to sleep for a period of time.

The tag is: *misp-galaxy:tool="WEBC2-UGX"*

*Table 6795. Table References*

<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>
---

## WEBC2-Y21K

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. Members of this family of backdoor malware talk to specific Web-based Command & Control (C2) servers. The backdoor has a limited command set, depending on version. It is primarily a downloader, but it classified as a backdoor because it can accept a limited command set, including changing local directories, downloading and executing additional files, sleeping, and connecting to a specific IP & port not initially included in the instruction set for the malware. Each version of the malware has at least one hardcoded URL to which it connects to receive its initial commands. This family of malware installs itself as a service, with the malware either being the executable run by the service, or the service DLL loaded by a legitimate service. The same core code is seen recompiled on different dates or with different names, but the same functionality. Key signatures include a specific set of functions (some of which can be used with the OS-provided rundll32.exe tool to install the malware as a service), and hardcoded strings used in communication with C2 servers to issue commands to the implant.

The tag is: *misp-galaxy:tool="WEBC2-Y21K"*

*Table 6796. Table References*

-------

<a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a>
---

## WEBC2-YAHOO

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-YAHOO variant enters a loop where every ten minutes it attempts to download a web page that may contain an encoded URL. The encoded URL will be found in the pages returned inside an attribute named 'sb' or 'ex' within a tag named 'yahoo'. The embedded link can direct the malware to download and execute files.

The tag is: *misp-galaxy:tool="WEBC2-YAHOO"*

*Table 6797. Table References*

## BUGJUICE

BUGJUICE is a backdoor that is executed by launching a benign file and then hijacking the search order to load a malicious dll into it. That malicious dll then loads encrypted shellcode from the binary, which is decrypted and runs the final BUGJUICE payload. BUGJUICE defaults to TCP using a custom binary protocol to communicate with the C2, but can also use HTTP and HTTPS if directed by the C2. It has the capability to find files, enumerate drives, exfiltrate data, take screenshots and provide a reverse shell.

The tag is: *misp-galaxy:tool="BUGJUICE"*

# SNUGRIDE

SNUGRIDE is a backdoor that communicates with its C2 server through HTTP requests. Messages are encrypted using AES with a static key. The malware's capabilities include taking a system survey, access to the filesystem, executing commands and a reverse shell. Persistence is maintained through a Run registry key.

The tag is: `misp-galaxy:tool="SNUGRIDE"`

# QUASARRAT

QUASARRAT is an open-source RAT available at <https://github.com/quasar/QuasarRat> . The versions used by APT10 (1.3.4.0, 2.0.0.0, and 2.0.0.1) are not available via the public GitHub page, indicating that APT10 has further customized the open source version. The 2.0 versions require a dropper to decipher and launch the AES encrypted QUASARRAT payload. QUASARRAT is a fully functional .NET backdoor that has been used by multiple cyber espionage groups in the past.

The tag is: `misp-galaxy:tool="QUASARRAT"`

# da Vinci RCS

Hacking Team's "DaVinci" Remote Control System is able, the company says, to break encryption and allow law enforcement agencies to monitor encrypted files and emails (even ones encrypted with PGP), Skype and other Voice over IP or chat communication. It allows identification of the target's location and relationships. It can also remotely activate microphones and cameras on a computer and works worldwide. Hacking Team claims that its software is able to monitor hundreds of thousands of computers at once, all over the country. Trojans are available for Windows, Mac, Linux, iOS, Android, Symbian and Blackberry.

The tag is: *misp-galaxy:tool="da Vinci RCS"*

da Vinci RCS is also known as:

- DaVinci
- Morcut

# FlexSpy

covert surveillance tools

The tag is: *misp-galaxy:tool="FlexSpy"*

## feodo

Unfortunately, it is time to meet 'Feodo'. Since august of this year when FireEye's MPS devices detected this malware in the field, we have been monitoring this banking trojan very closely. In many ways, this malware looks similar to other famous banking trojans like Zbot and SpyEye. Although my analysis says that this malware is not a toolkit and is in the hands of a single criminal group.

The tag is: *misp-galaxy:tool="feodo"*

*Table 6835. Table References*

Links
<a href="https://www.fireeye.com/blog/threat-research/2010/10/feodosoff-a-new-botnet-on-the-rise.html">https://www.fireeye.com/blog/threat-research/2010/10/feodosoff-a-new-botnet-on-the-rise.html</a>

## Cardinal RAT

Palo Alto Networks has discovered a previously unknown remote access Trojan (RAT) that has been active for over two years. It has a very low volume in this two-year period, totaling roughly 27 total samples. The malware is delivered via an innovative and unique technique: a downloader we are calling Carp uses malicious macros in Microsoft Excel documents to compile embedded C# (C Sharp) Programming Language source code into an executable that in turn is run to deploy the Cardinal RAT malware family. These malicious Excel files use a number of different lures, providing evidence of what attackers are using to entice victims into executing them.

The tag is: *misp-galaxy:tool="Cardinal RAT"*

[View relationships graph](#)

Cardinal RAT has relationships with:

- similar: *misp-galaxy:tool="EVILNUM"* with *estimative-language:likelihood-probability="likely"*

*Table 6836. Table References*

<a href="http://researchcenter.paloaltonetworks.com/2017/04/unit42-cardinal-rat-active-two-years/">http://researchcenter.paloaltonetworks.com/2017/04/unit42-cardinal-rat-active-two-years/</a>

## REDLEAVES

The REDLEAVES implant consists of three parts: an executable, a loader, and the implant shellcode. The REDLEAVES implant is a remote administration Trojan (RAT) that is built in Visual C++ and

makes heavy use of thread generation during its execution. The implant contains a number of functions typical of RATs, including system enumeration and creating a remote shell back to the C2.

The tag is: *misp-galaxy:tool="REDLEAVES"*

Table 6837. Table References

Links
<a href="https://www.us-cert.gov/ncas/alerts/TA17-117A">https://www.us-cert.gov/ncas/alerts/TA17-117A</a>

## Kazuar

Kazuar is a fully featured backdoor written using the .NET Framework and obfuscated using the open source packer called ConfuserEx. Unit 42 researchers have uncovered a backdoor Trojan used in an espionage campaign. The developers refer to this tool by the name Kazuar, which is a Trojan written using the Microsoft .NET Framework that offers actors complete access to compromised systems targeted by its operator. Kazuar includes a highly functional command set, which includes the ability to remotely load additional plugins to increase the Trojan's capabilities. During our analysis of this malware we uncovered interesting code paths and other artifacts that may indicate a Mac or Unix variant of this same tool also exists. Also, we discovered a unique feature within Kazuar: it exposes its capabilities through an Application Programming Interface (API) to a built-in webserver. We suspect the Kazuar tool may be linked to the Turla threat actor group (also known as Uroburos and Snake), who have been reported to have compromised embassies, defense contractors, educational institutions, and research organizations across the globe. A hallmark of Turla operations is iterations of their tools and code lineage in Kazuar can be traced back to at least 2005. If the hypothesis is correct and the Turla threat group is using Kazuar, we believe they may be using it as a replacement for Carbon and its derivatives. Of the myriad of tools observed in use by Turla Carbon and its variants were typically deployed as a second stage backdoor within targeted environments and we believe Kazuar may now hold a similar role for Turla operations.

The tag is: *misp-galaxy:tool="Kazuar"*

## Hackshit

Netskope Threat Research Labs recently discovered a Phishing-as-a-Service (PhaaS) platform named Hackshit, that records the credentials of the phished bait victims. The phished bait pages are packaged with base64 encoding and served from secure (HTTPS) websites with “.moe” top level domain (TLD) to evade traditional scanners. “.moe” TLD is intended for the purpose of ‘The marketing of products or services deemed’. The victim’s credentials are sent to the Hackshit PhaaS platform via websockets. The Netskope Active Platform can proactively protect customers by creating custom applications and a policy to block all the activities related to Hackshit PhaaS.

Links
<a href="https://phishme.com/loki-bot-malware/">https://phishme.com/loki-bot-malware/</a>

## KONNI

Talos has discovered an unknown Remote Administration Tool that we believe has been in use for over 3 years. During this time it has managed to avoid scrutiny by the security community. The current version of the malware allows the operator to steal files, keystrokes, perform screenshots, and execute arbitrary code on the infected host. Talos has named this malware KONNI. Throughout the multiple campaigns observed over the last 3 years, the actor has used an email attachment as the initial infection vector. They then use additional social engineering to prompt the target to open a .scr file, display a decoy document to the users, and finally execute the malware on the victim's machine. The malware infrastructure of the analysed samples was hosted by a free web hosting provider: 000webhost. The malware has evolved over time. In this article, we will analyse this evolution:

## NOKKI

Beginning in early 2018, Unit 42 observed a series of attacks using a previously unreported malware family, which we have named 'NOKKI'. The malware in question has ties to a previously reported malware family named KONNI, however, after careful consideration, we believe enough differences are present to introduce a different malware family name. To reflect the close relationship with KONNI, we chose NOKKI, swapping KONNI's Ns and Ks. Because of code overlap found within both malware families, as well as infrastructure overlap, we believe the threat actors responsible for KONNI are very likely also responsible for NOKKI. Previous reports stated it was likely KONNI had been in use for over three years in multiple campaigns with a heavy interest in the Korean peninsula and surrounding areas. As of this writing, it is not certain if the KONNI or NOKKI operators are related to known adversary groups operating in the regions of interest, although there is evidence of a tenuous relationship with a group known as Reaper.

The tag is: *misp-galaxy:tool="NOKKI"*

## SpyDealer

Recently, Palo Alto Networks researchers discovered an advanced Android malware we've named "SpyDealer" which exfiltrates private data from more than 40 apps and steals sensitive messages from communication apps by abusing the Android accessibility service feature. SpyDealer uses exploits from a commercial rooting app to gain root privilege, which enables the subsequent data theft.

The tag is: *misp-galaxy:tool="SpyDealer"*

## Svpeng

In mid-July 2017, we found a new modification of the well-known mobile banking malware family Svping – Trojan-Banker.AndroidOS.Svping.ae. In this modification, the cybercriminals have added new functionality: it now also works as a keylogger, stealing entered text through the use of accessibility services.

The tag is: *misp-galaxy:tool="Svping"*

Svping is also known as:

- trojan-banker.androidos.svpeng.ae

[View relationships graph](#)

Svpeng has relationships with:

- similar: misp-galaxy:android="Svpeng" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:malpedia="Svpeng" with estimative-language:likelihood-probability="likely"

*Table 6851. Table References*

<a href="https://securelist.com/a-new-era-in-mobile-banking-trojans/79198/">https://securelist.com/a-new-era-in-mobile-banking-trojans/79198/</a>

## TwoFace

While investigating a recent security incident, Unit 42 found a webshell that we believe was used by the threat actor to remotely access the network of a targeted Middle Eastern organization. The construction of the webshell was interesting by itself, as it was actually two separate webshells: an initial webshell that was responsible for saving and loading the second fully functional webshell. It is this second webshell that enabled the threat actor to run a variety of commands on the compromised server. Due to these two layers, we use the name TwoFace to track this webshell. During our analysis, we extracted the commands executed by the TwoFace webshell from the server logs on the compromised server. Our analysis shows that the commands issued by the threat actor date back to June 2016; this suggests that the actor had access to this shell for almost an entire year. The commands issued show the actor was interested in gathering credentials from the compromised server using the Mimikatz tool. We also saw the attacker using the TwoFace webshell to move laterally through the network by copying itself and other webshells to other servers.

The tag is: *misp-galaxy:tool="TwoFace"*

*Table 6852. Table References*

Links
<a href="https://researchcenter.paloaltonetworks.com/2017/07/unit42-twoface-webshell-persistent-access-point-lateral-movement/">https://researchcenter.paloaltonetworks.com/2017/07/unit42-twoface-webshell-persistent-access-point-lateral-movement/</a>

## IntrudingDivisor

Like TwoFace, the IntrudingDivisor webshell requires the threat actor to authenticate before issuing commands. To authenticate, the actor must provide two pieces of information, first an integer that is divisible by 5473 and a string whose MD5 hash is "9A26A0E7B88940DAA84FC4D5E6C61AD0". Upon successful authentication, the webshell has a command handler that uses integers within the request to determine the command to execute - To complete

## JS\_POWMET

Attacks that use completely fileless malware are a rare occurrence, so we thought it important to discuss a new trojan known as JS\_POWMET (Detected by Trend Micro as JS\_POWMET.DE), which arrives via an autostart registry procedure. By utilizing a completely fileless infection chain, the malware will be more difficult to analyze using a sandbox, making it more difficult for anti-malware engineers to examine.

The tag is: *misp-galaxy:tool="JS\_POWMET"*

Table 6854. Table References

[http://blog.trendmicro.com/trendlabs-security-intelligence/look-js\\_powmet-completely-fileless-malware/](http://blog.trendmicro.com/trendlabs-security-intelligence/look-js_powmet-completely-fileless-malware/)

## EngineBox Malware

The main malware capabilities include a privilege escalation attempt using MS16-032 exploitation; a HTTP Proxy to intercept banking transactions; a backdoor to make it possible for the attacker to issue arbitrary remote commands and a C&C through a IRC channel. As it's being identified as a Generic Trojan by most of VirusTotal (VT) engines, let's name it EngineBox—the core malware class I saw after reverse engineering it.

The tag is: *misp-galaxy:tool="EngineBox Malware"*

Table 6855. Table References

Links

<https://isc.sans.edu/diary/22736>

## Joao

Spread via hacked Aeria games offered on unofficial websites, the modular malware can download and install virtually any other malicious code on the victim's computer. To spread their malware, the attackers behind Joao have misused massively-multiplayer online role-playing games (MMORPGs) originally published by Aeria Games. At the time of writing this article, the Joao downloader was being distributed via the anime-themed MMORPG Grand Fantasia offered on [gf.ignitgames.com](http://gf.ignitgames.com).

The tag is: *misp-galaxy:tool="Joao"*

## ShadowPad

ShadowPad is a modular cyber-attack platform that attackers deploy in victim networks to gain flexible remote control capabilities. The platform is designed to run in two stages. The first stage is a shellcode that was embedded in a legitimate `nsock2.dll` used by Xshell, Xmanager and other software packages produced by NetSarang. This stage is responsible for connecting to “validation” command and control (C&C) servers and getting configuration information including the location of the real C&C server, which may be unique per victim. The second stage acts as an orchestrator for five main modules responsible for C&C communication, working with the DNS protocol, loading and injecting additional plugins into the memory of other processes.

The tag is: `misp-galaxy:tool="ShadowPad"`

ShadowPad is also known as:

- POISONPLUG
- Barlaiy

## [View relationships graph](#)

ShadowPad has relationships with:

## IoT\_reaper

IoT\_reaper is fairly large now and is actively expanding. For example, there are multiple C2s we are tracking, the most recently data (October 19) from just one C2 shows the number of unique active bot IP address is more than 10k per day. While at the same time, there are millions of potential vulnerable device IPs being queued into the c2 system waiting to be processed by an automatic loader that injects malicious code to the devices to expand the size of the botnet.

<a href="https://www.arbornetworks.com/blog/asert/formidable-formbook-form-grabber/">https://www.arbornetworks.com/blog/asert/formidable-formbook-form-grabber/</a>

## Dimnie

Dimnie, the commonly agreed upon name for the binary dropped by the PowerShell script above, has been around for several years. Palo Alto Networks has observed samples dating back to early 2014 with identical command and control mechanisms. The malware family serves as a downloader and has a modular design encompassing various information stealing functionalities. Each module is injected into the memory of core Windows processes, further complicating analysis. During its lifespan, it appears to have undergone few changes and its stealthy command and control methods combined with a previously Russian focused target base has allowed it to fly under

the radar up until this most recent campaign.

The tag is: *misp-galaxy:tool="Dimnie"*

## ALMA Communicator

The ALMA Communicator Trojan is a backdoor Trojan that uses DNS tunneling exclusively to receive commands from the adversary and to exfiltrate data. This Trojan specifically reads in a configuration from the cfg file that was initially created by the Clayslide delivery document. ALMA does not have an internal configuration, so the Trojan does not function without the cfg file created by the delivery document.

The tag is: *misp-galaxy:tool="ALMA Communicator"*

## Silence

In September 2017, we discovered a new targeted attack on financial institutions. Victims are mostly Russian banks but we also found infected organizations in Malaysia and Armenia. The attackers were using a known but still very effective technique for cybercriminals looking to make money: gaining persistent access to an internal banking network for a long period of time, making video recordings of the day to day activity on bank employees' PCs, learning how things works in their target banks, what software is being used, and then using that knowledge to steal as much money as possible when ready. We saw that technique before in Carbanak, and other similar cases worldwide. The infection vector is a spear-phishing email with a malicious attachment. An interesting point in the Silence attack is that the cybercriminals had already compromised banking infrastructure in order to send their spear-phishing emails from the addresses of real bank employees and look as unsuspecting as possible to future victims.

The tag is: *misp-galaxy:tool="Silence"*

<a href="https://securelist.com/the-silence/83009/">https://securelist.com/the-silence/83009/</a>

## Volgmer

Volgmer is a backdoor Trojan designed to provide covert access to a compromised system. Since at least 2013, HIDDEN COBRA actors have been observed using Volgmer malware in the wild to target the government, financial, automotive, and media industries. It is suspected that spear phishing is the primary delivery mechanism for Volgmer infections; however, HIDDEN COBRA actors use a suite of custom tools, some of which could also be used to initially compromise a system. Therefore, it is possible that additional HIDDEN COBRA malware may be present on network infrastructure compromised with Volgmer

## TRISIS

(Dragos Inc.) The team identifies this malware as TRISIS because it targets Schneider Electric's Triconex safety instrumented system (SIS) enabling the replacement of logic in final control elements. TRISIS is highly targeted and likely does not pose an immediate threat to other Schneider Electric customers, let alone other SIS products. (FireEye Inc.) This malware, which we call TRITON, is an attack framework built to interact with Triconex Safety Instrumented System (SIS) controllers. We have not attributed the incident to a threat actor, though we believe the activity is consistent with a nation state preparing for an attack. TRITON is one of a limited number of publicly identified malicious software families targeted at industrial control systems (ICS). It follows Stuxnet which was used against Iran in 2010 and Industroyer which we believe was deployed by Sandworm Team against Ukraine in 2016.

The tag is: *misp-galaxy:tool="TRISIS"*

TRISIS is also known as:

- TRITON

<http://blog.trendmicro.com/trendlabs-security-intelligence/dissecting-prilex-cutlet-maker-atm-malware-families/>

## Satori

According to a report Li shared with Bleeping Computer today, the Mirai Satori variant is quite different from all previous pure Mirai variants. Previous Mirai versions infected IoT devices and then downloaded a Telnet scanner component that attempted to find other victims and infect them with the Mirai bot. The Satori variant does not use a scanner but uses two embedded exploits that will try to connect to remote devices on ports 37215 and 52869. Effectively, this makes Satori an IoT worm, being able to spread by itself without the need for separate components.

The tag is: *misp-galaxy:tool="Satori"*

Satori is also known as:

- Okiru

[View relationships graph](#)

Satori has relationships with:

## PowerSpritz

PowerSpritz is a Windows executable that hides both its legitimate payload and malicious PowerShell command using a non-standard implementation of the already rarely used Spritz encryption algorithm (see the Attribution section for additional analysis of the Spritz implementation). This malicious downloader has been observed being delivered via spearphishing attacks using the TinyCC link shortener service to redirect to likely attacker-controlled servers hosting the malicious PowerSpritz payload.

The tag is: *misp-galaxy:tool="PowerSpritz"*

## PowerRatankba

PowerRatankba is used for the same purpose as Ratankba: as a first stage reconnaissance tool and for the deployment of further stage implants on targets that are deemed interesting by the actor. Similar to its predecessor, PowerRatankba utilizes HTTP for its C&C communication.

The tag is: *misp-galaxy:tool="PowerRatankba"*

# Ratankba

In one instance we observed, one of the initial malware delivered to the victim, RATANKBA, connects to a legitimate but compromised website from which a hack tool (nbt\_scan.exe) is also downloaded. The domain also serves as one of the campaign's platform for C&C communication. The threat actor uses RATANKBA to survey the lay of the land as it looks into various aspects of the host machine where it has been initially downloaded—the machine that has been victim of the watering hole attack. Information such as the running tasks, domain, shares, user information, if the host has default internet connectivity, and so forth.

# Travle

The Travle sample found during our investigation was a DLL with a single exported function (MSOProtect). The malware name Travle was chosen given a string found in early samples of this family: “Travle Path Failed!”. This typo was replaced with correct word “Travel” in newer releases. We believe that Travle could be a successor to the NetTraveler family.

The tag is: *misp-galaxy:tool="Travle"*

Travle is also known as:

- PYLOT

*Table 6893. Table References*

Links
<a href="https://securelist.com/travle-aka-pyilot-backdoor-hits-russian-speaking-targets/83455/">https://securelist.com/travle-aka-pyilot-backdoor-hits-russian-speaking-targets/83455/</a>

# Digmine

Digmine is coded in AutoIt, and sent to would-be victims posing as a video file but is actually an AutoIt executable script. If the user’s Facebook account is set to log in automatically, Digmine will manipulate Facebook Messenger in order to send a link to the file to the account’s friends. The abuse of Facebook is limited to propagation for now, but it wouldn’t be implausible for attackers to hijack the Facebook account itself down the line. This functionality’s code is pushed from the command-and-control (C&C) server, which means it can be updated.

The tag is: *misp-galaxy:tool="Digmine"*

## Aurora

You probably have heard the recent news about a widespread attack that was carried out using a 0-Day exploit for Internet Explorer as one of the vectors. This exploit is also known as the "Aurora Exploit". The code has recently gone public and it was also added to the Metasploit framework. This exploit was used to deliver a malicious payload, known by the name of Trojan.Hydraq, the main purpose of which was to steal information from the compromised computer and report it back to the attackers. The exploit code makes use of known techniques to exploit a vulnerability that exists in the way Internet Explorer handles a deleted object. The final purpose of the exploit itself is to access an object that was previously deleted, causing the code to reference a memory location over which the attacker has control and in which the attacker dropped his malicious code.

The tag is: `misp-galaxy:tool="Aurora"`

Aurora is also known as:

- Hydraq

## [View relationships graph](#)

## Cheshire Cat

Oldest Cheshire Cat malware compiled in 2002. It's a very old family of malware. The time stamps may be forged but the malware does have support for very old operating systems. The 2002 implant retrieves a handle for an `asr2892` drives that they never got their hands on. It checks for a NE header which is a header type used before PE headers even existed. References to 16bit or DOS on a non 9x platform. This malware implant IS REALLY for old systems. The malware is for espionage - it's very carefully made to stay hidden. Newer versions install as icon handler shell extension for .lnk files. Shell in this case means the program manager because windows explorer was not yet a thing. It sets up COM server objects. It looks like it was written in pure C, but made to look like C++. A sensitive implant as well: it checks for all kinds of old MS platforms including Windows NT, win95, win98, winME and more. It checks the patch level as well. A lot of effort was put into adapting this malware to a lot of different operating systems with very granular decision chains.

The tag is: `misp-galaxy:tool="Cheshire Cat"`

## Neuron

Neuron consists of both client and server components. The Neuron client and Neuron service are written using the .NET framework with some codebase overlaps. The Neuron client is used to infect victim endpoints and extract sensitive information from local client machines. The Neuron server is used to infect network infrastructure such as mail and web servers, and acts as local Command & Control (C2) for the client component. Establishing a local C2 limits interaction with the target network and remote hosts. It also reduces the log footprint of actor infrastructure and enables client interaction to appear more convincing as the traffic is contained within the target network.

The tag is: *misp-galaxy:tool="Neuron"*

[View relationships graph](#)

Neuron has relationships with:

- similar: *misp-galaxy:malpedia="Neuron"* with *estimative-language:likelihood-*

probability="likely"

Table 6904. Table References

## Gamut Botnet

Gamut was found to be downloaded by a Trojan Downloader that arrives as an attachment from a spam email message. The bot installation is quite simple. After the malware binary has been downloaded, it launches itself from its current directory, usually the Windows %Temp% folder and installs itself as a Windows service. The malware utilizes an anti-VM (virtual machine) trick and terminates itself if it detects that it is running in a virtual machine environment. The bot uses INT 03h trap sporadically in its code, an anti-debugging technique which prevents its code from running within a debugger environment. It can also determine if it is being debugged by using the Kernel32 API - IsDebuggerPresent function.

The tag is: *misp-galaxy:tool="Gamut Botnet"*

## DOGCALL

DOGCALL is a backdoor commonly distributed as an encoded binary file downloaded and decrypted by shellcode following the exploitation of weaponized documents. DOGCALL is capable of capturing screenshots, logging keystrokes, evading analysis with anti-virtual machine detections, and leveraging cloud storage APIs such as Cloud, Box, Dropbox, and Yandex. DOGCALL was used to target South Korean Government and military organizations in March and April 2017. The malware is typically dropped using an HWP exploit in a lure document. The wiper tool, RUHAPPY, was found on some of the systems targeted by DOGCALL. While DOGCALL is primarily an espionage tool, RUHAPPY is a destructive wiper tool meant to render systems inoperable.

The tag is: *misp-galaxy:tool="DOGCALL"*

DOGCALL is also known as:

## HAPPYWORK

HAPPYWORK is a malicious downloader that can download and execute a second-stage payload, collect system information, and beacon it to the command and control domains. The collected system information includes: computer name, user name, system manufacturer via registry, IsDebuggerPresent state, and execution path. In November 2016, HAPPYWORK targeted government and financial targets in South Korea.

The tag is: `misp-galaxy:tool="HAPPYWORK"`

HAPPYWORK is also known as:

- FE\_APT\_Downloader\_HAPPYWORK
- FE\_APT\_Exploit\_HWP\_Happy
- Downloader.APT.HAPPYWORK

[View relationships graph](#)

HAPPYWORK has relationships with:

- similar: `misp-galaxy:mitre-malware="HAPPYWORK - S0214"` with `estimative-`

language:likelihood-probability="likely"

## KARAE

Karae backdoors are typically used as first-stage malware after an initial compromise. The backdoors can collect system information, upload and download files, and may be used to retrieve a second-stage payload. The malware uses public cloud-based storage providers for command and control. In March 2016, KARAE malware was distributed through torrent file-sharing websites for South Korean users. During this campaign, the malware used a YouTube video downloader application as a lure.

The tag is: *misp-galaxy:tool="KARAE"*

KARAE is also known as:

- FE\_APT\_Backdoor\_Karae\_enc
- FE\_APT\_Backdoor\_Karae
- Backdoor.APT.Karae

## MILKDROP

MILKDROP is a launcher that sets a persistence registry key and launches a backdoor.

The tag is: *misp-galaxy:tool="MILKDROP"*

MILKDROP is also known as:

- FE\_Trojan\_Win32\_MILKDROP\_1

Table 6912. Table References

Links
-------

## POORAIM

POORAIM malware is designed with basic backdoor functionality and leverages AOL Instant Messenger for command and control communications. POORAIM includes the following capabilities: System information enumeration, File browsing, manipulation and exfiltration, Process enumeration, Screen capture, File execution, Exfiltration of browser favorites, and battery status. Exfiltrated data is sent via files over AIM. POORAIM has been involved in campaigns against South Korean media organizations and sites relating to North Korean refugees and defectors since early 2014. Compromised sites have acted as watering holes to deliver newer variants of POORAIM.

The tag is: *misp-galaxy:tool="POORAIM"*

POORAIM is also known as:

- Backdoor.APT.POORAIM

[View relationships graph](#)

POORAIM has relationships with:

- similar: *misp-galaxy:mitre-malware="POORAIM - S0216"* with *estimative-language:likelihood-probability="likely"*

## RICECURRENCY

RICECURRENCY is a Javascript based profiler used to fingerprint a victim's web browser and deliver malicious code in return. Browser, operating system, and Adobe Flash version are detected by RICECURRENCY, which may be a modified version of PluginDetect.

The tag is: *misp-galaxy:tool="RICECURRENCY"*

RICECURRENCY is also known as:

- Exploit.APT.RICECURRENCY

*Table 6914. Table References*

Links

[https://www2.fireeye.com/rs/848-DID-242/images/rpt\\_APT37.pdf](https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf)

# RUHAPPY

RUHAPPY is a destructive wiper tool seen on systems targeted by DOGCALL. It attempts to overwrite the MBR, causing the system not to boot. When victims' systems attempt to boot, the string 'Are you Happy?' is displayed. The malware is believed to be tied to the developers of DOGCALL and HAPPYWORK based on similar PDB paths in all three.

The tag is: *misp-galaxy:tool="RUHAPPY"*

RUHAPPY is also known as:

- FE\_APT\_Trojan\_Win32\_RUHAPPY\_1

Table 6915. Table References

<a href="https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf">https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf</a>

# SHUTTERSPEED

SHUTTERSPEED is a backdoor that can collect system information, acquire screenshots, and download/execute an arbitrary executable. SHUTTERSPEED typically requires an argument at runtime in order to execute fully. Observed arguments used by SHUTTERSPEED include: 'help', 'console', and 'sample'. The spear phishing email messages contained documents exploiting RTF vulnerability CVE-2017-0199. Many of the compromised domains in the command and control infrastructure are linked to South Korean companies. Most of these domains host a fake webpage pertinent to targets.

The tag is: *misp-galaxy:tool="SHUTTERSPEED"*

SHUTTERSPEED is also known as:

- FE\_APT\_Backdoor\_SHUTTERSPEED
- APT.Backdoor.SHUTTERSPEED

[View relationships graph](#)

SHUTTERSPEED has relationships with:

- similar: *misp-galaxy:mitre-malware="SHUTTERSPEED - S0217"* with *estimative-language:likelihood-probability="likely"*

# SLOWDRIFT

SLOWDRIFT is a launcher that communicates via cloud based infrastructure. It sends system information to the attacker command and control and then downloads and executes additional payloads. Lure documents distributing SLOWDRIFT were not tailored for specific victims, suggesting that TEMP.Reaper is attempting to widen its target base across multiple industries and in the private sector. SLOWDRIFT was seen being deployed against academic and strategic targets in South Korea using lure emails with documents leveraging the HWP exploit. Recent SLOWDRIFT samples were uncovered in June 2017 with lure documents pertaining to cyber crime prevention and news stories. These documents were last updated by the same actor who developed KARAE, POORAIM and ZUMKONG.

The tag is: *misp-galaxy:tool="SLOWDRIFT"*

SLOWDRIFT is also known as:

- FE\_APT\_Downloader\_Win\_SLOWDRIFT\_1
- FE\_APT\_Downloader\_Win\_SLOWDRIFT\_2
- APT.Downloader.SLOWDRIFT

[View relationships graph](#)

# RoyalCli

The RoyalCli backdoor appears to be an evolution of BS2005 and uses familiar encryption and encoding routines. The name RoyalCli was chosen by us due to a debugging path left in the binary:

'c:\users\wizard\documents\visual studio 2010\Projects\RoyalCli\Release\RoyalCli.pdb' RoyalCli and BS2005 both communicate with the attacker's command and control (C2) through Internet Explorer (IE) by using the COM interface IWebBrowser2. Due to the nature of the technique, this results in C2 data being cached to disk by the IE process; we'll get to this later.

The tag is: *misp-galaxy:tool="RoyalCli"*

## KillDisk Wiper

KillDisk, along with the multipurpose, cyberespionage-related BlackEnergy, was used in

cyberattacks in late December 2015 against Ukraine's energy sector as well as its banking, rail, and mining industries. The malware has since metamorphosed into a threat used for digital extortion, affecting Windows and Linux platforms. The note accompanying the ransomware versions, like in the case of Petya, was a ruse: Because KillDisk also overwrites and deletes files (and don't store the encryption keys on disk or online), recovering the scrambled files was out of the question. The new variant we found, however, does not include a ransom note.

The tag is: *misp-galaxy:tool="KillDisk Wiper"*

KillDisk Wiper is also known as:

- KillDisk

## GoScanSSH

During a recent Incident Response (IR) engagement, Talos identified a new malware family that was being used to compromise SSH servers exposed to the internet. This malware, which we have named GoScanSSH, was written using the Go programming language, and exhibited several

interesting characteristics. This is not the first malware family that Talos has observed that was written using Go. However, it is relatively uncommon to see malware written in this programming language. In this particular case, we also observed that the attacker created unique malware binaries for each host that was infected with the GoScanSSH malware. Additionally, the GoScanSSH command and control (C2) infrastructure was observed leveraging the Tor2Web proxy service in an attempt to make tracking the attacker-controlled infrastructure more difficult and resilient to takedowns.

The tag is: *misp-galaxy:tool="GoScanSSH"*

Table 6926. Table References

## Kwampirs

Once Orangethrow has infiltrated a victim's network, they deploy Trojan.Kwampirs, a backdoor Trojan that provides the attackers with remote access to the compromised computer. When executed, Kwampirs decrypts and extracts a copy of its main DLL payload from its resource section. Before writing the payload to disk, it inserts a randomly generated string into the middle of the

decrypted payload in an attempt to evade hash-based detections.

The tag is: *misp-galaxy:tool="Kwampirs"*

## Maikspy

We discovered a malware family called Maikspy — a multi-platform spyware that can steal users' private data. The spyware targets Windows and Android users, and first posed as an adult game named after a popular U.S.-based adult film actress. Maikspy, which is an alias that combines the name of the adult film actress and spyware, has been around since 2016.

The tag is: *misp-galaxy:tool="Maikspy"*

## FacexWorm

Facebook, Chrome, and cryptocurrency users should be on the lookout for a new malware strain named FacexWorm that infects victims for the purpose of stealing passwords, stealing cryptocurrency funds, running cryptojacking scripts, and spamming Facebook users. This new strain was spotted in late April by Trend Micro researchers and appears to be related to two other Facebook Messenger spam campaigns, one that took place last August, and another one from December 2017, the latter spreading the Digmime malware. Researchers say FacexWorm's modus operandi is similar to the previous two campaigns, but with the addition of new techniques aimed at cryptocurrency users.

<a href="https://www.intezer.com/iron-cybercrime-group-under-the-scope-2/">https://www.intezer.com/iron-cybercrime-group-under-the-scope-2/</a>

## Brambul

Brambul malware is a malicious Windows 32-bit SMB worm that functions as a service dynamic link library file or a portable executable file often dropped and installed onto victims' networks by dropper malware. When executed, the malware attempts to establish contact with victim systems and IP addresses on victims' local subnets. If successful, the application attempts to gain unauthorized access via the SMB protocol (ports 139 and 445) by launching brute-force password

attacks using a list of embedded passwords. Additionally, the malware generates random IP addresses for further attacks.

## BabaYaga

The group behind BabaYaga —believed to be Russian-speaking hackers— uses this malware to inject sites with special keyboards to drive SEO traffic to hidden pages on compromised sites. These pages are then used to redirect users to affiliate marketing links, where if the user purchases advertised goods, the hackers also make a profit. The malware per-se is comprised of two modules—one that injects the spam content inside the compromised sites, and a backdoor module that gives attackers control over an infected site at any time. The intricacies of both modules are detailed in much more depth in this 26-page report authored by Defiant (formerly known as WordFence), the security firm which dissected the malware's more recent versions. "[BabaYaga] is relatively well-written, and it demonstrates that the author has some understanding of software development

challenges, like code deployment, performance and management," Defiant researchers say. "It can also infect Joomla and Drupal sites, or even generic PHP sites, but it is most fully developed around Wordpress."

The tag is: *misp-galaxy:tool="BabaYaga"*

## InvisiMole

Except for the malware's binary file, very little is known of who's behind it, how it spreads, or in what types of campaigns has this been used.

"Our telemetry indicates that the malicious actors behind this malware have been active at least since 2013, yet the cyber-espionage tool was never analyzed nor detected until discovered by ESET products on compromised computers in Ukraine and Russia," said ESET researcher Zuzana Hromcová, who recently penned an in-depth report about this new threat.

"All infection vectors are possible, including installation facilitated by physical access to the machine," Hromcová added.

Typical to malware used in highly-targeted attacks, the malware has been stripped of most clues that could lead researchers back to its author. With the exception of one file (dating to October 13, 2013), all compilation dates have been stripped and replaced with zeros, giving little clues regarding its timeline and lifespan.

Furthermore, the malware is some clever piece of coding in itself, as it's comprised of two modules, both with their own set of spying features, but which can also help each other in exfiltrating data.

The tag is: *misp-galaxy:tool="InvisiMole"*

## Roaming Mantis

Roaming Mantis malware is designed for distribution through a simple, but very efficient trick based on a technique known as DNS hijacking. When a user attempts to access any website via a compromised router, they will be redirected to a malicious website. For example, if a user were to navigate to [www.securelist.com](http://www.securelist.com) using a web browser, the browser would be redirected to a rogue server which has nothing to do with the security research blog. As long as the browser displays the original URL, users are likely to believe the website is genuine. The web page from the rogue server displays the popup message: To better experience the browsing, update to the latest chrome version.

## PLEAD Downloader

PLEAD is referred to both as a name of malware including TSCookie and its attack campaign. PLEAD has two kinds – RAT (Remote Access Tool) and downloader. The RAT operates based on commands that are provided from C&C servers. On the other hand, PLEAD downloader downloads modules and runs it on memory in the same way as TSCookie does.

The tag is: *misp-galaxy:tool="PLEAD Downloader"*

## ClipboardWalletHijacker

The malware's purpose is to intercept content recorded in the Windows clipboard, look for strings resembling Bitcoin and Ethereum addresses, and replace them with ones owned by the malware's authors. ClipboardWalletHijacker's end-plan is to hijack BTC and ETH transactions, so victims unwittingly send funds to the malware's authors.

The tag is: *misp-galaxy:tool="ClipboardWalletHijacker"*

# Olympic Destroyer

The Winter Olympics this year is being held in Pyeongchang, South Korea. The Guardian, a UK Newspaper reported an article that suggested the Olympic computer systems suffered technical issues during the opening ceremony. Officials at the games confirmed some technical issues to non-critical systems and they completed recovery within around 12 hours. Sunday 11th February the Olympic games officials confirmed a cyber attack occurred but did not comment or speculate further. Talos have identified the samples, with moderate confidence, used in this attack. The infection vector is currently unknown as we continue to investigate. The samples identified, however, are not from adversaries looking for information from the games but instead they are aimed to disrupt the games. The samples analysed appear to perform only destructive functionality. There does not appear to be any exfiltration of data. Analysis shows that actors are again favouring legitimate pieces of software as PsExec functionality is identified within the sample. The destructive nature of this malware aims to render the machine unusable by deleting shadow copies, event logs and trying to use PsExec & WMI to further move through the environment. This is something we have witnessed previously with BadRabbit and Nyetya.

## DDKONG

The malware in question is configured with the following three exported functions: ServiceMain, Rundll32Call, DllEntryPoint. The ServiceMain exported function indicates that this DLL is expected to be loaded as a service. If this function is successfully loaded, it will ultimately spawn a new instance of itself with the Rundll32Call export via a call to rundll32.exe. The Rundll32Call exported function begins by creating a named event named 'RunOnce'. This event ensures that only a single instance of DDKong is executed at a given time. If this is the only instance of DDKong running at the time, the malware continues. If it's not, it dies. This ensures that only a single instance of DDKong is executed at a given time. DDKong attempts to decode an embedded configuration using a single byte XOR key of 0xC3. After this configuration is decoded and parsed, DDKONG proceeds to send a beacon to the configured remote server via a raw TCP connection. The packet has a header of length 32 and an optional payload. In the beacon, no payload is provided, and as such, the length of this packet is set to zero. After it sends the beacon, the malware expects a response command of either 0x4 or 0x6. Both responses instruct the malware to download and load a remote plugin. In the event 0x4 is specified, the malware is instructed to load the exported 'InitAction' function. If 0x6 is specified, the malware is instructed to load the exported 'KernelDllCmdAction' function. Prior to downloading the plugin, the malware downloads a buffer that is concatenated with the embedded configuration and ultimately provided to the plugin at runtime. As we can see in the above text, two full file paths are included in this buffer, providing us with insight into the original malware family's name, as well as the author. After this buffer is collected, the malware downloads the plugin and loads the appropriate function. This plugin provides the attacker with the ability to both list files and download/upload files on the victim machine.

The tag is: *misp-galaxy:tool="DDKONG"*

## PLAINTEE

This sample is configured with three exported functions: Add, Sub, DllEntryPoint. The DLL expects the export named 'Add' to be used when initially loaded. When this function is executed PLAINTEE executes a command in a new process to add persistence. Next, the malware calls the 'Sub' function

which begins by spawning a mutex named 'microsoftfuckedupb' to ensure only a single instance is running at a given time. In addition, PLAINTEE will create a unique GUID via a call to CoCreateGuid() to be used as an identifier for the victim. The malware then proceeds to collect general system enumeration data about the infected machine and enters a loop where it will decode an embedded config blob and send an initial beacon to the C2 server. The configuration blob is encoded using a simple single-byte XOR scheme. The first byte of the string is used as the XOR key to in turn decode the remainder of the data. The malware then proceeds to beacon to the configured port via a custom UDP protocol. The network traffic is encoded in a similar fashion, with a random byte being selected as the first byte, which is then used to decode the remainder of the packet via XOR. This beacon is continuously sent out until a valid response is obtained from the C2 server (there is no sleep timer set). After the initial beacon, there is a two second delay in between all other requests made. This response is expected to have a return command of 0x66660002 and to contain the same GUID that was sent to the C2 server. Once this response is received, the malware spawns several new threads, with different Command parameters, with the overall objective of loading and executing a new plugin that is to be received from the C2 server. During a file analysis of PLAINTEE in WildFire, we observed the attackers download and execute a plugin during the runtime for that sample. PLAINTEE expects the downloaded plugin to be a DLL with an export function of either 'shell' or 'file'. The plugin uses the same network protocol as PLAINTEE and so we were able to trivially decode further commands that were sent. The following commands were observed: tasklist, ipconfig /all. The attacker performed these two commands 33 seconds apart. As automated commands are typically performed more quickly this indicates that they may have been sent manually by the attacker.

## Bisonal

In early May, Unit 42 discovered an attack campaign against at least one defense company in Russia and one unidentified organization in South Korea delivering a variant of Bisonal malware. While not previously publicly documented, the variant has been in the wild since at least 2014. There are three primary differences between it and older Bisonal malware including a different cipher and encryption for C2 communication, and a large rewrite of the code for both network communication and maintaining persistence. To date, we have only collected 14 samples of this variant, indicating it may be sparingly used. The adversary behind these attacks lured the targets into launching the Microsoft Windows executable malware by masquerading it as a PDF file (using a fake PDF icon) and reusing publicly available data for the decoy PDF file's contents. Attacks using Bisonal have been blogged about in the past. In 2013, both COSEINC and FireEye revealed attacks using Bisonal against Japanese organizations . In October 2017, AhnLab published a report called "Operation Bitter Biscuit," an attack campaign against South Korea, Japan, India and Russia using Bisonal and its successors, Bioazih and Dexbia.

## Sekur

Sekur has been CARBON SPIDER's primary tool for several years, although usage over the last year appears to have declined. It contains all the functionality you would expect from a RAT, allowing the adversary to execute commands, manage the file system, manage processes, and collect data. In addition, it can record videos of victim sessions, log keystrokes, enable remote desktop, or install Ammy Admin or VNC modules. From July 2014 on, samples were compiled with the capability to target Epicor POS systems and to collect credit card data.

The tag is: *misp-galaxy:tool="Sekur"*

Table 6953. Table References

Links

<https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/>

## Agent ORM

Agent ORM began circulating alongside Skeur in campaigns throughout the second half of 2015. The malware collects basic system information and is able to take screenshots of victim systems. It is used to download next-stage payloads when systems of interest are identified. It is strongly suspected that Agent ORM has been deprecated in favor of script-based first-stage implants (VB Flash, JS Flash, and Bateleur).

The tag is: *misp-galaxy:tool="Agent ORM"*

Agent ORM is also known as:

- Tosliph
- DRIFTPIN

Table 6954. Table References

Links

<https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/>

## VB Flash

VB Flash was first observed being deployed alongside Agent ORM in September 2015. It is likely that this was developed as a replacement to Agent ORM and contained similar capabilities. The first observed instance of VB Flash included comments and was easy to analyze—later versions soon began to integrate multiple layers of obfuscation. Several versions of VB Flash were developed including ones that utilized Google Forms, Google Macros, and Google Spreadsheets together to make a command-and-control (C2) channel. This variant would POST victim data to a specified Google form, then make a request to a Google macro script, receiving an address for a Google Spreadsheet from which to request commands.

The tag is: *misp-galaxy:tool="VB Flash"*

VB Flash is also known as:

- HALFBAKED

[View relationships graph](#)

VB Flash has relationships with:

- similar: `misp-galaxy:mitre-malware="HALFBAKED - S0151"` with estimative-

language:likelihood-probability="likely"

Table 6955. Table References

Links
<a href="https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/">https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/</a>

## JS Flash

JS Flash capabilities closely resemble those of VB Flash and leverage interesting techniques in deployment via batch scripts embedded as OLE objects in malicious documents. Many iterations of JS Flash were observed being tested before deployment, containing minor changes to obfuscation and more complex additions, such as the ability to download TinyMet (a cutdown of the Metasploit Meterpreter payload). PowerShell was also used heavily for the execution of commands and arbitrary script execution. No JS Flash samples were observed being deployed after November 2017.

The tag is: *misp-galaxy:tool="JS Flash"*

JS Flash is also known as:

- JavaScript variant of HALFBAKED

Table 6956. Table References

Links
<a href="https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/">https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/</a>

## Bateleur

Bateleur deployments began not long after JS Flash and were also written in JavaScript. Deployments were more infrequent and testing was not observed. It is likely that Bateleur was run in parallel as an alternative tool and eventually replaced JS Flash as CARBON SPIDER's first stage tool of choice. Although much simpler in design than JS Flash, all executing out of a single script with more basic obfuscation, Bateleur has a wealth of capabilities—including the ability to download arbitrary scripts and executables, deploy TinyMet, execute commands via PowerShell, deploy a credential stealer, and collect victim system information such as screenshots.

## BISKVIT

The BISKVIT Trojan is a multi-component malware written in C#. We dubbed this malware BISKVIT based on the namespaces used in the code, which contain the word “biscuit”. Unfortunately, there is already an existing unrelated malware called BISCUIT, so BISKVIT is used instead, which is the Russian translation of biscuit.

The tag is: *misp-galaxy:tool="BISKVIT"*

*Table 6970. Table References*

## Links

<https://www.fortinet.com/blog/threat-research/russian-army-exhibition-decoy-leads-to-new-biskvit-malware.html>

## Sirefef

This family of malware uses stealth to hide its presence on your PC. Trojans in this family can do different things, including: -Downloading and running other files -Contacting remote hosts -Disabling security features Members of the family can also change search results, which can generate money for the hackers who use Sirefef.

The tag is: *misp-galaxy:tool="Sirefef"*

Sirefef is also known as:

- Win32/Sirefef

*Table 6971. Table References*

## Links

<https://www.microsoft.com/en-us/wdsi/threats/malware-encyclopedia-description?Name=Win32%2Fsirefef>

## MagentoCore Malware

A Dutch security researcher has lifted the veil on a massive website hacking campaign that has infected 7,339 Magento stores with a script that collects payment card data from people shopping on the sites. The script is what industry experts call a "payment card scraper" or "skimmer." Hackers breach sites and modify their source code to load the script along with its legitimate files. The script usually loads on store checkout pages and secretly records payment card details entered in payment forms, data that it later sends to a server under the hacker's control.

The tag is: *misp-galaxy:tool="MagentoCore Malware"*

*Table 6972. Table References*

## Links

<https://www.bleepingcomputer.com/news/security/magentocore-malware-found-on-7-339-magento-stores/>

## NotPetya

Threat actors deploy a tool, called NotPetya, with the purpose of encrypting data on victims' machines and rendering it unusable. The malware was spread through tax software that companies and individuals require for filing taxes in Ukraine. Australia, Estonia, Denmark, Lithuania, Ukraine, the United Kingdom, and the United States issued statements attributing NotPetya to Russian state-sponsored actors. In June 2018, the United States sanctioned Russian

organizations believed to have assisted the Russian state-sponsored actors with the operation.

The tag is: *misp-galaxy:tool="NotPetya"*

NotPetya is also known as:

- Not Petya

## Xbash

Xbash is a malware family that is targeting Linux and Microsoft Windows servers. We can tie this malware, which we have named Xbash, to the Iron Group, a threat actor group known for previous ransomware attacks. Xbash was developed using Python and converted into self-contained Linux ELF executables by abusing the legitimate tool PyInstaller for distribution. Xbash aimed on discovering unprotected services, deleting victim's MySQL, PostgreSQL and MongoDB databases, and ransom for Bitcoins. Linux based systems are targeted for ransomware and botnet capabilities. The ransomware targets and deletes linux databases and there is no evidence of any functionality that makes recovery even possible by payment the ransom. Where as, windows based systems are targeted for coinmining & self-propagating capabilities. Xbash spreads by attacking weak passwords and unpatched vulnerabilities.

The tag is: *misp-galaxy:tool="Xbash"*

*Table 6974. Table References*

## FASTCash

Treasury has identified a sophisticated cyber-enabled ATM cash out campaign we are calling FASTCash. FASTCash has been active since late 2016 targeting banks in Africa and Asia to remotely compromise payment switch application servers within banks to facilitate fraudulent transactions, primarily involving ATMs, to steal cash equivalent to tens of millions of dollars. FBI has attributed malware used in this campaign to the North Korean government. We expect FASTCash to continue targeting retail payment systems vulnerable to remote exploitation.

The tag is: *misp-galaxy:tool="FASTCash"*

## Zebrocy

Zebrocy is a tool used by APT28, which has been observed since late 2015. The communications module used by Zebrocy transmits using HTTP. The implant has key logging and file exfiltration functionality and utilises a file collection capability that identifies files with particular extensions.

The tag is: *misp-galaxy:tool="Zebrocy"*

Zebrocy is also known as:

- Zekapab

## CoalaBot

The tag is: *misp-galaxy:tool="CoalaBot"*

## DanderSpritz

DanderSpritz consists entirely of plugins to gather intelligence, use exploits and examine already controlled machines. It is written in Java and provides a graphical windows interface similar to botnets administrative panels as well as a Metasploit-like console interface. It also includes its own backdoors and plugins for not-FuzzBunch-controlled victims DanderSpritz is the framework for controlling infected machines, different from FuZZbuNch as the latter provides a limited toolkit for the post-exploitation stage with specific functions such as DisableSecurity and EnableSecurity for DarkPulsar. For DanderSpritz works for a larger range of backdoors, using PeedleCheap in the victim to enable operators launching plugins. PeedleCheap is a plugin of DanderSpritz which can be used to configure implants and connect to infected machines. Once a connection is established all DanderSpritz post-exploitation features become available.

The tag is: *misp-galaxy:tool="DanderSpritz"*

DanderSpritz is also known as:

- Dander Spritz

## GhostMiner

GhostMiner is a new cryptocurrency mining malware. By the end of March 2018, a new variant of mining malware was detected targeting MSSQL, phpMyAdmin, and Oracle WebLogic servers. The sample uses Powershell to execute code with volatile resources and scans the server's processes to detect and stop other miners that might have been running prior to execution. The fileless malware has become more popular in the last years. The malicious code runs directly in main memory

without writing any file on disk, where an antivirus engine could detect it.

## KingMiner

A recently discovered cryptomining operation forces access to Windows servers to use their CPU cycles for mining Monero coins. Detected six months ago, the activity went through multiple stages of evolution. Since it was spotted in mid-June, the malware received two updates and the number of attacks keeps increasing. The researchers at CheckPoint analyzed the new threat and gave it the name KingMiner. They found that it targets Microsoft IIS and SQL Servers in particular and runs a brute-force attack to gain access. Once in, the malware determines the CPU architecture and checks for older versions of itself to remove them.

# SpicyOmelette

In 2018, CTU researchers observed several GOLD KINGSWOOD campaigns involving SpicyOmelette, a tool used by the group during initial exploitation of an organization. This sophisticated JavaScript remote access tool is generally delivered via phishing, and it uses multiple defense evasion techniques to hinder prevention and detection activities. GOLD KINGSWOOD delivered SpicyOmelette through a phishing email containing a shortened link that appeared to be a PDF document attachment. When clicked, the link used the Google AppEngine to redirect the system to a GOLD KINGSWOOD-controlled Amazon Web Services (AWS) URL that installed a signed JavaScript file, which was SpicyOmelette.

## OSX/Shlayer

The initial Trojan horse infection (the fake Flash Player installer) component of OSX/Shlayer leverages shell scripts to download additional malware or adware onto the infected system. The primary goal of OSX/Shlayer is to download and install adware onto an infected Mac. Although "adware" may not sound like a big deal, it can be a lot more harmful than the name implies; be sure to watch our aforementioned interview with Amit Serper to learn more about one particular example of malicious Mac adware. At least one variant of the malware also appears to exhibit an interesting behavior: It checks whether one of several Mac anti-virus products is installed.

## BabyShark

BabyShark is a relatively new malware. The earliest sample we found from open source repositories and our internal data sets was seen in November 2018. The malware is launched by executing the first stage HTA from a remote location, thus it can be delivered via different file types including PE files as well as malicious documents. It exfiltrates system information to C2 server, maintains persistence on the system, and waits for further instruction from the operator.

The tag is: *misp-galaxy:tool="BabyShark"*

*Table 7003. Table References*

# StealthWorker

Hackers are running a new campaign which drops the StealthWorker brute-force malware on Windows and Linux machines that end up being used to brute force other computers in a series of distributed brute force attacks. As unearthed by FortiGuard Labs' Rommel Joven, the StealthWorker Golang-based brute forcer (also known as GoBrut) discovered by Malwarebytes at the end of February is actively being used to target and compromise multiple platforms. StealthWorker was previously connected to a number of compromised Magento-powered e-commerce websites on which attackers infiltrated skimmers designed to exfiltrate both payment and personal information. As later discovered, the malware is capable of exploiting a number of vulnerabilities in to infiltrate Magento, phpMyAdmin, and cPanel Content Management Systems (CMSs), as well as brute force its way in if everything else fails.

The tag is: *misp-galaxy:tool="StealthWorker"*

## Karkoff

In addition to increased reports of threat activity, we have also discovered new evidence that the threat actors behind the DNSpionage campaign continue to change their tactics, likely in an attempt to improve the efficacy of their operations. In February, we discovered some changes to the actors' tactics, techniques and procedures (TTPs), including the use of a new reconnaissance phase that selectively chooses which targets to infect with malware. In April 2019, we also discovered the actors using a new malware, which we are calling Karkoff.

The tag is: `misp-galaxy:tool="Karkoff"`

Table 7009. Table References

## Links

<https://blog.talosintelligence.com/2019/04/dnspionage-brings-out-karkoff.html>

# KimJongRAT

We conclude that this RAT/stealer is efficient and was also really interesting to analyse. Furthermore, the creator made efforts to look Korean, for example the author of the .pdf file is Kim Song Chol. He is the brother of Kim Jong-un, the leader of North Korea. We identified that the author of a variant of this stealer is another brother of Kim Jong-un. Maybe the author named every variant with the name of each brother. After some searches using Google, we identified an old variant of this malware here: <http://contagiodump.blogspot.ca/2010/10/oct-08-cve-2010-2883-pdf-nuclear.html>. The code of the malware available on the blog is close to our case but with fewer features. In 2010, the password of the Gmail account was futurekimkim. Three years ago, the author was already fixated on the Kim family... The language of the resource stored in the .dll file is Korean (LANG\_KOREAN). The owner of the gmail mailbox is laoshi135.zhang and the secret question of this account is in Korean too. We don't know if the malware truly comes from Korea. However, thanks to these factors, we decided to name this sample KimJongRAT/Stealer.

The tag is: *misp-galaxy:tool="KimJongRAT"*

## Reaver

Unit 42 has discovered a new malware family we've named "Reaver" with ties to attackers who use SunOrcal malware. SunOrcal activity has been documented to at least 2013, and based on metadata surrounding some of the C2s, may have been active as early as 2010. The new family appears to have been in the wild since late 2016 and to date we have only identified 10 unique samples, indicating it may be sparingly used. Reaver is also somewhat unique in the fact that its final payload is in the form of a Control panel item, or CPL file. To date, only 0.006% of all malware seen by Palo Alto Networks employs this technique, indicating that it is in fact fairly rare.

The tag is: *misp-galaxy:tool="Reaver"*

## SURTR

The Citizen Lab analyzed a malicious email sent to Tibetan organizations in June 2013. The email in question purported to be from a prominent member of the Tibetan community and repurposed content from a community mailing list. Attached to the email were what appeared to be three Microsoft Word documents (.doc), but which were trojaned with a malware family we call "Surtr".<sup>1</sup> All three attachments drop the exact same malware. We have seen the Surtr malware family used in attacks on Tibetan groups dating back to November 2012.

## SunOrcal

SunOrcal is a trojan malware family whose activity dates back to at least 2013. A version discovered in November 2017 incorporates steganography techniques and can collect C2 information via GitHub, obscuring its C2 infrastructure and evading detection using the legitimate site for its first beacon. The threat actors have targeted users in the Vietnam area, spreading phishing emails containing malicious documents purportedly regarding South China Sea disputes. The new SunOrcal version has also been used with the recently discovered Reaver trojan and the original SunOrcal version. Some of the recent activity also incorporates the use of the Surtr malware.

The tag is: *misp-galaxy:tool="SunOrcal"*

## Bookworm

Threat actors have delivered Bookworm as a payload in attacks on targets in Thailand. Readers who are interested in this campaign should start with our first blog that lays out the overall functionality of the malware and introduces its many components. Unit 42 does not have detailed targeting information for all known Bookworm samples, but we are aware of attempted attacks on at least two branches of government in Thailand. We speculate that other attacks delivering Bookworm were also targeting organizations in Thailand based on the contents of the associated decoys documents, as well as several of the dynamic DNS domain names used to host C2 servers that contain the words “Thai” or “Thailand”. Analysis of compromised systems seen communicating with Bookworm C2 servers also confirms our speculation on targeting with a majority of systems existing within Thailand.

The tag is: *misp-galaxy:tool="Bookworm"*

<a href="https://www.welivesecurity.com/2019/08/01/banking-trojans-amavaldo/">https://www.welivesecurity.com/2019/08/01/banking-trojans-amavaldo/</a>

## TVSPY

hacker going by the handle Mr. Burns. He also created something similar called RMS, which

behaves very much like the TVSPY builder. “RMS/TVSPY continues to be developed, with a new version being posted by the developer/reseller on a regular basis,” Damballa researchers noted. “In fact, the legitimate RMS version developed by TektonIT and the version posted in criminal forums appear to be identical. TVSPY seems to be merely a modification of RMS to utilize TeamViewer infrastructure and a command-and-control interface manageable through the Web.

The tag is: *misp-galaxy:tool="TVSPY"*

TVSPY is also known as:

- TVRAT
- SpY-Agent
- teamspy

## COMpfun

The COMpfun malware was initially documented by G-DATA in 2014. Although G-DATA didn’t identify which actor was using this malware, Kaspersky tentatively linked it to the Turla APT, based on the victimology. Our telemetry indicates that the current campaign using Reductor started at the end of April 2019 and remained active at the time of writing (August 2019). We identified targets in Russia and Belarus.

The tag is: *misp-galaxy:tool="COMpfun"*

<a href="https://www.gdatasoftware.com/blog/2014/10/23941-com-object-hijacking-the-discreet-way-of-persistence">https://www.gdatasoftware.com/blog/2014/10/23941-com-object-hijacking-the-discreet-way-of-persistence</a>

## Reductor

We called these new modules ‘Reductor’ after a .pdb path left in some samples. Besides typical RAT functions such as uploading, downloading and executing files, Reductor’s authors put a lot of effort into manipulating digital certificates and marking outbound TLS traffic with unique host-related identifiers. The Kaspersky Attribution Engine shows strong code similarities between this family and the COMPfun Trojan. Moreover, further research showed that the original COMPfun Trojan most probably is used as a downloader in one of the distribution schemes. Based on these similarities, we’re quite sure the new malware was developed by the COMPfun authors.

The tag is: *misp-galaxy:tool="Reductor"*

Table 7021. Table References

## DePriMon

DePriMon is a malicious downloader, with several stages and using many non-traditional techniques. To achieve persistence, the malware registers a new local port monitor – a trick falling under the “Port Monitors” technique in the MITRE ATT&CK knowledgebase. For that, the malware uses the “Windows Default Print Monitor” name; that’s why we have named it DePriMon. Due to its complexity and modular architecture, we consider it to be a framework.

The tag is: *misp-galaxy:tool="DePriMon"*

Table 7023. Table References

## Private Internet Access

Private Internet Access provides state of the art, multi-layered security with advanced privacy protection using VPN tunneling.

The tag is: *misp-galaxy:tool="Private Internet Access"*

Private Internet Access is also known as:

- PIA

Table 7024. Table References

Links
<a href="https://www.privateinternetaccess.com/">https://www.privateinternetaccess.com/</a>

## Netcat

Reads from and writes to network connections using TCP or UDP protocols.

The tag is: *misp-galaxy:tool="Netcat"*

## NBTScan

NBTScan is a program for scanning IP networks for NetBIOS name information (similar to what the Windows nbtstat tool provides against single hosts). It sends a NetBIOS status query to each address in a supplied range and lists received information in human readable form. For each responded host it lists IP address, NetBIOS computer name, logged-in user name and MAC address.

The tag is: *misp-galaxy:tool="NBTScan"*

Table 7025. Table References

Links
<a href="https://sectools.org/tool/nbtscan/">https://sectools.org/tool/nbtscan/</a>

## PowerGhost

PowerGhost is capable of stealthily establishing itself in a system and spreading across large corporate networks infecting both workstations and servers. This type of hidden consolidation is

typical of miners: the more machines that get infected and the longer they remain that way, the greater the attacker's profits. Therefore, it's not uncommon to see clean software being infected with a miner; the popularity of the legitimate software serves to promote the malware's proliferation. The creators of PowerGhost, however, went further and started using fileless techniques to establish the illegal miner within the victim system.

The tag is: *misp-galaxy:tool="PowerGhost"*

<a href="https://www.ibm.com/downloads/cas/OAJ4VZNJ">https://www.ibm.com/downloads/cas/OAJ4VZNJ</a>

## **Dustman**

At the heart of the recent Bapco attack is a new strain of malware named Dustman. According to an analysis by Saudi Arabia's cyber-security agency, Dustman is a so-called data wiper — malware designed to delete data on infected computers, once launched into execution. Dustman represents the third different data-wiping malware linked to the Tehran regime. Iranian state-backed hackers have a long history of developing data-wiping malware.

The tag is: *misp-galaxy:tool="Dustman"*

# GoldMax

Written in Go, GoldMax acts as command-and-control backdoor for the actor. It uses several different techniques to obfuscate its actions and evade detection. The malware writes an encrypted configuration file to disk, where the file name and AES-256 cipher keys are unique per implant and based on environmental variables and information about the network where it is running. GoldMax establishes a secure session key with its C2 and uses that key to securely communicate with the C2, preventing non-GoldMax-initiated connections from receiving and identifying malicious traffic. The C2 can send commands to be launched for various operations, including native OS commands, via psuedo-randomly generated cookies. The hardcoded cookies are unique to each implant, appearing to be random strings but mapping to victims and operations on the actor side.

The tag is: `misp-galaxy:tool="GoldMax"`

## GoldFinder

Tool written in Go, GoldFinder was most likely used as a custom HTTP tracer tool that logs the route or hops that a packet takes to reach a hardcoded C2 server. When launched, the malware issues an HTTP request for a hardcoded IP address (e.g., hxxps://185[.]225[.]69[.]69/) and logs the HTTP response to a plaintext log file (e.g., loglog.txt created in the present working directory). GoldFinder uses the following hardcoded labels to store the request and response information in the log file:

## Sibot

Sibot is a dual-purpose malware implemented in VBScript. It is designed to achieve persistence on the infected machine then download and execute a payload from a remote C2 server. The VBScript file is given a name that impersonates legitimate Windows tasks and is either stored in the registry of the compromised system or in an obfuscated format on disk. The VBScript is then run via a scheduled task.

## Matanbuchus

Matanbuchus is a loader promoted by BelialDemon. It can launch an EXE or DLL file in memory, leverage schtasks.exe to add or modify task schedules, and launch custom PowerShell commands, among other capabilities. Attackers use a Microsoft Excel document as the initial vector to drop the Matanbuchus Loader DLL.

## BLUELIGHT

It is likely that BLUELIGHT is used as a secondary payload following successful delivery of Cobalt Strike.

## ESPecter bootkit

ESET researchers have analyzed a previously undocumented, real-world UEFI bootkit that persists on the EFI System Partition (ESP). The bootkit, which we've named ESPecter, can bypass Windows Driver Signature Enforcement to load its own unsigned driver, which facilitates its espionage activities. Alongside Kaspersky's recent discovery of the unrelated FinSpy bootkit, it is now safe to say that real-world UEFI threats are no longer limited to SPI flash implants, as used by Lojax.

## Shark

Shark is a 32-bit executable written in C# and .NET. To run Shark, a parameter is passed on the command line that includes the executable's filename. Shark generates a mutex that uses the executable's filename as the mutex value. The mutex likely ensures Shark does not execute on a

machine where it is already running and that the correct version of Shark is executed.

## BadPotato

BadPotato leaks a system token handle through the MS RPN API, which can be used to get NT AUTHORITY\SYSTEM access.
