## BitPaymer - S0570

[BitPaymer](<https://attack.mitre.org/software/S0570>) is a ransomware variant first observed in August 2017 targeting hospitals in the U.K. [BitPaymer](<https://attack.mitre.org/software/S0570>) uses a unique encryption key, ransom note, and contact information for each operation. [BitPaymer](<https://attack.mitre.org/software/S0570>) has several indicators suggesting overlap with the [Dridex](<https://attack.mitre.org/software/S0384>) malware and is often delivered via [Dridex](<https://attack.mitre.org/software/S0384>). ## KillDisk - S0607

[KillDisk](<https://attack.mitre.org/software/S0607>) is a disk-wiping tool designed to overwrite files with random data to render the OS unbootable. It was first observed as a component of [BlackEnergy](<https://attack.mitre.org/software/S0089>) malware during cyber attacks against Ukraine in 2015. [KillDisk](<https://attack.mitre.org/software/S0607>) has since evolved into stand-alone malware used by a variety of threat actors against additional targets in Europe and Latin America; in 2016 a ransomware component was also incorporated into some [KillDisk](<https://attack.mitre.org/software/S0607>) variants.(Citation: KillDisk Ransomware)(Citation: ESEST Black Energy Jan 2016)(Citation: Trend Micro KillDisk 1)(Citation: Trend Micro KillDisk 2)

## BlackEnergy - S0089

[BlackEnergy](<https://attack.mitre.org/software/S0089>) is a malware toolkit that has been used by both criminal and APT actors. It dates back to at least 2007 and was originally designed to create botnets for use in conducting Distributed Denial of Service (DDoS) attacks, but its use has evolved to support various plug-ins. It is well known for being used during the confrontation between Georgia and Russia in 2008, as well as in targeting Ukrainian institutions. Variants include BlackEnergy 2 and BlackEnergy 3. ## FinFisher - S0182

[FinFisher](<https://attack.mitre.org/software/S0182>) is a government-grade commercial surveillance

spyware reportedly sold exclusively to government agencies for use in targeted and lawful criminal investigations. It is heavily obfuscated and uses multiple anti-analysis techniques. It has other variants including [Wingbird](<https://attack.mitre.org/software/S0176>). (Citation: FinFisher Citation) (Citation: Microsoft SIR Vol 21) (Citation: FireEye FinSpy Sept 2017) (Citation: Securelist BlackOasis Oct 2017) (Citation: Microsoft FinFisher March 2018)

## ChChes - S0144

[ChChes](<https://attack.mitre.org/software/S0144>) is a Trojan that appears to be used exclusively by [menuPass](<https://attack.mitre.org/groups/G0045>). It was used to target Japanese organizations in 2016. Its lack of persistence methods suggests it may be intended as a first-stage tool. (Citation: Palo Alto menuPass Feb 2017) (Citation: JPCERT ChChes Feb 2017) (Citation: PWC Cloud Hopper Technical Annex April 2017)

## POWERSOURCE - S0145

[POWERSOURCE](<https://attack.mitre.org/software/S0145>) is a PowerShell backdoor that is a heavily obfuscated and modified version of the publicly available tool DNS\_TXT\_Pwnage. It was observed in February 2017 in spearphishing campaigns against personnel involved with United States Securities and Exchange Commission (SEC) filings at various organizations. The malware was delivered when macros were enabled by the victim and a VBS script was dropped. (Citation: FireEye FIN7 March 2017) (Citation: Cisco DNSMessenger March 2017)

## SimBad - S0419

[SimBad](<https://attack.mitre.org/software/S0419>) was a strain of adware on the Google Play Store, distributed through the RXDroider Software Development Kit. The name "SimBad" was derived from the fact that most of the infected applications were simulator games. The adware was controlled using an instance of the open source framework Parse Server.(Citation: CheckPoint SimBad 2019)

## Matryoshka - S0167

[Matryoshka](<https://attack.mitre.org/software/S0167>) is a malware framework used by [CopyKittens](<https://attack.mitre.org/groups/G0052>) that consists of a dropper, loader, and RAT. It has multiple versions; v1 was seen in the wild from July 2016 until January 2017. v2 has fewer commands and other minor differences. (Citation: ClearSky Wilted Tulip July 2017) (Citation: CopyKittens Nov 2015)

## GravityRAT - S0237

[GravityRAT](<https://attack.mitre.org/software/S0237>) is a remote access tool (RAT) and has been in ongoing development since 2016. The actor behind the tool remains unknown, but two usernames have been recovered that link to the author, which are "TheMartian" and "The Invincible." According to the National Computer Emergency Response Team (CERT) of India, the malware has been identified in attacks against organization and entities in India. (Citation: Talos GravityRAT)

## Proxysvc - S0238

[Proxysvc](<https://attack.mitre.org/software/S0238>) is a malicious DLL used by [Lazarus Group](<https://attack.mitre.org/groups/G0032>) in a campaign known as Operation GhostSecret. It has appeared to be operating undetected since 2017 and was mostly observed in higher education organizations. The goal of [Proxysvc](<https://attack.mitre.org/software/S0238>) is to deliver additional payloads to the target and to maintain control for the attacker. It is in the form of a DLL that can also be executed as a standalone process. (Citation: McAfee GhostSecret)

## PoetRAT - S0428

[PoetRAT](<https://attack.mitre.org/software/S0428>) is a remote access trojan (RAT) that was first identified in April 2020. [PoetRAT](<https://attack.mitre.org/software/S0428>) has been used in multiple campaigns against the private and public sectors in Azerbaijan, including ICS and SCADA systems in the energy sector. The STIBNITE activity group has been observed using the malware. [PoetRAT](<https://attack.mitre.org/software/S0428>) derived its name from references in the code to poet William Shakespeare. (Citation: Talos PoetRAT April 2020)(Citation: Talos PoetRAT October 2020)(Citation: Dragos Threat Report 2020)

## ShiftyBug - S0294

[ShiftyBug](<https://attack.mitre.org/software/S0294>) is an auto-rooting adware family of malware for Android. The family is very similar to the other Android families known as Shedun, Shuanet, Kemoge, though it is not believed all the families were created by the same group. (Citation: Lookout-Adware)

## Mosquito - S0256

[Mosquito](<https://attack.mitre.org/software/S0256>) is a Win32 backdoor that has been used by [Turla](<https://attack.mitre.org/groups/G0010>). [Mosquito](<https://attack.mitre.org/software/S0256>) is made up of three parts: the installer, the launcher, and the backdoor. The main backdoor is called CommanderDLL and is launched by the loader program. (Citation: ESET Turla Mosquito Jan 2018)

## TrickBot - S0266

[TrickBot](<https://attack.mitre.org/software/S0266>) is a Trojan spyware program written in C++ that first emerged in September 2016 as a possible successor to [Dyre](<https://attack.mitre.org/software/S0024>). [TrickBot](<https://attack.mitre.org/software/S0266>) was developed and initially used by

[Wizard Spider](<https://attack.mitre.org/groups/G0102>) for targeting banking sites in North America, Australia, and throughout Europe; it has since been used against all sectors worldwide as part of "big game hunting" ransomware campaigns.(Citation: S2 Grupo TrickBot June 2017)(Citation: Fidelis TrickBot Oct 2016)(Citation: IBM TrickBot Nov 2016)(Citation: CrowdStrike Wizard Spider October 2020)

## NOKKI - S0353

[NOKKI](<https://attack.mitre.org/software/S0353>) is a modular remote access tool. The earliest observed attack using [NOKKI](<https://attack.mitre.org/software/S0353>) was in January 2018. [NOKKI](<https://attack.mitre.org/software/S0353>) has significant code overlap with the [KONNI](<https://attack.mitre.org/software/S0356>) malware family. There is some evidence potentially linking [NOKKI](<https://attack.mitre.org/software/S0353>) to [APT37](<https://attack.mitre.org/groups/G0067>). (Citation: Unit 42 NOKKI Sept 2018)(Citation: Unit 42 Nokki Oct 2018)

## Azorult - S0344

[Azorult](<https://attack.mitre.org/software/S0344>) is a commercial Trojan that is used to steal information from compromised hosts. [Azorult](<https://attack.mitre.org/software/S0344>) has been observed in the wild as early as 2016. In July 2018, [Azorult](<https://attack.mitre.org/software/S0344>) was seen used in a spearphishing campaign against targets in North America. [Azorult](<https://attack.mitre.org/software/S0344>) has been seen used for cryptocurrency theft. (Citation: Unit42 Azorult Nov 2018)(Citation: Proofpoint Azorult July 2018)

## Pony - S0453

[Pony](<https://attack.mitre.org/software/S0453>) is a credential stealing malware, though has also been used among adversaries for its downloader capabilities. The source code for Pony Loader 1.0 and 2.0 were leaked online, leading to their use by various threat actors.(Citation: Malwarebytes Pony April 2016)

## OceanSalt - S0346

[OceanSalt](<https://attack.mitre.org/software/S0346>) is a Trojan that was used in a campaign targeting victims in South Korea, United States, and Canada. [OceanSalt](<https://attack.mitre.org/software/S0346>) shares code similarity with [SpyNote RAT](<https://attack.mitre.org/software/S0305>), which has been linked to [APT1](<https://attack.mitre.org/groups/G0006>). (Citation: McAfee Oceansalt Oct 2018)

## Dridex - S0384

[Dridex](<https://attack.mitre.org/software/S0384>) is a prolific banking Trojan that first appeared in 2014. By December 2019, the US Treasury estimated [Dridex](<https://attack.mitre.org/software/S0384>) had infected computers in hundreds of banks and financial institutions in over 40 countries, leading to more than \$100 million in theft. [Dridex](<https://attack.mitre.org/software/S0384>) was created from the source code of the Bugat banking Trojan (also known as Cridex).(Citation: Dell Dridex Oct 2015)(Citation: Kaspersky Dridex May 2017)(Citation: Treasury EvilCorp Dec 2019)

## GoldenSpy - S0493

[GoldenSpy](<https://attack.mitre.org/software/S0493>) is a backdoor malware which has been packaged with legitimate tax preparation software. [GoldenSpy](<https://attack.mitre.org/software/S0493>) was discovered targeting organizations in China, being delivered with the "Intelligent Tax" software suite which is produced by the Golden Tax Department of Aisino Credit Information Co. and required to pay local taxes.(Citation: Trustwave GoldenSpy June 2020)

## WannaCry - S0366

[WannaCry](<https://attack.mitre.org/software/S0366>) is ransomware that was first seen in a global attack during May 2017, which affected more than 150 countries. It contains worm-like features to spread itself across a computer network using the SMBv1 exploit EternalBlue.(Citation: LogRhythm WannaCry)(Citation: US-CERT WannaCry 2017)(Citation: Washington Post WannaCry 2017)(Citation: FireEye WannaCry 2017)

## Emotet - S0367

[Emotet](<https://attack.mitre.org/software/S0367>) is a modular malware variant which is primarily used as a downloader for other malware variants such as [TrickBot](<https://attack.mitre.org/software/S0266>) and [IcedID](<https://attack.mitre.org/software/S0483>). Emotet first emerged in June 2014 and has been primarily used to target the banking sector. (Citation: Trend Micro Banking Malware Jan 2019)

## NotPetya - S0368

[NotPetya](<https://attack.mitre.org/software/S0368>) is malware that was used by [Sandworm Team](<https://attack.mitre.org/groups/G0034>) in a worldwide attack starting on June 27, 2017. While [NotPetya](<https://attack.mitre.org/software/S0368>) appears as a form of ransomware, its main purpose was to destroy data and disk structures on compromised systems; the attackers never intended to make the encrypted data recoverable. As such, [NotPetya](<https://attack.mitre.org/software/S0368>) may be more appropriately thought of as a form of wiper malware. [NotPetya](<https://attack.mitre.org/software/S0368>) contains worm-like features to spread itself across a computer network using the SMBv1 exploits EternalBlue and EternalRomance.(Citation: Talos Nyetya June 2017)(Citation: US-CERT NotPetya 2017)(Citation: ESET Telebots June 2017)(Citation: US District Court Indictment GRU Unit 74455 October 2020)

## ShimRat - S0444

[ShimRat](<https://attack.mitre.org/software/S0444>) has been used by the suspected China-based adversary [Mofang](<https://attack.mitre.org/groups/G0103>) in campaigns targeting multiple countries and sectors including government, military, critical infrastructure, automobile, and weapons development. The name "[ShimRat](<https://attack.mitre.org/software/S0444>)" comes from the malware's extensive use of Windows Application Shimming to maintain persistence. (Citation: FOX-IT May 2016 Mofang)

## Lokibot - S0447

[Lokibot](<https://attack.mitre.org/software/S0447>) is a widely distributed information stealer that was first reported in 2015. It is designed to steal sensitive information such as usernames, passwords, cryptocurrency wallets, and other credentials. [Lokibot](<https://attack.mitre.org/software/S0447>) can also create a backdoor into infected systems to allow an attacker to install additional payloads.(Citation: Infoblox Lokibot January 2019)(Citation: Morphisec Lokibot April 2020)(Citation: CISA Lokibot September 2020)

## Maze - S0449

[Maze](<https://attack.mitre.org/software/S0449>) ransomware, previously known as "ChaCha", was discovered in May 2019. In addition to encrypting files on victim machines for impact, [Maze](<https://attack.mitre.org/software/S0449>) operators conduct information stealing campaigns prior to encryption and post the information online to extort affected companies.(Citation: FireEye Maze May 2020)(Citation: McAfee Maze March 2020)(Citation: Sophos Maze VM September 2020)

## AppleJeus - S0584

[AppleJeus](<https://attack.mitre.org/software/S0584>) is a family of downloaders initially discovered in 2018 embedded within trojanized cryptocurrency applications. [AppleJeus](<https://attack.mitre.org/software/S0584>) has been used by [Lazarus Group](<https://attack.mitre.org/groups/G0032>), targeting companies in the energy, finance, government, industry, technology, and telecommunications sectors, and several countries including the United States, United Kingdom, South Korea, Australia, Brazil, New Zealand, and Russia. [AppleJeus](<https://attack.mitre.org/software/S0584>) has been used to distribute the [FALLCHILL](<https://attack.mitre.org/software/S0181>) RAT.(Citation: CISA AppleJeus Feb 2021)

## Mandrake - S0485

[Mandrake](<https://attack.mitre.org/software/S0485>) is a sophisticated Android espionage platform that has been active in the wild since at least 2016. [Mandrake](<https://attack.mitre.org/software/S0485>) is very actively maintained, with sophisticated features and attacks that are executed with surgical precision.

[Mandrake](<https://attack.mitre.org/software/S0485>) has gone undetected for several years by

providing legitimate, ad-free applications with social media and real reviews to back the apps. The malware is only activated when the operators issue a specific command.(Citation: Bitdefender Mandrake)

## Turian - S0647

[Turian](<https://attack.mitre.org/software/S0647>) is a backdoor that has been used by [BackdoorDiplomacy](<https://attack.mitre.org/groups/G0135>) to target Ministries of Foreign Affairs, telecommunication companies, and charities in Africa, Europe, the Middle East, and Asia. First reported in 2021, [Turian](<https://attack.mitre.org/software/S0647>) is likely related to Quarian, an older backdoor that was last observed being used in 2013 against diplomatic targets in Syria and the United States.(Citation: ESET BackdoorDiplomacy Jun 2021)

## WolfRAT - S0489

[WolfRAT](<https://attack.mitre.org/software/S0489>) is malware based on a leaked version of [Dendroid](<https://attack.mitre.org/software/S0301>) that has primarily targeted Thai users. [WolfRAT](<https://attack.mitre.org/software/S0489>) has most likely been operated by the now defunct organization Wolf Research.(Citation: Talos-WolfRAT)

## ThiefQuest - S0595

[ThiefQuest](<https://attack.mitre.org/software/S0595>) is a virus, data stealer, and wiper that presents itself as ransomware targeting macOS systems. [ThiefQuest](<https://attack.mitre.org/software/S0595>) was first seen in 2020 distributed via trojanized pirated versions of popular macOS software on Russian forums sharing torrent links.(Citation: Reed thiefquest fake ransom) Even though [ThiefQuest](<https://attack.mitre.org/software/S0595>) presents itself as ransomware, since the dynamically generated encryption key is never sent to the attacker it may be more appropriately thought of as a form of wiper malware.(Citation: wardle evilquest partii)(Citation: reed thiefquest ransomware analysis)

## ShadowPad - S0596

[ShadowPad](<https://attack.mitre.org/software/S0596>) is a modular backdoor that was first identified in a supply chain compromise of the NetSarang software in mid-July 2017. The malware was originally thought to be exclusively used by [APT41](<https://attack.mitre.org/groups/G0096>), but has since been observed to be used by various Chinese threat activity groups. (Citation: Recorded Future RedEcho Feb 2021)(Citation: Securelist ShadowPad Aug 2017)(Citation: Kaspersky ShadowPad Aug 2017)

## SUPERNOVA - S0578

[SUPERNOVA](<https://attack.mitre.org/software/S0578>) is an in-memory web shell written in .NET C#. It was discovered in November 2020 during the investigation of [APT29](<https://attack.mitre.org/groups/G0016>)'s SolarWinds cyber operation but determined to be unrelated. Subsequent analysis suggests [SUPERNOVA](<https://attack.mitre.org/software/S0578>) may have been used by the China-based threat group SPIRAL.(Citation: Guidepoint SUPERNOVA Dec 2020)(Citation: Unit42 SUPERNOVA Dec 2020)(Citation: SolarWinds Advisory Dec 2020)(Citation: CISA Supernova Jan 2021)(Citation: Microsoft Analyzing Solorigate Dec 2020)

## GoldFinder - S0597

[GoldFinder](<https://attack.mitre.org/software/S0597>) is a custom HTTP tracer tool written in Go that logs the route a packet takes between a compromised network and a C2 server. It can be used to inform threat actors of potential points of discovery or logging of their actions, including C2 related to other malware. [GoldFinder](<https://attack.mitre.org/software/S0597>) was discovered in early 2021 during an investigation into the SolarWinds cyber intrusion by [APT29](<https://attack.mitre.org/groups/G0016>). ## GoldMax - S0588

[GoldMax](<https://attack.mitre.org/software/S0588>) is a second-stage C2 backdoor written in Go that was used by [APT29](<https://attack.mitre.org/groups/G0016>) and discovered in early 2021 during the investigation into breaches related to the SolarWinds intrusion. [GoldMax](<https://attack.mitre.org/software/S0588>) uses multiple defense evasion techniques, including avoiding virtualization execution and masking malicious traffic.(Citation: MSTIC NOBELIUM Mar 2021)(Citation: FireEye SUNSHUTTLE Mar 2021)

## Invoke-PSImage - S0231

[Invoke-PSImage](<https://attack.mitre.org/software/S0231>) takes a PowerShell script and embeds the bytes of the script into the pixels of a PNG image. It generates a one liner for executing either from a file or from the web. Example of usage is embedding the PowerShell code from the Invoke-Mimikatz module and embed it into an image file. By calling the image file from a macro for example, the macro will download the picture and execute the PowerShell code, which in this case will dump the passwords. (Citation: GitHub Invoke-PSImage)

## Net - S0039

The [Net](<https://attack.mitre.org/software/S0039>) utility is a component of the Windows operating system. It is used in command-line operations for control of users, groups, services, and network connections. (Citation: Microsoft Net Utility)

[Net](<https://attack.mitre.org/software/S0039>) has a great deal of functionality, (Citation: Savill 1999) much of which is useful for an adversary, such as gathering system and network information for Discovery, moving laterally through [SMB/Windows Admin Shares](<https://attack.mitre.org/techniques/T1021/002>) using `net use` commands, and interacting with services. The net1.exe utility is executed for certain functionality when net.exe is run and can be used directly in commands such as `net1 user`.

## Tor - S0183

[Tor](<https://attack.mitre.org/software/S0183>) is a software suite and network that provides increased anonymity on the Internet. It creates a multi-hop proxy network and utilizes multilayer encryption to protect both the message and routing information. [Tor](<https://attack.mitre.org/software/S0183>) utilizes "Onion Routing," in which messages are encrypted with multiple layers of encryption; at each step in the proxy network, the topmost layer is decrypted and the contents forwarded on to the next node until it reaches its destination. ## RawDisk - S0364

[RawDisk](<https://attack.mitre.org/software/S0364>) is a legitimate commercial driver from the EldoS Corporation that is used for interacting with files, disks, and partitions. The driver allows for direct modification of data on a local computer's hard drive. In some cases, the tool can enact these raw disk modifications from user-mode processes, circumventing Windows operating system security features.(Citation: EldoS RawDisk ITpro)(Citation: Novetta Blockbuster Destructive Malware)

## ShimRatReporter - S0445

[ShimRatReporter](<https://attack.mitre.org/software/S0445>) is a tool used by suspected Chinese adversary [Mofang](<https://attack.mitre.org/groups/G0103>) to automatically conduct initial discovery. The details from this discovery are used to customize follow-on payloads (such as [ShimRat](<https://attack.mitre.org/software/S0444>)) as well as set up faux infrastructure which mimics the adversary's targets. [ShimRatReporter](<https://attack.mitre.org/software/S0445>) has been used in campaigns targeting multiple countries and sectors including government, military, critical infrastructure, automobile, and weapons development.(Citation: FOX-IT May 2016 Mofang)

## Enforce UAC Prompt

Enforce administrative users to confirm an action that requires elevated rights

The tag is: *misp-galaxy:preventive-measure="Enforce UAC Prompt"*

Table 5759. Table References

Links
<a href="https://technet.microsoft.com/en-us/library/dd835564(WS.10).aspx">https://technet.microsoft.com/en-us/library/dd835564(WS.10).aspx</a>

## Remove Admin Privileges

Remove and restrict administrative rights whenever possible. Malware can only modify files that users have write access to.

The tag is: *misp-galaxy:preventive-measure="Remove Admin Privileges"*

## Restrict Workstation Communication

Activate the Windows Firewall to restrict workstation to workstation communication

The tag is: *misp-galaxy:preventive-measure="Restrict Workstation Communication"*

## Sandboxing Email Input

Using sandbox that opens email attachments and removes attachments based on behavior analysis

The tag is: *misp-galaxy:preventive-measure="Sandboxing Email Input"*

## Execution Prevention

Software that allows to control the execution of processes - sometimes integrated in Antivirus software Free: AntiHook, ProcessGuard, System Safety Monitor

The tag is: *misp-galaxy:preventive-measure="Execution Prevention"*

## Change Default "Open With" to Notepad

Force extensions primarily used for infections to open up in Notepad rather than Windows Script Host or Internet Explorer

The tag is: *misp-galaxy:preventive-measure="Change Default "Open With" to Notepad"*

## Telecrypt Ransomware

This is most likely to affect Russian speaking users, since the note is written in Russian. Therefore, residents of Russian speaking country are affected. The hacker spread the virus using email spam, fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc.. The ransomware's authors would request around \$75 from their victims to provide them with a decryptor (payments are accepted via Russian payment services Qiwi or Yandex.Money ). Right from the start, however, researchers suggested that TeleCrypt was written by cybercriminals without advanced skills. Telecrypt will generate a random string to encrypt with that is between 10-20 length and only contain the letters vo,pr,bm,xu,zt,dq.

The tag is: *misp-galaxy:ransomware="Telecrypt Ransomware"*

## Jaff

We recently observed several large scale email campaigns that were attempting to distribute a new variant of ransomware that has been dubbed "Jaff". Interestingly we identified several characteristics that we have previously observed being used during Dridex and Locky campaigns. In a short period of time, we observed multiple campaigns featuring high volumes of malicious spam emails being distributed, each using a PDF attachment with an embedded Microsoft Word

document functioning as the initial downloader for the Jaff ransomware.

## SynAck

The ransomware does not use a customized desktop wallpaper to signal its presence, and the only way to discover that SynAck has infected your PC is by the ransom notes dropped on the user's desktop, named in the format: RESTORE\_INFO-[id].txt. For example: RESTORE\_INFO-4ABFA0EF.txt. In addition, SynAck also appends its own extension at the end of all files it encrypted. This file extensions format is ten random alpha characters for each file. For example: test.jpg.XbMiJQiuh. Experts believe the group behind SynAck uses RDP brute-force attacks to access remote computers and manually download and install the ransomware.

The tag is: *misp-galaxy:ransomware="SynAck"*

SynAck is also known as:

- Syn Ack

## Bad Rabbit

On October 24, 2017, Cisco Talos was alerted to a widescale ransomware campaign affecting organizations across eastern Europe and Russia. As was the case in previous situations, we quickly mobilized to assess the situation and ensure that customers remain protected from this and other threats as they emerge across the threat landscape. There have been several large scale ransomware campaigns over the last several months. This appears to have some similarities to Nyetya in that it is also based on Petya ransomware. Major portions of the code appear to have been rewritten. The distribution does not appear to have the sophistication of the supply chain attacks we have seen recently.

The tag is: *misp-galaxy:ransomware="Bad Rabbit"*

Bad Rabbit is also known as:

- BadRabbit
- Bad-Rabbit

## Halloware

A malware author by the name of Luc1F3R is peddling a new ransomware strain called Halloware for the lowly price of \$40. Based on evidence gathered by Bleeping Computer, Luc1F3R started selling his ransomware this week, beginning Thursday.

The tag is: *misp-galaxy:ransomware="Halloware"*

## StorageCrypt

Recently BleepingComputer has received a flurry of support requests for a new ransomware being named StorageCrypt that is targeting NAS devices such as the Western Digital My Cloud. Victims have been reporting that their files have been encrypted and a note left with a ransom demand of between .4 and 2 bitcoins to get their files back. User's have also reported that each share on their NAS device contains a Autorun.inf file and a Windows executable named Beauty.exe, which translates to Beauty and the beast. From the samples BleepingComputer has received, this Autorun.inf is an attempt to spread the Beauty.exe file to other computers that open the folders on the NAS devices.

## HC7

A new ransomware called HC7 is infecting victims by hacking into Windows computers that are running publicly accessible Remote Desktop services. Once the developers gain access to the hacked computer, the HC7 ransomware is then installed on all accessible computers on the network. Originally released as HC6, victims began posting about it in the BleepingComputer forums towards the end of November. As this is a Python-to-exe executable, once the script was extracted ID Ransomware creator Michael Gillespie was able determine that it was decryptable and released a

decryptor. Unfortunately, a few days later, the ransomware developers released a new version called HC7 that was not decryptable. This is because they removed the hard coded encryption key and instead switched to inputting the key as a command line argument when the attackers run the ransomware executable. Thankfully, there may be a way to get around that as well so that victims can recover their keys.

The tag is: *misp-galaxy:ransomware="HC7"*

# Scarab

The Scarab ransomware is a relatively new ransomware strain that was first spotted by security researcher Michael Gillespie in June this year. Written in Delphi, the first version was simplistic and was recognizable via the ".scarab" extension it appended after the names of encrypted files. Malwarebytes researcher Marcelo Rivera spotted a second version in July that used the ".scorpio" extension. The version spotted with the Necurs spam today has reverted back to using the .scarab extension. The current version of Scarab encrypts files but does not change original file names as previous versions. This Scarab version appends each file's name with the "[suupport@protonmail.com].scarab" extension. Scarab also deletes shadow volume copies and drops a ransom note named "IF YOU WANT TO GET ALL YOUR FILES BACK, PLEASE READ THIS.TXT" on users' computers, which it opens immediately.

The tag is: *misp-galaxy:ransomware="Scarab"*

## File Spider

A new ransomware called File Spider is being distributed through spam that targets victims in Bosnia and Herzegovina, Serbia, and Croatia. These spam emails contains malicious Word documents that will download and install the File Spider ransomware onto a victims computer. File Spider is currently being distributed through malspam that appears to be targeting countries such as Croatia, Bosnia and Herzegovina, and Serbia. The spam start with subjects like "Potrazivanje

dugovanja", which translates to "Debt Collection" and whose message, according to Google Translate, appear to be in Serbian.

The tag is: *misp-galaxy:ransomware="File Spider"*

File Spider is also known as:

- Spider

## ShurL0ckr

Security researchers uncovered a new ransomware named ShurL0ckr (detected by Trend Micro as

RANSOM\_GOSHIFR.B) that reportedly bypasses detection mechanisms of cloud platforms. Like Cerber and Satan, ShurLOckr's operators further monetize the ransomware by peddling it as a turnkey service to fellow cybercriminals, allowing them to earn additional income through a commission from each victim who pays the ransom.

The tag is: *misp-galaxy:ransomware="ShurLOckr"*

## Black Ruby

A new ransomware was discovered this week by MalwareHunterTeam called Black Ruby. This ransomware will encrypt the files on a computer, scramble the file name, and then append the BlackRuby extension. To make matters worse, Black Ruby will also install a Monero miner on the computer that utilizes as much of the CPU as it can. Discovered on February 6, 2018. May have been distributed through unknown vectors. Will not encrypt a machine if its IP address is identified as coming from Iran; this feature enables actors to avoid a particular Iranian cybercrime law that prohibits Iran-based actors from attacking Iranian victims. Encrypts files on the infected machine, scrambles files, and appends the .BlackRuby extension to them. Installs a Monero miner on the infected computer that utilizes the machine's maximum CPU power. Delivers a ransom note in English asking for US\$650 in Bitcoins. Might be installed via Remote Desktop Services.

The tag is: *misp-galaxy:ransomware="Black Ruby"*

Black Ruby is also known as:

- BlackRuby

## LockCrypt

LockCrypt is an example of yet another simple ransomware created and used by unsophisticated attackers. Its authors ignored well-known guidelines about the proper use of cryptography. The internal structure of the application is also unprofessional. Sloppy, unprofessional code is pretty

commonplace when ransomware is created for manual distribution. Authors don't take much time preparing the attack or the payload. Instead, they're rather focused on a fast and easy gain, rather than on creating something for the long run. Because of this, they could easily be defeated.

The tag is: *misp-galaxy:ransomware="LockCrypt"*

## Reveton ransomware

A ransomware family that targets users from certain countries or regions. It locks the computer and displays a location-specific webpage that covers the desktop and demands that the user pay a fine for the supposed possession of illicit material. The Reveton ransomware is one of the first screen-locking ransomware strains, and it appeared when Bitcoin was still in its infancy, and before it became the cryptocurrency of choice in all ransomware operations. Instead, Reveton operators asked victims to buy GreenDot MoneyPak vouchers, take the code on the voucher and enter it in the Reveton screen locker.

## Fusob

Fusob is one of the major mobile ransomware families. Between April 2015 and March 2016, about 56 percent of accounted mobile ransomware was Fusob. Like a typical mobile ransomware, it employs scare tactics to extort people to pay a ransom. The program pretends to be an accusatory authority, demanding the victim to pay a fine from \$100 to \$200 USD or otherwise face a fictitious charge. Rather surprisingly, Fusob suggests using iTunes gift cards for payment. Also, a timer clicking down on the screen adds to the users' anxiety as well. In order to infect devices, Fusob masquerades as a pornographic video player. Thus, victims, thinking it is harmless, unwittingly download Fusob. When Fusob is installed, it first checks the language used in the device. If it uses Russian or certain Eastern European languages, Fusob does nothing. Otherwise, it proceeds on to lock the device and demand ransom. Among victims, about 40% of them are in Germany with the United Kingdom and the United States following with 14.5% and 11.4% respectively. Fusob has lots in common with Small, which is another major family of mobile ransomware. They represented over 93% of mobile ransoms between 2015 and 2016.

## NMCRYPT Ransomware

The NMCRYPT Ransomware is a generic file encryption Trojan that was detected in the middle of April 2018. The NMCRYPT Ransomware is a file encoder Trojan that is designed to make data unreadable and convince users to pay a fee for unlocking content on the infected computers. The NMCRYPT Ransomware is nearly identical to hundreds of variants of the HiddenTear open-source ransomware and compromised users are unable to use the Shadow Volume snapshots made by Windows to recover. Unfortunately, the NMCRYPT Ransomware disables the native recovery features on Windows, and you need third-party applications to rebuild your data.

The tag is: *misp-galaxy:ransomware="NMCRYPT Ransomware"*

## Iron

It is currently unknown if Iron is indeed a new variant by the same creators of Maktub, or if it was simply inspired by the latter, by copying the design for the payment portal for example. We know the Iron ransomware has mimicked at least three ransomware families: Maktub (payment portal

design) DMA Locker (Iron Unlocker, decryption tool) Satan (exclusion list)

The tag is: *misp-galaxy:ransomware="Iron"*

## Unnamed ransomware 1

A new in-development ransomware was discovered that has an interesting characteristic. Instead of the distributed executable performing the ransomware functionality, the executables compiles an embedded encrypted C# program at runtime and launches it directly into memory.

The tag is: *misp-galaxy:ransomware="Unnamed ransomware 1"*

Table 6301. Table References

Links
<a href="https://www.bleepingcomputer.com/news/security/new-c-ransomware-compiles-itself-at-runtime/">https://www.bleepingcomputer.com/news/security/new-c-ransomware-compiles-itself-at-runtime/</a>

## HPE iLO 4 Ransomware

Attackers are targeting Internet accessible HPE iLO 4 remote management interfaces, supposedly encrypting the hard drives, and then demanding Bitcoins to get access to the data again. According to the victim, the attackers are demanding 2 bitcoins to gain access to the drives again. The attackers will also provide a bitcoin address to the victim that should be used for payment. These bitcoin addresses appear to be unique per victim as the victim's was different from other reported ones. An interesting part of the ransom note is that the attackers state that the ransom price is not negotiable unless the victim's are from Russia. This is common for Russian based attackers, who in many cases tries to avoid infecting Russian victims. Finally, could this be a decoy/wiper rather than an actual true ransomware attack? Ransomware attacks typically provide a unique ID to the victim in order to distinguish one victim from another. This prevents a victim from "stealing" another victim's payment and using it to unlock their computer. In a situation like this, where no unique ID is given to identify the encrypted computer and the email is publicly accessible, it could be a case

where the main goal is to wipe a server or act as a decoy for another attack.

The tag is: *misp-galaxy:ransomware="HPE iLO 4 Ransomware"*

## Aurora Ransomware

Typical ransom software, Aurora virus plays the role of blackmailing PC operators. It encrypts files and the encryption cipher it uses is pretty strong. After encryption, the virus attaches .aurora at the end of the file names that makes it impossible to open the data. Thereafter, it dispatches the ransom note totaling 6 copies, without any change to the main objective i.e., victims must write an electronic mail addressed to [anonimus.mr@yahoo.com](mailto:anonimus.mr@yahoo.com) while stay connected until the criminals reply telling the ransom amount.

The tag is: *misp-galaxy:ransomware="Aurora Ransomware"*

Aurora Ransomware is also known as:

- Zorro Ransomware

## DBGer Ransomware

The authors of the Satan ransomware have rebranded their "product" and they now go by the name of DBGer ransomware, according to security researcher MalwareHunter, who spotted this new version earlier today. The change was not only in name but also in the ransomware's modus operandi. According to the researcher, whose discovery was later confirmed by an Intezer code similarity analysis, the new (Satan) DBGer ransomware now also incorporates Mimikatz, an open-source password-dumping utility. The purpose of DBGer incorporating Mimikatz is for lateral movement inside compromised networks. This fits a recently observed trend in Satan's modus operandi.

The tag is: *misp-galaxy:ransomware="DBGer Ransomware"*

## TYRANT

DUMB variant discovered on November 16, 2017. Disguised itself as a popular virtual private network (VPN) in Iran known as Psiphon and infected Iranian users. Included Farsi-language ransom note, decryptable in the same way as previous DUMB-based variants. Message requested only US\$15 for unlock key. Advertised two local and Iran-based payment processors: exchange.ir and webmoney.ir. Shared unique and specialized indicators with RASTAKHIZ; iDefense threat intelligence analysts believe this similarity confirms that the same actor was behind the repurposing of both types of ransomware.

The tag is: *misp-galaxy:ransomware="TYRANT"*

TYRANT is also known as:

- Crypto Tyrant

## WannaSmile

zCrypt variant discovered on November 17, 2017, one day after the discovery of TYRANT. Used Farsi-language ransom note asking for a staggering 20 Bitcoin ransom payment. Also advertised local Iran-based payment processors and exchanges—www.exchangeing[.]ir, www.payment24[.]ir, www.farhadexchange.net, and www.digiarz.com)—through which Bitcoins could be acquired.

The tag is: *misp-galaxy:ransomware="WannaSmile"*

# Unnamed Android Ransomware

Uses APK Editor Pro. Picks and activates DEX>Smali from APK Editor. Utilizes LockService application and edits the “const-string v4, value” to a desired unlock key. Changes contact information within the ransom note. Once the victim has downloaded the malicious app, the only way to recover its content is to pay the ransom and receive the unlock key.

The tag is: *misp-galaxy:ransomware="Unnamed Android Ransomware"*

## CryptoNar

When the CryptoNar, or Crypto Nar, Ransomware encrypts a victims files it will perform the encryption differently depending on the type of file being encrypted. If the targeted file has a .txt or .md extension, it will encrypt the entire file and append the .fully.cryptoNar extension to the encrypted file's name. All other files will only have the first 1,024 bytes encrypted and will have the .partially.cryptoNar extensions appended to the file's name.

The tag is: *misp-galaxy:ransomware="CryptoNar"*

[View relationships graph](#)

CryptoNar has relationships with:

## Crypt0saur

The tag is: *misp-galaxy:ransomware="Crypt0saur"*

## Mongo Lock

An attack called Mongo Lock is targeting remotely accessible and unprotected MongoDB databases, wiping them, and then demanding a ransom in order to get the contents back. While this new campaign is using a name to identify itself, these types of attacks are not new and MongoDB databases have been targeted for a while now. These hijacks work by attackers scanning the Internet or using services such as Shodan.io to search for unprotected MongoDB servers. Once connected, the attackers may export the databases, delete them, and then create a ransom note explaining how to get the databases back.

The tag is: *misp-galaxy:ransomware="Mongo Lock"*

*Table 6335. Table References*

Links

<https://www.bleepingcomputer.com/news/security/mongo-lock-attack-ransoming-deleted-mongodb-databases/>

## Kraken Cryptor Ransomware

The Kraken Cryptor Ransomware is a newer ransomware that was released in August 2018. A new version, called Kraken Cryptor 1.5, was recently released that is masquerading as the legitimate SuperAntiSpyware anti-malware program in order to trick users into installing it.

The tag is: *misp-galaxy:ransomware="Kraken Cryptor Ransomware"*

*Table 6336. Table References*

## WeChat Ransom

Over 100,000 thousand computers in China have been infected in just a few days with poorly-written ransomware that encrypts local files and steals credentials for multiple Chinese online services. The crooks show a screen titled UNNAMED1989 and demand the victim a ransom of 110 yuan (\$16) in exchange for decrypting the files, payable via Tencent's WeChat payment service by scanning a QR code.

The tag is: *misp-galaxy:ransomware="WeChat Ransom"*

WeChat Ransom is also known as:

- UNNAMED1989

# Ryuk ransomware

Similar to Samas and BitPaymer, Ryuk is specifically used to target enterprise environments. Code comparison between versions of Ryuk and Hermes ransomware indicates that Ryuk was derived from the Hermes source code and has been under steady development since its release. Hermes is commodity ransomware that has been observed for sale on forums and used by multiple threat actors. However, Ryuk is only used by GRIM SPIDER and, unlike Hermes, Ryuk has only been used to target enterprise environments. Since Ryuk's appearance in August, the threat actors operating it have netted over 705.80 BTC across 52 transactions for a total current value of \$3,701,893.98 USD.

The tag is: *misp-galaxy:ransomware="Ryuk ransomware"*

*Table 6364. Table References*

<https://www.cert.ssi.gouv.fr/uploads/CERTFR-2019-ACT-005.pdf>

## BitPaymer

In August 2017, a new ransomware variant identified as BitPaymer was reported to have ransomed the U.K.'s National Health Service (NHS), with a high ransom demand of 53 BTC (approximately \$200,000 USD). The targeting of an organization rather than individuals, and the high ransom demands, made BitPaymer stand out from other contemporary ransomware at the time. Though the encryption and ransom functionality of BitPaymer was not technically sophisticated, the malware contained multiple anti-analysis features that overlapped with Dridex. Later technical analysis of BitPaymer indicated that it had been developed by INDRIK SPIDER, suggesting the group had expanded its criminal operation to include ransomware as a monetization strategy.

The tag is: *misp-galaxy:ransomware="BitPaymer"*

BitPaymer is also known as:

- FriedEx
- IEncrypt

*Table 6365. Table References*

# Princess Evolution

We have been observing a malvertising campaign via Rig exploit kit delivering a cryptocurrency-mining malware and the GandCrab ransomware since July 25. On August 1, we found Rig's traffic stream dropping a then-unknown ransomware. Delving into this seemingly new ransomware, we checked its ransom payment page in the Tor network and saw it was called Princess Evolution (detected by Trend Micro as RANSOM\_PRINCESSLOCKER.B), and was actually a new version of the Princess Locker ransomware that emerged in 2016. Based on its recent advertisement in underground forums, it appears that its operators are peddling Princess Evolution as a ransomware as a service (RaaS) and are looking for affiliates. The new malvertising campaign we observed since July 25 is notable in that the malvertisements included Coinhive (COINMINER\_MALXMR.TIDBF). Even if users aren't diverted to the exploit kit and infected with the ransomware, the cybercriminals can still earn illicit profit through cryptocurrency mining. Another characteristic of this new campaign is that they hosted their malvertisement page on a free web hosting service and used domain name system canonical name (DNS CNAME) to map their advertisement domain on a malicious webpage on the service.

The tag is: *misp-galaxy:ransomware="Princess Evolution"*

Princess Evolution is also known as:

- PrincessLocker Evolution

*Table 6367. Table References*

# GlobeImposter

During December 2017, a new variant of the GlobeImposter Ransomware was detected for the first time and reported on malware-traffic-analysis. At first sight this ransomware looks very similar to other ransomware samples and uses common techniques such as process hollowing. However, deeper inspection showed that like LockPoS, which was analyzed by CyberBit, GlobeImposter too bypasses user-mode hooks by directly invoking system calls. Given this evasion technique is being leveraged by new malware samples may indicate that this is a beginning of a trend aiming to bypass user-mode security products.

The tag is: *misp-galaxy:ransomware="GlobeImposter"*

## Sodinokibi

Attackers are actively exploiting a recently disclosed vulnerability in Oracle WebLogic to install a new variant of ransomware called "Sodinokibi." Sodinokibi attempts to encrypt data in a user's directory and delete shadow copy backups to make data recovery more difficult. Oracle first patched the issue on April 26, outside of their normal patch cycle, and assigned it CVE-2019-2725. This vulnerability is easy for attackers to exploit, as anyone with HTTP access to the WebLogic server could carry out an attack. Because of this, the bug has a CVSS score of 9.8/10. Attackers have

been making use of this exploit in the wild since at least April 17. Cisco's Incident Response (IR) team, along with Cisco Talos, are actively investigating these attacks and Sodinokibi.

The tag is: *misp-galaxy:ransomware="Sodinokibi"*

Sodinokibi is also known as:

- REvil
- Revil

*Table 6375. Table References*

## PornBlackmailer

A new infection is being distributed by porn sites that tries to blackmail a victim into paying a ransom by stating they will tell law enforcement that the victim is spreading child porn. This is done by collecting information about the user, including screen shots of their active desktop, in order to catch them in compromising situations.

The tag is: *misp-galaxy:ransomware="PornBlackmailer"*

---

## Nodera Ransomware

Nodera is a ransomware family that uses the Node.js framework and was discovered by Quick Heal researchers. The infection chain starts with a VBS script embedded with multiple JavaScript files. Upon execution, a directory is created and both the main node.exe program and several required NodeJS files are downloaded into the directory. Additionally, a malicious JavaScript payload that performs the encryption process is saved in this directory. After checking that it has admin privileges and setting applicable variables, the malicious JavaScript file enumerates the drives to create a list of targets. Processes associated with common user file types are stopped and volume shadow copies are deleted. Finally, all user-specific files on the C: drive and all files on other drives are encrypted and are appended with a .encrypted extension. The ransom note containing instructions on paying the Bitcoin ransom are provided along with a batch script to be used for decryption after obtaining the private key. Some mistakes in the ransom note identified by the researchers include the fact that it mentions a 2048-bit RSA public key instead of 4096-bit (the size

that was actually used), a hard-coded private key destruction time dating back almost 2 years ago, and a lack of instructions for how the private key will be obtained after the ransom is paid. These are signs that the ransomware may be in the development phase and was likely written by an amateur. For more information, see the QuickHeal blog post in the Reference section below.

## Bart ransomware

Bart ransomware is distributed by the same Russian Cyber Mafia behind Dridex 220 and Locky. Bart doesn't communicate with a command and control (C&C) server, so it can encrypt files without being connected to a computer. Bart is spread to end users via phishing emails containing .zip attachments with JavaScript Code and use social engineering to trick users into opening the 'photo' attachments. The zipped files are obfuscated to make it more hard to tell what actions they are performing. See screenshot above for an example of what they look like. If opened, these attachments download and install the intermediary loader RockLoader which downloads Bart onto the machine over HTTPS. Once executed, it will first check the language on the infected computer. If the malware detects Russian, Belorussian, or Ukrainian, the ransomware will terminate and will not proceed with the infection. If it's any other language, it will start scanning the computer for certain file extensions to encrypt. Because Bart does not require communication with C&C infrastructure prior to encrypting files, Bart could possibly encrypt machines sitting behind corporate firewalls that would otherwise block such traffic. Thus, organizations need to ensure that Bart is blocked at the email gateway using rules that block zipped executables.

The tag is: *misp-galaxy:ransomware="Bart ransomware"*

Bart ransomware is also known as:

- Locky Bart

<https://www.knowbe4.com/bart-ransomware>

## Razor

Razor was discovered by dnwls0719, it is a part of Garrandydecrypt ransomware family. Like many other programs of this type, Razor is designed to encrypt files (make them unusable/inaccessible), change their filenames, create a ransom note and change victim's desktop wallpaper. Razor renames files by appending the ".razor" extension to their filenames. For example, it renames "1.jpg" to "1.jpg.razor", and so on. It creates a ransom note which is a text file named "**RECOVERY.txt**", this file contains instructions on how to contact Razor's developers (cyber criminals) and other details. As stated in the "**RECOVERY.txt**" file, this ransomware encrypts all files and information about how to purchase a decryption tool can be received by contacting Razor's developers. Victims supposed to contact them via [razor2020@protonmail.ch](mailto:razor2020@protonmail.ch), Jabber client ([razor2020@jxmpp.jp](xmpp:razor2020@jxmpp.jp)) or ICQ client (@razor2020) and wait for further instructions. It is very likely that they will name a price of a decryption tool and/or key and provide cryptocurrency wallet's address that should be used to make a transaction. However, it is never a good idea to trust (pay) any cyber criminals/ransomware developers. It is common that they do not provide decryption tools even after a payment. Another problem is that ransomware-type programs encrypt files with strong encryption algorithms and their developers are the only ones who have tools that can decrypt files encrypted by their ransomware. In most cases victims have the only free and safe

option: to restore files from a backup. Also, it is worth mentioning that files remain encrypted even after uninstallation of ransomware, its removal only prevents it from causing further encryptions.

The tag is: *misp-galaxy:ransomware="Razor"*

## CoronaVirus

A new ransomware called CoronaVirus has been distributed through a fake web site pretending to promote the system optimization software and utilities from WiseCleaner. With the increasing fears and anxiety of the Coronavirus (COVID-19) outbreak, an attacker has started to build a campaign to distribute a malware cocktail consisting of the CoronaVirus Ransomware and the Kpot information-stealing Trojan. This new ransomware was discovered by MalwareHunterTeam and after further digging into the source of the file, we have been able to determine how the threat actor plans on distributing the ransomware and possible clues suggesting that it may actually be a wiper.

The tag is: *misp-galaxy:ransomware="CoronaVirus"*

*Table 6400. Table References*

## Snake Ransomware

Snake ransomware first attracted the attention of malware analysts in January 2020 when they observed the crypto-malware family targeting entire corporate networks. Shortly after this discovery, the threat quieted down. It produced few new detected infections in the wild for the next few months. That was until May 4, when ID Ransomware registered a sudden spike in submissions for the ransomware.

The tag is: *misp-galaxy:ransomware="Snake Ransomware"*

## eCh0raix

Anomali researchers have observed a new ransomware family, dubbed eCh0raix, targeting QNAP Network Attached Storage (NAS) devices. QNAP devices are created by the Taiwanese company

QNAP Systems, Inc., and contain device storage and media player functionality, amongst others. The devices appear to be compromised by brute forcing weak credentials and exploiting known vulnerabilities in targeted attacks. The malicious payload encrypts the targeted file extensions on the NAS using AES encryption and appends .encrypt extension to the encrypted files. The ransom note created by the ransomware has the form shown below. eCh0raix was first seen in June 2019, after victims began reporting ransomware attacks in a forum topic on BleepingComputer. On June 1st, 2020, there has been a sudden surge of eCh0raix victims seeking help in our forums and submissions to the ransomware identification site ID-Ransomware.

## LockBit

LockBit operators tend to be very indiscriminate and opportunistic in their targeting. Actors behind this attack will use a variety of methods to gain initial access, up to and including basic methods such as brute force. After gaining initial access the actor follows a fairly typical escalation, lateral movement and ransomware execution playbook. LockBit operators tend to have a very brief dwell time, executing the final ransomware payload as quickly as they are able to. LockBit ransomware has the built-in lateral movement features; given adequate permissions throughout the targeted environment.

The tag is: *misp-galaxy:ransomware="LockBit"*

LockBit is also known as:

- ABCD ransomware

*Table 6405. Table References*

<a href="https://usa.kaspersky.com/resource-center/threats/lockbit-ransomware">https://usa.kaspersky.com/resource-center/threats/lockbit-ransomware</a>

## WastedLocker

WastedLocker primarily targets corporate networks. Upon initial compromise, often using a fake browser update containing SocGhosh, the actor then takes advantage of dual-use and LoLBin tools

in an attempt to evade detection. Key observations include lateral movement and privilege escalation. The WastedLocker ransomware has been tied back to EvilCorp.

The tag is: *misp-galaxy:ransomware="WastedLocker"*

## Babuk Ranomsware

Since this is the first detection of this malware in the wild, it's not surprising that Babuk is not obfuscated at all. Overall, it's a pretty standard ransomware that utilizes some of the new techniques we see such as multi-threading encryption as well as abusing the Windows Restart Manager similar to Conti and REvil. For encrypting scheme, Babuk uses its own implementation of SHA256 hashing, ChaCha8 encryption, and Elliptic-curve Diffie–Hellman (ECDH) key generation and exchange algorithm to protect its keys and encrypt files. Like many ransomware that came before, it also has the ability to spread its encryption through enumerating the available network resources.

The tag is: *misp-galaxy:ransomware="Babuk Ranomsware"*

## Darkside

Darkside, the latest ransomware operation to emerge has been attacking organizations beginning earlier this month. Darkside's customized attacks on companies have already garnered them million-dollar payouts. Through their "press release", these threat actors have claimed to be affiliated with prior ransomware operations making millions of dollars. They stated that they created this new product to match their needs, as prior products didn't. Darkside explains that they only target companies they know that can pay the specified ransom. They have allegedly promised that they will not attack the following sectors. They include medicine, education, non-profit organizations, and the government sector.

The tag is: *misp-galaxy:ransomware="Darkside"*

Darkside is also known as:

- BlackMatter

## RansomEXX

We recently discovered a new file-encrypting Trojan built as an ELF executable and intended to encrypt data on machines controlled by Linux-based operating systems. After the initial analysis we noticed similarities in the code of the Trojan, the text of the ransom notes and the general approach to extortion, which suggested that we had in fact encountered a Linux build of the previously known ransomware family RansomEXX. This malware is notorious for attacking large organizations and was most active earlier this year. RansomEXX is a highly targeted Trojan. Each sample of the malware contains a hardcoded name of the victim organization. Moreover, both the encrypted file extension and the email address for contacting the extortionists make use of the victim's name.

The tag is: *misp-galaxy:ransomware="RansomEXX"*

RansomEXX is also known as:

- Ransom X
- Defray777
- Defray-777
- Defray 2018

# CovidLock

Mobile ransomware. The Zscaler ThreatLabZ team recently came across a URL named `hxxp://coronavirusapp[.]site/mobile.html`, which portrays itself as a download site for an Android app that tracks the coronavirus spread across the globe. In reality, the app is Android ransomware, which locks out the victim and asks for ransom to unlock the device. The app portrays itself as a Coronavirus Tracker. As soon as it starts running, it asks the user for several authorizations, including admin rights. In fact, this ransomware does not encrypt nor steal anything and only lock the device with an hard coded code.

# MedusaLocker

Observed as recently as May 2022, MedusaLocker actors predominantly rely on vulnerabilities in Remote Desktop Protocol (RDP) to access victims' networks. The MedusaLocker actors encrypt the victim's data and leave a ransom note with communication instructions in every folder containing an encrypted file. The note directs victims to provide ransomware payments to a specific Bitcoin wallet address. MedusaLocker appears to operate as a Ransomware-as-a-Service (RaaS) model based on the observed split of ransom payments. Typical RaaS models involve the ransomware developer and various affiliates that deploy the ransomware on victim systems. MedusaLocker ransomware payments appear to be consistently split between the affiliate, who receives 55 to 60 percent of the ransom; and the developer, who receives the remainder.

The tag is: *misp-galaxy:ransomware="MedusaLocker"*

## Conti

Conti ransomware is a RaaS and has been observed encrypting networks since mid-2020. Conti was developed by the “TrickBot” group, an organized Russian cybercriminal operation. Their reputation has allowed the group to create a strong brand name, attracting many affiliates which has made Conti one of the most widespread ransomware strains in the world. One of the last known “Conti” attacks was against the government of Costa Rica in April 2022 causing the country to declare a state of emergency. Shortly after this final attack, the “Conti” brand disappeared. The group behind it likely switched to a different brand to avoid sanctions and start over with a new, clean reputation.

# BlackCat

BlackCat (ALPHV) is ransomware written in Rust. The ransomware makes heavy use of plaintext JSON configuration files to specify the ransomware functionality. BlackCat has many advanced capabilities like escalating privileges and bypassing UAC make use of AES and ChaCha20 or Salsa

encryption, may use the Restart Manager, can delete volume shadow copies, can enumerate disk volumes and network shares automatically, and may kill specific processes and services. The ransomware exists for both Windows, Linux, and ESXi systems. Multiple extortion techniques are used by the BlackCat gang, such as exfiltrating victim data before the ransomware deployment, threats to release data if the ransomw is not paid, and distributed denial-of-service (DDoS) attacks.

The tag is: *misp-galaxy:ransomware="BlackCat"*

BlackCat is also known as:

- ALPHV

## HelloXD

HelloXD is a ransomware family performing double extortion attacks that surfaced in November 2021. During our research we observed multiple variants impacting Windows and Linux systems. Unlike other ransomware groups, this ransomware family doesn't have an active leak site; instead it prefers to direct the impacted victim to negotiations through TOX chat and onion-based messenger instances.

The tag is: *misp-galaxy:ransomware="HelloXD"*

*Table 6425. Table References*

<https://unit42.paloaltonetworks.com/helloxd-ransomware/>

## Maui ransomware

Maui ransomware stand out because of a lack of several key features commonly seen with tooling from RaaS providers, such as an embedded ransom note to provide recovery instructions or automated means of transmitting encryption keys to attackers. Instead, it is believed that Maui is manually operated, in which operators will specify which files to encrypt when executing it and then exfiltrate the resulting runtime artifacts. There are many aspects to Maui ransomware that are unknown, including usage context.

The tag is: *misp-galaxy:ransomware="Maui ransomware"*

## Lorenz Ransomware

Lorenz is a ransomware group that has been active since at least February 2021 and like many ransomware groups, performs double-extortion by exfiltrating data before encrypting systems.

The tag is: *misp-galaxy:ransomware="Lorenz Ransomware"*

## BlackBasta

Black Basta is a new ransomware strain discovered during April 2022 - looks in dev since at least early February 2022 - and due to their ability to quickly amass new victims and the style of their negotiations, this is likely not a new operation but rather a rebrand of a previous top-tier ransomware gang that brought along their affiliates.

The tag is: `misp-galaxy:ransomware="BlackBasta"`

[View relationships graph](#)

BlackBasta has relationships with:

- successor-of: `misp-galaxy:ransomware="Conti"` with `estimative-language:likelihood-probability="likely"`
- uses: `misp-galaxy:botnet="Qbot"` with `estimative-language:likelihood-probability="likely"`

# RAT

remote administration tool or remote access tool (RAT), also called sometimes remote access trojan, is a piece of software or programming that allows a remote "operator" to control a system as if they have physical access to that system..

RAT is a cluster galaxy available in JSON format at [this location](#) The JSON format can be freely reused in your application or automatically enabled in [MISP](#).

## authors

Various - raw-data

## Iperius Remote

Iperius Remote is advertised with these features: Control remotely any computer with Iperius Remote Desktop Free. For remote support or presentations. Ideal for technical assistance. Easy to use and secure.

The tag is: *misp-galaxy:rat="Iperius Remote"*

## Back Orifice 2000

Back Orifice 2000 (often shortened to BO2k) is a computer program designed for remote system administration. It enables a user to control a computer running the Microsoft Windows operating system from a remote location. The name is a pun on Microsoft BackOffice Server software. Back Orifice 2000 is a new version of the famous Back Orifice backdoor trojan (hacker's remote access tool). It was created by the Cult of Dead Cow hackers group in July 1999. Originally the BO2K was released as a source code and utilities package on a CD-ROM. There are reports that some files on that CD-ROM were infected with CIH virus, so the people who got that CD might get infected and spread not only the compiled backdoor, but also the CIH virus.

The tag is: *misp-galaxy:rat="Back Orifice 2000"*

Back Orifice 2000 is also known as:

- BO2k

## DarkRat

In March 2017, Fujitsu Cyber Threat Intelligence uncovered a newly developed remote access tool referred to by its developer as ‘Dark RAT’ – a tool used to steal sensitive information from victims. Offered as a Fully Undetectable build (FUD) the RAT has a tiered price model including 24/7 support and an Android version. Android malware has seen a significant rise in interest and in 2015 this resulted in the arrests of a number of suspects involved in the infamous DroidJack malware.

The tag is: `misp-galaxy:rat="DarkRat"`

DarkRat is also known as:

- DarkRAT

## LuxNET

Just saying that this is a very badly coded RAT by the biggest skid in this world, that is XilluX. The connection is very unstable, the GUI is always flickering because of the bad Multi-Threading and many more bugs.

The tag is: `misp-galaxy:rat="LuxNET"`

Table 6461. Table References

Links
<a href="https://leakforums.net/thread-284656">https://leakforums.net/thread-284656</a>

## NJRat

NJRat is a remote access trojan (RAT), first spotted in June 2013 with samples dating back to November 2012. It was developed and is supported by Arabic speakers and mainly used by cybercrime groups against targets in the Middle East. In addition to targeting some governments in the region, the trojan is used to control botnets and conduct other typical cybercrime activity. It infects victims via phishing attacks and drive-by downloads and propagates through infected USB keys or networked drives. It can download and execute additional malware, execute shell commands, read and write registry keys, capture screenshots, log keystrokes, and spy on webcams.

The tag is: `misp-galaxy:rat="NJRat"`

NJRat is also known as:

- NjwOrm

## Dendroid

Dendroid is malware that affects Android OS and targets the mobile platform. It was first discovered in early of 2014 by Symantec and appeared in the underground for sale for \$300. Some things were noted in Dendroid, such as being able to hide from emulators at the time. When first discovered in 2014 it was one of the most sophisticated Android remote administration tools known at that time. It was one of the first Trojan applications to get past Google’s Bouncer and caused researchers to warn about it being easier to create Android malware due to it. It also seems to have follow in the footsteps of Zeus and SpyEye by having simple-to-use command and control panels. The code appeared to be leaked somewhere around 2014. It was noted that an apk binder was included in the leak, which provided a simple way to bind Dendroid to legitimate applications.

## Kiler RAT

This remote access trojan (RAT) has capabilities ranging from manipulating the registry to opening a reverse shell. From stealing credentials stored in browsers to accessing the victims webcam. Through the Command & Control (CnC) server software, the attacker has capabilities to create and configure the malware to spread utilizing physic devices, such as USB drives, but also to use the victim as a pivot point to gain more access laterally throughout the network. This remote access trojan could be classified as a variant of the well known njrat, as they share many similar features such as their display style, several abilities and a general template for communication methods . However, where njrat left off KilerRat has taken over. KilerRat is a very feature rich RAT with an active development force that is rapidly gaining in popularity amongst the middle eastern community and the world.

The tag is: *misp-galaxy:rat="Kiler RAT"*

Kiler RAT is also known as:

- Njw0rm

<a href="http://www.dameware.com/dameware-mini-remote-control">http://www.dameware.com/dameware-mini-remote-control</a>

## Remote Utilities

Remote Utilities is a free remote access program with some really great features. It works by pairing two remote computers together with what they call an "Internet ID." You can control a total of 10 PCs with Remote Utilities.

The tag is: *misp-galaxy:rat="Remote Utilities"*

*Table 6529. Table References*

Links
<a href="https://www.remoteutilities.com/">https://www.remoteutilities.com/</a>

## Ammyy Admin

Ammyy Admin is a completely portable remote access program that's extremely simple to setup. It works by connecting one computer to another via an ID supplied by the program.

The tag is: *misp-galaxy:rat="Ammyy Admin"*

Ammyy Admin is also known as:

- Ammyy

*Table 6530. Table References*

Links
<a href="http://ammyy-admin.soft32.com/">http://ammyy-admin.soft32.com/</a>

## Ultra VNC

UltraVNC works a bit like Remote Utilities, where a server and viewer is installed on two PCs, and the viewer is used to control the server.

The tag is: *misp-galaxy:rat="Ultra VNC"*

Table 6531. Table References

Links
<a href="http://www.uvnc.com/">http://www.uvnc.com/</a>

## AeroAdmin

AeroAdmin is probably the easiest program to use for free remote access. There are hardly any settings, and everything is quick and to the point, which is perfect for spontaneous support.

The tag is: *misp-galaxy:rat="AeroAdmin"*

Table 6532. Table References

Links
<a href="http://www.aeroadmin.com/en/">http://www.aeroadmin.com/en/</a>

## Windows Remote Desktop

Windows Remote Desktop is the remote access software built into the Windows operating system. No additional download is necessary to use the program.

The tag is: *misp-galaxy:rat="Windows Remote Desktop"*

## RemotePC

RemotePC, for good or bad, is a more simple free remote desktop program. You're only allowed one connection (unless you upgrade) but for many of you, that'll be just fine.

The tag is: *misp-galaxy:rat="RemotePC"*

Table 6533. Table References

Links
<a href="https://www.remotepc.com/">https://www.remotepc.com/</a>

## Seecreen

Seecreen (previously called Firnass) is an extremely tiny (500 KB), yet powerful free remote access program that's absolutely perfect for on-demand, instant support.

The tag is: *misp-galaxy:rat="Seecreen"*

Seecreen is also known as:

- Firnass

Table 6534. Table References

Links
<a href="http://seecreen.com/">http://seecreen.com/</a>

## Chrome Remote Desktop

Chrome Remote Desktop is an extension for the Google Chrome web browser that lets you setup a computer for remote access from any other Chrome browser.

The tag is: *misp-galaxy:rat="Chrome Remote Desktop"*

Table 6535. Table References

Links
<a href="https://chrome.google.com/webstore/detail/chrome-remote-desktop/gbchcmhahfdphkhhkmpfmihenigmpp?hl=en">https://chrome.google.com/webstore/detail/chrome-remote-desktop/gbchcmhahfdphkhhkmpfmihenigmpp?hl=en</a>

## AnyDesk

AnyDesk is a remote desktop program that you can run portably or install like a regular program.

The tag is: *misp-galaxy:rat="AnyDesk"*

Table 6536. Table References

Links
<a href="https://anydesk.com/remote-desktop">https://anydesk.com/remote-desktop</a>

## LiteManager

LiteManager is another remote access program, and it's strikingly similar to Remote Utilities, which I explain on the first page of this list. However, unlike Remote Utilities, which can control a total of only 10 PCs, LiteManager supports up to 30 slots for storing and connecting to remote computers, and also has lots of useful features.

The tag is: *misp-galaxy:rat="LiteManager"*

Table 6537. Table References

Links
<a href="http://www.litemanager.com/">http://www.litemanager.com/</a>

## Comodo Unite

Comodo Unite is another free remote access program that creates a secure VPN between multiple computers. Once a VPN is established, you can remotely have access to applications and files through the client software.

The tag is: *misp-galaxy:rat="Comodo Unite"*

Table 6538. Table References

Links
<a href="https://www.comodo.com/home/download/download.php?prod=comodounite">https://www.comodo.com/home/download/download.php?prod=comodounite</a>

## ShowMyPC

ShowMyPC is a portable and free remote access program that's nearly identical to UltraVNC but uses a password to make a connection instead of an IP address.

The tag is: *misp-galaxy:rat="ShowMyPC"*

Table 6539. Table References

Links
<a href="https://showmypc.com/">https://showmypc.com/</a>

## join.me

join.me is a remote access program from the producers of LogMeIn that provides quick access to another computer over an internet browser.

The tag is: *misp-galaxy:rat="join.me"*

Table 6540. Table References

Links
<a href="https://www.join.me/">https://www.join.me/</a>

## DesktopNow

DesktopNow is a free remote access program from NCH Software. After optionally forwarding the proper port number in your router, and signing up for a free account, you can access your PC from anywhere through a web browser.

The tag is: *misp-galaxy:rat="DesktopNow"*

## NanoCore

In September of 2015, a DigiTrust client visited a web link that was providing an Adobe Flash Player update. The client, an international retail organization, attempted to download and run what appeared to be a regular update. The computer trying to download this update was a back office system that processed end of day credit card transactions. This system also had the capability of connecting to the corporate network which contained company sales reports. DigiTrust experts were alerted to something malicious and blocked the download. The investigation found that what appeared to be an Adobe Flash Player update, was a Remote Access Trojan called NanoCore. If installation had been successful, customer credit card data, personal information, and internal sales information could have been captured and monetized. During the analysis of NanoCore, our

experts found that there was much more to this RAT than simply being another Remote Access Trojan.

The tag is: *misp-galaxy:rat="NanoCore"*

# Xsser

Xsser mRAT is a piece of malware that targets iOS devices that have software limitations removed. The app is installed via a rogue repository on Cydia, the most popular third-party application store for jailbroken iPhones. Once the malicious bundle has been installed and executed, it gains persistence - preventing the user from deleting it. The mRAT then makes server-side checks and proceeds to steal data from the user's device and executes remote commands as directed by its command-and-control (C2) server.

The tag is: *misp-galaxy:rat="Xsser"*

Xsser is also known as:

- mRAT

## Quaverse

Quaverse RAT or QRAT is a fairly new Remote Access Tool (RAT) introduced in May 2015. This RAT is marketed as an undetectable Java RAT. As you might expect from a RAT, the tool is capable of grabbing passwords, key logging and browsing files on the victim's computer. On a regular basis for the past several months, we have observed the inclusion of QRAT in a number of spam campaigns.

The tag is: *misp-galaxy:rat="Quaverse"*

Quaverse is also known as:

- QRAT

## Trochilus

Trochilus is a remote access trojan (RAT) first identified in October 2015 when attackers used it to infect visitors of a Myanmar website. It was then used in a 2016 cyber-espionage campaign, dubbed "the Seven Pointed Dagger," managed by another group, "Group 27," who also uses the PlugX trojan. Trochilus is primarily spread via emails with a malicious .RAR attachment containing the malware. The trojan's functionality includes a shellcode extension, remote uninstall, a file manager, and the ability to download and execute, upload and execute, and access the system information. Once present on a system, Trochilus can move laterally in the network for better access. This trojan operates in memory only and does not write to the disk, helping it evade detection.

The tag is: *misp-galaxy:rat="Trochilus"*

---

## Matryoshka

Their most commonly used initial attack vector is a simple, yet alarmingly effective, spearphishing attack, infecting unsuspecting victims via a malicious email attachment (usually an executable that has been disguised as something else). From there, Matryoshka runs second stage malware via a dropper and covertly installs a Remote Access Toolkit (RAT). This is done using a reflective loader technique that allows the malware to run in process memory, rather than being written to disk. This not only hides the install of the RAT but also ensures that the RAT will be 'reinstalled' after system restart.

The tag is: *misp-galaxy:rat="Matryoshka"*

## Mangit

First discovered by Trend Micro in June, Mangit is a new malware family being marketed on both the Dark web and open internet. Users have the option to rent the trojan's infrastructure for about \$600 per 10-day period or buy the source code for about \$8,800. Mangit was allegedly developed by "Ric", a Brazilian hacker, who makes himself available via Skype to discuss rental agreements. Once the malware is rented or purchased, the user controls a portion of the Mangit botnet, the trojan, the dropper, an auto-update system, and the server infrastructure to run their attacks. Mangit contains support for nine Brazilian banks including Citibank, HSBC, and Santander. The malware can also be used to steal user PayPal credentials. Mangit has the capability to collect banking credentials, receive SMS texts when a victim is accessing their bank account, and take over victim's browsers. To circumvent two-factor authentication, attackers can use Mangit to lock victim's browsers and push pop-ups to the victim asking for the verification code they just received.

The tag is: *misp-galaxy:rat="Mangit"*

## Revenge-RAT

Revenge v0.1 was a simple tool, according to a researcher known as Rui, who says the malware's author didn't bother obfuscating the RAT's source code. This raised a question mark with the researchers, who couldn't explain why VirusTotal scanners couldn't pick it up as a threat right away. Revenge, which was written in Visual Basic, also didn't feature too many working features, compared to similar RATs. Even Napoleon admitted that his tool was still in the early development stages, a reason why he provided the RAT for free.

The tag is: *misp-galaxy:rat="Revenge-RAT"*

## VJwOrm 0.1

“Vengeance Justice Worm” was first discovered in 2016 and is a highly multifunctional, modular, publicly available “commodity malware”, i.e., it can be purchased by those interested through various cybercrime and hacking related forums and channels.

VJwOrm is a JavaScript-based malware and combines characteristics of Worm, Information Stealer, Remote-Access Trojan (RAT), Denial-of-Service (DOS) malware, and spam-bot.

VJwOrm is propagated primarily by malicious email attachments and by infecting removable storage devices.

Once executed by the victim, the very heavily obfuscated VJwOrm will enumerate installed drives and, if a removable drive is found, VJwOrm will infect it if configured to do so.

It will continue to gather victim information such as operating system details, user’s details, installed anti-virus product details, stored browser cookies, the presence of vbc.exe on the system (Microsoft’s .NET Visual Basic Compiler, this indicates that .NET is installed on the system and can affect the actor’s choice of additional malware delivery), and whether the system has been previously infected.

VJwOrm will then report this information back to its command-and-control server and await further commands, such as downloading and executing additional malware or employing any of its other numerous capabilities.

Finally, VJwOrm establishes persistency in the form of registry auto-runs, system startup folders, a scheduled-task, or any combination of these methods.

The tag is: *misp-galaxy:rat="VJwOrm 0.1"*

VJwOrm 0.1 is also known as:

- Vengeance Justice Worm
- VJwOrm
- VJwOrm

# rokrat

ROKRAT is a remote access trojan (RAT) that leverages a malicious Hangual Word Processor (HWP) document sent in spearphishing emails to infect hosts. The HWP document contains an embedded Encapsulated PostScript (EPS) object. The object exploits an EPS buffer overflow vulnerability and downloads a binary disguised as a .JPG file. The file is then decoded and the ROKRAT executable is initiated. The trojan uses legitimate Twitter, Yandex, and Mediafire websites for its command and control communications and exfiltration platforms, making them difficult to block globally. Additionally, the platforms use HTTPS connections, making it more difficult to gather additional data on its activities. Cisco's Talos Group identified two email campaigns. In one, attackers send potential victims emails from an email server of a private university in Seoul, South Korea with a sender email address of "[kgf2016@yonsei.ac.kr](mailto:kgf2016@yonsei.ac.kr)," the contact email for the Korea Global Forum, adding a sense of legitimacy to the email. It is likely that the email address was compromised and used by the attackers in this campaign. The second is less sophisticated and sends emails claiming to be from a free Korean mail service with a the subject line, "Request Help" and attached malicious HWP filename, "I'm a munchon person in Gangwon-do, North Korea." The ROKRAT developer uses several techniques to hinder analysis, including identifying tools usually used by malware analysts or within sandbox environments. Once it has infected a device, this trojan can execute commands, move a file, remove a file, kill a process, download and execute a file, upload documents, capture screenshots, and log keystrokes. Researchers believe the developer is a native Korean speaker and the campaign is currently targeting Korean-speakers.

## RATAttack

RATAttack is a remote access trojan (RAT) that uses the Telegram protocol to support encrypted communication between the victim's machine and the attacker. The Telegram protocol also provides a simple method to communicate to the target, negating the need for port forwarding. Before using RATAttack, the attacker must create a Telegram bot and embed the bot's Telegram token into the trojan's configuration file. When a system is infected with RATAttack, it connects to the bot's Telegram channel. The attacker can then connect to the same channel and manage the RATAttack clients on the infected host machines. The trojan's code was available on GitHub then was taken down by the author on April 19, 2017.

The tag is: `misp-galaxy:rat="RATAttack"`

<a href="https://objective-see.com/blog/blog_0x25.html">https://objective-see.com/blog/blog_0x25.html</a>

## DNSMessenger

Talos recently analyzed an interesting malware sample that made use of DNS TXT record queries and responses to create a bidirectional Command and Control (C2) channel. This allows the attacker to use DNS communications to submit new commands to be run on infected machines and return the results of the command execution to the attacker. This is an extremely uncommon and evasive way of administering a RAT. The use of multiple stages of Powershell with various stages being completely fileless indicates an attacker who has taken significant measures to avoid detection.

The tag is: *misp-galaxy:rat="DNSMessenger"*

## htpRAT

On November 8, 2016 a non-disclosed entity in Laos was spear-phished by a group closely related to known Chinese adversaries and most likely affiliated with the Chinese government. The attackers utilized a new kind of Remote Access Trojan (RAT) that has not been previously observed or reported. The new RAT extends the capabilities of traditional RATs by providing complete remote execution of custom commands and programming. htpRAT, uncovered by RiskIQ cyber investigators, is the newest weapon in the Chinese adversary's arsenal in a campaign against Association of Southeast Asian Nations (ASEAN). Most RATs can log keystrokes, take screenshots, record audio and video from a webcam or microphone, install and uninstall programs and manage files. They support a fixed set of commands operators can execute using different command IDs —'file download' or 'file upload,' for example—and must be completely rebuilt to have different functionality. htpRAT, on the other hand, serves as a conduit for operators to do their job with greater precision and effect. On the Command and Control (C2) server side, threat actors can build new functionality in commands, which can be sent to the malware to execute. This capability makes htpRAT a small, agile, and incredibly dynamic piece of malware. Operators can change functionality, such as searching for a different file on the victim's network, simply by wrapping commands.

## FALLCHILL

According to trusted third-party reporting, HIDDEN COBRA actors have likely been using FALLCHILL malware since 2016 to target the aerospace, telecommunications, and finance industries. The malware is a fully functional RAT with multiple commands that the actors can issue from a command and control (C2) server to a victim's system via dual proxies. FALLCHILL typically

infects a system as a file dropped by other HIDDEN COBRA malware or as a file downloaded unknowingly by users when visiting sites compromised by HIDDEN COBRA actors. HIDDEN COBRA actors use an external tool or dropper to install the FALLCHILL malware-as-a-service to establish persistence. Because of this, additional HIDDEN COBRA malware may be present on systems compromised with FALLCHILL.

## joanap

Joanap is a two-stage malware used to establish peer-to-peer communications and to manage botnets designed to enable other operations. Joanap malware provides HIDDEN COBRA actors with the ability to exfiltrate data, drop and run secondary payloads, and initialize proxy communications on a compromised Windows device.

## Sisfader

Sisfader maintains persistence installing itself as a system service, it is made up of multiple components ([1] Dropper - installing the malware, [2] Agent - main code of the RAT, [3] Config - written to the registry, [4] Auto Loader - responsible for extracting the Agent, the Config from the registry) and it has its own custom protocol for communication.

## SocketPlayer

The RAT is written in .NET, it uses socket.io for communication. Currently there are two variants of the malware, the 1st variant is a typical downloader whereas the 2nd one has download and C2 functionalities.

The tag is: `misp-galaxy:rat="SocketPlayer"`

## BONDUPDATER

BONDUPDATER is a PowerShell-based Trojan first discovered by FireEye in mid-November 2017, when OilRig targeted a different Middle Eastern governmental organization. The BONDUPDATER Trojan contains basic backdoor functionality, allowing threat actors to upload and download files, as well as the ability to execute commands. BONDUPDATER, like other OilRig tools, uses DNS tunneling to communicate with its C2 server. During the past month, Unit 42 observed several attacks against a Middle Eastern government leveraging an updated version of the BONDUPDATER malware, which now includes the ability to use TXT records within its DNS tunneling protocol for its C2 communications.

The tag is: *misp-galaxy:rat="BONDUPDATER"*

## FlawedGrace

Proofpoint also point out that FlawedGrace is a full-featured RAT written in C++ and that it is a very large program that "extensive use of object-oriented and multithreaded programming techniques. "As a consequence, getting familiar with its internal structure takes a lot of time and is far from a simple task.

## H-worm

H-worm is a VBS (Visual Basic Script) based RAT written by an individual going by the name Houdini. We believe the author is based in Algeria and has connections to njq8, the author of njw0rm [1] and njRAT/LV [2] through means of a shared or common code base. We have seen the H-worm RAT being employed in targeted attacks against the international energy industry; however, we also see it being employed in a wider context as run of the mill attacks through spammed email attachments and malicious links.

The tag is: *misp-galaxy:rat="H-worm"*

## Parasite-HTTP-RAT

The RAT, dubbed Parasite HTTP, is especially notable for the extensive array of techniques it incorporates for sandbox detection, anti-debugging, anti-emulation, and other protections. The malware is also modular in nature, allowing actors to add new capabilities as they become available or download additional modules post infection.

The tag is: *misp-galaxy:rat="Parasite-HTTP-RAT"*

Parasite-HTTP-RAT is also known as:

- Parasite HTTP

## FlawedAmmy

During the month of October, Check Point researchers discovered a widespread malware campaign spreading a remote access trojan (dubbed “FlawedAmmy”) that allows attackers to take over victims’ computers and data. The campaign was the latest and most widespread delivering the ‘FlawedAmmy’ RAT, following a number of campaigns that have spread this malware in recent months. The Trojan allows attackers to gain full access to the machine’s camera and microphone, collect screen grabs, steal credentials and sensitive files, and intrusively monitor the victims’ actions. As a result, FlawedAmmy is the first RAT to enter the Global Threat Index’s top 10 ranking.

The tag is: *misp-galaxy:rat="FlawedAmmy"*

## Felipe

The Zscaler ThreatLabZ team came across a new strain of infostealer Trojan called Felipe, which silently installs itself onto a user’s system and connects to a command-and-control (C&C) server to send system information from the compromised system. This malware is compiled for both 32-bit and 64-bit Windows operating systems. Felipe basically steals the victim’s debit and credit card information and sends it, along with other personal information, to the remote C&C server. It also sets a date and time to perform other malicious activity upon successful infection of the victim machine.

## SDBbot

SDBbot is a new remote access Trojan (RAT) written in C++ that has been delivered by the Get2 downloader in recent TA505 campaigns. Its name is derived from the debugging log file (sdb.log.txt) and DLL name (BotDLL[.dll]) used in the initial analyzed sample. It also makes use of application shimming [1] for persistence. SDBbot is composed of three pieces: an installer, a loader, and a RAT component.

The tag is: *misp-galaxy:rat="SDBbot"*

SDBbot is also known as:

- SDB bot

## Sepulcher

A China-based APT has been sending organizations spear-phishing emails that distribute a never-before-seen intelligence-collecting RAT dubbed Sepulcher.

Researchers discovered the new malware being distributed over the past six months through two separate campaigns. The first, in March, targeted European diplomatic and legislative bodies, non-profit policy research organizations and global organizations dealing with economic affairs. The second, in July, targeted Tibetan dissidents. They tied the campaigns to APT group TA413, which researchers say has been associated with Chinese state interests and is known for targeting the Tibetan community.

“Based on the use of publicly known sender addresses associated with Tibetan dissident targeting and the delivery of Sepulcher malware payloads, [we] have attributed both campaigns to the APT actor TA413,” said Proofpoint researchers in a Wednesday analysis. “The usage of publicly known

Tibetan-themed sender accounts to deliver Sepulcher malware demonstrates a short-term realignment of TA413's targets of interest."

The tag is: *misp-galaxy:rat="Sepulcher"*
