## CyberGate

According to Subex Secure, CyberGate is a Remote Access Trojan (RAT) that allows an attacker to gain unauthorized access to the victim's system. Attackers can remotely connect to the compromised system from anywhere around the world. The Malware author generally uses this program to steal private information like passwords, files, etc. It might also be used to install malicious software on the compromised systems.

The tag is: *misp-galaxy:malpedia="CyberGate"*

CyberGate is also known as:

- Rebhip

## DADJOKE

DADJOKE was discovered as being distributed via email, targeting a South-East Asian Ministry of Defense. It is delivered as an embedded EXE file in a Word document using remote templates and a unique macro using multiple GET requests. The payload is deployed using load-order hijacking with a benign Windows Defender executable. Stage 1 has only beacon+download functionality, made to

look like a PNG file. Additional analysis by Kaspersky found 8 campaigns over 2019 and no activity prior to January 2019, DADJOKE is attributed with medium confidence to APT40.

## DanaBot

Proofpoints describes DanaBot as the latest example of malware focused on persistence and stealing useful information that can later be monetized rather than demanding an immediate ransom from victims. The social engineering in the low-volume DanaBot campaigns we have observed so far has been well-crafted, again pointing to a renewed focus on “quality over quantity” in email-based threats. DanaBot’s modular nature enables it to download additional components, increasing the flexibility and robust stealing and remote monitoring capabilities of this banker.

## danbot

Danbot is a backdoor malware that is originally written in C#. Recent versions of Danbot are written in C++. Danbot is capable of giving a remote attacker remote access features such as running a cmd command, upload and download files, move and copy files. The backdoor commands are transmitted by either using HTTP or DNS protocols. The commands are encapsulated in an XML file that gets stored in disk. Danbot's backdoor component picks up the XML file where it decodes and decrypts the commands.

## DarkComet

DarkComet is one of the most famous RATs, developed by Jean-Pierre Lesueur in 2008. After being used in the Syrian civil war in 2011, Lesueur decided to stop developing the trojan. Indeed, DarkComet is able to enable control over a compromised system through use of a simple graphic user interface. Experts think that this user friendliness is the key of its mass success.

## Darksky

DarkSky is a botnet that is capable of downloading malware, conducting a number of network and application-layer distributed denial-of-service (DDoS) attacks, and detecting and evading security controls, such as sandboxes and virtual machines. It is advertised for sale on the dark web for \$20. Much of the malware that DarkSky has available to download onto targeted systems is associated with cryptocurrency-mining activity. The DDoS attacks that DarkSky can perform include DNS amplification attacks, TCP (SYN) flood, UDP flood, and HTTP flood. The botnet can also perform a check to determine whether or not the DDoS attack succeeded and turn infected systems into a SOCKS/HTTP proxy to route traffic to a remote server.

## DarkTequila

Dark Tequila is a complex malicious campaign targeting Mexican users, with the primary purpose of stealing financial information, as well as login credentials to popular websites that range from code versioning repositories to public file storage accounts and domain registrars.

## DarkTortilla

DarkTortilla is a complex and highly configurable .NET-based crypter that has possibly been active since at least August 2015. It typically delivers popular information stealers and remote access trojans (RATs) such as AgentTesla, AsyncRat, NanoCore, and RedLine. While it appears to primarily deliver commodity malware, Secureworks® Counter Threat Unit™ (CTU) researchers identified DarkTortilla samples delivering targeted payloads such as Cobalt Strike and Metasploit. It can also deliver "addon packages" such as additional malicious payloads, benign decoy documents, and executables. It features robust anti-analysis and anti-tamper controls that can make detection, analysis, and eradication challenging.

From January 2021 through May 2022, an average of 93 unique DarkTortilla samples per week were uploaded to the VirusTotal analysis service. Code similarities suggest possible links between DarkTortilla and other malware: a crypter operated by the RATs Crew threat group, which was active between 2008 and 2012, and the Gameloader malware that emerged in 2021.

## Defray

Defray is ransomware that appeared in 2017, and is targeted ransomware, mainly on the healthcare vertical.

The distribution of Defray has several notable characteristics: According to Proofpoint: " Defray is currently being spread via Microsoft Word document attachments in email The campaigns are as small as several messages each The lures are custom crafted to appeal to the intended set of potential victims The recipients are individuals or distribution lists, e.g., group@ and websupport@ Geographic targeting is in the UK and US Vertical targeting varies by campaign and is narrow and selective "

<a href="https://malpedia.caad.fkie.fraunhofer.de/details/win.dented">https://malpedia.caad.fkie.fraunhofer.de/details/win.dented</a>

## Deprimon

According to ESET Research, DePriMon is a malicious downloader, with several stages and using many non-traditional techniques. To achieve persistence, the malware registers a new local port monitor – a trick falling under the “Port Monitors” technique in the MITRE ATT&CK knowledgebase. For that, the malware uses the “Windows Default Print Monitor” name; that’s why we have named it DePriMon. Due to its complexity and modular architecture, researcher believe it to be a framework.

DePriMon has been active since at least March 2017. DePriMon was detected in a private company, based in Central Europe, and at dozens of computers in the Middle East.

The tag is: *misp-galaxy:malpedia="Deprimon"*

Deprimon is also known as:

## Dexphot

Dexphot is a cryptominer Malware attacking windows machines to gain profit from their resources. It implements many techniques to evade common security systems and a file-less technology to become inject malicious behavior. According to Microsoft the Dexphot It hijacked legitimate system processes to disguise malicious activity. If not stopped, Dexphot is equipped by monitoring services and scheduled tasks triggering re-infection when defenders attempt to remove the malware.

## Dharma

According to MalwareBytes, the Dharma Ransomware family is installed manually by attackers hacking into computers over Remote Desktop Protocol Services (RDP). The attackers will scan the Internet for computers running RDP, usually on TCP port 3389, and then attempt to brute force the password for the computer.

Once they gain access to the computer they will install the ransomware and let it encrypt the computer. If the attackers are able to encrypt other computers on the network, they will attempt to do so as well.

The tag is: *misp-galaxy:malpedia="Dharma"*

Dharma is also known as:

- Arena
- Crysis
- Wadhrama
- ncov

## DMSniff

DMSniff is a point-of-sale malware previously only privately sold. It has been used in breaches of small- and medium-sized businesses in the restaurant and entertainment industries. It uses a domain generation algorithm (DGA) to create lists of command-and-control domains on the fly.

The tag is: *misp-galaxy:malpedia="DMSniff"*

DMSniff is also known as:

*Table 2051. Table References*

## DneSpy

DneSpy collects information, takes screenshots, and downloads and executes the latest version of other malicious components in the infected system. The malware is designed to receive a “policy” file in JSON format with all the commands to execute. The policy file sent by the C&C server can be changed and updated over time, making dneSpy flexible and well-designed. The output of each executed command is zipped, encrypted, and exfiltrated to the C&C server. These characteristics make dneSpy a fully functional espionage backdoor.

The tag is: *misp-galaxy:malpedia="DneSpy "*

DneSpy is also known as:

*Table 2052. Table References*

# DNSMessenger

DNSMessenger makes use of DNS TXT record queries and responses to create a bidirectional Command and Control (C2) channel. This allows the attacker to use DNS communications to submit new commands to be run on infected machines and return the results of the command execution to the attacker.

The tag is: *misp-galaxy:malpedia="DNSMessenger"*

DNSMessenger is also known as:

- TEXTMATE

## DoppelPaymer

Doppelpaymer is a ransomware family that encrypts user data and later on it asks for a ransom in order to restore original files. It is recognizable by its trademark file extension added to encrypted files: .doppeled. It also creates a note file named: ".how2decrypt.txt".

The tag is: *misp-galaxy:malpedia="DoppelPaymer"*

DoppelPaymer is also known as:

- Pay OR Grief

# DreamBot

2010 Gozi v2.0, Gozi ISFB, ISFB, Pandemyia(\*) 2014 Dreambot (Gozi ISFB variant)

In 2014, a variant of Gozi ISFB was developed. Mainly, the dropper performs additional anti-vm checks (vmware, vbox, qemu), while the actual bot-dll remains unchanged in most parts. New functionality, such as TOR support, was added though and often, the Fluxxy fast-flux network is used.

See win.gozi for additional historical information.

The tag is: *misp-galaxy:malpedia="DreamBot"*

DreamBot is also known as:

# Dridex

OxCERT blog describes Dridex as "an evasive, information-stealing malware variant; its goal is to acquire as many credentials as possible and return them via an encrypted tunnel to a Command-and-Control (C&C) server. These C&C servers are numerous and scattered all over the Internet, if the malware cannot reach one server it will try another. For this reason, network-based measures such as blocking the C&C IPs is effective only in the short-term." According to MalwareBytes, "Dridex uses an older tactic of infection by attaching a Word document that utilizes macros to install malware. However, once new versions of Microsoft Office came out and users generally updated, such a threat subsided because it was no longer simple to infect a user with this method." IBM X-Force discovered "a new version of the Dridex banking Trojan that takes advantage of a code injection technique called AtomBombing to infect systems. AtomBombing is a technique for injecting malicious code into the 'atom tables' that almost all versions of Windows uses to store certain application data. It is a variation of typical code injection attacks that take advantage of input validation errors to insert and to execute malicious code in a legitimate process or application. Dridex v4 is the first malware that uses the AtomBombing process to try and infect systems."

## DRIFTPIN

Driftpin is a small and simple backdoor that enables the attackers to assess the victim. When executed the trojan connects to a C&C server and receives commands to grab screenshots, enumerate running processes and get information about the system and campaign ID.

The tag is: *misp-galaxy:malpedia="DRIFTPIN"*

DRIFTPIN is also known as:

- Spy.Agent ORM
- ToshliPh

## Dtrack

Dtrack is a Remote Administration Tool (RAT) developed by the Lazarus group. Its core functionality includes operations to upload a file to the victim's computer, download a file from the victim's computer, dump disk volume data, persistence and more.

A variant of Dtrack was found on Kudankulam Nuclear Power Plant (KNPP) which was used for a targeted attack.

The tag is: *misp-galaxy:malpedia="Dtrack"*

Dtrack is also known as:

- TroyRAT

## DUSTMAN

In 2019, multiple destructive attacks were observed targeting entities within the Middle East. The National Cyber Security Centre (NCSC), a part of the National Cybersecurity Authority (NCA), detected a new malware named "DUSTMAN" that was detonated on December 29, 2019. Based on analyzed evidence and artifacts found on machines in a victim's network that were not wiped by the malware. NCSC assess that the threat actor behind the attack had some kind of urgency on executing the files on the date of the attack due to multiple OPSEC failures observed on the infected network. NCSC is calling the malware used in this attack "DUSTMAN" after the filename and string embedded in the malware. "DUSTMAN" can be considered as a new variant of "ZeroCleare" malware, published in December 2019.

## EASYNIGHT

FireEye describes EASYNIGHT is a loader observed used with several malware families, including HIGHNOON and HIGHNOON.LITE. The loader often acts as a persistence mechanism via search order hijacking.

Examples include a patched bcrypt.dll with no other modification than an additional import entry, in the observed case "printwin.dll!gzwrite64" (breaking the file signature).

The tag is: *misp-galaxy:malpedia="EASYNIGHT"*

EASYNIGHT is also known as:

## ELECTRICFISH

The application is a command-line utility and its primary purpose is to tunnel traffic between two

IP addresses. The application accepts command-line arguments allowing it to be configured with a destination IP address and port, a source IP address and port, a proxy IP address and port, and a user name and password, which can be utilized to authenticate with a proxy server. It will attempt to establish TCP sessions with the source IP address and the destination IP address. If a connection is made to both the source and destination IPs, this malicious utility will implement a custom protocol, which will allow traffic to rapidly and efficiently be tunneled between two machines. If necessary, the malware can authenticate with a proxy to be able to reach the destination IP address. A configured proxy server is not required for this utility.

## ELMER

ELMER is a non-persistent proxy-aware HTTP backdoor written in Delphi, and is capable of performing file uploads and downloads, file execution, and process and directory listings. To retrieve commands, ELMER sends HTTP GET requests to a hard-coded CnC server, and parses the HTTP response packets received from the CnC server for an integer string corresponding to the command that needs to be executed.

The tag is: *misp-galaxy:malpedia="ELMER"*

ELMER is also known as:

## Emotet

While Emotet historically was a banking malware organized in a botnet, nowadays Emotet is mostly seen as infrastructure as a service for content delivery. For example, since mid 2018 it is used by Trickbot for installs, which may also lead to ransomware attacks using Ryuk, a combination observed several times against high-profile targets. It is always stealing information from victims but what the criminal gang behind it did, was to open up another business channel by selling their infrastructure delivering additional malicious software. From malware analysts it has been classified into epochs depending on command and control, payloads, and delivery solutions which change over time. Emotet had been taken down by authorities in January 2021, though it appears to have sprung back to life in November 2021.

## Expiro

Expiro malware has been around for more than a decade, and the malware authors still continue their work and update it with more features. Also the infection routine was changed in samples found in 2017 (described by McAfee). Expiro "infiltrates" executables on 32- and 64bit Windows OS versions. It has capabilities to install browser extensions, change security behaviour/settings on the infected system, and steal information (e.g. account credentials). There is a newly described EPO file infector source code called m0yv in 2022, which is wrongly identified as expiro by some AVs.

The tag is: *misp-galaxy:malpedia="Expiro"*

Expiro is also known as:

- Xpiro

## FatDuke

According to ESET Research, FatDuke is the current flagship backdoor of APT29 and is only deployed on the most interesting machines. It is generally dropped by the MiniDuke backdoor, but ESET also have seen the operators dropping FatDuke using lateral movement tools such as PsExec. The operators regularly repack this malware in order to evade detections. The most recent sample of FatDuke that ESET have seen was compiled on May 24, 2019. They have seen them trying to regain control of a machine multiple times in a few days, each time with a different sample. Their packer, described in a later section, adds a lot of code, leading to large binaries. While the effective code should not be larger than 1MB, ESET have seen one sample weighing in at 13MB, hence our name for this backdoor component: FatDuke.

## FinFisher RAT

FinFisher is a commercial software used to steal information and spy on affected victims. It began

with few functionalities which included password harvesting and information leakage, but now it is mostly known for its full Remote Access Trojan (RAT) capabilities. It is mostly known for being used in governmental targeted and lawful criminal investigations. It is well known for its anti-detection capabilities and use of VMProtect.

The tag is: *misp-galaxy:malpedia="FinFisher RAT"*

FinFisher RAT is also known as:

- FinSpy

## Fire Chili

The purpose of this rootkit/driver is hiding and protecting malicious artifacts from user-mode components(e.g. files, processes, registry keys and network connections). According to Fortguard Labs, this malware uses Direct Kernel Object Modification (DKOM), which involves undocumented kernel structures and objects, for its operations, why this malware has to rely on specific OS builds.

## Gameover P2P

Gameover Zeus is a peer-to-peer botnet based on components from the earlier Zeus trojan. According to a report by Symantec, Gameover Zeus has largely been used for banking fraud and distribution of the CryptoLocker ransomware. In early June 2014, the U.S. Department of Justice announced that an international inter-agency collaboration named Operation Tovar had succeeded in temporarily cutting communication between Gameover Zeus and its command and control servers.

## Gandcrab

GandCrab was a Ransomware-as-a-Service (RaaS) emerged in January 28, 2018, managed by a criminal organization known to be confident and vocal, while running a rapidly evolving ransomware campaign. Through their aggressive, albeit unusual, marketing strategies and constant recruitment of affiliates, they were able to globally distribute a high volume of their malware.

In a surprising announcement on May 31, 2019, the GandCrab's operators posted on a dark web forum, announced the end of a little more than a year of ransomware operations, citing staggering profit figures. However, If there's one thing that sets these threat actors apart from other groups, it is that they are unpredictable; so there is always the possibility that they might re-surface in one form or another.

The tag is: *misp-galaxy:malpedia="Gandcrab"*

Gandcrab is also known as:

- GrandCrab

## GEARSHIFT

According to FireEye, GEARSHIFT is a memory-only dropper for two keylogger DLLs. It is designed to replace a legitimate Fax Service DLL.

The tag is: *misp-galaxy:malpedia="GEARSHIFT"*

GEARSHIFT is also known as:

*Table 2217. Table References*

Links
<a href="https://malpedia.caad.fkie.fraunhofer.de/details/win.gearshift">https://malpedia.caad.fkie.fraunhofer.de/details/win.gearshift</a>

## GEMCUTTER

According to FireEye, GEMCUTTER is used in a similar capacity as BACKBEND (downloader), but maintains persistence by creating a Windows registry run key. GEMCUTTER checks for the presence of the mutex MicrosoftGMMZJ to ensure only one copy of GEMCUTTER is executing. If the mutex doesn't exist, the malware creates it and continues execution; otherwise, the malware signals the MicrosoftGMMExit event.

The tag is: *misp-galaxy:malpedia="GEMCUTTER"*

GEMCUTTER is also known as:

*Table 2218. Table References*

## Ghost RAT

According to Security Ninja, Gh0st RAT (Remote Access Terminal) is a trojan “Remote Access Tool” used on Windows platforms, and has been used to hack into some of the most sensitive computer networks on Earth.

Below is a list of Gh0st RAT capabilities. Take full control of the remote screen on the infected bot. Provide real time as well as offline keystroke logging. Provide live feed of webcam, microphone of infected host. Download remote binaries on the infected remote host. Take control of remote shutdown and reboot of host. Disable infected computer remote pointer and keyboard input. Enter into shell of remote infected host with full control. Provide a list of all the active processes. Clear all existing SSDT of all existing hooks.

The tag is: *misp-galaxy:malpedia="Ghost RAT"*

Ghost RAT is also known as:

- Farfli
- Gh0st RAT
- PC RAT

# GlobeImposter

GlobeImposter is a ransomware application which is mainly distributed via "blank slate" spam (the spam has no message content and an attached ZIP file), exploits, malicious advertising, fake updates, and repacked installers. GlobeImposter mimics the Globe ransomware family. This malware may prevent execution of Anti-Virus solutions and other OS related security features and may prevent system restoration.

The tag is: *misp-galaxy:malpedia="GlobeImposter"*

GlobeImposter is also known as:

- Fake Globe

## GoldMax

Gold Max is a Golang written command and control backdoor used by the NOBELIUM threat actor group. It uses several different techniques to obfuscate its actions and evade detection. The malware writes an encrypted configuration file to disk, where the file name and AES-256 cipher keys are unique per implant and based on environmental variables and information about the network where it is running.

The tag is: *misp-galaxy:malpedia="GoldMax"*

GoldMax is also known as:

- SUNSHUTTLE

## GoldDragon

GoldDragon was a second-stage backdoor which established a permanent presence on the victim's system once the first-stage, file-less, PowerShell-based attack leveraging steganography was executed. The initial attack was observed first in December 2017, when a Korean-language spear phishing campaign targeted organizations linked with Pyeongchang Winter Olympics 2018. GoldDragon was delivered once the attacker had gained an initial foothold in the targeted environment.

The malware was capable of a basic reconnaissance, data exfiltration and downloading of additional components from its C&C server.

The tag is: *misp-galaxy:malpedia="GoldDragon"*

GoldDragon is also known as:

- Lovexxx

# Gomorrah stealer

Gomorrah is a stealer with no or little obfuscation that appeared around March 2020. It is sold for about 150\$ lifetime for v4 (originally 400\$ for v3) or 100\$ per month by its developer called "th3darkly / lucifer" (which is also the developer of CosaNostra botnet). The malware's main functionalities are stealing (passwords, cryptocurrency wallets) and loading of tasks and other payloads.

## Gozi

2000 Ursnif aka Snifula 2006 Gozi v1.0, Gozi CRM, CRM, Papras 2010 Gozi v2.0, Gozi ISFB, ISFB, Pandemyia(\*) → 2010 Gozi Prinimalka → Vawtrak/Neverquest

In 2006, Gozi v1.0 ('Gozi CRM' aka 'CRM') aka Papras was first observed. It was offered as a CaaS, known as 76Service. This first version of Gozi was developed by Nikita Kurmin, and he borrowed code from Ursnif aka Snifula, a spyware developed by Alexey Ivanov around 2000, and some other kits. Gozi v1.0 thus had a formgrabber module and often is classified as Ursnif aka Snifula.

In September 2010, the source code of a particular Gozi CRM dll version was leaked, which led to Vawtrak/Neverquest (in combination with Pony) via Gozi Prinimalka (a slightly modified Gozi v1.0) and Gozi v2.0 (aka 'Gozi ISFB' aka 'ISFB' aka Pandemyia). This version came with a webinject module.

The tag is: *misp-galaxy:malpedia="Gozi"*

## Grateful POS

POS malware targets systems that run physical point-of-sale device and operates by inspecting the process memory for data that matches the structure of credit card data (Track1 and Track2 data), such as the account number, expiration date, and other information stored on a card's magnetic stripe. After the cards are first scanned, the personal account number (PAN) and accompanying data sit in the point-of-sale system's memory unencrypted while the system determines where to send it for authorization. Masked as the LogMein software, the GratefulPOS malware appears to have emerged during the fall 2017 shopping season with low detection ratio according to some of the earliest detections displayed on VirusTotal. The first sample was upload in November 2017. Additionally, this malware appears to be related to the Framework POS malware, which was linked to some of the high-profile merchant breaches in the past.

The tag is: *misp-galaxy:malpedia="Grateful POS"*

Grateful POS is also known as:

- FrameworkPOS
- SCRAPMINT
- trinity

## GRIMAGENT

GRIMAGENT is a backdoor that can execute arbitrary commands, download files, create and delete scheduled tasks, and execute programs via scheduled tasks or via the ShellExecute API. The malware persists via a randomly named scheduled task and a registry Run key. The backdoor communicates to hard-coded C&C servers via HTTP requests with portions of its network communications encrypted using both asymmetric and symmetric cryptography. GRIMAGENT was used during some Ryuk Ransomware intrusions in 2020.

## Hakbit

Hakbit ransomware is written in .NET. It uploads (some) files to be encrypted to a ftp-server. The ransom note is embedded - in earlier versions as plain string, then as base64 string. In some versions, these strings are slightly obfuscated.

Contact is via an email address hosted on protonmail. Hakbit (original) had hakbit@, more recent "KiraLock" has kiraransom@ (among others of course).

The tag is: *misp-galaxy:malpedia="Hakbit"*

Hakbit is also known as:

- Thanos Ransomware

## Havex RAT

Havex is a remote access trojan (RAT) that was discovered in 2013 as part of a widespread espionage campaign targeting industrial control systems (ICS) used across numerous industries and attributed to a hacking group referred to as "Dragonfly" and "Energetic Bear". Havex is estimated to have impacted thousands of infrastructure sites, a majority of which were located in Europe and the United States. Within the energy sector, Havex specifically targeted energy grid operators, major electricity generation firms, petroleum pipeline operators, and industrial equipment providers. Havex also impacted organizations in the aviation, defense, pharmaceutical, and petrochemical industries.

Once installed, Havex scanned the infected system to locate any Supervisory Control and Data Acquisition (SCADA) or ICS devices on the network and sent the data back to command and control servers. To do so, the malware leveraged the Open Platform Communications (OPC) standard, which is a universal communication protocol used by ICS components across many industries that facilitates open connectivity and vendor equipment interoperability. Havex used the Distributed Component Object Model (DCOM) to connect to OPC servers inside of an ICS network and collect information such as CLSID, server name, Program ID, OPC version, vendor information, running state, group count, and server bandwidth.

Havex was an intelligence-collection tool used for espionage and not for the disruption or destruction of industrial systems. However, the data collected by Havex would have aided efforts to design and develop attacks against specific targets or industries.

## HAWKBALL

HAWKBALL is a backdoor that attackers can use to collect information from the victim, as well as to deliver payloads. HAWKBALL is capable of surveying the host, creating a named pipe to execute native Windows commands, terminating processes, creating, deleting and uploading files, searching for files, and enumerating drives.

## HawkEye Keylogger

HawKeye is a keylogger that is distributed since 2013. Discovered by IBM X-Force, it is currently spread over phishing campaigns targeting businesses on a worldwide scale. It is designed to steal credentials from numerous applications but, in the last observed versions, new "loader capabilities" have been spotted. It is sold by its development team on dark web markets and hacking forums.

## HD MR

HD MR is a ransomware which encrypts user files and adds a .DMR64 extension. It also drops a ransom note named: "!!! READ THIS !!!hta".

The tag is: *misp-galaxy:malpedia="HD MR"*

HD MR is also known as:

- GO-SPORT

## HermeticWiper

According to SentinelLabs, HermeticWiper is a custom-written application with very few standard functions. It abuses a signed driver called "empntdrv.sys" which is associated with the legitimate Software "EaseUS Partition Master Software" to enumerate the MBR and all partitions of all Physical Drives connected to the victims Windows Device and overwrite the first 512 Bytes of every MBR and Partition it can find, rendering them useless. This malware is associated to the malware attacks against Ukraine during Russians Invasion in February 2022.

The tag is: *misp-galaxy:malpedia="HermeticWiper"*

HermeticWiper is also known as:

- DriveSlayer
- FoxBlade
- KillDisk.NCV
- NEARMISS

## HiddenTear

HiddenTear is an open source ransomware developed by a Turkish programmer and later released as proof of concept on GitHub. The malware generates a local symmetric key in order to encrypt a configurable folder (/test was the default one) and it sends it to a centralized C&C server. Due to its small payload it was used as real attack vector over email phishing campaigns. Variants are still used in attacks.

## HIGHNOON

According to FireEye, HIGHNOON is a backdoor that may consist of multiple components. The components may include a loader, a DLL, and a rootkit. Both the loader and the DLL may be dropped together, but the rootkit may be embedded in the DLL. The HIGHNOON loader may be designed to run as a Windows service.

# Hive (Windows)

Hive is a strain of ransomware that was first discovered in June 2021. Hive was designed to be used by Ransomware-as-a-service providers, to enable novice cyber-criminals to launch ransomware attacks on healthcare providers, energy providers, charities, and retailers across the globe. In 2022 there was a switch from GoLang to Rust.

# homefry

a 64-bit Windows password dumper/cracker that has previously been used in conjunction with AIRBREAK and BADFLICK backdoors. Some strings are obfuscated with XOR x56. The malware accepts up to two arguments at the command line: one to display cleartext credentials for each login session, and a second to display cleartext credentials, NTLM hashes, and malware version for each login session.

# HOTWAX

HOTWAX is a module that upon starting imports all necessary system API functions, and searches for a .CHM file. HOTWAX decrypts a payload using the Spritz algorithm with a hard-coded key and then searches the target process and attempts to inject the decrypted payload module from the CHM file into the address space of the target process.

The tag is: *misp-galaxy:malpedia="HOTWAX"*

## Houdini

Houdini is a VBS-based RAT dating back to 2013. Past in the days, it used to be wrapped in an .exe but started being spamvertized or downloaded by other malware directly as .vbs in 2018. In 2019, WSHRAT appeared, a Javascript-based version of Houdini, recoded by the name of Kognito.

The tag is: *misp-galaxy:malpedia="Houdini"*

Houdini is also known as:

- Hworm
- Jenxcus
- Kognito
- Njw0rm
- WSHRAT
- dinihou
- dunihi

## HyperBro

HyperBro is a RAT that has been observed to target primarily within the gambling industries, though it has been spotted in other places as well. The malware typically consists of 3 or more components: a) a genuine loader typically with a signed certification b) a malicious DLL loader loaded from the former component via DLL hijacking c) an encrypted and compressed blob that decrypts to a PE-based payload which has its C2 information hardcoded within.

The tag is: *misp-galaxy:malpedia="HyperBro"*

HyperBro is also known as:

## IcedID

Analysis Observations:

- It sets up persistence by creating a Scheduled Task with the following characteristics:
- Name: Update
- Trigger: At Log on
- Action: %LocalAppData%\\$Example\\waroupada.exe /i
- Conditions: Stop if the computer ceases to be idle.
- The sub-directory within %LocalAppdata%, Appears to be randomly picked from the list of directories within %ProgramFiles%. This needs more verification.
- The filename remained static during analysis.
- The original malware exe (ex. waroupada.exe) will spawn an instance of svchost.exe as a sub-process and then inject/execute its malicious code within it
- If “/i” is not passed as an argument, it sets up persistence and waits for reboot.
- If “/I” is passed as an argument (as is the case when the scheduled task is triggered at login), it skips persistence setup and actually executes; resulting in C2 communication.
- Employs an interesting method for sleeping by calling the Sleep function of kernel32.dll from the shell, like so: rundll32.exe kernel32,Sleep -s
- Setup a local listener to proxy traffic on 127.0.0.1:50000

## win.icexloader

IceXLoader is a commercial malware used to download and deploy additional malware on infected machines. The latest version is written in Nim, a relatively new language utilized by threat actors

the past two years, most notably by the NimzaLoader variant of BazarLoader used by the TrickBot group.

The v1 was written in AutoIT.

The tag is: *misp-galaxy:malpedia="win.icexloader"*

win.icexloader is also known as:

## Ice IX

The ICE IX bot is a banking trojan derived of the Zeus botnet because it uses significant parts of Zeus's source code. ICE IX communicates using the HTTP protocol, so it can be considered to be a third-generation botnet. While it has been used for a variety of purposes, a primary threat of ICE IX comes from its manipulation of banking operations on compromised machines. As with any bot, execution of the bot results in establishing a master-slave relationship between the botmaster and the compromised computer.

## win.innfirat

InnifIRAT is coded in .NET and targets personal data on infected devices, with its top priority appearing to be bitcoin and litecoin wallet data.

InffirAT also includes a backdoor which allows attackers to control the infected host remotely. Possibilities include login key stroke, taking pictures with webcam, accessing confidential information, formatting drives, and more.

It attempts to steal browser cookies to steal usernames and passwords and monitors the users activities with screenshot functionality.

## InvisiMole

InvisiMole had a modular architecture, starting with a wrapper DLL, and performing its activities using two other modules that were embedded in its resources, named RC2FM and RC2CL. They were feature-rich backdoors and turned the affected computer into a video camera, letting the attackers to spy the victim. The malicious actors behind this malware were active at least since 2013 in highly targeted campaigns with only a few dozen compromised computers in Ukraine and

Russia. The wrapper DLL posed as a legitimate mpr.dll library and was placed in the same folder as explorer.exe, which made it being loaded during the Windows startup into the Windows Explorer process instead of the legitimate library. Malware came in both 32-bit and 64-bit versions, which made this persistence technique functional on both architectures.

The smaller of the modules, RC2FM, contained a backdoor with fifteen supported commands indexed by numbers. The commands could perform simple changes on the system and spying features like capturing sounds, taking screenshots or monitoring all fixed and removable drives.

The second module, RC2CL, offered features for collecting as much data about the infected computer as possible, rather than for making system changes. The module supported up to 84 commands such as file system operations, file execution, registry key manipulation, remote shell activation, wireless network scanning, listing of installed software etc. Though the backdoor was capable of interfering with the system (e.g. to log off a user, terminate a process or shut down the system), it mostly provided passive operations. Whenever possible, it tried to hide its activities by restoring the original file access time or safe-deleting its traces.

## IRONHALO

IRONHALO is a downloader that uses the HTTP protocol to retrieve a Base64 encoded payload from a hard-coded command-and-control (CnC) server and uniform resource locator (URL) path.

The encoded payload is written to a temporary file, decoded and executed in a hidden window. The encoded and decoded payloads are written to files named `igfxHK[%rand%].dat` and `igfxHK[%rand%].exe` respectively, where `[%rand%]` is a 4-byte hexadecimal number based on the current timestamp. It persists by copying itself to the current user's Startup folder.

## ISFB

2006 Gozi v1.0, Gozi CRM, CRM, Papras 2010 Gozi v2.0, Gozi ISFB, ISFB, Pandemyia(\*)

In September 2010, the source code of a particular Gozi CRM dll version was leaked. This led to two main branches: one became known as Gozi Prinimalka, which was merge with Pony and became Vawtrak/Neverquest.

The other branch became known as Gozi ISFB, or ISFB in short. Webinject functionality was added to this version.

There is one panel which often was used in combination with ISFB: IAP. The panel's login page comes with the title 'Login - IAP'. The body contains 'AUTHORIZATION', 'Name:', 'Password:' and a single button 'Sign in' in a minimal design. Often, the panel is directly accessible by entering the C2 IP address in a browser. But there are ISFB versions which are not directly using IAP. The bot accesses a gate, which is called the 'Dreambot' gate. See win.dreambot for further information.

ISFB often was protected by Rovnix. This led to a further complication in the naming scheme - many companies started to call ISFB Rovnix. Because the signatures started to look for Rovnix, other trojans protected by Rovnix (in particular ReactorBot and Rerdom) sometimes got wrongly labelled.

In April 2016 a combination of Gozi ISFB and Nymaim was detected. This breed became known as GozNym. The merge uses a shellcode-like version of Gozi ISFB, that needs Nymaim to run. The C2 communication is performed by Nymaim.

See win.gozi for additional historical information.

The tag is: *misp-galaxy:malpedia="ISFB"*

ISFB is also known as:

- Gozi ISFB
- IAP
- Pandemyia

# ISR Stealer

ISR Stealer is a modified version of the Hackhound Stealer. It is written in VB and often comes in a .NET-wrapper. ISR Stealer makes use of two Nirsoft tools: Mail PassView and WebBrowserPassView.

Incredibly, it uses an hard-coded user agent string: Hardcore Software For : Public

The tag is: *misp-galaxy:malpedia="ISR Stealer"*

ISR Stealer is also known as:

# jason

Jason is a graphic tool implemented to perform Microsoft exchange account brute-force in order to “harvest” the highest possible emails and accounts information. Distributed in a ZIP container the interface is quite intuitive: the Microsoft exchange address and its version shall be provided. Three brute-force methods could be selected: EWS (Exchange Web Service), OAB (Offline Address Book) or both (All). Username and password list can be selected and threads number should be provided in order to optimize the attack balance.

## JSOutProx

JSOutProx is a sophisticated attack framework built using both Javascript and .NET. It uses the .NET (de)serialization feature to interact with a Javascript file which is the core module running on a victim machine. Once the malware is run on the victim, the framework can load several plugins performing additional malicious activities on the target.

## Kardon Loader

According to ASERT, Kardon Loader is a fully featured downloader, enabling the download and installation of other malware, eg. banking trojans/credential theft etc. This malware has been on sale by an actor under the username Yattaze, starting in late April. The actor offers the sale of the malware as a standalone build with charges for each additional rebuild, or the ability to set up a botshop in which case any customer can establish their own operation and further sell access to a new customer base.

## Karius

According to checkpoint, Karius is a banking trojan in development, borrowing code from Ramnit, Vawtrack as well as Trickbot, currently implementing webinject attacks only.

It comes with an injector that loads an intermediate "proxy" component, which in turn loads the actual banker component.

Communication with the c2 are in json format and encrypted with RC4 with a hardcoded key.

In the initial version, observed in March 2018, the webinjects were hardcoded in the binary, while in subsequent versions, they were received by the c2.

## KleptoParasite Stealer

KleptoParasite Stealer is advertised on Hackforums as a noob-friendly stealer. It is modular and comes with a IP retriever module, a Outlook stealer (32bit/64bit) and a Chrome/Firefox stealer (32bit/64bit). Earlier versions come bundled (loader plus modules), newer versions come with a loader (167k) that grabs the modules.

PDB-strings suggest a relationship to JogLog v6 and v7.

The tag is: *misp-galaxy:malpedia="KleptoParasite Stealer"*

KleptoParasite Stealer is also known as:

# Konni

Konni is a remote administration tool, observed in the wild since early 2014. The Konni malware family is potentially linked to APT37, a North-Korean cyber espionage group active since 2012. The group primary victims are South-Korean political organizations, as well as Japan, Vietnam, Russia, Nepal, China, India, Romania, Kuwait, and other parts of the Middle East.

The tag is: *misp-galaxy:malpedia="Konni"*

## Kovter

Kovter is a Police Ransomware

Feb 2012 - Police Ransomware Aug 2013 - Became AD Fraud Mar 2014 - Ransomware to AD Fraud malware June 2014 - Distributed from sweet orange exploit kit Dec 2014 - Run affiliated node Apr 2015 - Spread via fiesta and nuclear pack May 2015 - Kovter become fileless 2016 - Malvertising

campaign on Chrome and Firefox June 2016 - Change in persistence July 2017 - Nemucod and Kovter was packed together Jan 2018 - Cyclance report on Persistence

The tag is: *misp-galaxy:malpedia="Kovter"*

## Krachulka

According to ESET, this malware family is a banking trojan and was active in Brazil until the middle of 2019. Its most noticeable characteristic was its usage of well-known cryptographic methods to encrypt strings, as opposed to the majority of Latin American banking trojans that mainly use custom encryption schemes.

The tag is: *misp-galaxy:malpedia="Krachulka"*

## Kutaki

Cofense characterizes Kutaki as a data stealer that uses old-school techniques to detect sandboxes and debugging. Kutaki however works quite well against unhardened virtual machines and other analysis devices. By backdooring a legitimate application, it can fool unsophisticated detection methodologies.

The tag is: *misp-galaxy:malpedia="Kutaki"*

## Kwampirs

Kwampirs is a family of malware which uses SMB to spread. It typically will not execute or deploy in environments in which there is no publicly available admin\$ share. It is a fully featured backdoor which can download additional modules. Typical C2 traffic is over HTTP and includes "q=[ENCRYPTED DATA]" in the URI.

## LatentBot

FireEye describes this malware as a highly obfuscated bot that has been in the wild since mid-2013. It has managed to leave hardly any traces on the Internet, is capable of watching its victims without ever being noticed, and can even corrupt a hard disk, thus making a PC useless.

Using Dynamic Threat Intelligence, they have observed multiple campaigns targeting multiple industries in the United States, United Kingdom, South Korea, Brazil, United Arab Emirates, Singapore, Canada, Peru and Poland – primarily in the financial services and insurance sectors. Although the infection strategy is not new, the final payload dropped – which they named LATENTBOT – caught attention since it implements several layers of obfuscation, a unique exfiltration mechanism, and has been very successful at infecting multiple organizations.

## LimeRAT

### ## Description

Simple yet powerful RAT for Windows machines. This project is simple and easy to understand, It should give you a general knowledge about dotNET malwares and how it behaves.

## Main Features

- .NET
- Coded in Visual Basic .NET, Client required framework 2.0 or 4.0 dependency, And server is 4.0
- **Connection**
- Using pastebin.com as ip:port , Instead of noip.com DNS. And Also using multi-ports
- **Plugin**

- Using plugin system to decrease stub's size and lower the AV detection
- **Encryption**
- The communication between server & client is encrypted with AES
- **Spreading**
- Infecting all files and folders on USB drivers
- **Bypass**
- Low AV detection and undetected startup method
- **Lightweight**
- Payload size is about 25 KB
- **Anti Virtual Machines**
- Uninstall itself if the machine is virtual to avoid scanning or analyzing
- **Ransomware**
- Encrypting files on all HHD and USB with .Lime extension
- **XMR Miner**
- High performance Monero CPU miner with user idle\active optimizations
- **DDoS**
- Creating a powerful DDOS attack to make an online service unavailable
- **Crypto Stealer**
- Stealing Cryptocurrency sensitive data
- **Screen-Locker**
- Prevents user from accessing their Windows GUI
- **And more**
- On Connect Auto Task
- Force enable Windows RDP
- Persistence
- File manager
- Passowrds stealer
- Remote desktop
- Bitcoin grabber
- Downloader
- Keylogger

## LiteDuke

According to CarbonBlack, LiteDuke is a third stage backdoor. It appears to use the same dropper as PolyglotDuke. Its payload makes use of an AES encrypted SQLite database to store its configuration. LiteDuke supports a large number of individual commands including host information retrieval, file upload and download, and the ability to execute other code. LiteDuke C2 servers appear to be compromised servers, and the malware communicates with them using normal HTTP requests. It attempts to use a realistic User-Agent string to blend in better with normal HTTP traffic. ESET have dubbed it LiteDuke because it uses SQLite to store information such as its configuration.

The tag is: *misp-galaxy:malpedia="LiteDuke"*

LiteDuke is also known as:

## LiteHTTP

According to AlienVault, LiteHTTP bot is a new HTTP bot programmed in C#. The bot has the ability to collect system information, download and execute programs, and update and kill other bots

present on the system.

# LockerGoga

According to Trend Micro, LockerGoga is a ransomware that has been used in multiple attacks, most notably against Altran Technologies and Norsk Hydro. It encrypts a range of documents and source code files but certain versions had little to no whitelist that would protect import system files such as the Windows Boot Manager.

## Locky

Locky is a high profile ransomware family that first appeared in early 2016 and was observed being active until end of 2017. It encrypts files on the victim system and asks for ransom in order to have back original files. In its first version it added a .locky extension to the encrypted files, and in recent

versions it added the .lukitus extension. The ransom amount is defined in BTC and depends on the actor.

The tag is: *misp-galaxy:malpedia="Locky"*

Locky is also known as:

# Loda

Loda is a previously undocumented AutoIT malware with a variety of capabilities for spying on victims. Proofpoint first observed Loda in September of 2016 and it has since grown in popularity. The name Loda is derived from a directory to which the malware author chose to write keylogger logs. It should be noted that some antivirus products currently detect Loda as “Trojan.Nymeria”, although the connection is not well-documented.

The tag is: *misp-galaxy:malpedia="Loda"*

Loda is also known as:

- LodaRAT
- Nymeria

## LokiLocker

LokiLocker is a .Net ransomware, which was seen first in August 2021. This malware is protected with NETGuard (modified ConfuserEX) using the additional KoiVM virtualization plugin. The victims were observed to be scattered around the world, with main concentration in Eastern Europe and Asia (BlackBerry).

The tag is: *misp-galaxy:malpedia="LokiLocker"*

LokiLocker is also known as:

# Loki Password Stealer (PWS)

"Loki Bot is a commodity malware sold on underground sites which is designed to steal private data from infected machines, and then submit that info to a command and control host via HTTP POST. This private data includes stored passwords, login credential information from Web browsers, and a variety of cryptocurrency wallets." - PhishMe

Loki-Bot employs function hashing to obfuscate the libraries utilized. While not all functions are hashed, a vast majority of them are.

Loki-Bot accepts a single argument/switch of '-u' that simply delays execution (sleeps) for 10 seconds. This is used when Loki-Bot is upgrading itself.

The Mutex generated is the result of MD5 hashing the Machine GUID and trimming to 24-characters. For example: "B7E1C2CC98066B250DDB2123".

Loki-Bot creates a hidden folder within the %APPDATA% directory whose name is supplied by the 8th thru 13th characters of the Mutex. For example: "%APPDATA%\C98066".

There can be four files within the hidden %APPDATA% directory at any given time: ".exe," ".lck," ".hdb" and ".kdb." They will be named after characters 13 thru 18 of the Mutex. For example: "6B250D." Below is the explanation of their purpose:

FILE EXTENSION	FILE DESCRIPTION
.exe	A copy of the malware that will execute every time the user account is logged into
.lck	A lock file created when either decrypting Windows Credentials or Keylogging to prevent resource conflicts
.hdb	A database of hashes for data that has already been exfiltrated to the C2 server
.kdb	A database of keylogger data that has yet to be sent to the C2 server

If the user is privileged, Loki-Bot sets up persistence within the registry under HKEY\_LOCAL\_MACHINE. If not, it sets up persistence under HKEY\_CURRENT\_USER.

The first packet transmitted by Loki-Bot contains application data.

The second packet transmitted by Loki-Bot contains decrypted Windows credentials.

The third packet transmitted by Loki-Bot is the malware requesting C2 commands from the C2 server. By default, Loki-Bot will send this request out every 10 minutes after the initial packet is sent.

Communications to the C2 server from the compromised host contain information about the user and system including the username, hostname, domain, screen resolution, privilege level, system architecture, and Operating System.

The first WORD of the HTTP Payload represents the Loki-Bot version.

The second WORD of the HTTP Payload is the Payload Type. Below is the table of identified payload types:

BYTE PAYLOAD TYPE	DESCRIPTION
0x26	Stolen Cryptocurrency Wallet
0x27	Stolen Application Data
0x28	Get C2 Commands from C2 Server
0x29	Stolen File
0x2A	POS (Point of Sale?)
0x2B	Keylogger Data
0x2C	Screenshot

The 11th byte of the HTTP Payload begins the Binary ID. This might be useful in tracking campaigns or specific threat actors. This value is typically “ckav.ru”. If you come across a Binary ID that is different from this, take note!

Loki-Bot encrypts both the URL and the registry key used for persistence using Triple DES encryption.

The Content-Key HTTP Header value is the result of hashing the HTTP Header values that precede it. This is likely used as a protection against researchers who wish to poke and prod at Loki-Bot’s C2 infrastructure.

Loki-Bot can accept the following instructions from the C2 Server:

BYTE INSTRUCTION DESCRIPTION 0x00 Download EXE & Execute 0x01 Download DLL & Load #1 0x02 Download DLL & Load #2 0x08 Delete HDB File 0x09 Start Keylogger 0x0A Mine & Steal Data 0x0E Exit Loki-Bot 0x0F Upgrade Loki-Bot 0x10 Change C2 Polling Frequency 0x11 Delete Executables & Exit

Suricata Signatures RULE SID RULE NAME 2024311 ET TROJAN Loki Bot Cryptocurrency Wallet Exfiltration Detected 2024312 ET TROJAN Loki Bot Application/Credential Data Exfiltration Detected M1 2024313 ET TROJAN Loki Bot Request for C2 Commands Detected M1 2024314 ET TROJAN Loki Bot File Exfiltration Detected 2024315 ET TROJAN Loki Bot Keylogger Data Exfiltration Detected M1 2024316 ET TROJAN Loki Bot Screenshot Exfiltration Detected 2024317 ET TROJAN Loki Bot Application/Credential Data Exfiltration Detected M2 2024318 ET TROJAN Loki Bot Request for C2 Commands Detected M2 2024319 ET TROJAN Loki Bot Keylogger Data Exfiltration Detected M2

## looChiper

LooChiper is a Ransomware. It uses a nice but scary name: LooCipher. The name is at the same time an allusion to its capabilities (thank to the term “Cipher”) and to the popular mythological figure, Lucifer. Despite its evocative nickname, the functionalities of this malware are pretty straight forward, not very different from those belonging to many other ransomware families.

## L0rdix

L0rdix is a multipurpose .NET remote access tool (RAT) first discovered being sold on underground forums in November 2018. Out of the box, L0rdix supports eight commands, although custom commands can be defined and added. These include:

Download and execute Update Open page (visible) Open page (invisible) Cmd Kill process Upload file HTTP Flood

L0rdix can extract credentials from common web browsers and steal data from crypto wallets and a target's clipboard. Optionally, L0rdix can deploy a cryptominer (XMRig) to its bots.

The tag is: *misp-galaxy:malpedia="L0rdix"*

L0rdix is also known as:

## Lorenz

Tesorion describes Lorenz as a ransomware with design and implementation flaws, leading to impossible decryption with tools provided by the attackers. A free decryptor for 2021 versions was made available via the NoMoreRansom initiative. A new version of the malware was discovered in March 2022, for which again was provided a free decryptor, while the ransomware operators are not able to provide tools to decrypt affected files.

## m0yv

Modular x86/x64 file infector created/used by Maze ransomware developer. According to the author, it has been mistakenly tagged by AVs as Expiro.

The tag is: *misp-galaxy:malpedia="m0yv"*

m0yv is also known as:

*Table 2538. Table References*

## Machete

According to ESET, Machete's dropper is a RAR SFX executable. Three py2exe components are dropped: GoogleCrash.exe, Chrome.exe and GoogleUpdate.exe. A single configuration file, jer.dll, is dropped, and it contains base64-encoded text that corresponds to AES-encrypted strings. GoogleCrash.exe is the main component of the malware. It schedules execution of the other two components and creates Windows Task Scheduler tasks to achieve persistence. Regarding the geolocation of victims, Chrome.exe collects data about nearby Wi-Fi networks and sends it to the Mozilla Location Service API. In short, this application provides geolocation coordinates when it's given other sources of data such as Bluetooth beacons, cell towers or Wi-Fi access points. Then the malware takes latitude and longitude coordinates to build a Google Maps URL. The GoogleUpdate.exe component is responsible for communicating with the remote C&C server. The configuration to set the connection is read from the jer.dll file: domain name, username and password. The principal means of communication for Machete is via FTP, although HTTP communication was implemented as a fallback in 2019.

The tag is: *misp-galaxy:malpedia="Machete"*

Machete is also known as:

- El Machete

## MASS Logger

MassLogger is a .NET credential stealer. It starts with a launcher that uses simple anti-debugging techniques which can be easily bypassed when identified. This first stage loader eventually XOR-decrypts the second stage assembly which then decrypts, loads and executes the final MassLogger payload.

The tag is: *misp-galaxy:malpedia="MASS Logger"*

## Maze

Maze Ransomware encrypts files and makes them inaccessible while adding a custom extension containing part of the ID of the victim. The ransom note is placed inside a text file and an htm file. There are a few different extensions appended to files which are randomly generated.

Actors are known to exfiltrate the data from the network for further extortion. It spreads mainly using email spam and various exploit kits (Spelevo, Fallout).

The code of Maze ransomware is highly complicated and obfuscated, which helps to evade security solutions using signature-based detections.

The tag is: *misp-galaxy:malpedia="Maze"*

Maze is also known as:

- ChaCha

## MBRlock

This ransomware modifies the master boot record of the victim's computer so that it shows a ransom note before Windows starts.

The tag is: *misp-galaxy:malpedia="MBRlock"*

MBRlock is also known as:

- DexLocker

# MedusaLocker

A Windows ransomware that will run certain tasks to prepare the target system for the encryption of files. MedusaLocker avoids executable files, probably to avoid rendering the targeted system unusable for paying the ransom. It uses a combination of AES and RSA-2048, and reportedly appends extensions such as .encrypted, .bomber, .boroff, .breakingbad, .locker16, .newlock, .nlocker, and .skynet.

The tag is: *misp-galaxy:malpedia="MedusaLocker"*

MedusaLocker is also known as:

- AKO Doxware
- AKO Ransomware
- MedusaReborn

# MegaCortex

Megacortex is a ransomware used in targeted attacks against corporations. Once the ransomware is run it tries to stop security related services and after that it starts its own encryption process adding a .aes128ctr or .megac0rtx extension to the encrypted files. It is used to be carried from downloaders and trojans, it has no own propagation capabilities.

The tag is: *misp-galaxy:malpedia="MegaCortex"*

MegaCortex is also known as:

## Midas

This malware written in C# is a variant of the Thanos ransomware family and emerged in October 2021 and is obfuscated using SmartAssembly. In 2022, ThreatLabz analysed a report of Midas ransomware was slowly deployed over a two month period (ZScaler). This ransomware features also its own data leak site as part of its double extortion strategy.

## Milum

In August 2019, Kaspersky Labs discovered a malware they dubbed Milum (naming based on internal file name fragments) when investigating an operation they named WildPressure. It is written in C++ using STL, primarily to parse JSON. Functionality includes bidirectional file transmission and remote command execution.

The tag is: *misp-galaxy:malpedia="Milum"*

## MimiKatz

Varonis summarizes Mimikatz as an open-source application that allows users to view and save authentication credentials like Kerberos tickets. Benjamin Delpy continues to lead Mimikatz developments, so the toolset works with the current release of Windows and includes the most up-to-date attacks.

Attackers commonly use Mimikatz to steal credentials and escalate privileges: in most cases, endpoint protection software and anti-virus systems will detect and delete it. Conversely, pentesters use Mimikatz to detect and exploit vulnerabilities in your networks so you can fix them.

The tag is: `misp-galaxy:malpedia="MimiKatz"`

MimiKatz is also known as:

## Mispadu

According to ESET Research, Mispadu is an ambitious Latin American banking trojan that utilizes McDonald's malvertising and extends its attack surface to web browsers. It is used to target the general public and its main goals are monetary and credential theft. In Brazil, ESET has seen it distributing a malicious Google Chrome extension that attempts to steal credit card data and online banking data, and that compromises the Boleto payment system.

## ModPipe

ModPipe is point-of-sale (POS) malware capable of accessing sensitive information stored in devices running ORACLE MICROS Restaurant Enterprise Series (RES) 3700 POS – a management software suite used by hundreds of thousands of bars, restaurants, hotels and other hospitality establishments worldwide. ModPipe uses modular architecture consisting of basic components and

downloadable modules. One of them – named GetMicInfo – contains an algorithm designed to gather database passwords by decrypting them from Windows registry values. Exfiltrated credentials allow ModPipe’s operators access to database contents, including various definitions and configuration, status tables and information about POS transactions.

## MoleNet

MoleNet is a .NET downloader malware used by the Molerats group in targeted attacks in the Middle East. Before downloading additional payloads, it first collects information about the infected machine using WMI queries and sends the data to its operators. It was first discovered in 2020, however, Cybereason researchers showed that it has been in use since at least 2019, with infrastructure that operated since 2017.

## Moriya

This tool is a passive backdoor which allows attackers to inspect all incoming traffic to the infected machine, filter out packets that are marked as designated for the malware and respond to them. This forms a covert channel over which attackers are able to issue shell commands and receive back their outputs.

The tag is: *misp-galaxy:malpedia="Moriya"*

Moriya is also known as:

## Nefilim

According to Vitali Kremez and Michael Gillespie, this ransomware shares much code with Nemty 2.5. A difference is removal of the RaaS component, which was switched to email communications for payments. Uses AES-128, which is then protected RSA2048.

The tag is: *misp-galaxy:malpedia="Nefilim"*

Nefilim is also known as:

## NESTEGG

NESTEGG is a memory-only backdoor that can proxy commands to other infected systems using a custom routing scheme. It accepts commands to upload and download files, list and delete files, list and terminate processes, and start processes. NESTEGG also creates Windows Firewall rules that allows the backdoor to bind to a specified port number to allow for inbound traffic.

## NetSupportManager RAT

Enigma Software notes that NetSupport Manager is a genuine application, which was first released about twenty years ago. The purpose of the NetSupport Manager tool is to enable users to receive remote technical support or provide remote computer assistance. However, cyber crooks have hijacked this useful application and misappropriated it to use it in their harmful campaigns. The name of the modified version of the NetSupport Manager has been labeled the NetSupport Manager RAT.

The tag is: *misp-galaxy:malpedia="NetSupportManager RAT"*

NetSupportManager RAT is also known as:

- NetSupport

## NetWire RC

Netwire is a RAT, its functionality seems focused on password stealing and keylogging, but includes remote control capabilities as well.

Keylog files are stored on the infected machine in an obfuscated form. The algorithm is:

```
for i in range(0,num_read):  
    buffer[i] = ((buffer[i]-0x24)^0x9D)&0xFF
```

The tag is: *misp-galaxy:malpedia="NetWire RC"*

NetWire RC is also known as:

- NetWeird
- NetWire
- Recam

# NjRAT

RedPacket Security describes NJRat as "a remote access trojan (RAT) has capabilities to log keystrokes, access the victim's camera, steal credentials stored in browsers, open a reverse shell, upload/download files, view the victim's desktop, perform process, file, and registry manipulations, and capabilities to let the attacker update, uninstall, restart, close, disconnect the RAT and rename its campaign ID. Through the Command & Control (CnC) server software, the attacker has capabilities to create and configure the malware to spread through USB drives."

It is supposedly popular with actors in the Middle East. Similar to other RATs, many leaked builders may be backdoored.

The tag is: *misp-galaxy:malpedia="NjRAT"*

NjRAT is also known as:

- Bladabindi

## OLDBAIT

According to FireEye, OLDBAIT is a credential stealer that has been observed to be used by APT28. It targets Internet Explorer, Mozilla Firefox, Eudora, The Bat! (an email client by a Moldovan company), and Becky! (an email client made by a Japanese company). It can use both HTTP or SMTP to exfiltrate data. In some places it is mistakenly named "Sasfis", which however seems to be a completely different and unrelated malware family.

The tag is: *misp-galaxy:malpedia="OLDBAIT"*

OLDBAIT is also known as:

- Sasfis

## Orcus RAT

Orcus has been advertised as a Remote Administration Tool (RAT) since early 2016. It has all the features that would be expected from a RAT and probably more. The long list of the commands is documented on their website. But what separates Orcus from the others is its capability to load custom plugins developed by users, as well as plugins that are readily available from the Orcus repository. In addition to that, users can also execute C# and VB.net code on the remote machine in real-time.

The tag is: *misp-galaxy:malpedia="Orcus RAT"*

Orcus RAT is also known as:

- Schnorchel

## Ordinypt

This malware claims to be a ransomware, but it's actually a wiper. After execution, this malware terminates a number of processes such as database processes, likely to allow access to any files that these programs may have held open. Ordinypt will avoid wiping certain files and folders in order to prevent the infected machine from becoming unusable. Affected files are overwritten with null character and receive a random 5 character file extension. Finally, shadow copies are removed and Windows startup repair is disabled to complicate recovery of data from the affected system. The desktop background is changed and a ransom note is dropped for the victim. A C2 check-in occurs to keep track of the file extension used on that specific machine, as well as which BitCoin address was randomly provided for payment to the victim (drawn from a long list stored in the ransomware configuration).

The tag is: *misp-galaxy:malpedia="Ordinypt"*

Ordinypt is also known as:

- GermanWiper
- HSDFSDCrypt

## PandaBanker

According to Arbor, Forcepoint and Proofpoint, Panda is a variant of the well-known Zeus banking trojan(\*). Fox IT discovered it in February 2016.

This banking trojan uses the infamous ATS (Automatic Transfer System/Scripts) to automate online bank portal actions.

The baseconfig (c2, crypto material, botnet name, version) is embedded in the malware itself. It then obtains a dynamic config from the c2, with further information about how to grab the webinjects and additional modules, such as vnc, backsocks and grabber.

Panda does have some DGA implemented, but according to Arbor, a bug prevents it from using it.

The tag is: *misp-galaxy:malpedia="PandaBanker"*

PandaBanker is also known as:

- ZeusPanda

## Parallax RAT

Parallax is a Remote Access Trojan used by attackers to gain access to a victim's machine. It was involved in one of the many infamous "coronamalware" campaigns. Basically, the attackers abused the COVID-19 pandemic news to lure victims into opening themed emails spreading parallax.

The tag is: *misp-galaxy:malpedia="Parallax RAT"*

Parallax RAT is also known as:

- ParallaxRAT

# PeddleCheap

PeddleCheap is a module of the DanderSpritz framework which surface with the "Lost in Translation" release of TheShadowBrokers leaks. In May 2020, ESET mentioned that they found mysterious samples of PeddleCheap packed with a custom packer so far exclusively attributed to Winnti.

## Peppy RAT

Peppy is a Python-based RAT with the majority of its appearances having similarities or definite overlap with MSIL/Crimson appearances. Peppy communicates to its C&C over HTTP and utilizes SQLite for much of its internal functionality and tracking of exfiltrated files. The primary purpose of Peppy may be the automated exfiltration of potentially interesting files and keylogs. Once Peppy successfully communicates to its C&C, the keylogging and exfiltration of files using configurable search parameters begins. Files are exfiltrated using HTTP POST requests.

# PHOREAL

Phoreal is a very simple backdoor that is capable of creating a reverse shell, performing simple file I/O and top-level window enumeration. It communicates to a list of four preconfigured C2 servers via ICMP on port 53

The tag is: *misp-galaxy:malpedia="PHOREAL"*

PHOREAL is also known as:

- Rizzo

## PlugX

RSA describes PlugX as a RAT (Remote Access Trojan) malware family that is around since 2008 and is used as a backdoor to control the victim's machine fully. Once the device is infected, an attacker can remotely execute several kinds of commands on the affected system.

Notable features of this malware family are the ability to execute commands on the affected machine to retrieve: machine information capture the screen send keyboard and mouse events keylogging reboot the system manage processes (create, kill and enumerate) manage services (create, start, stop, etc.); and manage Windows registry entries, open a shell, etc.

The malware also logs its events in a text log file.

The tag is: *misp-galaxy:malpedia="PlugX"*

PlugX is also known as:

- Destroy RAT
- Kaba
- Korplug
- RedDelta
- Sogu
- TIGERPLUG

# PNGLoad

According to ESET Research, PNGLoad is a second-stage payload deployed by Worok on compromised systems and loaded either by CLRLoad or PowHeartBeat. PNGLoad has capabilities to download and execute additional payloads from a C&C server, which is likely how the attackers have deployed PNGLoad on systems compromised with PowHeartBeat. PNGLoad is a loader that uses bytes from PNG files to create a payload to execute. It is a 64-bit .NET executable - obfuscated with .NET Reactor - that masquerades as legitimate software.

The tag is: *misp-galaxy:malpedia="PNGLoad"*

PNGLoad is also known as:

*Table 2830. Table References*

# poisonplug

According to FireEye, POISONPLUG is a highly obfuscated modular backdoor with plug-in capabilities. The malware is capable of registry or service persistence, self-removal, plug-in execution, and network connection forwarding. POISONPLUG has been observed using social platforms to host encoded C&C commands.

The tag is: *misp-galaxy:malpedia="poisonplug"*

poisonplug is also known as:

- Barlaiy

## Pony

According to KnowBe4, Pony Stealer is a password stealer that can decrypt or unlock passwords for over 110 different applications including VPN, FTP, email, instant messaging, web browsers and much more. Pony Stealer is very dangerous and once it infects a PC it will turn the device into a botnet, allowing it to use the PCs it infects to infect other PCs.

# pupy (Windows)

Pupy is an open-source, cross-platform RAT and post-exploitation framework mainly written in python. Pupy can be loaded from various loaders, including PE EXE, reflective DLL, Linux ELF, pure python, powershell and APK. Most of the loaders bundle an embedded python runtime, python library modules in source/compiled/native forms as well as a flexible configuration. They bootstrap a python runtime environment mostly in-memory for the later stages of pupy to run in. Pupy can communicate using various transports, migrate into processes, load remote python code, python packages and python C-extensions from memory.

The tag is: *misp-galaxy:malpedia="pupy (Windows)"*

pupy (Windows) is also known as:

- Patpoopy

# PurpleFox

Purple Fox uses `msi.dll` function, 'MsiInstallProductA', to download and execute its payload. The payload is a `.msi` file that contains encrypted shellcode including 32-bit and 64-bit versions. once executed the system will be restarted and uses the 'PendingFileRenameOperations' registry to rename it's components.

Upon restart the rootkit capability of Purple Fox is invoked. It creates a suspended `svchost` process and injects a DLL that will create a driver with the rootkit capability.

The latest version of Purple Fox abuses open-source code to enable it's rootkit components, which includes hiding and protecting its files and registry entries. It also abuses a file utility software to hide its DLL component, which deters reverse engineering.

The tag is: `misp-galaxy:malpedia="PurpleFox"`

PurpleFox is also known as:

## Pushdo

Pushdo is usually classified as a "downloader" trojan - meaning its true purpose is to download and install additional malicious software. There are dozens of downloader trojan families out there, but Pushdo is actually more sophisticated than most, but that sophistication lies in the Pushdo control server rather than the trojan.

## PwndLocker

PwndLocker is a ransomware that was observed in late 2019 and is reported to have been used to

target businesses and local governments/cities. According to one source, ransom amounts demanded as part of PwndLocker activity range from \$175k USD to \$650k USD depending on the size of the network. PwndLocker attempts to disable a variety of Windows services so that their data can be encrypted. Various processes will also be targeted, such as web browsers and software related to security, backups, and databases. Shadow copies are cleared by the ransomware, and encryption of files occurs once the system has been prepared in this way. Executable files and those that are likely to be important for the system to continue to function appear to be skipped by the ransomware, and a large number of folders mostly related to Microsoft Windows system files are also ignored. As of March 2020, encrypted files have been observed with the added extensions of .key and .pwnd. Ransom notes are dropped in folders where encrypted files are found and also on the user's desktop.

## PyXie

Full-featured Python RAT compiled into an executable.

PyXie RAT functionality includes: \* Man-in-the-middle (MITM) Interception \* Web-injects \* Keylogging \* Credential harvesting \* Network Scanning \* Cookie theft \* Clearing logs \* Recording video \* Running arbitrary payloads \* Monitoring USB drives and exfiltrating data \* WebDav server \* Socks5 proxy \* Virtual Network Connection (VNC) \* Certificate theft \* Inventorying software \* Enumerating the domain with Sharpbound

The tag is: *misp-galaxy:malpedia="PyXie"*

PyXie is also known as:

- PyXie RAT

## QakBot

QBot is a modular information stealer also known as Qakbot or Pinkslipbot. It has been active for years since 2007. It has historically been known as a banking Trojan, meaning that it steals financial data from infected systems, and a loader using C2 servers for payload targeting and download.

The tag is: *misp-galaxy:malpedia="QakBot"*

QakBot is also known as:

- Oakboat
- Pinkslipbot
- Qbot
- Quakbot

## QUICKMUTE

QuickMute is a malware developed using the C/C++ programming language. Functionally provides download, RC4 decryption, and in-memory launch of the payload (waiting for a PE file with the export function "HttpsVictimMain"). To communicate with the management server, a number of protocols are provided, in particular: TCP, UDP, HTTP, HTTPS.

The tag is: *misp-galaxy:malpedia="QUICKMUTE"*

QUICKMUTE is also known as:

<https://cert.gov.ua/article/375404>

## QuietSieve

According to Microsoft, this is a heavily obfuscated .NET malware, primarily geared towards the exfiltration of data from the compromised host. But it can also receive and execute a remote

payload from the operator.

The tag is: *misp-galaxy:malpedia="QuietSieve"*

QuietSieve is also known as:

## Raccoon

Raccoon Stealer is a malware reportedly sold for \$75 a week or \$200 a month. It gathers personal information including passwords, browser cookies and autofill data, as well as cryptowallet details. Additionally, Raccoon Stealer records system information such as IP addresses and geo-location data.

The tag is: *misp-galaxy:malpedia="Raccoon"*

Raccoon is also known as:

- Mohazo
- RaccoonStealer
- Racealer
- Racocon

## Ragnarok

According to Bleeping Computer, the ransomware is used in targeted attacks against unpatched Citrix servers. It excludes Russian and Chinese targets using the system's Language ID for filtering. It also tries to disable Windows Defender and has a number of UNIX filepath references in its

strings. Encryption method is AES using a dynamically generated key, then bundling this key up via RSA.

## Ratankba

This is a backdoor that establishes persistence using the Startup folder. It communicates to its C&C server using HTTPS and a static HTTP User-Agent string. QUICKRIDE is capable of gathering information about the system, downloading and loading executables, and uninstalling itself. It was leveraged against banks in Poland.

The tag is: *misp-galaxy:malpedia="Ratankba"*

Ratankba is also known as:

## Reaver

Reaver is a type of malware discovered by researchers at Palo Alto Networks in November 2017, but its activity dates back to at least late 2016. Researchers identified only ten unique samples of the malware, indicating limited use, and three different variants, noted as versions 1, 2, and 3. The malware is unique as its final payload masquerades as a control panel link (CPL) file. The intended targets of this activity are unknown as of this writing; however, it was used concurrently with the SunOrcal malware and the same C2 infrastructure used by threat actors who primarily target based on the "Five Poisons" - five perceived threats deemed dangerous to, and working against the interests of, the Chinese government.

## RedLine Stealer

RedLine Stealer is a malware available on underground forums for sale apparently as standalone (\$100/\$150 depending on the version) or also on a subscription basis (\$100/month). This malware harvests information from browsers such as saved credentials, autocomplete data, and credit card information. A system inventory is also taken when running on a target machine, to include details such as the username, location data, hardware configuration, and information regarding installed security software. More recent versions of RedLine added the ability to steal cryptocurrency. FTP and IM clients are also apparently targeted by this family, and this malware has the ability to upload and download files, execute commands, and periodically send back information about the infected computer.

The tag is: *misp-galaxy:malpedia="RedLine Stealer"*

RedLine Stealer is also known as:

## Regin

Regin is a sophisticated malware and hacking toolkit attributed to United States' National Security Agency (NSA) for government spying operations. It was first publicly revealed by Kaspersky Lab, Symantec, and The Intercept in November 2014. Regin malware targeted victims in a range of industries, telecom, government, and financial institutions. It was engineered to be modular and over time dozens of modules have been found and attributed to this family. Symantec observed around 100 infections in 10 different countries across a variety of organisations including private companies, government entities, and research institutes.

# Remcos

Remcos (acronym of Remote Control & Surveillance Software) is a Remote Access Software used to remotely control computers. Remcos, once installed, opens a backdoor on the computer, granting full access to the remote user. Remcos can be used for surveillance and penetration testing purposes, and in some instances has been used in hacking campaigns.

The tag is: *misp-galaxy:malpedia="Remcos"*

Remcos is also known as:

- RemcosRAT
- Remvio
- Socmer

# Retefe (Windows)

Retefe is a Windows Banking Trojan that can also download and install additional malware onto the system using Windows PowerShell. It's primary functionality is to assist the attacker with stealing credentials for online banking websites. It is typically targeted against Swiss banks. The malware binary itself is primarily a dropper component for a Javascript file which builds a VBA file which in turn loads multiple tools onto the host including: 7zip and TOR. The VBA installs a new root certificate and then forwards all traffic via TOR to the attacker controlled host in order to effectively MITM TLS traffic.

## Revenge RAT

According to Cofense, Revenge RAT is a simple and freely available Remote Access Trojan that automatically gathers system information before allowing threat actors to remotely access system components such as webcams, microphones, and various other utilities.

The tag is: *misp-galaxy:malpedia="Revenge RAT"*

Revenge RAT is also known as:

- Revetrat

## REvil (Windows)

REvil                      Beta                      MD5:                      bed6fc04aeb785815744706239a1f243                      SHA1:  
3d0649b5f76dbb9f86b926afbd18ae028946bf                      SHA256:  
3641b09bf6eae22579d4fd5aae420476a134f5948966944189a70afd8032cb45 \* Privilege escalation via  
CVE-2018-8453 (64-bit only) \* Rerun with RunAs to elevate privileges \* Implements a requirement  
that if "exp" is set, privilege escalation must be successful for full execution to occur \* Implements  
target whitelisting using GetKeyboardLayoutList \* Contains debug console logging functionality \*  
Defines the REvil registry root key as SOFTWARE\!test \* Includes two variable placeholders in the  
ransom note: UID & KEY \* Terminates processes specified in the "prc" configuration key prior to  
encryption \* Deletes shadow copies and disables recovery \* Wipes contents of folders specified in  
the "wfld" configuration key prior to encryption \* Encrypts all non-whitelisted files on fixed drives  
\* Encrypts all non-whitelisted files on network mapped drives if it is running with System-level  
privileges or can impersonate the security context of explorer.exe \* Partially implements a  
background image setting to display a basic "Image text" message \* Sends encrypted system data to  
a C2 domain via an HTTPS POST request (URI path building is not implemented.)

REvil 1.00

MD5: 65aa793c000762174b2f86077bdafaea

SHA1: 95a21e764ad0c98ea3d034d293aee5511e7c8457

SHA256: f0c60f62ef9ffc044d0b4aeb8cc26b971236f24a2611cb1be09ff4845c3841bc

- \* Adds 32-bit implementation of CVE-2018-8453 exploit
- \* Removes console debug logging
- \* Changes the REvil registry root key to SOFTWARE\recfg

- \* Removes the System/Impersonation success requirement for encrypting network mapped drives
- \* Adds a "wipe" key to the configuration for optional folder wiping
- \* Fully implements the background image setting and leverages values defined in the "img" configuration key
- \* Adds an EXT variable placeholder to the ransom note to support UID, KEY, and EXT
- \* Implements URI path building so encrypted system data is sent to a C2 pseudo-random URL
- \* Fixes the function that returns the victim's username so the correct value is placed in the stats JSON data

REvil 1.01 MD5: 2abff29b4d87f30f011874b6e98959e9 SHA1: 9d1b61b1cba411ee6d4664ba2561fa59cdb0732c SHA256: a88e2857a2f3922b44247316642f08ba8665185297e3cd958bbd22a83f380feb \* Removes the exp/privilege escalation requirement for full execution and encrypts data regardless of privilege level \* Makes encryption of network mapped drives optional by adding the "-nolan" argument

- REvil 1.02
- MD5: 4af953b20f3a1f165e7cf31d6156c035
- SHA1: b859de5ffcb90e4ca8e304d81a4f81e8785bb299
- SHA256: 89d80016ff4c6600e8dd8cfad1fa6912af4d21c5457b4e9866d1796939b48dc4
- \* Enhances whitelisting validation by adding inspection of GetUserDefaultUILanguage and GetSystemDefaultUILanguage
  - \* Partially implements "lock file" logic by generating a lock filename based on the first four bytes of the Base64-decoded pk key, appending a .lock file extension, and adding the filename to the list of whitelisted files in the REvil configuration (It does not appear that this value is referenced after it is created and stored in memory. There is no evidence that a lock file is dropped to disk.)
  - \* Enhances folder whitelisting logic that take special considerations if the folder is associated with "program files" directories
  - \* Hard-codes whitelisting of all direct content within the Program Files or Program Files x86 directories
  - \* Hard-codes whitelisting of "sql" subfolders within program files
  - \* Encrypts program files sub-folders that does not contain "sql" in the path
  - \* Compares other folders to the list of whitelisted folders specified in the REvil configuration to determine if they are whitelisted
  - \* Encodes stored strings used for URI building within the binary and decodes them in memory right before use
  - \* Introduces a REvil registry root key "sub\_key" registry value containing the attacker's public key

REvil 1.03 MD5: 3cae02306a95564b1fff4ea45a7dfc00 SHA1: 0ce2cae5287a64138d273007b34933362901783d SHA256: 78fa32f179224c46ae81252c841e75ee4e80b57e6b026d0a05bb07d34ec37bbf \* Removes lock file logic that was partially implemented in 1.02 \* Leverages WMI to continuously monitor for and kill newly launched processes whose names are listed in the prc configuration key (Previous versions performed this action once.) \* Encodes stored shellcode \* Adds the -path argument: \* Does not wipe folders (even if wipe == true) \* Does not set desktop background \* Does not contact the C2 server

(even if net == true) \* Encrypts files in the specified folder and drops the ransom note \* Changes the REvil registry root key to SOFTWARE\QtProject\OrganizationDefaults \* Changes registry key values from -> to: \* sub\_key -> pvg \* pk\_key -> sxsP \* sk\_key -> BDDC8 \* 0\_key -> f7gVD7 \* rnd\_ext -> Xu7Nnkd \* stat -> sMMnxpgk

REvil 1.04

MD5: 6e3efb83299d800edf1624ecbc0665e7

SHA1: 0bd22f204c5373f1a22d9a02c59f69f354a2cc0d

SHA256: 2ca64feaaf5ab6cf96677fbc2bc0e1995b3bc93472d7af884139aa757240e3f6

\* Leverages PowerShell and WMI to delete shadow copies if the victim's operating system is newer than Windows XP (For Windows XP or older, it uses the original command that was executed in all previous REvil versions.)

\* Removes the folder wipe capability

\* Changes the REvil registry root key to SOFTWARE\GitForWindows

\* Changes registry key values from --> to:

\* pvg --> QPM

\* sxsP --> cMtS

\* BDDC8 --> WGg7j

\* f7gVD7 --> zbhs8h

\* Xu7Nnkd --> H85TP10

\* sMMnxpgk --> GCZg2PXD

REvil v1.05 MD5: cfefcc2edc5c54c74b76e7d1d29e69b2 SHA1: 7423c57db390def08154b77e2b5e043d92d320c7 SHA256: e430479d1ca03a1bc5414e28f6cddb301939c4c95547492cdbe27b0a123344ea \* Add new 'arn' configuration key that contains a boolean true/false value that controls whether or not to implement persistence. \* Implements persistence functionality via registry Run key. Data for value is set to the full path and filename of the currently running executable. The executable is never moved into any 'working directory' such as %AppData% or %TEMP% as part of the persistence setup. The Reg Value used is the hardcoded value of 'lNOWZyAWVv' : \* SOFTWARE\Microsoft\Windows\CurrentVersion\Run\lNOWZyAWVv \* Before exiting, REvil sets up its malicious executable to be deleted upon reboot by issuing a call to MoveFileExW and setting the destination to NULL and the flags to 4 (MOVEFILE\_DELAY\_UNTIL\_REBOOT). This breaks persistence however as the target executable specified in the Run key will no longer exist once this is done. \* Changes registry key values from -> to: \* QPM -> tgE \* cMtS -> 8K09 \* WGg7j -> xMtNc \* zbhs8h -> CTgE4a \* H85TP10 -> oE5bZg0 \* GCZg2PXD -> DC408Qp4

REvil v1.06

MD5: 65ff37973426c09b9ff95f354e62959e

SHA1: b53bc09cfbd292af7b3609734a99d101bd24d77e

SHA256: 0e37d9d0a7441a98119eb1361a0605042c4db0e8369b54ba26e6ba08d9b62f1e

\* Updated string decoding function to break existing yara rules. Likely the result of the blog posted by us.

\* Modified handling of network file encryption. Now explicitly passes every possible "Scope" constant to the WNetOpenEnum function when looking for files to encrypt. It also changed the 'Resource Type' from RESOURCETYPE\_DISK to RESOURCETYPE\_ANY which will now include things like mapped printers.

\* Persistence registry value changed from 'lNOWZyAWVv' to 'sNpEShi30R'

\* Changes registry key values from --> to:

- \* tgE --> 73g
- \* 8K09 --> vTGj
- \* xMtNc --> Q7PZe
- \* CTgE4a --> BuCrIp
- \* oE5bZg0 --> lcZd70Y
- \* DC408Qp4 --> sLF86MWC

REvil v1.07 MD5: ea4cae3d6d8150215a4d90593a4c30f2 SHA1:  
8dcbcbefaedf5675b170af3fd44db93ad864894e SHA256:  
6a2bd52a5d68a7250d1de481dcce91a32f54824c1c540f0a040d05f757220cd3 TBD

## RMS

CyberInt states that Remote Manipulator System (RMS) is a legitimate tool developed by Russian organization TektonIT and has been observed in campaigns conducted by TA505 as well as numerous smaller campaigns likely attributable to other, disparate, threat actors. In addition to the availability of commercial licenses, the tool is free for non-commercial use and supports the remote administration of both Microsoft Windows and Android devices.

The tag is: *misp-galaxy:malpedia="RMS"*

RMS is also known as:

- Gussdoor
- Remote Manipulator System

# RokRAT

It is a backdoor commonly distributed as an encoded binary file downloaded and decrypted by shellcode following the exploitation of weaponized documents. DOGCALL is capable of capturing screenshots, logging keystrokes, evading analysis with anti-virtual machine detections, and leveraging cloud storage APIs such as Cloud, Box, Dropbox, and Yandex.

The tag is: *misp-galaxy:malpedia="RokRAT"*

RokRAT is also known as:

- DOGCALL

# RoyalCli

RoyalCli is a backdoor which appears to be an evolution of BS2005 and uses familiar encryption and encoding routines. The name RoyalCli was chosen by us due to a debugging path left in the binary. RoyalCli and BS2005 both communicate with the attacker's command and control (C2) through Internet Explorer (IE) by using the COM interface IWebBrowser2.

The tag is: *misp-galaxy:malpedia="RoyalCli"*

RoyalCli is also known as:

## Ryuk

Ryuk is a ransomware which encrypts its victim's files and asks for a ransom via bitcoin to release the original files. It has been observed being used to attack companies or professional environments. Cybersecurity experts figured out that Ryuk and Hermes ransomware shares pieces of codes. Hermes is commodity ransomware that has been observed for sale on dark-net forums and used by multiple threat actors.

## Ryuk Stealer

Information Stealer that searches for sensitive documents and uploads its results to an FTP server.

Skips files with known Ryuk extensions.

The tag is: *misp-galaxy:malpedia="Ryuk Stealer"*

Ryuk Stealer is also known as:

- Sidoh

*Table 3018. Table References*

## Sality

F-Secure states that the Sality virus family has been circulating in the wild as early as 2003. Over

the years, the malware has been developed and improved with the addition of new features, such as rootkit or backdoor functionality, and so on, keeping it an active and relevant threat despite the relative age of the malware.

Modern Sality variants also have the ability to communicate over a peer-to-peer (P2P) network, allowing an attacker to control a botnet of Sality-infected machines. The combined resources of the Sality botnet may also be used by its controller(s) to perform other malicious actions, such as attacking routers.

Infection Sality viruses typically infect executable files on local, shared and removable drives. In earlier variants, the Sality virus simply added its own malicious code to the end of the infected (or host) file, a technique known as prepending. The viral code that Sality inserts is polymorphic, a form of complex code that is intended to make analysis more difficult.

Earlier Sality variants were regarded as technically sophisticated in that they use an Entry Point Obscuration (EPO) technique to hide their presence on the system. This technique means that the virus inserts a command somewhere in the middle of an infected file's code, so that when the system is reading the file to execute it and comes to the command, it forces the system to 'jump' to the malware's code and execute that instead. This technique was used to make discovery and disinfection of the malicious code harder.

Payload Once installed on the computer system, Sality viruses usually also execute a malicious payload. The specific actions performed depend on the specific variant in question, but generally Sality viruses will attempt to terminate processes, particularly those related to security programs. The virus may also attempt to open connections to remote sites, download and run additional malicious files, and steal data from the infected machine.

Links
<a href="https://malpedia.caad.fkie.fraunhofer.de/details/win.serpico">https://malpedia.caad.fkie.fraunhofer.de/details/win.serpico</a>

# ServHelper

ServHelper is written in Delphi and according to ProofPoint best classified as a backdoor.

ProofPoint noticed two distinct variant - "tunnel" and "downloader" (citation): "The 'tunnel' variant has more features and focuses on setting up reverse SSH tunnels to allow the threat actor to access the infected host via Remote Desktop Protocol (RDP). Once ServHelper establishes remote desktop access, the malware contains functionality for the threat actor to 'hijack' legitimate user accounts or their web browser profiles and use them as they see fit. The 'downloader' variant is stripped of the tunneling and hijacking functionality and is used as a basic downloader."

The tag is: *misp-galaxy:malpedia="ServHelper"*

ServHelper is also known as:

## SharpStage

The SharpStage backdoor is a .NET malware with backdoor capabilities. Its name is a derivative of the main activity class called "Stage\_One". SharpStage can take screenshots, run arbitrary commands and downloads additional payloads. It exfiltrates data from the infected machine to a dropbox account by implementing a dropbox client in its code. SharpStage was seen used by the Molerats group in targeted attacks in the middle east.

The tag is: *misp-galaxy:malpedia="SharpStage"*

SharpStage is also known as:

- LastConn

# Shifu

Shifu was originally discovered by Trusteer security researchers (Ilya Kolmanovich, Denis Laskov) in the middle of 2015. It is a banking trojan mostly focusing on Japanese banks and has rich features for remote data extraction and control.

The tag is: *misp-galaxy:malpedia="Shifu"*

Shifu is also known as:

## SMOKEDHAM

According to Mandiant, SMOKEDHAM is dropped through a powershell script that contains the (C#) source code for this backdoor, which is stored in an encrypted variable. The dropper dynamically defines a cmdlet and .NET class for the backdoor, meaning the compiled code is only found in memory.

The tag is: *misp-galaxy:malpedia="SMOKEDHAM"*

SMOKEDHAM is also known as:

# SmokeLoader

The SmokeLoader family is a generic backdoor with a range of capabilities which depend on the modules included in any given build of the malware. The malware is delivered in a variety of ways and is broadly associated with criminal activity. The malware frequently tries to hide its C2 activity by generating requests to legitimate sites such as microsoft.com, bing.com, adobe.com, and others. Typically the actual Download returns an HTTP 404 but still contains data in the Response Body.

The tag is: *misp-galaxy:malpedia="SmokeLoader"*

SmokeLoader is also known as:

- Dofail
- Sharik
- Smoke
- Smoke Loader

## Snake

Snake Ransomware is a Golang ransomware reportedly containing obfuscation not typically seen in Golang ransomware. This malware will remove shadow copies and kill processes related to SCADA/ICS devices, virtual machines, remote management tools, network management software, and others. After this, encryption of files on the device commences, while skipping Windows system folders and various system files. A random 5 character string is appended to encrypted files. According to Bleeping Computer, this ransomware takes an especially long time to encrypt files on a targeted machine. This ransomware is reported to target an entire network, rather than individual workstations.

The tag is: *misp-galaxy:malpedia="Snake"*

Snake is also known as:

- EKANS
- SNAKEHOSE

## Snatch

Snatch is a ransomware which infects victims by rebooting the PC into Safe Mode. Most of the existing security protections do not run in Safe Mode so that the malware can act without expected countermeasures and it can encrypt as many files as it finds. It uses common packers such as UPX to hide its payload.

The tag is: *misp-galaxy:malpedia="Snatch"*

Snatch is also known as:

## SodaMaster

This is a RAT that is usually loaded with one or more shellcode and/or reflective DLL injection techniques. The RAT uses RC4 or a hardcoded RSA key for traffic encryption/decryption. Its communication can either happen via a raw TCP socket or a HTTP POST request. Depending on the version, the RAT may remotely execute DLLs or shellcode.

The tag is: *misp-galaxy:malpedia="SodaMaster"*

SodaMaster is also known as:

- DelfsCake
- HEAVYPOT
- dfls

## **solarmarker**

Unit 42 notes that they identified a new version of SolarMarker, a malware family known for its infostealing and backdoor capabilities, mainly delivered through search engine optimization (SEO) manipulation to convince users to download malicious documents.

Some of SolarMarker’s capabilities include the exfiltration of auto-fill data, saved passwords and saved credit card information from victims’ web browsers. Besides capabilities typical for infostealers, SolarMarker has additional capabilities such as file transfer and execution of commands received from a C2 server.

The malware invests significant effort into defense evasion, which consists of techniques like signed files, huge files, impersonation of legitimate software installations and obfuscated PowerShell scripts.

The tag is: *misp-galaxy:malpedia="solarmarker"*

solarmarker is also known as:

- Jupyter
- Polazert
- Yellow Cockatoo

## SPACESHIP

SPACESHIP searches for files with a specified set of file extensions and copies them to a removable drive. FireEye believes that SHIPSHAPE is used to copy SPACESHIP to a removable drive, which could be used to infect another victim computer, including an air-gapped computer. SPACESHIP is then used to steal documents from the air-gapped system, copying them to a removable drive inserted into the SPACESHIP-infected system

## SpyEye

SpyEye is a malware targeting both Microsoft Windows browsers and Apple iOS Safari. Originated in Russia, it was available in dark forums for \$500+ claiming to be the "The Next Zeus Malware". It performed many functionalities typical from bankers trojan such as keyloggers, auto-fill credit card modules, email backups, config files (encrypted), http access, Pop3 grabbers and FTP grabbers. SpyEye allowed hackers to steal money from online bank accounts and initiate transactions even while valid users are logged into their bank account.

## Squirrelwaffle

According to Sophos, Squirrelwaffle is a malware loader that is distributed as a malicious Office document in spam campaigns. It provides attackers with an initial foothold in a victim's environment and a channel to deliver and infect systems with other malware. When a recipient opens a Squirrelwaffle-infected document and enables macros, a visual basic script typically downloads and executes malicious files and scripts, giving further control of the computer to an attacker. Squirrelwaffle operators also use DocuSign to try and trick the user into enabling macros in Office documents.

The tag is: *misp-galaxy:malpedia="Squirrelwaffle"*

Squirrelwaffle is also known as:

- DatopLoader

## STOP

STOP Djvu Ransomware it is a ransomware which encrypts user data through AES-256 and adds one of the dozen available extensions as marker to the encrypted file's name. It is not used to encrypt the entire file but only the first 5 MB. In its original version it was able to run offline and, in that case, it used a hard-coded key which could be extracted to decrypt files.

The tag is: *misp-galaxy:malpedia="STOP"*

STOP is also known as:

- Djvu
- KeyPass

*Table 3178. Table References*

# SUNBURST

FireEye describes SUNBURST as a trojanized SolarWinds digitally-signed component of the Orion software framework that contains a backdoor that communicates via HTTP to third party servers. After an initial dormant period of up to two weeks, it uses a DGA to generate specific subdomains for a set C&C domain. The backdoor retrieves and executes commands, that include the ability to transfer files, execute files, profile the system, reboot the machine, and disable system services. The C2 traffic to the malicious domains is designed to mimic normal SolarWinds API communications: Orion Improvement Program (OIP) protocol. The backdoor uses multiple obfuscated blocklists to identify forensic and anti-virus tools running as processes, services, and drivers. Multiple trojanized updates were digitally signed from March - May 2020 and posted to the SolarWinds updates website.

The tag is: *misp-galaxy:malpedia="SUNBURST"*

SUNBURST is also known as:

- Solorigate

## Syscon

SYSCON is a Remote Access Trojan used in a targeted champing against US government agencies. It has been recently observed in conjunction with CARROTBAT and CARROTBALL downloaders and it uses the File Transfer Protocol as Command and Control channel. Use of the family is attributed by Unit 42 to the Konni Group.

## Sysraw Stealer

Sysraw stealer got its name because at some point, it was started as "ZSysRaw\sysraw.exe". PDB strings suggest the name "Clipsa" though. First stage connects to /WPCoreLog/, the second one to /WPSecurity/. Its behavior suggest that it is an info stealer. It creates a rather large amount of files in a subdirectory (e.g. data) named "1?[-+].dat" and POSTs them.

The tag is: *misp-galaxy:malpedia="Sysraw Stealer"*

Sysraw Stealer is also known as:

- Clipsa

# Taurus Stealer

According to Zscaler, Taurus is a stealer that surfaced in June 2020. It is being developed by the author(s) that previously created Predator the Thief. The name overlaps partly with the StealerOne / Terra\* family (also aliased Taurus Loader) but appears to be a completely disjunct project.

## TeamBot

Recently, Check Point researchers spotted a targeted attack against officials within government finance authorities and representatives in several embassies in Europe. The attack, which starts with a malicious attachment disguised as a top secret US document, weaponizes TeamViewer, the popular remote access and desktop sharing software, to gain full control of the infected computer. This is achieved by sideloading another DLL among the legit TeamViewer.

The tag is: *misp-galaxy:malpedia="TeamBot"*

TeamBot is also known as:

## TEARDROP

TEARDROP is a memory only dropper that runs as a service, spawns a thread and reads from the file “gracious\_truth.jpg”, which likely has a fake JPG header. Next it checks that HKU\SOFTWARE\Microsoft\CTF exists, decodes an embedded payload using a custom rolling XOR algorithm and manually loads into memory an embedded payload using a custom PE-like file format. TEARDROP does not have code overlap with any previously seen malware. FireEye believe that this was used to execute a customized Cobalt Strike BEACON.

The tag is: *misp-galaxy:malpedia="TEARDROP"*

TEARDROP is also known as:

## TFlower

TFlower is a new ransomware targeting mostly corporate networks discovered in August, 2019. It is reportedly installed on networks by attackers after they gain access via RDP. TFlower displays a console showing activity being performed by the ransomware when it encrypts a machine, further indicating that this ransomware is triggered by the attacker post compromise, similar to Samsam/Samas in terms of TTP. Once encryption is started, the ransomware will conduct a status report to an apparently hard-coded C2. Shadow copies are deleted and the Windows 10 repair environment is disabled by this ransomware. This malware also will terminate any running Outlook.exe process so that the mail files can be encrypted. This ransomware does not add an

extension to encrypted files, but prepends the marker "\*tflower" and what may be the encrypted encryption key for the file to each affected file. Once encryption is completed, another status report is sent to the C2 server.

## Tiger RAT

This is third stage backdoor mentioned in the Kaspersky blog, "Andariel evolves to target South Korea with ransomware". The third stage payload was created via the second stage payload, is interactively executed in the operation and exists in both x64 and x86 versions. Most of them use Internet Explorer or Google Chrome icons and corresponding file names to disguise themselves as legitimate internet browsers. The malware decrypts the embedded payload at runtime. It uses an embedded 16-byte XOR key to decrypt the base64 encoded payload. The decrypted payload is another portable executable file that runs in memory. Before getting decrypted with a hardcoded XOR key, the backdoor also checks for sandbox environment. The backdoor has some code overlap with a know malware family PEBBLEDASH, attributed to Lazarus/LABYRINTH CHOLLIMA.

## Tinba

F-Secure notes that TinyBanker or short Tinba is usually distributed through malvertising (advertising content that leads the user to sites hosting malicious threats), exploit kits and spam email campaigns. According to news reports, Tinba has been found targeting bank customers in the United States and Europe.

If Tinba successfully infects a device, it can steal banking and personal information through webinjects. To do this, the malware monitors the user's browser activity and if specific banking portals are visited, Tinba injects code to present the victim with fake web forms designed to mimic the legitimate web site. The malware then tricks them into entering their personal information, log-in credentials, etc in the legitimate-looking page.

Tinba may also display socially-engineered messages to lure or pressure the user into entering their information on the fake page; for example, a message may be shown which attempts to convince the victim that funds were accidentally deposited to his account and must be refunded immediately.

The tag is: *misp-galaxy:malpedia="Tinba"*

Tinba is also known as:

- Illi
- TinyBanker
- Zusy

## TinyNuke

TinyNuke (aka Nuclear Bot) is a fully-fledged banking trojan including HiddenDesktop/VNC server and a reverse socks4 server. It was for sale on underground marketplaces for \$2500 in 2016. The program's author claimed the malware was written from scratch, but that it functioned similarly to the Zeus banking trojan in that it could steal passwords and inject arbitrary content when victims visited banking Web sites. However, he then proceeded to destroy his own reputation on hacker forums by promoting his development too aggressively. As a displacement activity, he published his source code on Github. XBot is an off-spring of TinyNuke, but very similar to its ancestor.

The tag is: *misp-galaxy:malpedia="TinyNuke"*

TinyNuke is also known as:

- MicroBankingTrojan
- Nuclear Bot
- NukeBot
- Xbot
