Introduction

The MISP threat sharing platform is a free and open source software helping information sharing of threat intelligence including cyber security indicators, financial fraud or counter-terrorism information. The MISP project includes multiple sub-projects to support the operational requirements of analysts and improve the overall quality of information shared.

MISP galaxy is a simple method to express a large object called cluster that can be attached to MISP events or attributes. A cluster can be composed of one or more elements. Elements are expressed as key-values. There are default vocabularies available in MISP galaxy but those can be overwritten, replaced or updated as you wish. Existing clusters and vocabularies can be used as-is or as a template. MISP distribution can be applied to each cluster to permit a limited or broader distribution scheme. The following document is generated from the machine-readable JSON describing the [MISP galaxy](#).

Funding and Support

The MISP project is financially and resource supported by [CIRCL Computer Incident Response Center Luxembourg](#).

A CEF (Connecting Europe Facility) funding under CEF-TC-2016-3 - Cyber Security has been granted from 1st September 2017 until 31th August 2019 as **Improving MISP as building blocks for next-generation information sharing**.

Co-financed by the European Union
Connecting Europe Facility

If you are interested to co-fund projects around MISP, feel free to get in touch with us.

MISP galaxy

Android

Android malware galaxy based on multiple open sources..

Android is a cluster galaxy available in JSON format at [this location](#) The JSON format can be freely reused in your application or automatically enabled in [MISP](#).

authors

Unknown

CopyCat

CopyCat is a fully developed malware with vast capabilities, including rooting devices, establishing persistency, and injecting code into Zygote – a daemon responsible for launching apps in the Android operating system – that allows the malware to control any activity on the device.

The tag is: `misp-galaxy:android="CopyCat"`

Table 1. Table References

Andr/Dropr-FH

Andr/Dropr-FH can silently record audio and video, monitor texts and calls, modify files, and ultimately spawn ransomware.

The tag is: `misp-galaxy:android="Andr/Dropr-FH"`

Andr/Dropr-FH is also known as:

- GhostCtrl

[View relationships graph](#)

Andr/Dropr-FH has relationships with:

- similar: `misp-galaxy:malpedia="GhostCtrl"` with `estimative-language:likelihood-probability="likely"`

Judy

The malware, dubbed Judy, is an auto-clicking adware which was found on 41 apps developed by a Korean company. The malware uses infected devices to generate large amounts of fraudulent clicks on advertisements, generating revenues for the perpetrators behind it.

The tag is: *misp-galaxy:android="Judy"*

<https://blog.checkpoint.com/2017/05/25/judy-malware-possibly-largest-malware-campaign-found-google-play/>

RedAlert2

The trojan waits in hiding until the user opens a banking or social media app. When this happens, the trojan shows an HTML-based overlay on top of the original app, alerting the user of an error, and asking to reauthenticate. Red Alert then collects the user's credentials and sends them to its C&C server.

The tag is: *misp-galaxy:android="RedAlert2"*

[View relationships graph](#)

RedAlert2 has relationships with:

- similar: *misp-galaxy:malpedia="RedAlert2"* with *estimative-language:likelihood-probability="likely"*

https://www.threatfabric.com/blogs/new_android_trojan_targeting_over_60_banks_and_social_apps.html

Tizi

Tizi is a fully featured backdoor that installs spyware to steal sensitive data from popular social

media applications. The Google Play Protect security team discovered this family in September 2017 when device scans found an app with rooting capabilities that exploited old vulnerabilities. The team used this app to find more applications in the Tizi family, the oldest of which is from October 2015. The Tizi app developer also created a website and used social media to encourage more app installs from Google Play and third-party websites.

The tag is: *misp-galaxy:android="Tizi"*

DoubleLocker

DoubleLocker can change the device's PIN, preventing victims from accessing their devices, and also encrypts the data requesting a ransom. It will misuse accessibility services after being installed by impersonating the Adobe Flash player - similar to BankBot.

The tag is: *misp-galaxy:android="DoubleLocker"*

[View relationships graph](#)

DoubleLocker has relationships with:

- similar: *misp-galaxy:malpedia="DoubleLocker"* with *estimative-language:likelihood-probability="likely"*

Table 6. Table References

Svpeng

Svpeng is a Banking trojan which acts as a keylogger. If the Android device is not Russian, Svping will ask for permission to use accessibility services. In abusing this service it will gain administrator rights allowing it to draw over other apps, send and receive SMS and take screenshots when keys are pressed.

The tag is: *misp-galaxy:android="Svping"*

Svping is also known as:

- Invisible Man

[View relationships graph](#)

Svping has relationships with:

- similar: `misp-galaxy:tool="Svpeng"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:malpedia="Svpeng"` with `estimative-language:likelihood-probability="likely"`

LokiBot

LokiBot is a banking trojan for Android 4.0 and higher. It can steal the information and send SMS messages. It has the ability to start web browsers, and banking applications, along with showing notifications impersonating other apps. Upon attempt to remove it will encrypt the devices' external storage requiring Bitcoins to decrypt files.

The tag is: `misp-galaxy:android="LokiBot"`

[View relationships graph](#)

LokiBot has relationships with:

- similar: `misp-galaxy:malpedia="Loki Password Stealer (PWS)"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:malpedia="LokiBot"` with `estimative-language:likelihood-probability="likely"`

Switcher

Switcher is a Trojan horse for Android devices that modifies Wi-Fi router DNS settings. Switcher attempts to infiltrate a router's admin interface on the devices' WIFI network by using brute force techniques. If the attack succeeds, Switcher alters the DNS settings of the router, making it possible to reroute DNS queries to a network controlled by the malicious actors.

The tag is: *misp-galaxy:android="Switcher"*

[View relationships graph](#)

Switcher has relationships with:

- similar: *misp-galaxy:malpedia="Switcher"* with *estimative-language:likelihood-probability="likely"*

GM Bot

GM Bot – also known as Acecard, SlemBunk, or Bankosy – scams people into giving up their banking log-in credentials and other personal data by displaying overlays that look nearly identical to banking apps log-in pages. Subsequently, the malware intercepts SMS to obtain two-factor authentication PINs, giving cybercriminals full access to bank accounts.

The tag is: *misp-galaxy:android="GM Bot"*

GM Bot is also known as:

- Acecard
- SlemBunk
- Bankosy

[View relationships graph](#)

GM Bot has relationships with:

Adwind

Adwind is a backdoor written purely in Java that targets system supporting the Java runtime environment. Commands that can be used, among other things, to display messages on the system, open URLs, update the malware, download/execute files, and download/load plugins. According to the author, the backdoor component can run on Windows, Mac OS, Linux and Android platforms providing rich capabilities for remote control, data gathering, data exfiltration and lateral movement.

The tag is: *misp-galaxy:android="Adwind"*

Adwind is also known as:

- AlienSpy
- Frutas
- Unrecom
- Sockrat
- Jsocket
- jRat
- Backdoor:Java/Adwind

Loapi

A malware strain known as Loapi will damage phones if users don't remove it from their devices. Left to its own means, this modular threat will download a Monero cryptocurrency miner that will overheat and overwork the phone's components, which will make the battery bulge, deform the phone's cover, or even worse. Discovered by Kaspersky Labs, researchers say Loapi appears to have evolved from Podec, a malware strain spotted in 2015.

The tag is: *misp-galaxy:android="Loapi"*

Podec

Late last year, we encountered an SMS Trojan called Trojan-SMS.AndroidOS.Podec which used a very powerful legitimate system to protect itself against analysis and detection. After we removed the protection, we saw a small SMS Trojan with most of its malicious payload still in development. Before long, though, we intercepted a fully-fledged version of Trojan-SMS.AndroidOS.Podec in early 2015. The updated version proved to be remarkable: it can send messages to premium-rate numbers employing tools that bypass the Advice of Charge system (which notifies users about the price of a service and requires authorization before making the payment). It can also subscribe users to premium-rate services while bypassing CAPTCHA. This is the first time Kaspersky Lab has encountered this kind of capability in any Android-Trojan.

The tag is: *misp-galaxy:android="Podec"*

Chamois

Chamois is one of the largest PHA families in Android to date and is distributed through multiple channels. While much of the backdoor version of this family was cleaned up in 2016, a new variant emerged in 2017. To avoid detection, this version employs a number of techniques, such as implementing custom code obfuscation, preventing user notifications, and not appearing in the device's app list. Chamois apps, which in many cases come preloaded with the system image, try to trick users into clicking ads by displaying deceptive graphics to commit WAP or SMS fraud.

The tag is: *misp-galaxy:android="Chamois"*

IcicleGum

IcicleGum is a spyware PHA family whose apps rely on versions of the Igexin ads SDK that offer dynamic code-loading support. IcicleGum apps use this library's code-loading features to fetch encrypted DEX files over HTTP from command-and-control servers. The files are then decrypted and loaded via class reflection to read and send phone call logs and other data to remote locations.

The tag is: *misp-galaxy:android="IcicleGum"*

BreadSMS

BreadSMS is a large SMS-fraud PHA family that we started tracking at the beginning of 2017. These apps compose and send text messages to premium numbers without the user's consent. In some cases, BreadSMS apps also implement subscription-based SMS fraud and silently enroll users in services provided by their mobile carriers. These apps are linked to a group of command-and-control servers whose IP addresses change frequently and that are used to provide the apps with premium SMS numbers and message text.

The tag is: `misp-galaxy:android="BreadSMS"`

Table 417. Table References

| |
|---|
| Links |
| https://source.android.com/security/reports/Google_Android_Security_2017_Report_Final.pdf |

JamSkunk

JamSkunk is a toll-fraud PHA family composed of apps that subscribe users to services without their consent. These apps disable Wi-Fi to force traffic to go through users' mobile data connection and then contact command-and-control servers to dynamically fetch code that tries to bypass the network's WAP service subscription verification steps. This type of PHA monetizes their abuse via WAP billing, a payment method that works through mobile data connections and allows users to easily sign up and pay for new services using their existing account (i.e., services are billed directly by the carrier, and not the service provider; the user does not need a new account or a different form of payment). Once authentication is bypassed, JamSkunk apps enroll the device in services that the user may not notice until they receive and read their next bill.

The tag is: `misp-galaxy:android="JamSkunk"`

Expensive Wall

Expensive Wall is a family of SMS-fraud apps that affected a large number of devices in 2017.

Expensive Wall apps use code obfuscation to slow down analysis and evade detection, and rely on the JS2Java bridge to allow JavaScript code loaded inside a Webview to call Java methods the way Java apps directly do. Upon launch, Expensive Wall apps connect to command-and-control servers to fetch a domain name. This domain is then contacted via a Webview instance that loads a webpage and executes JavaScript code that calls Java methods to compose and send premium SMS messages or click ads without users' knowledge.

The tag is: *misp-galaxy:android="Expensive Wall"*

BambaPurple

BambaPurple is a two-stage toll-fraud PHA family that tries to trick users into installing it by disguising itself as a popular app. After install, the app disables Wi-Fi to force the device to use its 3G connection, then redirects to subscription pages without the user's knowledge, clicks subscription buttons using downloaded JavaScript, and intercepts incoming subscription SMS messages to prevent the user from unsubscribing. In a second stage, BambaPurple installs a backdoor app that requests device admin privileges and drops a .dex file. This executable checks to make sure it is not being debugged, downloads even more apps without user consent, and displays ads.

The tag is: *misp-galaxy:android="BambaPurple"*

KoreFrog

KoreFrog is a family of trojan apps that request permission to install packages and push other apps onto the device as system apps without the user's authorization. System apps can be disabled by the user, but cannot be easily uninstalled. KoreFrog apps operate as daemons running in the background that try to impersonate Google and other system apps by using misleading names and icons to avoid detection. The KoreFrog PHA family has also been observed to serve ads, in addition to apps.

The tag is: *misp-galaxy:android="KoreFrog"*

Table 421. Table References

| |
|-------|
| Links |
|-------|

Gaiaphish

Gaiaphish is a large family of trojan apps that target authentication tokens stored on the device to abuse the user's privileges for various purposes. These apps use base64-encoded URL strings to avoid detection of the command-and-control servers they rely on to download APK files. These files contain phishing apps that try to steal GAIA authentication tokens that grant the user permissions to access Google services, such as Google Play, Google+, and YouTube. With these tokens, Gaiaphish apps are able to generate spam and automatically post content (for instance, fake app ratings and comments on Google Play app pages)

The tag is: *misp-galaxy:android="Gaiaphish"*

HenBox

HenBox apps masquerade as others such as VPN apps, and Android system apps; some apps carry legitimate versions of other apps which they drop and install as a decoy technique. While some of legitimate apps HenBox uses as decoys can be found on Google Play, HenBox apps themselves are found only on third-party (non-Google Play) app stores. HenBox apps appear to primarily target the Uyghurs – a Turkic ethnic group living mainly in the Xinjiang Uyghur Autonomous Region in North West China. HenBox has ties to infrastructure used in targeted attacks, with a focus on politics in South East Asia. These attackers have used additional malware families in previous activity dating to at least 2015 that include PlugX, Zupdax, 9002, and Poison Ivy. HenBox apps target devices made by Chinese consumer electronics manufacture, Xiaomi and those running MIUI, Xiaomi's operating system based on Google Android. Furthermore, the malicious apps register their intent to process certain events broadcast on compromised devices in order to execute malicious code. This is common practice for many Android apps, however, HenBox sets itself up to trigger based on alerts from Xiaomi smart-home IoT devices, and once activated, proceeds in stealing information from a

myriad of sources, including many mainstream chat, communication and social media apps. The stolen information includes personal and device information.

Skygofree

At the beginning of October 2017, we discovered new Android spyware with several features previously unseen in the wild. In the course of further research, we found a number of related samples that point to a long-term development process. We believe the initial versions of this malware were created at least three years ago – at the end of 2014. Since then, the implant's functionality has been improving and remarkable new features implemented, such as the ability to record audio surroundings via the microphone when an infected device is in a specified location; the stealing of WhatsApp messages via Accessibility Services; and the ability to connect an infected device to Wi-Fi networks controlled by cybercriminals. We observed many web landing pages that mimic the sites of mobile operators and which are used to spread the Android implants. These domains have been registered by the attackers since 2015. According to our telemetry, that was the year the distribution campaign was at its most active. The activities continue: the most recently observed domain was registered on October 31, 2017. Based on our KSN statistics, there are several infected individuals, exclusively in Italy. Moreover, as we dived deeper into the investigation, we discovered several spyware tools for Windows that form an implant for exfiltrating sensitive data on a targeted machine. The version we found was built at the beginning of 2017, and at the moment we are not sure whether this implant has been used in the wild. We named the malware Skygofree, because we found the word in one of the domains.

Phishing

In the context of ATT&CK for Fraud, phishing is described as the sending of fraudulent emails to a large audience in order to obtain sensitive information (PII, credentials, payment information). Phishing is never targeted to a specific individual or organisation. Phishing tries to create a sense of urgency or curiosity in order to capture the victim.

The tag is: *misp-galaxy:financial-fraud="Phishing"*

ATM skimming

ATM Skimming refers to the act of capturing the data stored on a bank cards (tracks) and the Personal Identification Number (PIN) associated to that card. Upon obtaining the data, the criminal proceeds to encode the same information into a new card and use it in combination with the PIN to perform illicit cash withdrawals. ATM Skimming is often achieved with a combination of a skimmer device for the card and a camera to capture the PIN.

Backdoor

A list of backdoor malware..

Backdoor is a cluster galaxy available in JSON format at [this location](#) The JSON format can be freely reused in your application or automatically enabled in [MISP](#).

authors

raw-data

WellMess

Cross-platform malware written in Golang, compatible with Linux and Windows. Although there are some minor differences, both variants have the same functionality. The malware communicates with a CnC server using HTTP requests and performs functions based on the received commands. Results of command execution are sent in HTTP POST requests data (RSA-encrypted). Main functionalities are: (1) Execute arbitrary shell commands, (2) Upload/Download files. The PE variant of the infection, in addition, executes PowerShell scripts. A .Net version was also observed in the wild.

The tag is: `misp-galaxy:backdoor="WellMess"`

Rosenbridge

The rosenbridge backdoor is a small, non-x86 core embedded alongside the main x86 core in the CPU. It is enabled by a model-specific-register control bit, and then toggled with a launch-instruction. The embedded core is then fed commands, wrapped in a specially formatted x86 instruction. The core executes these commands (which we call the 'deeply embedded instruction set'), bypassing all memory protections and privilege checks.

While the backdoor should require kernel level access to activate, it has been observed to be enabled by default on some systems, allowing any unprivileged code to modify the kernel.

The rosenbridge backdoor is entirely distinct from other publicly known coprocessors on x86 CPUs,

such as the Management Engine or Platform Security Processor; it is more deeply embedded than any known coprocessor, having access to not only all of the CPU's memory, but its register file and execution pipeline as well.

The tag is: *misp-galaxy:backdoor="Rosenbridge"*

ServHelper

The purpose of the macro was to download and execute a variant of ServHelper that set up reverse SSH tunnels that enabled access to the infected host through the Remote Desktop Protocol (RDP) port 3389.

"Once ServHelper establishes remote desktop access, the malware contains functionality for the threat actor to "hijack" legitimate user accounts or their web browser profiles and use them as they see fit," researchers from Proofpoint explain in an analysis released today.

The other ServHelper variant does not include the tunneling and hijacking capabilities and functions only as a downloader for the FlawedGrace RAT.

The tag is: *misp-galaxy:backdoor="ServHelper"*

Table 438. Table References

Rising Sun

The Rising Sun backdoor uses the RC4 cipher to encrypt its configuration data and communications. As with most backdoors, on initial infection, Rising Sun will send data regarding the infected system to a command and control (C2) site. That information captures computer and user name, IP address, operating system version and network adapter information. Rising Sun contains 14 functions including executing commands, obtaining information on disk drives and running processes, terminating processes, obtaining file creation and last access times, reading and writing files, deleting files, altering file attributes, clearing the memory of processes and connecting to a specified IP address.

The tag is: *misp-galaxy:backdoor="Rising Sun"*

SLUB

A new backdoor was observed using the Github Gist service and the Slack messaging system as communication channels with its masters, as well as targeting a very specific type of victim using a watering hole attack. The backdoor dubbed SLUB by the Trend Micro Cyber Safety Solutions Team who detected it in the wild is part of a multi-stage infection process designed by capable threat actors who programmed it in C++. SLUB uses statically-linked curl, boost, and JsonCpp libraries for performing HTTP request, "extracting commands from gist snippets," and "parsing Slack channel communication." The campaign recently observed by the Trend Micro security researchers abusing the Github and Slack uses a multi-stage infection process.

Asruex

Since it first emerged in 2015, Asruex has been known for its backdoor capabilities and connection to the spyware DarkHotel. However, when we encountered Asruex in a PDF file, we found that a variant of the malware can also act as an infector particularly through the use of old vulnerabilities CVE-2012-0158 and CVE-2010-2883, which inject code in Word and PDF files respectively.

The tag is: *misp-galaxy:backdoor="Asruex"*

Speculoos

FreeBSD-based payload, Speculoos was delivered by exploiting CVE-2019-19781, a vulnerability affecting the Citrix Application Delivery Controller, Citrix Gateway, and Citrix SD-WAN WANOP appliances that allowed an adversary to remotely execute arbitrary commands. This vulnerability was first disclosed on December 17, 2019 via security bulletin CTX267679 which contained several mitigation recommendations. By January 24, 2020, permanent patches for the affected appliances were issued. Based on the spread of industries and regions, in addition to the timing of the vulnerability disclosure, we believe this campaign may have been more opportunistic in nature compared to the highly targeted attack campaigns that are often associated with these types of adversaries. However, considering the exploitation of the vulnerability in conjunction with delivery of a backdoor specifically designed to execute on the associated FreeBSD operating system indicates the adversary was absolutely targeting the affected devices.

The tag is: *misp-galaxy:backdoor="Speculoos"*

BazarBackdoor

Something that made the brute-force attacks on RDP connections easier was a new module of the notorious Trojan, TrickBot. It now seems that the TrickBot developers have a new tactic. Cybersecurity researchers have discovered a new phishing campaign that delivers a stealthy backdoor called BazarBackdoor, which can be used to compromise and gain full access to corporate networks. As is the case with 91% of cyberattacks, this one starts with a phishing email. A range of subjects are used to personalize the emails: Customer complaints, coronavirus-themed payroll reports, or employee termination lists. All these emails contain links to documents hosted on Google Docs. To send the malicious emails, the cybercriminals use the marketing platform Sendgrid. This campaign uses spear phishing, which means that the perpetrators have made an effort to ensure that the websites sent in the emails seem legitimate and correspond to the emails subjects.

SpyEye

SpyEye is a similar to the Zeus botnet banking trojan. It utilizes a web control panel for C2 and can perform form grabbing, autofill credit card modules, ftp grabber, pop3 grabber and HTTP basic access authorization grabber. It also contained a Kill Zeus feature which would remove any Zeus infections if SpyEye was on the system. Distributed primarily via exploit kits and malspam emails.

The tag is: *misp-galaxy:banker="SpyEye"*

IcedID

According to X-Force research, the new banking Trojan emerged in the wild in September 2017, when its first test campaigns were launched. Our researchers noted that IcedID has a modular malicious code with modern banking Trojan capabilities comparable to malware such as the Zeus Trojan. At this time, the malware targets banks, payment card providers, mobile services providers, payroll, webmail and e-commerce sites in the U.S. Two major banks in the U.K. are also on the target list the malware fetches.

downAndExec

Services like Netflix use content delivery networks (CDNs) to maximize bandwidth usage as it gives users greater speed when viewing the content, as the server is close to them and is part of the Netflix CDN. This results in faster loading times for series and movies, wherever you are in the world. But, apparently, the CDNs are starting to become a new way of spreading malware. The attack chain is very extensive, and incorporates the execution of remote scripts (similar in some respects to the recent “fileless” banking malware trend), plus the use of CDNs for command and control (C&C), and other standard techniques for the execution and protection of malware.

The tag is: `misp-galaxy:banker="downAndExec"`

Smominru

Since the end of May 2017, we have been monitoring a Monero miner that spreads using the EternalBlue Exploit (CVE-2017-0144). The miner itself, known as Smominru (aka Ismo) has been well-documented, so we will not discuss its post-infection behavior. However, the miner’s use of Windows Management Infrastructure is unusual among coin mining malware. The speed at which mining operations conduct mathematical operations to unlock new units of cryptocurrency is referred to as “hash power”. Based on the hash power associated with the Monero payment address for this operation, it appeared that this botnet was likely twice the size of Adylkuzz. The operators had already mined approximately 8,900 Monero (valued this week between \$2.8M and \$3.6M). Each day, the botnet mined roughly 24 Monero, worth an average of \$8,500 this week.

The tag is: `misp-galaxy:banker="Smominru"`

Kronos

Kronos was a type of banking malware first reported in 2014. It was sold for \$7000. As of September 2015, a renew version was reconnecting with infected bots and sending them a brand new configuration file against U.K. banks and one bank in India. Similar to Zeus it was focused on stealing banking login credentials from browser sessions. A new version of this malware appears to have been used in 2018, the main difference is that the 2018 edition uses Tor-hosted C&C control panels.

The tag is: *misp-galaxy:banker="Kronos"*

Bhadra Framework

Bhadra Threat Modeling Framework.

Bhadra Framework is a cluster galaxy available in JSON format at [this location](#). The JSON format can be freely reused in your application or automatically enabled in [MISP](#).

authors

Siddharth Prakash Rao - Silke Holtmanns - Tuomas Aura

Attacks from UE

"Attacks from UE" refers to any technique that involves the attacks launched by the software or hardware components of the user equipment to send malicious traffic into the mobile network.

The tag is: *misp-galaxy:bhadra-framework="Attacks from UE"*

SIM-based attacks

The "SIM-based attacks" are the techniques that involve any physical smart cards, namely SIM from 2G, USIM from 3G, and UICC from 4G networks.

The tag is: *misp-galaxy:bhadra-framework="SIM-based attacks"*

Attacks from radio access network

The "attacks from radio access network" are the techniques where an adversary with radio capabilities impersonates the mobile network to the UE (or vice versa) and becomes a man-in-the-middle.

The tag is: *misp-galaxy:bhadra-framework="Attacks from radio access network"*

Attacks from other mobile network

The "attacks from other mobile networks" and the "attacks with physical access to transport network" techniques can be conducted by evil mobile operators, law enforcement agencies for legal interception and human insiders with access to network nodes

The tag is: *misp-galaxy:bhadra-framework="Attacks from other mobile network"*

Attacks with access to transport network

The "attacks from other mobile networks" and the "attacks with physical access to transport network" techniques can be conducted by evil mobile operators, law enforcement agencies for legal interception and human insiders with access to network nodes

The tag is: *misp-galaxy:bhadra-framework="Attacks with access to transport network"*

Attacks from IP-based network

The "attacks from IP-based attacks" techniques mostly are launched from the service and application network, which allows non operator entities to infuse malicious traffic into an operator's network.

The tag is: *misp-galaxy:bhadra-framework="Attacks from IP-based network"*

Insider attacks and human errors

The "insider attacks and human errors" technique involve the intentional attacks and unintentional mistakes from human insiders with access to any component of the mobile communication ecosystem.

The tag is: *misp-galaxy:bhadra-framework="Insider attacks and human errors"*

Infecting UE hardware or software

Retaining the foothold gained on the target system through the initial access by infecting UE hardware or software.

The tag is: *misp-galaxy:bhadra-framework="Infecting UE hardware or software"*

Infecting SIM cards

Retaining the foothold gained on the target system through the initial access by infecting SIM cards.

The tag is: *misp-galaxy:bhadra-framework="Infecting SIM cards"*

Spoofed radio network

Retaining the foothold gained on the target system through the initial access by radio network spoofing.

The tag is: *misp-galaxy:bhadra-framework="Spoofed radio network"*

Infecting network nodes

Retaining the foothold gained on the target system through the initial access by infecting network nodes.

The tag is: *misp-galaxy:bhadra-framework="Infecting network nodes"*

Covert channels

Retaining the foothold gained on the target system through the initial access via covert channels.

The tag is: *misp-galaxy:bhadra-framework="Covert channels"*

Port scanning or sweeping

"Port scanning or sweeping" techniques to probe servers or hosts with open ports.

The tag is: *misp-galaxy:bhadra-framework="Port scanning or sweeping"*

Perimeter mapping

"perimeter mapping" techniques such as command-line utilities (e.g., nmap and whois), web-based lookup tools and official APIs provided by the Internet registrars that assign the ASNs using a wide range of publicly available sources.

The tag is: *misp-galaxy:bhadra-framework="Perimeter mapping"*

Threat intelligence gathering

"Threat intelligence gathering" using dedicated search engines (such as Censys, Shodan) to gather information about vulnerable devices or networks, or using advanced search options of traditional search engines.

The tag is: *misp-galaxy:bhadra-framework="Threat intelligence gathering"*

CN-specific scanning

"CN-specific scanning", used to scan nodes that are interconnected with protocols specific to the mobile communication domain (GTP, SCTP).

The tag is: *misp-galaxy:bhadra-framework="CN-specific scanning"*

Internal resource search

"Internal resource search" refers to an insider with access to provider internal databases abusing the information as a discovery tactic.

The tag is: *misp-galaxy:bhadra-framework="Internal resource search"*

UE knocking

"UE knocking" refers to the technique that scans User Equipment, similarly to how IP endpoints and core network nodes are scanned or mapped.

The tag is: *misp-galaxy:bhadra-framework="UE knocking"*

Exploit roaming agreements

"Exploit roaming agreements" is a technique exploited by evil mobile operators. Despite communication with operators is dependent on a roaming agreement being in place, an attacker that has gained a foothold with one operator, it can abuse the roaming agreements in place for lateral movement with all adjacent operators with agreements in place.

The tag is: *misp-galaxy:bhadra-framework="Exploit roaming agreements"*

Abusing interworking functionalities

"Abusing Inter-working functionalities" is a technique for adversaries to move between networks of different generations laterally

The tag is: *misp-galaxy:bhadra-framework="Abusing interworking functionalities"*

Exploit platform & service-specific vulnerabilities

Once an attacker has gained a foothold in an operator, it can conduct privilege escalation and process injection for gaining administrative rights, password cracking of valid user accounts on the nodes, exploit vulnerabilities in databases and file systems, and take advantage of improper configurations of routers and switches.

The tag is: *misp-galaxy:bhadra-framework="Exploit platform & service-specific vulnerabilities"*

SS7-based-attacks

Attacks abusing the SS7 protocol.

The tag is: *misp-galaxy:bhadra-framework="SS7-based-attacks"*

Diameter-based attacks

Attacks abusing the Diameter protocol.

The tag is: *misp-galaxy:bhadra-framework="Diameter-based attacks"*

GTP-based attacks

Attacks abusing the GTP protocol.

The tag is: *misp-galaxy:bhadra-framework="GTP-based attacks"*

DNS-based attacks

DNS based attacks.

The tag is: *misp-galaxy:bhadra-framework="DNS-based attacks"*

Pre-AKA attacks

Attack techniques that take place during the unencrypted communication that occurs prior to the AKA protocol.

The tag is: *misp-galaxy:bhadra-framework="Pre-AKA attacks"*

Security audit camouflage

The operating systems, software, and services used on the network nodes are prone to security vulnerabilities and installation of unwanted malware. Although operators conduct routine security audits to track and patch the vulnerabilities or remove the malware from the infected nodes, their effectiveness is not known to the public. Any means by which an adversary can remain undetected from such audits are referred to as the security audit camouflage technique.

The tag is: *misp-galaxy:bhadra-framework="Security audit camouflage"*

Blacklist evasion

Mobile operators employ several defenses in terms of securing their network traffic. For instance, operators maintain a whitelist of IPs and GTs of nodes from their own infrastructure and their partner operators (as agreed in IR 21), and traffic from only these nodes are processed. Similarly, a blacklist is also maintained to control spam due to configuration errors and malicious traffic. Anything from the blacklist is banned from entering the operator's network. Such defense mechanisms may defend against unsolicited traffic from external networks (e.g., from the public Internet and SAN), but it barely serves its purpose in the case of attacks from inter-operator communications. Since most of the communication protocols are unauthenticated in nature, an attacker with knowledge of identifiers of the allowed nodes (i.e. gained during the discovery phase) can impersonate their identity. We call it the blacklist evasion technique.

The tag is: *misp-galaxy:bhadra-framework="Blacklist evasion"*

Middlebox misconfiguration exploits

NAT middleboxes are used for separating private networks of mobile operators from public Internet works as the second line of defense. However, studies have shown that the middleboxes deployed by operators are prone to misconfigurations that allow adversaries to infiltrate malicious traffic into mobile networks e.g., by spoofing the IP headers. Some of the other NAT vulnerabilities lie in IPv4-to-IPv6 address mapping logic, which can be exploited by adversaries to exhaust the resources, wipe out the mapping, or to assist with blacklist evasion. Adversaries use such middlebox misconfiguration exploit techniques to launch denial-of-service or over-billing attacks.

The tag is: *misp-galaxy:bhadra-framework="Middlebox misconfiguration exploits"*

Bypass Firewall

Adversaries (e.g., evil operators) can for example exploit the implicit trust between roaming partners as a bypass firewall technique.

The tag is: *misp-galaxy:bhadra-framework="Bypass Firewall"*

Bypass homerouting

SMS home routing is a defense mechanism, where an additional SMS router intervenes in external location queries for SMS deliveries, and the roaming network takes the responsibility of delivering the SMS without providing location information to the external entity. Although many operators have implemented SMS home routing solutions, there are no silver bullets. If the SMS routers are incorrectly configured, adversaries can hide SMS delivery location queries within other messages so that the SMS home router fails to process them. We refer to it as the bypass home routing technique.

The tag is: *misp-galaxy:bhadra-framework="Bypass homerouting"*

Downgrading

Attacks on the radio access networks are well-studied and newer generations are designed to address the weaknesses in previous generations. Usage of weak cryptographic primitives, lack of integrity protection of the radio channels, and one-sided authentication (only from the network) remain as the problem of mostly GSM only radio communication. So, radio link attackers use downgrading as an attack technique to block service over newer generations and accept to serve only in the GSM radio network. The downgrading technique works similarly in the core network, where the adversary accepts to serve only in SS7-based signaling instead of Diameterbased signaling. Using interworking functions for inter-generation communication translation could make the downgrading attacks much easier.

The tag is: *misp-galaxy:bhadra-framework="Downgrading"*

Redirection

Redirection technique is a variant of the downgrading technique, where an adversary forcefully routes the traffic through networks or components that are under its control. By redirecting traffic to an unsafe network, the adversary can intercept mobile communication (e.g., calls and SMS) on the RAN part. Redirection attacks on the core network result in not only communication interception, but also in billing discrepancies, as an adversary can route the calls of a mobile user from its home network through a foreign network on a higher call rate.

The tag is: *misp-galaxy:bhadra-framework="Redirection"*

UE Protection evasion

Protection on the UE is mainly available in the form of antivirus apps as a defense against viruses

and malware that steals sensitive information (e.g., banking credentials and user passwords) or track user activities. Simple visual cues on UE (such as notifications) could also be a protection mechanism by itself. Unfortunately, mobile network-based attacks cannot be detected or defended effectively from UE's side by traditional antivirus apps, and such attacks do not trigger any visual signs. Although there are attempts for defending against radio link attacks, including citywide studies to detect IMSI catchers, their effectiveness is still under debate. Similarly, there are recent attempts to detect signaling attacks using distance bounding protocol run from a UE. However, such solutions are still in the research phase, and their effectiveness on a large scale is still untested. To this end, the absence of robust detection and defense mechanisms on the UE is, in fact, an evasion mechanism for an adversary. We refer to them as UE protection evasion techniques.

The tag is: *misp-galaxy:bhadra-framework="UE Protection evasion"*

Admin credentials

Stealing legitimate admin credentials for critical nodes is beneficial for the adversary to increase its chances of persistence to the target or masquerade its activities.

The tag is: *misp-galaxy:bhadra-framework="Admin credentials"*

User-specific identifiers

User-specific identifiers such as IMSI and IMEI are an indicator for who owns UE with a specific subscription and where a UE is located physically. Since mobile users always keep their mobile phones physically near them, an adversary with the knowledge of these permanent identifiers will be able to determine whether or not a user is in a specific location. On the other hand, temporary identifiers (e.g., TMSI and GUTI) are used to reduce the usage of permanent identifiers like IMSI over radio channels. Although the temporary identifiers are supposed to change frequently and expected to live for a short period, research has shown that it is not the case

The tag is: *misp-galaxy:bhadra-framework="User-specific identifiers"*

User-specific data

Adversaries can collect several types of user-specific data, such as the content of SMS and calls, location dumps from base stations, call and billing records, and browsing-related data (such as DNS queries and unencrypted browsing sessions).

The tag is: *misp-galaxy:bhadra-framework="User-specific data"*

Network-specific identifiers

Adversaries aim to collect network-specific identifiers such as GTs and IPs of critical nodes and Tunnel Endpoint Identifier (TEID) of GTP tunnels from operators' networks

The tag is: *misp-galaxy:bhadra-framework="Network-specific identifiers"*

Network-specific data

Adversaries may also be interested in network-specific data that are obtained mainly during the execution of discovery tactics. Such data includes, e.g., the network topology, the trust relationship between different nodes, routing metadata, and sensitive documents

The tag is: *misp-galaxy:bhadra-framework="Network-specific data"*

Location tracking

Attacker is able to track the location of the target end-user.

The tag is: *misp-galaxy:bhadra-framework="Location tracking"*

Calls eavesdropping

Attacker is able to eavesdrop on calls.

The tag is: *misp-galaxy:bhadra-framework="Calls eavesdropping"*

SMS interception

Attacker is able to intercept SMS messages.

The tag is: *misp-galaxy:bhadra-framework="SMS interception"*

Data interception

Attacker is able to intercept or modify internet traffic.

The tag is: *misp-galaxy:bhadra-framework="Data interception"*

Billing frauds

Billing frauds refer to various types of attacks where an adversary causes financial discrepancies for operators.

The tag is: *misp-galaxy:bhadra-framework="Billing frauds"*

DoS - network

The attacker can create signaling havoc in specific nodes of operators by repeatedly triggering resource allocation or revocation requests.

The tag is: *misp-galaxy:bhadra-framework="DoS - network"*

DoS - user

The attacker can cause denial of service to mobile users.

The tag is: *misp-galaxy:bhadra-framework="DoS - user"*

Identity-related attacks

Identity-based attacks involve attack techniques using user and network-specific identifiers. Identity-based attacks cause harm to the privacy of mobile users and produce fraudulent traffic that incurs a financial loss to operators. In most cases, identity-based attacks are used in impersonation, where an adversary impersonates a legitimate mobile user to the core network without possessing appropriate credentials, for example, to avail free mobile services. Most of the signaling attacks that use SS7 are also fall into this category. In other cases, identity-based attacks involve identity mapping, where the adversaries map temporary identifiers (e.g., TMSI and GUTI) to permanent identifiers (e.g., IMSI or MSISDN). In rare cases, the IMSI can further be mapped to social media identities.

The tag is: *misp-galaxy:bhadra-framework="Identity-related attacks"*

authors

Various

ADB.miner

A new botnet appeared over the weekend, and it's targeting Android devices by scanning for open debug ports so it can infect victims with malware that mines the Monero cryptocurrency.

The botnet came to life on Saturday, February 3, and is targeting port 5555, which on devices running the Android OS is the port used by the operating system's native Android Debug Bridge (ADB), a debugging interface that grants access to some of the operating system's most sensitive features.

Only devices running the Android OS have been infected until now, such as smartphones, smart TVs, and TV top boxes, according to security researchers from Qihoo 360's Network Security Research Lab [Netlab] division, the ones who discovered the botnet, which they named ADB.miner.

The tag is: *misp-galaxy:botnet="ADB.miner"*

Torpig

Torpig, also known as Anserin or Sinowal is a type of botnet spread through systems compromised by the Mebroot rootkit by a variety of trojan horses for the purpose of collecting sensitive personal and corporate data such as bank account and credit card information. It targets computers that use Microsoft Windows, recruiting a network of zombies for the botnet. Torpig circumvents antivirus software through the use of rootkit technology and scans the infected system for credentials, accounts and passwords as well as potentially allowing attackers full access to the computer. It is also purportedly capable of modifying data hajimeon the computer, and can perform man-in-the-browser attacks.

Storm

The Storm botnet or Storm worm botnet (also known as Dorf botnet and Ecard malware) is a remotely controlled network of "zombie" computers (or "botnet") that have been linked by the Storm Worm, a Trojan horse spread through e-mail spam. At its height in September 2007, the Storm botnet was running on anywhere from 1 million to 50 million computer systems, and accounted for 8% of all malware on Microsoft Windows computers. It was first identified around January 2007, having been distributed by email with subjects such as "230 dead as storm batters Europe," giving it its well-known name. The botnet began to decline in late 2007, and by mid-2008, had been reduced to infecting about 85,000 computers, far less than it had infected a year earlier.

The tag is: *misp-galaxy:botnet="Storm"*

Storm is also known as:

- Nuwar
- Peacomm
- Zhelatin
- Dorf
- Ecard

Sality

Sality is the classification for a family of malicious software (malware), which infects files on Microsoft Windows systems. Sality was first discovered in 2003 and has advanced over the years to become a dynamic, enduring and full-featured form of malicious code. Systems infected with Sality may communicate over a peer-to-peer (P2P) network for the purpose of relaying spam, proxying of communications, exfiltrating sensitive data, compromising web servers and/or coordinating distributed computing tasks for the purpose of processing intensive tasks (e.g. password cracking). Since 2010, certain variants of Sality have also incorporated the use of rootkit functions as part of an ongoing evolution of the malware family. Because of its continued development and capabilities, Sality is considered to be one of the most complex and formidable forms of malware to date.

The tag is: *misp-galaxy:botnet="Sality"*

Sality is also known as:

Maazben

A new botnet, dubbed Maazben, has also been observed and is also growing rapidly. MessageLabs Intelligence has been tracking the growth of Maazben since its infancy in late May and early June. Its dominance in terms of the proportion of spam has been accelerating in the last 30 days from just over 0.5% of all spam, peaking at 4.5% of spam when it is most active. Currently spam from Maazben accounts for approximately 1.4% of all spam, but this is likely to increase significantly over time, particularly since both overall spam per minute sent and spam per bot per minute are increasing.

The tag is: *misp-galaxy:botnet="Maazben"*

Gheg

Tofsee, also known as Gheg, is another botnet analyzed by CERT Polska. Its main job is to send spam, but it is able to do other tasks as well. It is possible thanks to the modular design of this malware – it consists of the main binary (the one user downloads and infects with), which later downloads several additional modules from the C2 server – they modify code by overwriting some of the called functions with their own. An example of some actions these modules perform is spreading by posting click-bait messages on Facebook and VKontakte (Russian social network).

The tag is: *misp-galaxy:botnet="Gheg"*

Gheg is also known as:

Zeus

Zeus, ZeuS, or Zbot is a Trojan horse malware package that runs on versions of Microsoft Windows. While it can be used to carry out many malicious and criminal tasks, it is often used to steal banking information by man-in-the-browser keystroke logging and form grabbing. It is also used to install the CryptoLocker ransomware. Zeus is spread mainly through drive-by downloads and

phishing schemes. First identified in July 2007 when it was used to steal information from the United States Department of Transportation, it became more widespread in March 2009. In June 2009 security company Prevx discovered that Zeus had compromised over 74,000 FTP accounts on websites of such companies as the Bank of America, NASA, Monster.com, ABC, Oracle, Play.com, Cisco, Amazon, and BusinessWeek. Similarly to Koobface, Zeus has also been used to trick victims of tech support scams into giving the scam artists money through pop-up messages that claim the user has a virus, when in reality they might have no viruses at all. The scammers may use programs such as Command prompt or Event viewer to make the user believe that their computer is infected.

Satori

According to a report Li shared with Bleeping Computer today, the Mirai Satori variant is quite different from all previous pure Mirai variants. Previous Mirai versions infected IoT devices and then downloaded a Telnet scanner component that attempted to find other victims and infect them with the Mirai bot. The Satori variant does not use a scanner but uses two embedded exploits that will try to connect to remote devices on ports 37215 and 52869. Effectively, this makes Satori an IoT worm, being able to spread by itself without the need for separate components.

The tag is: *misp-galaxy:botnet="Satori"*

Satori is also known as:

- Okiru

Hajime

Hajime (meaning ‘beginning’ in Japanese) is an IoT worm that was first mentioned on 16 October 2016 in a public report by RapidityNetworks. One month later we saw the first samples being uploaded from Spain to VT. This worm builds a huge P2P botnet (almost 300,000 devices at the time

of publishing this blogpost), but its real purpose remains unknown. It is worth mentioning that in the past, the Hajime IoT botnet was never used for massive DDoS attacks, and its existence was a mystery for many researchers, as the botnet only gathered infected devices but almost never did anything with them (except scan for other vulnerable devices).

The tag is: `misp-galaxy:botnet="Hajime"`

[View relationships graph](#)

Hajime has relationships with:

Muhstik

The botnet is exploiting the CVE-2018-7600 vulnerability —also known as Drupalgeddon 2— to access a specific URL and gain the ability to execute commands on a server running the Drupal CMS. At the technical level, Netlab says Muhstik is built on top of Tsunami, a very old strain of malware that has been used for years to create botnets by infecting Linux servers and smart devices running Linux-based firmware. Crooks have used Tsunami initially for DDoS attacks, but its feature-set has greatly expanded after its source code leaked online. The Muhstik version of Tsunami, according to a Netlab report published today, can launch DDoS attacks, install the XMRig Monero miner, or install the CGMiner to mine Dash cryptocurrency on infected hosts. Muhstik operators are using these three payloads to make money via the infected hosts.

The tag is: `misp-galaxy:botnet="Muhstik"`

Hide and Seek

Security researchers have discovered the first IoT botnet malware strain that can survive device reboots and remain on infected devices after the initial compromise. This is a major game-changing moment in the realm of IoT and router malware. Until today, equipment owners could always remove IoT malware from their smart devices, modems, and routers by resetting the device. The

reset operation flushed the device's flash memory, where the device would keep all its working data, including IoT malware strains. But today, Bitdefender researchers announced they found an IoT malware strain that under certain circumstances copies itself to /etc/init.d/, a folder that houses daemon scripts on Linux-based operating systems —like the ones on routers and IoT devices. By placing itself in this menu, the device's OS will automatically start the malware's process after the next reboot.

Sora

Big changes on the IoT malware scene. Security researchers have spotted a version of the Mirai IoT malware that can run on a vast range of architectures, and even on Android devices. This Mirai malware strain is called Sora, a strain that was first spotted at the start of the year. Initial versions were nothing out of the ordinary, and Sora's original author soon moved on to developing the Mirai Owari version, shortly after Sora's creation.

The tag is: *misp-galaxy:botnet="Sora"*

Sora is also known as:

- Mirai Sora

[View relationships graph](#)

Sora has relationships with:

Persirai

A new Internet of Things (IoT) botnet called Persirai (Detected by Trend Micro as ELF_PERSIRAI.A) has been discovered targeting over 1,000 Internet Protocol (IP) Camera models based on various Original Equipment Manufacturer (OEM) products. This development comes on the heels of Mirai—an open-source backdoor malware that caused some of the most notable incidents of 2016

via Distributed Denial-of-Service (DDoS) attacks that compromised IoT devices such as Digital Video Recorders (DVRs) and CCTV cameras—as well as the Hajime botnet.

The tag is: *misp-galaxy:botnet="Persirai"*

Chalubo

Since early September, SophosLabs has been monitoring an increasingly prolific attack targeting Internet-facing SSH servers on Linux-based systems that has been dropping a newly-discovered family of denial-of-service bots we're calling Chalubo. The attackers encrypt both the main bot component and its corresponding Lua script using the ChaCha stream cipher. This adoption of anti-analysis techniques demonstrates an evolution in Linux malware, as the authors have adopted principles more common to Windows malware in an effort to thwart detection. Like some of its predecessors, Chalubo incorporates code from the Xor.DDoS and Mirai malware families.

The tag is: *misp-galaxy:botnet="Chalubo"*

Branded Vulnerability

List of known vulnerabilities and attacks with a branding.

Branded Vulnerability is a cluster galaxy available in JSON format at [this location](#). The JSON format can be freely reused in your application or automatically enabled in [MISP](#).

authors

Unknown

Meltdown

Meltdown exploits the out-of-order execution feature of modern processors, allowing user-level programs to access kernel memory using processor caches as covert side channels. This is specific to the way out-of-order execution is implemented in the processors. This vulnerability has been assigned CVE-2017-5754.

The tag is: *misp-galaxy:branded-vulnerability="Meltdown"*

Spectre

Spectre exploits the speculative execution feature that is present in almost all processors in existence today. Two variants of Spectre are known and seem to depend on what is used to influence erroneous speculative execution. The first variant triggers speculative execution by performing a bounds check bypass and has been assigned CVE-2017-5753. The second variant uses branch target injection for the same effect and has been assigned CVE-2017-5715.

The tag is: *misp-galaxy:branded-vulnerability="Spectre"*

Heartbleed

Heartbleed is a security bug in the OpenSSL cryptography library, which is a widely used implementation of the Transport Layer Security (TLS) protocol. It was introduced into the software in 2012 and publicly disclosed in April 2014. Heartbleed may be exploited regardless of whether the vulnerable OpenSSL instance is running as a TLS server or client. It results from improper input validation (due to a missing bounds check) in the implementation of the TLS heartbeat extension, thus the bug's name derives from heartbeat. The vulnerability is classified as a buffer over-read,[5] a situation where more data can be read than should be allowed.

The tag is: *misp-galaxy:branded-vulnerability="Heartbleed"*

Shellshock

Shellshock, also known as Bashdoor, is a family of security bugs in the widely used Unix Bash shell, the first of which was disclosed on 24 September 2014. Many Internet-facing services, such as some web server deployments, use Bash to process certain requests, allowing an attacker to cause vulnerable versions of Bash to execute arbitrary commands. This can allow an attacker to gain unauthorized access to a computer system.

The tag is: *misp-galaxy:branded-vulnerability="Shellshock"*

Ghost

The GHOST vulnerability is a serious weakness in the Linux glibc library. It allows attackers to remotely take complete control of the victim system without having any prior knowledge of system credentials. CVE-2015-0235 has been assigned to this issue. During a code audit Qualys researchers discovered a buffer overflow in the `__nss_hostname_digits_dots()` function of glibc. This bug can be triggered both locally and remotely via all the `gethostbyname*()` functions. Applications have access to the DNS resolver primarily through the `gethostbyname*()` set of functions. These functions convert a hostname into an IP address.

The tag is: *misp-galaxy:branded-vulnerability="Ghost"*

Stagefright

Stagefright is the name given to a group of software bugs that affect versions 2.2 ("Froyo") and newer of the Android operating system. The name is taken from the affected library, which among other things, is used to unpack MMS messages. Exploitation of the bug allows an attacker to perform arbitrary operations on the victim's device through remote code execution and privilege escalation. Security researchers demonstrate the bugs with a proof of concept that sends specially crafted MMS messages to the victim device and in most cases requires no end-user actions upon message reception to succeed—the user doesn't have to do anything to 'accept' the bug, it happens in the background. The phone number is the only target information.

The tag is: *misp-galaxy:branded-vulnerability="Stagefright"*

Badlock

Badlock is a security bug disclosed on April 12, 2016 affecting the Security Account Manager (SAM) and Local Security Authority (Domain Policy) (LSAD) remote protocols[1] supported by Windows and Samba servers.

The tag is: *misp-galaxy:branded-vulnerability="Badlock"*

Dirty COW

Dirty COW (Dirty copy-on-write) is a computer security vulnerability for the Linux kernel that affects all Linux-based operating systems including Android. It is a local privilege escalation bug that exploits a race condition in the implementation of the copy-on-write mechanism in the kernel's memory-management subsystem. The vulnerability was discovered by Phil Oester. Because of the race condition, with the right timing, a local attacker can exploit the copy-on-write mechanism to turn a read-only mapping of a file into a writable mapping. Although it is a local privilege escalation, remote attackers can use it in conjunction with other exploits that allow remote execution of non-privileged code to achieve remote root access on a computer. The attack itself does not leave traces in the system log.

The tag is: *misp-galaxy:branded-vulnerability="Dirty COW"*

POODLE

The POODLE attack (which stands for "Padding Oracle On Downgraded Legacy Encryptio") is a man-in-the-middle exploit which takes advantage of Internet and security software clients' fallback to SSL 3.0. If attackers successfully exploit this vulnerability, on average, they only need to make 256 SSL 3.0 requests to reveal one byte of encrypted messages. Bodo Möller, Thai Duong and Krzysztof Kotowicz from the Google Security Team discovered this vulnerability; they disclosed the vulnerability publicly on October 14, 2014 (despite the paper being dated "September 2014"). Ivan Ristic does not consider the POODLE attack as serious as the Heartbleed and Shellshock attacks. On December 8, 2014 a variation of the POODLE vulnerability that affected TLS was announced.

The tag is: *misp-galaxy:branded-vulnerability="POODLE"*

BadUSB

The 'BadUSB' vulnerability exploits unprotected firmware in order to deliver malicious code to computers and networks. This is achieved by reverse-engineering the device and reprogramming it. As the reprogrammed firmware is not monitored or assessed by modern security software, this attack method is extremely difficult for antivirus/security software to detect and prevent.

The tag is: *misp-galaxy:branded-vulnerability="BadUSB"*

ImageTragick

The tag is: *misp-galaxy:branded-vulnerability="ImageTragick"*

Blacknurse

Blacknurse is a low bandwidth DDoS attack involving ICMP Type 3 Code 3 packets causing high CPU loads first discovered in November 2016. The earliest samples we have seen supporting this DDoS method are from September 2017.

The tag is: *misp-galaxy:branded-vulnerability="Blacknurse"*

SPOILER

SPOILER is a security vulnerability on modern computer central processing units that uses speculative execution to improve the efficiency of Rowhammer and other related memory and cache attacks. According to reports, all modern Intel CPUs are vulnerable to the attack. AMD has stated that its processors are not vulnerable.

The tag is: *misp-galaxy:branded-vulnerability="SPOILER"*

Australian Strategic Policy Institute

Academy of Military Science (中国人民解放军军事科学院)

AMS is responsible for leading and coordinating military science for the whole military. AMS is involved in not only the development of theory, strategy, and doctrine but also advancing national defense innovation. Pursuant to the PLA reforms, AMS has undergone dramatic changes starting in June 2017. At a July 2017 ceremony marking the AMS's reorganisation, Xi urged the AMS to construct a 'world-class military scientific research institution.' Through the National Defence Science and Technology Innovation Institute, the AMS is pursuing research in cutting-edge technologies including unmanned systems, artificial intelligence, biotechnology and quantum technology.

Aero Engine Corporation of China (中国航空发动机集团有限公司)

AECC is a leading producer of aircraft parts for the People's Liberation Army (PLA), having separated from its parent company the Aviation Industry Corporation of China (AVIC) in 2016. The company reports having 27 affiliated or subordinate companies, three major listed companies, and 84,000 staff. AVIC and the Commercial Aircraft Corporation of China (also known as COMAC) are major shareholders in AECC. AECC's main products include aircraft engines, combustion gas turbines, and transmission systems. AECC also develops aircraft power units, helicopter drive systems, monocrystalline blades, turbine disks, and graphene. AECC was established in order to improve China's capability in developing domestically built aircraft engines as part of the 'Made in China 2025' program. A priority is strengthening its supply chains within China. Though indigenously developed engines have proven challenging for AECC, the company had purported success in providing thrust vector control technology for the J-10B fighter jet.

Air Force Command College (中国人民解放军空军指挥学院)

The PLA Air Force Command College in Beijing is considered the PLA Air Force's 'peak institution for educating mid-rank and senior officers' for command posts across the service. The college has a long history and was initially established in Nanjing during the early years of the People's Republic in 1958. The Air Force Command College offers a range of degree programmes, mainly at the postgraduate level, including training in military disciplines such as military history, strategy, and tactics. It has published research on control science and radar. The college's other specialties

include battlefield command, military operations as well as political–ideological education.

Air Force Communication NCO Academy (空军通信士官学院)

The Air Force Communications Officers Academy is the PLA’s premier institution for the training of non-commissioned officers in communications systems and security. Established in 1986 as the Dalian Communications NCO College, the institution was renamed after Xi Jinping’s military reforms in 2017. The academy’s areas of research include command automation and satellite communications, along with wired and wireless communications.

Air Force Early Warning Academy (空军预警学院)

The Air Force Early Warning Academy is ‘an institution that trains military personnel from the PLA Air Force and Navy’s radar and electronic warfare units in command, engineering and technology’ that was established after the amalgamation of the Air Defence Academy and Radar College in 1958. As such, the Air Force Early Warning Academy focuses its research on radar engineering, information command systems engineering, networked command engineering, and early warning detection systems.

Air Force Engineering University (空军工程大学)

The Air Force Engineering University (AFEU) is one of the PLA’s five comprehensive universities alongside NUDT, Naval Engineering University, PLA Information Engineering University and Army Engineering University. It trains students in a variety of engineering and military disciplines

related to air combat.AFEU currently has around 8,000 students, including 1,600 postgraduate students. Its priority areas include technical studies in information and communication systems engineering as well as in social sciences such as in professional military training. Research into unmanned aerial vehicle technology is another important area of research at the university. In 2017, China’s Ministry of Education ranked AFEU equal fourth for armament science out of nine universities, only awarding it a B- grade for the discipline.Colleges under AFEU include:

Air Force Logistics University (空军后勤大学)

The Air Force Logistics University is an institution devoted to the study of command, management and technology for the PLA, established in Shanxi by the Central Military Commission in 1954. The university focusses its research on ‘management engineering’ for military equipment such as weaponry and aircraft fuel and also maintains research programmes on air battle command and personnel management.

Air Force Medical University (空军军医大学)

The Air Force Medical University, also known as the Fourth Military Medical University, is the PLA's premier institution for research into medical and psychological sciences, having been placed under command of the Air Force after Xi Jinping's military reforms in 2017. Its major areas of study are medical and psychological sciences tailored for personnel engaging in air and space operations, military preventative medicine and various other forms of clinical research. The Air Force Medical University conducts significant amounts of psychological research. Scientists from the Air Force Medical University have written studies on suicide, mental health across China, and mental health in military universities. The university's scientists have also looked at the extent to which mindfulness training can reduce anxiety for undergraduates at military universities, and at how fear induced by virtual combat scenarios impacts decision-making. This indicates that the university is interested in issues of troop morale and decision-making in high-stress situations.

Air Force Xi'an Flight Academy (空军西安飞行学院)

Created upon the merger of the PLA Air Force's Second and Fifth Flight Academies in 2011, the Air Force Xi'an Flight Academy specialises in training airmen in aviation while passing on the PLA's 'revolutionary traditions'. It remains 'one of the Air Force's three advanced institutions in air

combat, and is known to train the PLA Air Force's JJ-7 fighter pilots. Given this focus on training, the institution engages in little scientific research.

Army Academy of Armored Forces (陆军装甲兵学院)

The Army Academy of the Armored Forces is China's lead institute responsible for training and research for armoured combat. This includes a focus on tank warfare, mechanised artillery and infantry operations. The academy offers training in 'armored combat command, surveillance and intelligence, operational tactics' as well as in engineering disciplines relevant to operations involving the PLA Ground Force's armoured corps, such as materials science, mechanical engineering, electrical engineering and automation, communications engineering, weapons systems engineering and photoelectric information science.

Army Research Institute (中国人民解放军陆军研究院)

The Army Research Institute is an institution devoted to advanced defence research with applications to land warfare. The institute engages in a variety of defence research including radar technology, lasers, and hybrid electric vehicles. Researchers from the institute are known to have collaborated with partners from China's civilian universities in areas such as advanced manufacturing and automatic control, and laser technology. The Army Research Institute collaborates with civilian companies as part of China's military-civil fusion program. For example, General Guo Guangsheng from the Army Research Institute made a visit to Hong Run Precision Instruments Co. Ltd. (宏润精密仪器) on 24 August 2019 to assess how the company was performing in its military-civil fusion activities. Researchers from the Army Research Institute have also been involved in the product design and development of dual-use automobiles as part of a military-civil fusion project called 'Research, Development and Commercialisation of Advanced Off-road Passenger Vehicles' (先进越野乘用车研发、开发和商业化). The project included research into vehicles such as the BJ80 military and civilian off-road passenger vehicles as well as the BJ40L off-road vehicle.

Aviation Industry Corporation of China (中国航空工业集团公司)

AVIC is a state-owned defence conglomerate established in 2008 that focuses on providing aerospace products for military and civilian customers. AVIC's main product lines include a variety of aircraft for freight, commercial and military aviation along with other more specialised products such as printed circuit boards, liquid crystal displays and automotive parts, according to Bloomberg. AVIC also provides services to the aviation sector through flight testing, engineering, logistics and asset management. The conglomerate has over 400,000 employees and has a controlling share in around 200 companies. AVIC has over 25 subsidiaries listed on its website. AVIC is the PLA Air Force's largest supplier of military aircraft, producing fighter jets, strike aircraft, unmanned aerial vehicles and surveillance aircraft. Along with its core work on military aircraft, AVIC also produces surface-to-air, air-to-surface and air-to-air missiles. Its headline projects include the J-10 and the J-11 fighter aircraft. AVIC's subsidiary, the Shenyang Aircraft Corporation, was responsible for delivery of the J-15 fighter. Another subsidiary of AVIC, the Chengdu Aerospace Corporation, developed the PLA-AF's J-20 stealth fighter jet.

Aviation University of Air Force (中国人民解放军空军航空大学)

AUAF is one of China's main institutions devoted to the training of air force pilots. Its areas of focus are training in flight command and research into aeronautical engineering. Disciplines taught at AUAF include command science and engineering, aerospace science and technology as well as political work and military command. AUAF scientists publish and attend conferences on radar technology and electronic countermeasures. For example, scientists from AUAF's Information Countermeasures Division co-authored a publication on radar target recognition with a researcher from the PLA's Unit 94936 – an aviation unit stationed in Hangzhou. AUAF scientists have also done

notable work on complex systems radar and signal pre-sorting.

Beihang University (北京航空航天大学)

Beihang University engages in very high levels of defence research as one of the ‘Seven Sons of National Defence’ subordinate to the Ministry of Industry and Information Technology. The university specialises in aviation and spaceflight research. The top four employers of Beihang graduates in 2018 were all state-owned missile or defence aviation companies. In total, 29% of 2018 Beihang graduates who found employment were working in the defence sector. Beihang scientists are involved in the development of Chinese military aircraft and missiles. In 2018, the university signed a comprehensive strategic cooperation agreement with China Aerospace Science and Technology Corporation, a state-owned conglomerate that produces ballistic missiles and satellites. The university is also noteworthy for its leading research on stealth technology. Beihang hosts at least eight major defence laboratories working on fields such as aircraft engines, inertial navigation and fluid dynamics.

Beijing Electronic Science and Technology Institute (北京电子科技职业学院)

BESTI is a secretive university that trains information security experts for the bureaucracy. The institute is the only university run by the CCP General Office, which manages administrative matters for the Central Committee. The General Office is usually run by one of the general secretary’s most trusted aides. It oversees China’s cryptographic and state secrets agency as well as security for the party’s leadership. BESTI has a student population of around 2,000 and has strict admission requirements. Students at the university are scrutinized for their political beliefs, and are typically CCP or Communist Youth League members. The activities of their relatives are screened for political issues. Having no parents or siblings who worked abroad or were involved in ‘illegal organisations’ is a condition of enrolment. The institute claims to count 50 ministerial-level party officials among its 12,000 graduates. BESTI has a close relationship with Xidian University and Beijing University of Posts and Telecommunications. The two universities are its primary collaborators on scientific papers. BESTI runs joint master’s programs with Xidian University in cryptography, information and communication engineering, and computer applications technology.

It also has joint doctoral programs with the University of Science and Technology of China and Beijing University of Posts and Telecommunications in cybersecurity. The university runs the Key Laboratory of Information Security (信息安全/信息安全). Several websites claim that it runs a joint laboratory with the Chinese Academy of Sciences Institute of High Energy Physics, but this could not be confirmed.

Beijing Institute of Technology (北京理工大学)

BIT is one of the ‘Seven Sons of National Defence’ supervised by MIIT. It is a leading centre of military research and one of only fourteen institutions accredited to award doctorates in weapons science. In 2017, China’s Ministry of Education ranked BIT and Nanjing University of Science and Technology as the country’s top institutions for weapons science. It has received the most defence research prizes and defence patents out of all China’s universities. 31.80% of BIT graduates in 2018 who found employment were working in the defence sector. BIT’s claimed achievements include producing the PRC’s first light tank, first two-stage solid sounding rocket and first low-altitude altimetry radar. The university also states that it carries out world-class research on several areas of missile technology including “precision strikes, high damage efficiency, maneuver penetration, long-range suppression, and military communications systems and counter-measures”. In 2018, BIT announced that it was running a four-year experimental program training some of China’s top high school students in intelligent weapons systems. BIT is the chair of the B8 Cooperation Innovation Alliance (B8联盟 or 联盟), a group of eight Chinese research institutions that specialize in weapons science—the ‘B’ in ‘B8’ stands for Chinese work for armaments, bingqi (兵). BIT’s central role in advancing PLA warfighting capability is demonstrated by the fact that it participated in the development of equipment used by 22 of the 30 squads in the 2009 military parade for the 60th anniversary of the founding of the PRC.

Beijing University of Chemical Technology (北京化工大学)

BUCT is subordinate to the Ministry of Education. The university engages in high levels of defence research. In 2016, the Ministry of Education and defence industry agency SASTIND agreed to jointly construct BUCT, a move designed to expand its involvement in defence research. Between 2011 and 2015, the university’s spending on defence research reached RMB272 million (AUD56 million), approximately 15% of the university’s research spending and an increase of around 50% over the

previous five years. BUCT specialises in the development and application of critical materials for the defence industry. Its research on carbon fibres has been applied to the aerospace industry. BUCT holds secret-level security credentials, allowing it to participate in classified defence and weapons technology projects.

Beijing University of Posts and Telecommunications (北京邮电)

BUPT is subordinate to the Ministry of Education in addition to being jointly constructed by the Ministry of Industry and Information Technology. BUPT is one of eight Chinese universities known to have received top-secret security credentials. Since its establishment, the university has focused on information engineering and computer science, and has continued to produce important defence and security technology research. The School of Cyberspace Security is home to one of the university's two defence laboratories—the Key Laboratory of Network and Information Attack & Defense Technology of Ministry of Education—which carries out research for the Chinese military related to cyber attacks. BUPT is a member of several military-civilian fusion (MCF) alliances and has been awarded for its contributions to MCF and the PLA. During the past three years, major employers of BUPT graduates include the Ministry of State Security, the Ministry of Public Security and MIIT. This suggests a close relationship between BUPT and China's security and intelligence agencies.

Central South University (中南)

Out of all universities subordinate to the MOE, CSU reportedly receives the most military research funding and was the first to receive a weapons production license. In 2008 and 2011 respectively, the defence industry agency SASTIND and the Ministry of Education (MOE) signed agreements to jointly supervise CSU. Under this arrangement, SASTIND committed to expanding CSU's involvement in defence research and support the development of its School of Aeronautics and Astronautics and Military Industry Technology Research Institute. CSU's defence research appears to focus on metallurgy, materials science, and aviation technology, including the development of heat-resistant materials for aeroplane and rocket engines. The university has been involved in the

development of China's first atomic bomb, first intermediate-range ballistic missile, and first nuclear submarine. In 2018, it signed a strategic cooperation agreement with the Chinese Academy of Launch Vehicle Technology, a subsidiary of China Aerospace Science and Technology Corporation that is included on the US BIS Entity List for its involvement in developing rockets.

China Aerospace Science and Industry Corporation

(中国航天工业总公司)

CASIC specialises in defence equipment and aerospace products, particularly short- and medium-range missiles. CASIC is a leading provider to the Chinese military of high-end capabilities such as air-defence, cruise, and ballistic missile systems along with space launch vehicles, micro-satellites and anti-satellite interceptors, according to Mark Stokes and Dean Cheng. CASIC employs over 146,000 employees and is on the Fortune 500 list with revenue exceeding USD37 billion (AUD55 billion). Although defence products form part of CASIC's main product line, the company also produces products for civilian customers such as electronics, communications equipment and medical equipment. Nevertheless, CASIC claims that it 'will always uphold its core value of ranking national interests above all', which indicates that civilian products receive less priority than defence equipment.

China Aerospace Science and Technology Corporation

(中国航天科技集团公司)

CASC was established in 1999 as a defence aerospace conglomerate. The company is primarily focused on 'developing carrier rockets, various kinds of satellites, ... and tactical missile systems.' With revenues nearing USD38 billion (AUD55 billion), CASC employs nearly 180,000 personnel and is on the Fortune 500 list. PLA experts Mark Stokes and Dean Cheng have noted that CASC's main products for the PLA include 'ballistic missiles and space launch vehicles, large solid rocket motors, liquid fuelled engines, satellites, and related sub-assemblies and components.' The Federation of American Scientists claims CASC is particularly advanced in high-energy propellant technology, satellite applications, strap-on boosters and system integration. CASC maintains an investment business which may be geared towards civilian purposes, according to Bloomberg. The Federation of American Scientists notes that some civilian product lines for CASC include 'machinery, chemicals, communications equipment, transportation equipment, computers, medical care products and environmental protection equipment.' CASC oversees multiple research academies, which have been separately identified by Mark Stokes and Dean Cheng and by the Nuclear Threat Initiative. The Nuclear Threat Initiative has identified that CASC has the following subordinate companies:

China Electronics Corporation (中国电子科技集团公司)

CEC is a state-owned conglomerate that produces dual-use electronics. The company was established in 1989 to produce semi-conductors, electronic components, software and telecommunications products. The company describes itself as a defence industry conglomerate. CEC is one of China's largest companies with nearly 120 thousand employees. CEC claims to hold 22 subordinate enterprises and 14 listed companies. Global Security has provided a list of CEC's 36 member companies in English. CEC is divided into two operational groups. First is the China Electronics Party Institute (中国电子科技集团公司), which provides disciplinary oversight and organises communist party activities within CEC. Second is the Science and Technology Committee (中国电子科技集团公司), which is responsible for research and development within CEC. CEC's defence electronics are developed by the Military Engineering Department (中国电子科技集团公司) within CEC's Science and Technology Committee. Key defence electronics produced by CEC include tracking stations, radar technology, as well as command and control systems. The company maintains its own office for the management of classified information related to defence research. The Federation of American Scientists has identified CEC's defence-related enterprises on a list that can be found here.

China Electronics Technology Group Corporation

(中国电子科技集团公司)

CETC is a state-owned defence conglomerate that specialises in dual-use electronics. The company was established in 2002 by bringing dozens of research institutes administered by the Ministry of Information Industry, the predecessor to the Ministry of Industry and Information Technology, under one umbrella. CETC is one of the world's largest defence companies. It claims to have 523 subordinate units and companies and 160,000 employees. CETC divides its defence electronics products into seven categories: air base early warning, integrated electronic information systems, radar, communication and navigation, electronic warfare, UAVs and integrated IFF (identification, friend or foe). CETC also provides technology used for human rights abuses in Xinjiang, where approximately 1.5m are held in re-education camps. Several CETC research institutes and subsidiaries have been added to the US Government's entity list, restricting exports to them on national security grounds. CETC has been implicated by the US Department of Justice in at least three cases of illegal exports. CETC has a large international market and has also expanded its international research collaboration in recent years. It has a European headquarters in Graz, Austria, and has invested in the University of Technology Sydney.

China National Nuclear Corporation (中国核工业集团公司)

CNCC is the leading state-owned enterprise for China's civilian and military nuclear programs. It consists of more than 200 subordinate enterprises and research institutes, many of which are listed on the Nuclear Threat Initiative website. In 2018, CNCC took over China's main nuclear construction company, China Nuclear Engineering and Construction Group (中国核工业建设集团公司). The company is organized into eight industrial sectors, including nuclear power, nuclear power generation, nuclear fuel, natural uranium, nuclear environmental protection, application of nuclear technologies, non-nuclear civilian products and new energy sources. CNCC is mainly engaged in research and development, design, construction and production operations in the fields of nuclear power, nuclear fuel cycle, nuclear technology application, and nuclear environmental protection engineering. Because of the dual-use nature of nuclear technologies, the nuclear industry is a typical military-civil fusion industry. Naval nuclear power technology and nuclear reactor technology in the reactor core, fuel assembly, safety and security, and radioactive waste treatment all use the same or very similar processes. In March 2019, CNCC established an military-civil fusion fund dedicated to dual-use nuclear technology research and design. Two CNCC subsidiaries have been added to the US Government's Entity List, restricting exports to them on national security grounds. CNCC has cooperated with U.S. Westinghouse Electric to construct AP1000 nuclear power plants. The company also has a significant overseas presence, signing agreements for joint research with U.S., French, Canadian, U.K., Russian and Argentinian companies.

China North Industries Group (中国北方工业集团公司)

Norinco Group was established in 1999 as a state-owned defence conglomerate devoted to the development and production of armaments for Chinese and foreign defence customers. Its main defence products include artillery and tear gas, air defence and anti-missile systems, anti-tank missiles and precision-guided munitions as well as armoured vehicles such as main battle tanks and infantry combat vehicles. Bloomberg reports that Norinco Group's civilian products include various engineering services and heavy-duty construction equipment. Norinco Group employs over 210,000 personnel, has revenues exceeding US\$68.8 billion and is listed on the Fortune 500. Norinco Group has hundreds of subsidiaries and subordinate research institutes in China and around the world that have been catalogued by the International Peace Information Service and Omega Research Foundation in their working paper on the company and on Norinco Group's website. Norinco Group's Institute of Computer Application Technology (中国北方工业集团公司计算机应用技术研究所) was one of the first adopters of internet technology and remains a leading company for research into network security. The institute hosts four internet research centres and is reported to work with the National Administration for State Secrets Protection (国家保密局) on the Information Security and Testing and Evaluation Centre (中国北方工业集团公司信息安全与测试评估中心).

China Shipbuilding Industry Corporation (中国船舶工业集团有限公司)

CSIC was established as one of China's primary state-owned defence companies on 1 July 1999. CSIC is the PLA Navy's largest supplier of weapons platforms, accounting for nearly 80 per cent of all armaments. CSIC's signature products include conventional and nuclear submarines, warships and torpedoes, as well as the Liaoning aircraft carrier program. CSIC maintains a civilian shipbuilding program alongside its program of supplying the PLA Navy. CSIC's civilian work includes the production of oil and chemical tankers, container ships, bulk carriers and engineering ships. On 2 July 2019, it was announced that CSIC and the China State Shipbuilding Corporation would merge. According to Janes Defence Weekly, 'the two groups, which have combined assets of about USD120 billion and employ 240,000 people, dominate naval shipbuilding in China and between them operate 160 subsidiaries.' Nikkei has listed some of CSIC's main subsidiaries here.

China South Industries Group (中国南方工业集团有限公司)

CSGC is a leading producer of armaments for the People's Liberation Army. It was founded in 1999 and works on technologies such as advanced munitions, mobile assault weapons, lights armaments, information optoelectronics and counter-terrorism equipment. CSGC also maintains civilian product lines focused on the oil and energy sector, but most of the company's attention goes to developing armaments. The company employs nearly 200,000 personnel, its revenue approaches USD34 billion (AUD50 billion) and it is listed as a Fortune 500 company. CSGC holds a controlling share in more than 60 subsidiaries. 32 of these are listed on the company's website.

Chinese Academy of Engineering Physics (中国工程物理研究院)

CAEP was founded in 1958 and now has over 24,000 employees. It is headquartered in Mianyang, Sichuan Province, but also has facilities in Chengdu and Beijing. Notably, Mianyang is home to a military-civil fusion (MCF) demonstration base—the Sichuan Mianyang High-Technology City. Sichuan Military District Commander Jiang Yongshen (江永申) in 2016 stressed the important role that Mianyang plays in China’s larger science and technology development and the significance of its military-civil fusion (MCF) demonstration base. The academy is best known for nuclear weapons, but also carries out research on directed-energy weapons. CAEP’s four main tasks are to develop nuclear weapons, research microwaves and lasers for nuclear fusion ignition and directed-energy weapons, study technologies related to conventional weapons, and deepen military-civil fusion. It claims that its research covers 260 specialising, primarily in the broad areas of physics and mathematics, mechanics and engineering, materials and chemistry, electronics and information, and optics and electrical engineering. CAEP hosts part of the Tianhe-2 supercomputer, one of the worlds fastest supercomputers. Despite the sensitivity of its work, CAEP has expanded its international presence in recent years. It claims to send hundreds of scientists overseas to study or work as visiting scholars. CAEP has also used Chinese government talent recruitment schemes such as the Thousand Talents Plan to recruit dozens of scientists from abroad. By 2015, CAEP had recruited 57 scholars through the Thousand Talents Plan, making it one of the largest recruiters of Thousand Talents Plan scholars. CAEP maintains strong collaborative relationships with Chinese civilian universities. It runs a joint laboratory with the University of Electronic Science and Technology of China and collaborates with universities and research institutions including the Chinese Academy of Sciences, the University of Science and Technology of China, Shandong University, Southwest University of Science and Technology, Sichuan University, Jilin University, Peking University and Tsinghua University. CAEP sponsors postgraduate students in many of these institutions who are required to work there for five years after graduating.

Chongqing University (重庆大学)

CQU is a leading Chinese research institution subordinate to the Ministry of Education. Chongqing University is home to at least two laboratories devoted to defence research on nanotechnology and control systems. An institution accredited to conduct classified research, Chongqing University is active in improving its security culture with respect to the safeguarding of official secrets. In December 2016, the Ministry of Education entered an agreement with defence industry agency SASTIND to advance military-civil fusion at Chongqing University. Following this agreement, Chongqing University established the defence-focused Ministry of Education Key Laboratory for Complex Systems Safety and Autonomous Control, which works on control systems engineering in May 2018.

Chongqing University of Technology (重庆理工大学)

CQUT is a member of the B8 Cooperation Innovation Alliance (B8联盟 or 八八联盟), a group of eight Chinese research institutions that specialize in armament science—the ‘B’ in ‘B8’ stands for the Chinese word for armaments, bingqi (兵器). However its involvement in defence research does not appear as expansive as the other B8 members and it is a relatively low-ranked university. In 2017, its president stated that ‘Chongqing is an important site for the weapons industry, but its military-industrial research and development ability has not yet upgraded.’ Unlike the other members of the B8, SASTIND does not appear to supervise the university. The university has links to Norinco Group and China South Industries Group, China’s largest weapons manufacturers, and was under the supervision of the conglomerates’ predecessor, China Ordnance Industry Corporation, until 1999. In 2017 and 2018, it signed a partnerships with four local defence companies to collaborate on research and training. In 2011, CQUT received secret-level security credentials, enabling it to participate in classified defence projects.

Commercial Aircraft Corporation of China

(中国商用飞机有限责任公司)

COMAC was established in 2008 as a state-owned manufacturer of large commercial aircraft. The company oversees eleven subsidiaries that focus on various aspects of aircraft production. A list of COMAC's subordinate companies can be found in English on the company's website. Despite its focus on commercial aircraft, China's Ministry of Industry and Information Technology has referred to it as a defence industry conglomerate. The company maintains strong links to China's defence industry and some of its leadership is drawn from former executives at state-owned military aircraft and missile manufacturers. China's leading producer of military aircraft, the Aviation Industry Corporation of China (AVIC), also holds a 10 per cent share in COMAC. COMAC supports the continued development of China's defence industry by awarding 'national defence technology scholarships' to Chinese university students. COMAC's signature passenger aircraft, the C919, offers an example of how the company could use its civilian aircraft production for military purposes. Numerous Chinese analysts have studied Boeing's conversion of the 737 into the P-8 Poseidon and E-7A surveillance aircraft and argue that the C919 could also be retrofitted for early warning as well as anti-surface and anti-submarine warfare missions. With a greater flight range than China's other military aircraft, a retrofitted C919 for maritime surveillance operations could reduce China's dependence on artificial air bases in the South China Sea which currently render aircraft vulnerable to corrosion due to harsh weather conditions. Vice-Chairman of the Central Military Commission, Zhang Youxia, reportedly expressed an interest in learning from American companies in converting civilian aircraft into military aircraft while inspecting COMAC's C919.

Criminal Investigation Police University of China

(中国刑事警察学院)

CIPUS was founded in May 1948 and underwent several name changes, but was upgraded in 1981 to become the first police university offering a specialised undergraduate degree program. It runs a national engineering laboratory, two MPS key laboratories, and provincial key laboratories. It is focused on training in criminal investigation, criminology science and technology and criminal law. The university also has relationships with companies that provide the technological tools that contribute to the PRC's public security apparatus. For instance, it has a relationship with the company Haiyun Data on public security intelligence. Haiyun provides data visualization services for MPS bureaus across China.

Dalian Minzu University (大连民族大学)

DLMU was established in 1984 as an institution that researches China's ethnic minorities. The university is overseen by the State Ethnic Affairs Commission (SEAC), the Liaoning Provincial Government and the Dalian Municipal Government. Scientific disciplines taught by DLMU include communications and information engineering, machine engineering, civil engineering and environmental science. DLMU also researches political thought and minority groups of northeast China. DLMU currently hosts the Dalian Key Lab of Digital Technology for National Culture (大连国家文化数字技术重点实验室). Researchers at laboratory carry out research on facial recognition of ethnic minorities. The laboratory has collaborated with an academic from Curtin University on research related to the facial recognition of Tibetans, Koreans and Uyghurs—over one million of whom have disappeared into re-education camps. DLMU researchers are working on a database of facial and optical movements across different ethnic groups. DLMU also hosts the State Ethnic Affairs Commission Key Laboratory of Intelligent Perception and Advanced Control (国家民族事务委员会智能感知与先进控制重点实验室), housed within the university's College of Electromechanical Engineering (机电工程学院). The laboratory has done work on convolutional neural networks for visual image recognition, which could have applications for surveillance technology. DLMU's party committee has an active United Front Work Department. The department supervises non-CCP members and students returning from overseas study. Management of religious and ethnic minorities are likely to be other priorities for the department.

Dalian University of Technology (大连理工大学)

DLUT is directly under the administration of the Ministry of Education. In 2018, it came under the supervision of defence industry agency SASTIND as part of the government's efforts to deepen military-civil fusion in the university sector. In 2006, the university received secret-level security credentials, allowing it to participate in classified defence technology projects. Since then, it has expanded cooperation with the PLA Navy and joined several military-civil fusion innovation alliances. In 2015, the university established a defence laboratory in the School of Mechanical Engineering. The laboratory was proposed by a professor within the University's Institute of Science and Technology. The Institute of Science and Technology is primarily responsible for high-tech project management, where they manage projects for the 973 Program, the National Natural Science Foundation, and the Ministry of Education.

Hangzhou Dianzi University (杭州电子科技大学)

HDU specialises in information technology and has been jointly supervised by the Zhejiang Provincial Government and defence industry agency SASTIND since 2007. The university is Zhejiang Province's only provincial-level higher education institution to have officially designated national defence disciplines. HDU's leadership is closely integrated with its defence research. Since its creation in 2008, the university's main defence laboratory has been run by Xue Anke, who was the university's president until 2017. While president, Xue served on an expert advisory committee to the PLA on information technology. He is also a member of the Zhejiang Provincial Expert Committee on Artificial Intelligence Development. Key areas of defence research at HDU include electronics, artificial intelligence, military-use software, and communications and information systems. HDU has been expanding its research on artificial intelligence, establishing a school of artificial intelligence and an artificial intelligence research institute in 2018. HDU holds secret-level security credentials, allowing it to undertake classified weapons and defence technology projects. In 2011, the Zhejiang State Secrets Bureau established a State Secrets Academy in HDU. The academy, one of twelve in the country, trains personnel in managing and protecting confidential information.

Hangzhou Normal University (杭州师范大学)

Hangzhou Normal University is a Chinese university subordinate to the Zhejiang Provincial Government. The university was initially established in 1978 as Hangzhou Normal College (杭州师范学院) to focus on teacher training, art education as well as research in the humanities and natural sciences. Hangzhou Normal University retains this broad academic focus and oversees faculties such as the Alibaba Business School (阿里巴巴商学院). Hangzhou Normal University collaborates with China's MPS on the development of surveillance technology. In March 2019, the university entered into an agreement with the Zhejiang Police College, the Zhejiang Public Security Office, and Hikvision—China's leading producer of video surveillance technology—to establish a joint laboratory. The joint laboratory reportedly focuses on applying big data analysis, cloud computing and internet of things technology to improve China's policing capability.

Harbin Engineering University (哈尔滨工程大学)

HEU is one of China's top defence research universities. The university is a leading centre of

research and training on shipbuilding, naval armaments, maritime technology and nuclear power. 36.46% of the university's 2017 graduates who found employment were working in the defence sector. As one of the group of universities subordinate to the Ministry of Industry and Information Technology (MIIT) known as the 'Seven Sons of National Defence' (七子), HEU is an integral part of China's defence industry. HEU's achievements include producing China's first experimental submarine, ship-based computer, and hovercraft. The university claims to have participated in most of the PLA Navy's submarine, undersea weapon, and warship projects. HIT's role in the defence industry is highlighted by its formal affiliation with the PLA Navy, which became a supervising agency of the university in 2007. Under the supervisory agreement, the PLA Navy committed to developing HEU's capacity as a platform for research and development in military technology and for training defence personnel. The following year, HEU established a Defence Education Institute to train reserve officers. Since then, the institute has trained at least 1,700 officers. HEU also maintains a joint laboratory with the PLA Navy Coatings Analysis and Detection Center. HEU is an important hub research on nuclear engineering, including on nuclear submarines. In 2018, it signed a co-construction agreement with defence conglomerate China National Nuclear Corporation (CNNC). In 2019, HEU and CNNC established the China Nuclear Industry Safety and Simulation Technology Research Institute. HEU also runs a joint laboratory on energetic materials (such as explosives) with the Chinese Academy of Engineering Physics, China's nuclear warhead research organisation.

Harbin Institute of Technology (哈尔滨工业大学)

HIT is one of China's top defence research universities. As one of seven universities run by MIIT, it is known as one of the 'Seven Sons of National Defence' (七子). The Seven Sons of National Defence all have close relationships with the Chinese military and are core training and research facilities for China's defence industry. In 2018, HIT spent RMB1.97 billion (AUD400 million)—more than half of its research budget—on defence research. 29.96% of the university's graduates that year who found employment were working in the defence sector. HIT has been described by Chinese state media as having 'defence technology innovation and weapons and armaments modernisation as its core'. It excels in satellite technology, robotics, advanced materials and manufacturing technology, and information technology. Other areas of defence research at HIT include nuclear technology, nuclear combustion, nuclear power engineering and electronic propulsion and thruster technology, many of which are officially designated as skill shortage areas for the Chinese defence industry. HIT is best known for its aerospace research and has a close relationship with China Aerospace Science and Technology Corporation (CASC), a state-owned defence company that specialises in long-range ballistic missile and satellite technology. Since 2008, HIT and CASC have operated a joint research centre. Defence conglomerates CASC, CASIC, AVIC and CETC rank among the top employers of HIT graduates. The university is a major source of cyber talent and receives funding for information security research from the MSS, China's civilian intelligence agency. A report prepared for the US–China Security and Economic Review Commission identified it as one of four universities focused on research with applications in information warfare. In 2003, HIT founded its Information

Countermeasures Technology Research Institute (哈尔滨工业大学).

Hebei University (河北大学)

Hebei University is Hebei Province's only comprehensive university. The university subordinate to the Ministry of Education and also supervised by the Hebei Provincial Government and defence industry agency SASTIND. Its supervision by SASTIND, which began in 2013, is designed to support the university in 'strengthening its national defence characteristics'. HBU appears to be relatively secretive about its defence research. In 2017, SASTIND designated an area of research at the university's College of Physics Science and Technology as a 'discipline with defence characteristics'. An article about this on the university's news site has been taken down and deliberately did not specify the discipline. However, a speech given by the head of the college named military-use power and energy as HBU's only defence discipline. The university holds secret-level security credentials, allowing it to participate in classified defence technology projects. In 2017, HBU held a forum on military-civil fusion for technology and innovation to 'uncover the university's potential for defence-industry technological research' and encourage greater integration with defence companies.

Hebei University of Science and Technology (河北省科技大学)

HEBUST engages in moderate but growing levels of defence research. It has been supervised by defence industry agency SASTIND since 2013, when SASTIND and the Hebei Provincial Government agreed to jointly develop the university's involvement in defence research. By 2017, the university claimed to have completed 300 defence projects. The university holds secret-level security credentials, allowing it to participate in classified defence technology projects. While the university does not appear to have any dedicated defence laboratories, it has described five of its laboratories as platforms for defence research. Areas of materials science, mechanical engineering and control science at HEBUST have been designated 'disciplines with national defence characteristics' by SASTIND. HEBUST may also be pursuing greater integration between China's defence needs and the university's research on textiles engineering and biological fermentation. HEBUST states that it has developed close cooperation with China Electronics Technology Group Corporation's 54th Research Institute, an organization blacklisted by the US Government Entity List. Defence industry conglomerate Aviation Industry Corporation of China also funds research at the university.

Hefei University of Technology (合肥工业大学)

HFUT a leading Chinese university subordinate to the Ministry of Education. It specialises in engineering and engages in growing levels of defence research, particularly in the fields of advanced materials, smart manufacturing and electronic information. As of 2018, HFUT was the only civilian university in Anhui Province fully certified to carry out military projects, holding secret-level security credentials, and had undertaken over 200 such projects. In 2018, the university came under a 'joint-construction' agreement between the Ministry of Education and defence industry agency SASTIND. According to HFUT, this agreement 'will powerfully advance the university's development of national defence disciplines, training of talent for defence industry, and construction of defence industry and national defence research platforms.' Miao Wei, head of the Ministry of Industry and Information Technology, which oversees China's defence industry, is a graduate of HFUT.

Heilongjiang Institute of Technology (黑龙江科技学院)

HLJIT is an engineering-focused university that engages in growing levels of defence research. In 2015, the Heilongjiang Provincial Government partnered with defence industry agency SASTIND to expand the university's ability to 'show its national defence characteristics and serve the national defence science and technology industry.' SASTIND has designated military-use power and energy, optoelectronics and laser technology, and computing as three 'disciplines with national defence characteristics' at HLJIT. In June 2016, HLJIT and ZTE jointly launched an MOE-ZTE ICT Product-Teaching Integration Innovation Base (教育部-中兴ICT产教融合创新基地) and established the Heilongjiang School of Engineering-ZTE Information and Communications Technology College (黑龙江工程-ZTE信息与通信技术学院). ZTE has been reportedly barred from US government contracts. As it increases its implementation of military-civil fusion, HLJIT has developed relationships with defence conglomerates. The university is particularly close to China Aerospace Science and Technology Corporation (CASC), a leading state-owned manufacturer of long-range missiles and satellites. In 2017, HLJIT partnered with a subsidiary of CASC to establish a joint research centre, the Aerospace Smart City Research Institute. The subsidiary, Aerospace Shenzhou Smart System Technology Co., Ltd. (神州智能系统技术有限公司), specialises in smart city and informatization technology. HLJIT holds confidential-level security credentials, allowing it to participate in confidential defence technology projects.

Henan University of Science and Technology (河南科技大学)

HAUST is Henan province's leading civilian university for defence research. In 2008, it became the

first university in the province to receive security credentials allowing it to participate in classified weapons projects. In 2016, it became the province's only university subject to a 'joint-construction' agreement with defence industry agency SASTIND, an arrangement designed to increase HAUST's involvement in defence research. As early as 2009, the university stated that it had made great contributions to the defence and aviation industries, undertaking large amounts of defence research projects. HAUST describes itself as China's primary university for research and training for the mechanical bearings (such as ball bearings) industry. SASTIND has designated three areas of research at the university as 'disciplines with defence characteristics', covering systems engineering, materials science and mechanics. The university is actively involved in military-civil fusion activities. The university claims to have made important contributions to the development of bearings for aircraft engines, satellites, and spacecraft. It states that it has resolved critical technological problems for specific weapons guidance systems, ballistic missile testing systems and an infrared targeting and interference emulation system that are probably used to test guided missiles.

Huazhong University of Science and Technology (华中科技大学)

HUST is one of China's leading research institutions. While the university is subordinate to the Ministry of Education, it has also been supervised by the State Administration of Science, Technology and Industry for National Defense since 2012. The university hosts at least six laboratories dedicated to defence research. Its National Defence Research Institute reportedly oversees defence research in seven other HUST research centres. Artificial intelligence, shipbuilding, image processing, navigation technology, mechanical engineering, electronics, materials science and laser physics are focuses of HUST's defence research. HUST has worked closely with the PLA and China's defence industry. This collaboration includes the development artificial intelligence and imaging technology for weapons. The university's work on pulsed power is linked to China's nuclear and directed-energy weapons program. China's state-owned defence conglomerates and China's nuclear warhead facility sponsor dozens of HUST postgraduate students each year, who are required to work at their sponsoring organisation for at least five years after graduating. HUST holds secret-level security credentials, allowing it participate in research and production for classified weapons and defence projects.

Hunan University (湖南大学)

HNU is a leading Chinese university subordinate to the Ministry of Education. In recent years, its participation in defence research appears to have grown substantially. In 2010, it established the National Supercomputer Center in Changsha jointly with the PLA National University of Defense Technology, which has since been placed on the US Government Entity List for its suspected role in nuclear weapons research. In 2011, China's defence industry agency, SASTIND, entered a partnership with the MOE to expand the university's participation in defence research and defence industry ties. This arrangement was renewed in 2016. In 2013, SASTIND and the Hunan Provincial Government also signed an agreement to jointly support the development of the university's National Supercomputer Center. HNU holds secret-level security credentials, enabling it to participate in research and production for weapons and other defence projects.

Information Engineering University (信息工程大学)

IEU was formed in June 2017, combining the old Information Engineering University with the PLA Foreign Languages University. PLA experts have described IEU as 'the sole military academy for the cyber and electronic warfare arms of China's network-electronic forces'. The IEU is currently subordinate to the PLA Strategic Support Force's Network Systems Department, which holds the

military's signals intelligence capabilities. Previously, the university was run by the General Staff Department Third Department (commonly known as 3PLA), the PLA's signals intelligence service that has been incorporated into the Strategic Support Force. IEU's command tracks include Network Engineering (网络工程), which is dedicated to the cultivation of cyber attack and defense technical cadre (网络工程). It is responsible for the construction of the Henan Provincial Laboratory of Visible Light Communication (河南省可见光通信重点实验室). The university is primarily known for research and training on hacking, cryptography, signals processing, surveying and mapping, and navigation technology. However, since absorbing the PLA Foreign Languages University, it now serves as one of the most important language schools for Chinese military intelligence officers, describing itself as a 'whole-military foreign languages training base for individuals going abroad'. While the PLA Foreign Languages University is best known for training signals intelligence officers, it has also trained many officers in the PLA's political warfare wing, the Central Military Commission Political Work Department Liaison Bureau.

Jilin University (吉林大学)

JLU is directly under the administration of the Ministry of Education and came under the joint supervision of the ministry and defence industry agency SASTIND in 2016. In 2017, SASTIND designated eight fields of research at JLU as national defence disciplines, indicating the university carries out high levels of defence research. In 2012, JLU spent roughly RMB60 million (AUD12.5 million) on defence research, a number that is likely to have grown substantially. JLU's National Defense Science and Technology Research Institute, also known as the Advanced Technology Research Institute, was established in April 2006 and is responsible for the organization and management of the university's national defence science and technology projects. The research institute has received several certifications to conduct research for military applications. It conducts research in collaboration with the former PLA General Armaments Department, SASTIND, and state-owned defence conglomerates in the fields of aviation, aerospace, electronics, nuclear technology, and shipbuilding. JLU's State Key Laboratory of Superhard Materials (国家超硬材料实验室) works closely with China's nuclear weapons complex, the Chinese Academy of Engineering Physics (CAEP). Job advertisements for a CAEP subsidiary, the Center for High Pressure Science & Technology Advanced Research (国家超硬材料实验室) state that it has a branch within Jilin University. This suggests that CAEP may even be involved in managing the State Key Laboratory of Superhard Materials. The university hosts at least two defence research labs, located in the university's College of Computer Science and Technology and in the College of Chemistry. Its Key Laboratory of Attack and Defense Simulation Technology for Naval Warfare, Ministry of Education (国家超硬材料实验室) is involved in cybersecurity research for the Navy. The lab's academic committee is headed by a computer scientist from China Aerospace Science and Technology Corporation, a leading state-owned missile manufacturer. JLU holds secret-level security credentials, allowing it to participate in research and production for classified weapons and defence technology projects.

Logistics University of the People's Armed Police Force (中国人民武装警察部队后勤大学)

The Logistics University of the People's Armed Police Force is an institution devoted to training personnel in logistics for China's paramilitary service, the People's Armed Police. The university teaches subjects in applied economics, military logistics studies, paramilitary logistics, applied psychology, as well as communications and transportation engineering. The Logistics University of the People's Armed Police Force actively collaborates with private institutions and civilian universities on scientific research. For example, the university collaborated with Nankai University (南开大学) and the Tianjin Eminent Electric Cell Material Company (天津 eminent 电芯材料有限公司) on high performance lithium and sodium ion materials in 2018. The university also collaborated with the Tianjin Polytechnic University (天津理工大学) on intelligence, wearable technology that monitors heart rates for both military and civilian personnel.

Nanjing Tech University (南京理工大学)

In 2016, NJTech came under the joint supervision of the Jiangsu Provincial Government and defence industry agency SASTIND, which is an arrangement designed to develop the university's involvement in defense-related research and training. The university has four designated defence research areas and secret-level security credentials, allowing it to undertake classified defence technology projects. NJTech is expanding its defence research on materials science, chemistry, optical engineering and systems engineering. In 2018, the university established a Military-Civil Fusion Development Research Institute to deepen its implementation of military-civil fusion. NJTech has a Defence Industry Science Office (国防工业科学办公室) within its Department of Scientific Research. This office is responsible for the university's defence-related research and coordination. NJTech's School of Materials Science and Engineering (材料科学与工程学院) has previously worked on defence-related projects. The university has international ties with universities in England that focus on electronics and semiconductors. It has also established a joint research center with Russian universities for advanced technology R&D.

Nanjing University (南京大学)

NJU is subordinate to the MOE and has also been supervised by defence industry agency SASTIND

since 2012. In 2016, the university was selected as a participant in the first batch of national dual-use demonstration bases, and a year later in 2017 was selected as a Class A world-class university. NJU is home to at least two defence laboratories and has committed to deepening its involvement in military-civilian fusion. As the first university in China to establish a State Secrecy Academy, in 2009, Nanjing University is involved in cyber security research. In 2018, NJU established an Institute of Artificial Intelligence and reported its research progress to the Jiangsu Provincial Committee of Military-Civilian Fusion when they visited the university. Following the visit, the provincial committee expressed interest in deepening cooperation on MCF projects in order to promote Jiangsu's MCF work. The Institute of AI also co-built a research center with Intel, the Intel-Nanjing University Artificial Intelligence Research Center, which is Intel's first research center focusing on AI in China. The university's rapidly developing AI Institute provides an opportunity for deepening its involvement in MCF R&D. In May 2018, NJU signed a strategic cooperation agreement with Megvii 旷视. Megvii has been blacklisted by the US government over human rights abuses.

Nanjing University of Aeronautics and Astronautics (南京航空航天大学)

NUAA is one of the 'Seven Sons of National Defence' subordinate to the Ministry of Industry and Information Technology. NUAA specialises in aerospace research and works closely with the Chinese military as well as civilian and military aviation companies, including military aircraft manufacturers AVIC and AECC. 21% of the university's graduates in 2018 who found employment were working in the defence sector. The university claims to have participated in nearly all major national aviation projects, including the development of the Chang'e 3 unmanned lunar explorer. NUAA hosts China's only national defence laboratory for helicopter technology. NUAA has attracted controversy for its alleged involvement in the Ministry of State Security's efforts to steal US aviation technology.

Nanjing University of Science and Technology (南京理工大学)

NJUST is one of the ‘Seven Sons of National Defence’ administered by the Ministry of Industry and Information Technology. Together with Beijing Institute of Technology, it was ranked as China’s top university for armaments science in 2017. Roughly 16% of the university’s graduates in 2018 who found employment were working in the defence sector. NJUST is a member of the B8 Cooperation Innovation Alliance (B8 联盟 or 八八联盟), a group of eight Chinese research institutions specialising in weapons science—the ‘B’ in ‘B8’ stands for Chinese word for armaments, bingqi (兵). Indicative of the university’s high level of involvement in defence research, in 2013 a disused laboratory on its campus exploded, killing one, after workers disturbed a cache of explosives. NJUST has a collaborative relationship with a PLA signals intelligence research institute, involving cooperation on unmanned combat platforms and information security.

National Defense University (国防大学)

NDU is the PLA’s ‘premier’ institution for training in military theory, strategy, operations and political work, which can have its history traced back to the era of Mao Zedong’s peasant-led red army in 1927. The university is devoted to training the PLA’s officer corps in preparation for senior leadership positions. Given this focus on the softer skills of PLA administration, the National Defense University does not have as strong a focus on hard science as its counterpart, the National University of Defense Technology.

The tag is: *misp-galaxy:china-defence-universities="National Defense University (国防大学)"*

Table 664. Table References

| |
|---|
| Links |
| https://unitracker.aspi.org.au/universities/national-defense-university |

National University of Defense Technology

(国防科技大学)

In 2017, NUDT was reformed and placed in charge of the Institute of International Relations in Nanjing, the National Defense Information Institute in Wuhan, the Xi'an Communications College, the Electrical Engineering Institute in Hefei, and the College of Meteorology and Oceanography in Nanjing. The Institute of International Relations in Nanjing is a key training centre for intelligence officers. NUDT is known for its research on supercomputers, autonomous vehicles, hypersonic missiles and China's Beidou Navigation Satellite System. The university developed the Tianhe-2A supercomputer at the National Supercomputing Center in Guangzhou, the world's fastest supercomputer from 2013 to 2016. NUDT's Tianhe-1A supercomputer is based at Hunan University's National Supercomputing Center Changsha (国防科技大学长沙). For over a decade, NUDT has aggressively leveraged overseas expertise and resources to build its capabilities. The Australian Strategic Policy Institute's International Cyber Policy Centre's October 2018 report 'Picking flowers, making honey: The Chinese military's collaboration with foreign universities' documented and analysed NUDT's overseas presence. The report found that by 2013 the university had sent over 1,600 of its professors and students to study and work abroad. Universities in the United States, the United Kingdom, Australia, Canada, Singapore, the Netherlands and Germany engage in some of the highest levels of collaboration with NUDT. Some of NUDT's leading experts on drone swarms, hypersonic missiles, supercomputers, radars, navigation and quantum physics have been sent to study or work abroad. Defected Chinese spy Wang Liqiang claimed in 2019 that NUDT's 'Intelligence Center' sent him fake passports for his mission to interfere in Taiwanese politics. This indicates that the university plays an important role in supporting China's overseas intelligence activity. NUDT also works with foreign technology companies. Google and Microsoft have both worked with and trained NUDT scientists.

Naval Command College (海军指挥学院)

The Naval Command College is an institution that provides education and training for naval officers in a variety of disciplines such as military thought, strategic studies, intelligence training and political work along with military operations, tactics and campaigns. The college plays a crucial role in improving the quality of PLA Navy personnel, as well as providing combined arms training for mid-career political commissars, logistics officers and equipment officers. The college serves to improve strategic and tactical thinking in the PLA Navy by hosting the Naval Campaigns and Tactics Center Laboratory (海军战役战术中心实验室) and producing research that looks at operationalising new training and command systems. It is the PLA-N's last remaining command academic institution.

<https://unitracker.aspi.org.au/universities/naval-petty-officer-academy>

Naval Research Academy (海军研究院)

The Naval Research Academy was established in July 2017 following Xi Jinping's military reforms. Main areas of study include military theory and technological research as well as the maritime environment and national defence engineering. The Naval Research Academy actively collaborates with civilian universities as part of China's military-civil fusion program. In April 2019, delegates from the Naval Research Academy attended a meeting with officials from Xi'an Jiaotong University on co-operation directed at improving the quality assurance and technological reliability of complex armaments currently in service in the PLA Navy. Major General Li Wei from the Naval Research Academy stated that his colleagues were paying 'very close attention to this co-operation with Xi'an Jiaotong University' in the development and sustainment of naval equipment. The Naval Research Academy also collaborates with civilian research institutes. For example, the Institute for Industrial Military-Civil Fusion at the Research Institute of Machinery Industry Economic and Management claims to have worked with the Naval Research Academy and a number of state-owned enterprises that focus on defence technology such as China Shipbuilding Industry Corporation (CSIC) in order to develop strategies for military-civil fusion. The Naval Research Academy's involvement in military-civil fusion is particularly notable for work on maritime information technology and equipment. In January 2019, delegates from the Naval Research Academy attended a conference hosted by the National Key Laboratory of Underwater Acoustic Science and Technology (海军装备研究院) and the Key Laboratory of Marine Information Acquisition and Security Industry and Information Technology (海军装备研究院) of Harbin Engineering University (HEU). The Naval Research Academy's Liu Qingyu (刘庆宇) was reported to have made a presentation on international and domestic developments in marine sonar technology at the conference. Liu Qingyu from the Naval Research Academy has a particularly strong record of engagement with civilian and military institutions for his research into marine sonar technology. In 2018, Liu delivered a presentation to the Northwestern Polytechnical University (NPU) which 'elaborated on some of the problems facing the national coastal defence industry' and 'suggested areas for future research into marine acoustics.' Both students and academics from NPU attended Liu's presentation. Liu has also published papers on acoustic science with scholars from the Chinese Academy of Sciences, the Naval University of Engineering, and Northwestern Polytechnical University.

Naval University of Engineering (海军工程大学)

NUE is one of the PLA's five comprehensive universities, which trains students in a variety of engineering and core military disciplines related to naval warfare. The university is home to two national laboratories. The National Key Laboratory for Vessel Integrated Power System Technology (海军工程大学), which was established in 2010 to carry out 'indigenous research and development' into integrated electric propulsion (IEP) systems that power naval vessels at sea. IEP generally uses diesel generators and/or gas turbines to generate the electricity needed in order to turn propellers on large surface vessels such as guided missile destroyers or amphibious assault ships. The lab is jointly run by NUE and China Shipbuilding Industry Corporation's (CSIC) 712th Research Institute. Rear Admiral Ma Weiming has led the National Key Laboratory for Vessel Integrated Power System Technology to develop propulsion systems for aircraft catapults, electromagnetic weapons and satellite launches. Admiral Ma has been referred to as 'the father of China's electromagnetic catapult system' (电磁弹射之父) by official Chinese media sources. NUE's National Defense Technology Key Laboratory of Marine Vibration and Noise (海军工程大学) works on acoustic quieting technology for submarines. The lab is probably jointly run with CSIC's 701st Research Institute, also known as China Ship Development and Design Center (中国船舶集团有限公司). Another laboratory that conducts defence research at NUE is the Nuclear Marine Propulsion Engineering Military Key Laboratory (海军工程大学). The lab focuses on researching and training engineers in nuclear engineering for warships and submarines. Academic departments at the Naval University of Engineering include:

Navy Submarine Academy (中国海军潜艇学院)

The Navy Submarine Academy is responsible for the training of submariners to crew its conventionally and nuclear-powered submarines. The academy focuses its research on subjects such as electrical and information engineering, combat simulation, underwater acoustic engineering and navigation technology along with weapons systems and launch engineering and underwater ordnance technology. The academy also offers programs in combat tactics and the underwater combat environment. The Navy Submarine Academy pursues research that may contribute to Chinese anti-submarine warfare capabilities through the Underwater Operational Environment Military Key Laboratory (中国海军潜艇学院). The academy also oversees part of the publication record of researchers from the Navy Submarine Academy also suggests a strong interest in foreign developments in undersea warfare systems. In 2018, the Navy Submarine Academy signed a cooperative agreement with Harbin Engineering University (HEU). The agreement is directed at promoting research collaboration in subjects such as big data fusion, intelligent navigation, underwater acoustic target recognition, and underwater unmanned

intelligent control systems.

North China Institute of Aerospace Engineering (北航航天工程研究所)

NCIAE specialises aerospace technology and engineering. The university is primarily run by the Hebei Provincial Government, together with the State Administration of Science, Technology and Industry for National Defense, China Aerospace Science and Technology Corporation (CASC), and China Aerospace Science and Industry Corporation (CASIC). NCIAE appears to be a major training center for CASC and CASIC, state-owned defence conglomerates that dominate China's missile and satellite sector. NCIAE runs at least two research and development centres with CASC and was involved in the development of the Shenzhou spacecraft, Long March rockets and the DFH-5 satellite platform. In 2003, the Hebei Provincial Government, CASC and CASIC signed an agreement to jointly support NCIAE (pictured below, courtesy of NCIAE).

North University of China (北航)

NUC is a civilian university that specialises in defence research. It is jointly administered by the Shanxi Provincial Government and defence industry agency SASTIND. The university traces its roots back to an ordnance school established by the Eighth Route Army in 1941, and defence research is central to its identity. According to NUC's website, 'Our university has long established excellent and cooperative relationships with Central Military Commission departments, SASTIND, Norinco Group, China South Industries Group, China Aerospace Science and Technology Group, China Aerospace Science and Industry Group, and our graduates are spread across different areas in defence industry.' Approximately 2000 of its graduates enter the defence industry each year. NUC specialises in testing and developing weapons, including tanks, missiles and explosives. Its Underground Target Damage Technology National Defense Key Subject Laboratory reportedly runs the only underground shooting range in a Chinese university. The university is a member of the B8 Cooperation Innovation Alliance (B8联盟 or 北航联盟), a group of eight Chinese research institutions that specialize in armament science—the 'B' in 'B8' stands for Chinese work for armaments, bingqi (兵器).

Northeastern University (北航)

NEU is a major civilian university subordinate to the Ministry of Education. The university hosts three national laboratories, all of which are related to industrial manufacturing technology. NEU engages in growing levels of defence research. It holds secret-level security credentials allowing it to participate in classified weapons projects and hosts the defence-focused Key Laboratory of Aerodynamic Equipment Vibration and Control. In 2018, NEU was approved to build a further five laboratories that could be involved in future defence or security-related research. In 2019, NEU joined the Shenyang Aircraft Design Institute Collaborative Innovation Alliance (沈阳飞机设计研究所合作创新联盟), a group of universities and institutes, led by defence conglomerate AVIC, that are involved in the development of military aircraft. NEU also runs a National Defense Science and Technology Development Research Institute (国防科技开发研究院). In 2019, the institute's senior deputy director was awarded a China Industry-University-Research Cooperation Military-Civil Fusion Prize.

Northwest Institute of Nuclear Technology (西北核技术研究所)

NINT is one of China's main sites of nuclear technology research. While the Chinese Academy of

Engineering Physics is believed to be China's only manufacturer of nuclear warheads, NINT likely plays a supporting role in research for nuclear weapons. It is especially active in research on lasers, which can be used in nuclear fusion reactors or weapons. Aside from nuclear technology, NINT carries out research on topics including electronics, information science, materials science, control science and chemistry. NINT has partnerships with several institutes in the Chinese Academy of Sciences, Xiangtan University, Northwestern Polytechnical University, and Xi'an Jiaotong University.

Northwestern Polytechnical University (西北工业大学)

The university is one of the 'Seven Sons of National Defence' subordinate to MIIT. It is heavily engaged in military research, describing itself as 'devoted to improving and serving the national defence science and technology industry.' NWPU's research focuses on aviation, space and naval technology. Between 2014 and 2018, the university's School of Mechanics, Civil Engineering and Architecture alone spent nearly RMB200 million (AUD40 million) on defence research projects. 41.25% of 2017 NWPU graduates who gained employment were working in the defence sector. NWPU is known for its development of unmanned aerial vehicles (UAVs). The only Chinese university hosting a UAV defence laboratory, NWPU produces the ASN series of UAVs through its subsidiary company, Aisheng Technology Group Co., Ltd. The Chinese military is the company's largest customer and the company once claimed to produce 90% of China's drones. The university has close ties to state-owned shipbuilding and aerospace conglomerates.

Officers College of the PAP (中国人民武装警察部队警官学校)

The Officers College of the PAP was established as an institution devoted to training officers of China's paramilitary service in command and engineering disciplines. The college's research focusses on combat command, command information systems engineering, philosophy, law, political education, Chinese language and literature, history, mathematics, physics, applied psychology, electrical science and technology, computer science and technology, and management science and engineering. The Officers College of the PAP is especially active in developing drone technology. On 26 June 2019, the college tested its X-Swift unmanned aerial vehicles (UAV) for a test surveillance and reconnaissance flight with special operations personnel in Sichuan. The college is also active in developing applications for drone technology. Researchers from the college have collaborated with personnel from the PLA Logistics Engineering University to publish an article in

favour of deploying UAVs to southern Xinjiang for counter-terrorism missions. The researchers argue for UAVs to be deployed for regional surveillance and strike as well as search and seizure missions in Xinjiang, drawing off lessons from the US coalition against ISIS.

Peking University (北京大学)

PKU is considered among China’s most prestigious universities with a storied history. It is ranked as one of China’s top two academic institutions, along with Tsinghua University. Unsurprisingly, the university has been included in a number of the PRC’s educational initiatives, including as a Class A institution under the Double First-Class University program. PKU has been subject to at least two joint-supervision agreements between the Ministry of Education and defence industry agency SASTIND. These agreements, signed in 2012 and 2016, are designed to deepen the university’s involvement in defence research. PKU’s Advanced Technology Institute was founded in 2006 to oversee and develop the university’s defence research. Includes several research centres and supervises the university’s four major defence laboratories. The institute’s research covers semiconductors, nuclear technology, quantum physics, advanced materials, underwater acoustics, satellite navigation and communications, flight propulsion, aerospace engineering and microprocessors. In 2017, PKU and the Chinese Academy of Engineering Physics (CAEP)—China’s nuclear weapons program—established the PKU–CAEP New Structure Center for Applied Physics and Technology (中国科学院-北京大学应用物理与技术研究中心).. The institution was founded on the basis of the PKU Center for Applied Physics and Technology (中国科学院应用物理与技术研究中心) established with CAEP in 2007. The joint centre carries out research on materials, lasers for atomic physics applications, laser plasma physics, computer science and fluid dynamics. PKU’s report on the centre notes that it will serve China’s national defence needs and that CAEP’s deputy director emphasised it should ‘take the path of military-civil fusion’. The joint centre’s honorary director and founding director, He Xiantu, is credited as the developer of China’s first neutron bomb. PKU takes precautions for the protection of classified information. The university has an office devoted to the secure handling of

classified information, hosting regular meetings and training sessions to strengthen the university's security culture. In 2006, the university received security credentials for participation in classified defence research.

People's Armed Police Command College

(中国人民武装警察部队学院)

The PAP Command College is an institution devoted to training officers in China's paramilitary service, the People's Armed Police, that was established in 1984. The college's key subjects focus on law, engineering, military studies and management studies, but most attention is devoted to paramilitary training and political work. The PAP Command College maintains a focus on paramilitary training, but it does retain a scientific research program. Drone technology is another area of interest for the PAP Command College. The college was involved in testing the X-Swift unmanned aerial vehicle (UAV) in June 2019. Kang Jian from the college's Scientific Research Department also attended the 2017 Drone World Congress hosted in Shenzhen.

People's Public Security University of China

(中国人民公安大学)

PPSUC was founded in July 1948. In 1984, it was developed into a full-time higher education institution with master's and bachelor's degree programs. In 1998, it was merged with the Chinese People's Police University (中国人民警察大学). Its schools include a Marxism School, Law School, Law and Order School, Investigation and Anti-Terrorism School, Criminology School, Public Security Management School, International Policing and Law Enforcement School, Police Training College (which covers combat training and command and tactical training), Criminal Science and Technology School, Information Technology and Network Security School, and a Traffic Management School. PPSUC is involved in the development of technological tools for public security applications, including image recognition. For instance, the university signed an agreement with Chinese video surveillance equipment manufacturer Hikvision in 2016 to set up a joint laboratory on video image recognition technology. In 2018, it signed a strategic cooperation agreement with Xiamen Meiya Pico Information Co., a Chinese company that provides digital forensics and information security products, which included upgrading a forensics laboratory and establishing a

cyber security attack and defence laboratory. The university also has cooperation agreements with numerous local government-level public security bureaus across the PRC. These include agreements on image recognition technology for local public security bureaus and joint laboratories. For instance, in 2018 alongside the Nanshan sub-bureau of Shenzhen Public Security Bureau and the artificial intelligence companies SenseTime and Shenzhen Yuantian Lifei, it signed a strategic cooperation agreement on applying video recognition and the establishment of a joint laboratory.

Rocket Force Command College (火箭军指挥学院)

The Rocket Force Command College is the PLA's premier institute devoted to training cadets and early-to-mid career officers in conventional and nuclear missile campaigns. Candidates require understanding of battlefield command, management and campaign tactics prior to entry into the college. The college then builds on this knowledge by providing specialist training for missile campaigns.

Rocket Force Research Institute (火箭军研究院)

The Rocket Force Research Institute develops nuclear and conventional ballistic missiles, carrying out research on warhead, guidance and control technology. It appears to be the successor to the PLA Second Artillery Equipment Academy (第二炮兵装备学院) and the Rocket Force Equipment Academy (火箭军装备学院). The institute reportedly hosts two national-level defence laboratories. It also has a strategic cooperation agreement with Beijing Institute of Technology, which hosts two state key laboratories that study impacts and explosions.

Rocket Force Sergeant School (火箭军士官学校)

The Rocket Force Officer College is an institution devoted to training military personnel for China's tactical and strategic missile forces that was established after Xi Jinping's military reforms in 2017. The college's focus is on providing technical training to personnel in the PLARF's missile systems. However, the college has also produced research on underground engineering which would be useful to hardening bases for missile strikes.

Rocket Force University of Engineering

(火箭工程大学)

RFUE is the PLA strategic missile force's leading institution for training technical and scientific talent. Students entering the university tend to be university graduates and career members of the PLA Rocket Force. Defence research conducted by the RFUE focuses on building resilience and capabilities for conventional and nuclear missile strikes. RFUE hosts the Missile Testing and Control Virtual Simulation Experimental Teaching Center (虚拟仿真实验教学中心). The university's key areas of research include:

Shandong University (山东大学)

SDU is subordinate to the Ministry of Education. Since 2016, it has also been supervised by defence industry agency SASTIND as part of a program to expand universities' involvement in defence research and training. SDU has pursued greater involvement in defence research since at least 2006, when it established a national defence research institute to coordinate relevant work across the university. Shortly afterwards, it received secret-level security credentials allowing it to participate and research and production for classified weapons and defence technology projects. In 2008, it was recognised as one of Shandong Province's 10 outstanding defence industry units. SDU collaborates with the Chinese Academy of Engineering Physics, China's nuclear warheads development facility, on topics including the development of crystals that are used in the study of nuclear explosions and research on fusion ignition.

Shandong University of Technology (山东理工大学)

SDUT specialises in engineering and carries out growing levels of defence research. In 2018, SDUT became the only university in Shandong Province jointly supervised by defence industry agency SASTIND besides Shandong University. This indicates that SDUT's involvement in defence research and links to the defence industry will grow in coming years. SASTIND has specifically indicated its intention to build up advanced materials and advanced manufacturing technology as areas of defence research at SDUT. SDUT has carried out research on mechatronic engineering for the defence industry, and developed a non-destructive testing system for ceramic antenna covers on

missiles.

Shanghai Jiao Tong University (上海交通大学)

SJTU is directly under the administration of the MOE. In 2016 it also came under the supervision of defence industry agency SASTIND as part of a ‘joint construction’ agreement between the MOE and SASTIND. The university has at least three laboratories focused on defense research relating to materials science, ships and hydrodynamics. The defence labs have established substantial collaborative research and talent development relationships with hydrodynamics research groups at universities including MIT, Cornell, and the Danish Technical University. One of the university’s strongest departments is computer science. Its computer science program has garnered support from American tech companies such as Cisco Systems and Microsoft, which collaborated on establishing a laboratory for intelligent computing and intelligent systems at the university. In particular, the School of Information Security Engineering, has ties to the PLA through its dean and chief professor who both previously worked for the PLA. SJTU also has ties to the PLA Unit 61398, a cyber espionage unit that has been implicated in cyber attacks on the United States. SJTU is also known for its involvement in maritime research. The School of Naval Architecture, Ocean & Civil Engineering cooperates extensively with other universities from around the world as well as with many domestic industrial enterprises, such as defence conglomerate CSIC and CASC. The school is the lead unit of the High-tech Ship and Deep-Sea Development Equipment Collaborative Innovation Center (船舶深海高技术装备协同创新中心), where it has contributed to assisting the PLA Navy’s transition to offshore defense operations.

Shanghai University (上海大学)

SHU is engaged in growing levels of defence research. In 2016, the Shanghai Municipal Government and defence industry agency SASTIND agreed to jointly supervise and support its participation in defence research. Shanghai University has begun building up its capability in defence research in areas such as unmanned surface vehicles, materials for missiles, and microwave technology. It holds secret-level security credentials, allowing it to participate in classified defence technology projects. Shanghai University’s Research Institute of Unmanned Surface Vehicle Engineering researches and produces unmanned surface vessels, some of which are for the China Maritime Safety Administration.

Shenyang Aerospace University (沈阳航空航天大学)

SAU is the only university formally under the supervision of China's military aircraft manufacturer, AVIC. SAU engages in high levels of defence research and describes itself as a base for training talent in national defence science and technology. Serving China's military aviation industry is what SAU refers to as its 'glorious tradition'. Many of China's military aircraft are designed and built in Shenyang, which is home to AVIC subsidiaries Shenyang Aircraft Design Institute and Shenyang Aircraft Corporation. SAU and AVIC work closely together, including through a joint research institute.

Shenyang Ligong University (沈阳理工大学)

SYLU is a civilian university that specialises in defence research. The university's primary areas of defence research are armament science, information and communications engineering, control science, materials science and mechanical engineering. Apart from Xi'an Technological University, SYLU is the only Chinese civilian university supervised by state-owned arms manufacturers Norinco Group and China South Industries Group. In 2016, it also came under the supervision of defence industry agency SASTIND. SYLU is a member of the B8 Cooperation Innovation Alliance (B8联盟 or 八八联盟), a group of eight Chinese research institutions that specialize in armament science—the 'B' in 'B8' stands for the Chinese word for armaments, bingqi (兵器). The university runs a weapons museum on its campus. Furthermore, SYLU is a member of the Liaoning Military-Civil Fusion Arms Industry-College Alliance (辽宁省军民融合武器装备产业联盟) and SYLU's president doubles as chairman of the alliance. This indicates close ties between SYLU and China's arms industry.

Shijiazhuang Tiedao University (石家庄铁道大学)

STDU specializes in transportation science, engineering and information technology. Its predecessor was the PLA Railway Engineering College. Since 2013, STDU has also been supervised by defence industry agency SASTIND through an arrangement designed to expand the university's involvement in defense-related research and training. STDU has secret-level security credentials, allowing it to participate in classified defense technology research. STDU is home to the National Defense Transportation Research Institute (国防交通研究所), which is the only civilian university research institute that specializes in national defense transportation research. STDU is also home to the Institute of Complex Networks and Visualisations (复杂网络与可视化研究所), which develops military-use information processing software including remote-control systems for aerospace applications.

Sichuan University (四川大学)

Sichuan University (SCU) is a leading Chinese university subordinate to the Ministry of Education. In 2011 and again in 2016 SCU was the subject of joint construction agreements between the MOE and defence industry agency SASTIND designed to increase its involvement in defence research. The university hosts at least three laboratories that focus on defence research and has a close relationship with the Chinese Academy of Engineering Physics (CAEP), the PRC's primary nuclear warheads research facility. SCU's Institute of Atomic and Molecular Physics and CAEP jointly established the Institute of Atomic and Molecular Engineering and the Institute of High Temperature and High Pressure Physics. In 2012, SCU was added to the US BIS Entity List as an alias of CAEP, implying that it acts as a proxy for the facility. A 2011 study by American think tank Project 2049 concluded that a PLA signals intelligence unit 'likely maintain a close, mutually supportive relationship with related organizations in Chengdu, such as Sichuan University's Information Security and Network Attack and Defense Laboratory (信息安全与网络攻防实验室).'

Soochow University (苏大苏大)

Soochow University has been jointly supervised by the Jiangsu Provincial Government and defence industry agency SASTIND since 2016. This arrangement is designed to expand the university's involvement in defence-related research and training. The university has five designated defence disciplines, centred around research on radiation. In particular, its School of Radiation Medicine and Protection has strong defence links, as it has become a major teaching and research base for the nuclear industry. Suzhou University is also involved in promoting military-civil fusion. The university cooperated with Changfeng Science Technology Industry Group (a subsidiary of missile manufacturer CASC) and Suzhou Xinkuan Electronic Technology Co., Ltd. to jointly establish the 'Suzhou University Military-Civil Fusion Internet of Things Collaborative Innovation Center.'

South China University of Technology (华南理工大学)

SCUT is subordinate to the Ministry of Education and in 2018 was placed under a joint-construction agreement between the MOE and SASTIND. This arrangement is designed to develop the university's involvement in defence-related research and training. SCUT also holds secret-level security credentials, allowing it to participate in research and production for classified weapons and defence technology projects. As a result of the university's placement under joint construction and its secret-level security credentials, SCUT's involvement in defence research is likely to grow in coming years. Since 2008, the university has hosted a defence research laboratory on materials science. The lab was initially run by the university's president. In 2017, the university joined the Guangzhou Civil-Military Integration Industry Coalition. More recently in 2019, SCUT and iFlytek established an artificial intelligence company, Guangzhou Huanan Naokong Zhineng Keji Gongsi (广州环南纳控智能科技).

Southeast University (东南大学)

SEU is a leading Chinese university that engages in high levels of defence research. In 2015, the university undertook RMB180m (AUD37m) of defence research projects, placing it among the

Ministry of Education universities most involved in defence research. That figure has almost certainly grown since 2016, when SEU came under a ‘joint construction’ agreement between the Ministry of Education and defence industry agency SASTIND. The university has secret security credentials, enabling it to participate in secret defence projects. The university has also been linked to cyberespionage. Researchers at its School of Cyber Science and Engineering (东南大学网安学院) have been funded by the MSS, China’s civilian intelligence agency. The School of Cyber Science and Engineering has close ties to TopSec, a Chinese information security company that trains, recruits and works with PLA cyber security officers. SEU states that its defence research relies on its excellence in electronics. It has at least two laboratories that specialise in defence research on navigation technology and underwater acoustics. Both laboratories may be involved in developing technology for underwater warfare. Representatives from the PLA Navy’s Submarine Academy visited SEU in 2017. SEU has also built relationships with state-owned defence conglomerates. In 2017, the university signed a strategic cooperation agreement with missile-manufacturer China Aerospace Science and Industry Corporation. In 2018 and 2019, it signed similar agreements with subsidiaries of China Electronics Technology Group Corporation, China’s leading manufacturer of military electronics.

Southwest University of Science and Technology (西南科技大学)

SWUST is deeply engaged in defence research and is based in Mianyang, a city also home to China’s nuclear weapons program and many other parts of the defence industry. Since 2006, the university has been subject to several joint construction agreements between the Sichuan Provincial Government and SASTIND that are designed to increase its involvement in defence research. SWUST carries out defence-related research on nuclear waste, radiation protection and electronic information engineering. It holds secret-level security credentials, allowing it to undertake classified defence technology and weapons projects. The university’s main defence laboratory carries out research on topics such as the use of microorganisms to clean nuclear waste. SWUST has worked closely with the Chinese Academy of Engineering Physics (China’s nuclear warheads program), China Aerodynamics Research and Development Center (a PLA base specialising in aircraft design), and defence conglomerates since its establishment. The fact that the university hosts the province’s ‘Civil-military Integration Institute’ is a testament to its integration with the military and defence industry.

Space Engineering University (中国航天工程大学)

SEU was established in June 2017 as an expansion of the former PLA Equipment Academy (装备学院). SEU describes itself as a ‘comprehensive university that trains talents for space command management and engineering.’ It is intended to serve as the ‘cradle of the new PLA’s space talent training.’ The SEU is subordinate to and supports the PLA Strategic Support Force’s Space Systems Department (航天系统部), which has taken over the space and potentially counterspace capabilities that were previously the purview of the former General Armaments Department and, to a lesser degree, the former General Staff Department. The SEU offers degree programs at the undergraduate, master’s, and doctoral levels, as well as programs for non-commissioned officers, across disciplines including space target surveillance, remote sensing science and technology, and aerospace information security. Its faculty include nine CMC Science and Technology Commission experts and twenty professors who are designated as expert defence science and technology advisors. Beyond its mission of talent cultivation, the SEU also engages in extensive research. In particular, the SEU has a total of eighteen laboratories, which include two national-level key laboratories and one military-level key laboratory.

Sun Yat-sen University (中山大学)

SYSU is a leading Chinese university subordinate to the Ministry of Education. In 2018, it came under the joint supervision of MOE and defence industry agency SASTIND. This development indicates that SYSU’s involvement in the defence industry and defence research is growing. The university has a large defence research budget. In 2018, it spent nearly RMB200 million (AUD41 million) on defence research out of its total research budget of RMB3.1 billion (AUD640 million). SYSU is linked to the Chinese military through its National Supercomputer Center in Guangzhou (广州国家超级计算中心), which was placed on the US Government Entity List in 2015 for its role in nuclear weapons development. The centre was jointly established with the PLA National University

of Defense Technology in 2011 to host the Tianhe-2 supercomputer. The supercomputer is operated by the National University of Defense Technology and was the world's fastest from 2013 to 2015. Aside from the supercomputer center, SYSU's Key Laboratory of Information Science is the only known lab focused on defence research and is located within the School of Electronics and Information Technology. In 2010, the university established a State Secrets Academy (国防科技), serving as the third university in China to establish such an institute in partnership with China's National Administration of State Secrets Protection (国家保密局). The Institute carries out research and training on the protection of state secrets.

Tianjin Polytechnic University (天津理工大学)

TJPU is known for its research in the field of textile science and engineering. It is jointly supervised by the Ministry of Education and the city of Tianjin. In 2018, defence industry agency SASTIND and the Tianjin Municipal Government signed an agreement to jointly support TJPU. The purpose of the agreement is to support the university's development of defence disciplines, construction of defence laboratories, and training of defence scientists. Through this arrangement, SASTIND involves universities in military research projects and supports collaboration between universities and the defence industry. The university also holds secret-level security credentials that allow it to participate in classified defence technology projects. Tianjin Polytechnic University hosts one state key lab and two MOE key labs. One of the MOE key labs and the state key lab are located within the School of Material Science and Engineering. Additionally, TJPU's School of Textile Science and Engineering has conducted R&D that has been applied to industries in aerospace, defense, transportation, civil engineering, among others. The School of Textile Science and Engineering has reportedly become a backbone of research and innovation for China's textile industry.

Tianjin University (天津大学)

TJU is under the administration of the Ministry of Education and has also been supervised by defence industry agency SASTIND since 2012. The university has second-class security credentials, allowing it to participate in classified research projects at the level of 'secret'. It hosts two defence laboratories, working on optoelectronics and propellants. In 2015, A professor at Tianjin University was arrested by U.S. federal agents and accused of economic espionage and technology theft. He had been a professor in the School of Precision Instrument and Opto-electronics Engineering, which is home to one of the MOE labs involved in defense research. TJU is also a member of several

international engineering alliances and has one National Defense Technology Innovation Team. TJU carries out research for the Ministry of State Security (MSS), China's civilian intelligence agency. It has hosted at least one MSS researcher and its scientists have been awarded for their work for the MSS on communication and information engineering.

Tongji University (同济大学)

Tongji University recognized for its work in architecture, civil engineering, marine geology, and transportation engineering. The university established the only state key laboratory of deep-sea geology, which plays an important role in China's deep-sea observation and serves as a significant platform for the country's marine strategy. The university's involvement in marine research likely stems from its joint construction with the State Oceanic Administration (SOA). In 2010, the Ministry of Education and the State Oceanic Administration signed to jointly establish 17 universities, a collaboration aimed at enhancing the ability to cultivate marine talents in universities, develop marine science and technology, and make contributions to the development of China's marine industry. Tongji University has secret-level security credentials and is home to one Ministry of Education laboratory dedicated to defense research. In April 2019, the university was placed on the U.S. Unverified List, which places restrictions on US exports to the university. Entities are added the Unverified List if the US Government is unable to satisfactorily carry out end-user checks on them to ensure compliance with export licenses.

Tsinghua University (清华大学)

Tsinghua University is considered China's leading university in science and technology. Often characterized as 'China's MIT,' Tsinghua is highly ranked globally, while also being the alma mater of numerous Chinese leaders, including Xi Jinping. Tsinghua has been included in numerous Chinese educational initiatives, including acting as a Class A institution in the Double First-Class University Plan and with membership in China's C9 League. As of spring 2018, Tsinghua University had 390 research institutions operating across a range of fields. Tsinghua engages in a range of military research and was awarded secret-level security credentials for classified research in 2007. In advancing military-civil fusion, Tsinghua also continues its 'fine tradition' of serving China's national security and defense, actively creating new platforms and initiatives to support this strategy. Not only its dedicated defence laboratories but also a range of key laboratories and research institutions at the university have received funding from the military. Since at least 2012,

Tsinghua has also been jointly supervised by defence industry agency SASTIND as part of a program to deepen its defence research and links to the defence sector. Tsinghua's defence research covers areas such as artificial intelligence, air-to-air missiles, navigation technology, instrument science and materials science. The university trains students for China's nuclear weapons program, military and defence industry. In 2014 it signed a strategic cooperation agreement with the Chinese Academy of Engineering Physics (CAEP)—China's nuclear weapons program. In 2016, CAEP's Materials Institute and Tsinghua established a joint postgraduate training base for teaching, research collaboration and equipment sharing. Approximately 200 postgraduate students at Tsinghua are sponsored by CAEP or defence industry conglomerates each year through the Chinese government's National Defence Science and Technology Scholarship program. Scholarship recipients are required to work for their sponsoring organisation for five years after graduating. Roughly 2000 of the scholarships are awarded each year, indicating that Tsinghua students are among the primary recipients of them. Documents published by Tsinghua indicate that CAEP planned to sponsor 40 PhD students to study nuclear technology in 2013. CAEP continues to sponsor Tsinghua postgraduates. In 2004, Tsinghua agreed to supervise doctoral students from the PLA's Second Artillery Engineering University, now known as the Rocket Force University of Engineering.

University of Electronic Science and Technology of China (电子科技大学)

UESTC was established in 1961 as one of China's first defence industry universities. It is now subordinate to the Ministry of Education (MOE) and is also jointly supervised by defence industry agencies MIIT and SASTIND, as well as the Chinese military's leading electronics manufacturer, China Electronics Technology Group Corporation (CETC). The university is one of China's leading universities for defence electronics research. It claims to rank among the top MOE universities in terms of the scale of its defence research. Between 2011 and 2015, its annual spending on defence research grew by 210% to RMB400 million (AUD80 million) and may account for as much as 32% of its overall research spending. 16.43% of UESTC graduates in 2017 who found employment were working in the defence sector. UESTC gained secret-level security credentials about a decade ago, probably in 2006, making it one of the first MOE universities to hold them. UESTC research has been used by state-owned manufacturers of military aircraft, missiles, and military electronics and the PLA Navy on projects such as the JF-17 fighter and the Navy's aircraft carrier program. UESTC's defence research covers areas including electronics, microwaves, terahertz technology, anti-jamming technology and signal processing, communication systems, military-use critical materials, optoelectric imaging. Between 2001 and 2005, UESTC undertook over 900 military electronics projects worth in excess of RMB500 million (AUD104 million). UESTC's research on artificial intelligence has attracted scrutiny for its human rights implications. In 2015, a professor recruited by UESTC through the Thousand Talents Plan established a company called Koala AI. The company produces artificial intelligence surveillance systems that are used in Xinjiang, where an estimated 1.5 million Uyghurs and other ethnic minorities have disappeared into concentration camps. UESTC

has close relationships with the Chinese defence industry. The university operates a national laboratory on high-power radiation with the Chinese Academy of Engineering Physics, the PRC's primary nuclear warhead research complex. CETC, a state-owned defence conglomerate, partnered jointly with the MOE to develop UESTC's capabilities. Under the arrangement, UESTC agreed to expand its collaboration with CETC, help train CETC personnel and send its best students to work at CETC. Defence industry agency SASTIND also signed agreements to supervise UESTC in 2008 and 2016.

University of International Relations (中国人民国际关系学院)

UIR claims was established in 1949 under the direction of then Premier Zhou Enlai. In 1964 it was designated as a 'national key university', and this appears to be the evidence it uses to claim it is a Ministry of Education university. However, the university does not appear on the Ministry of Education's list of subordinate universities. Individuals formerly and presently affiliated with the university have also held affiliations with the MSS or the MSS-linked think tank the China Institutes of Contemporary International Relations (中国国际问题研究所). They include Geng Huichang (耿惠昌), a former Minister of State Security (2007-2016) and vice minister of State Security (1998-2007). Prior to this he was the head of China Institutes of Contemporary International Relations from 1992 to 1998. From 1990 to 1992, he was the director of UIR's American Research Department and from 1985-1990 he was deputy director of the American Research department. Notably, current UIR President Tao Jian is also a former CICIR vice-president and a UIR graduate. UIR gives the MSS a way to work with foreign universities and academics to shape and learn about perceptions of the PRC's views on security. It also provides a platform for the MSS to identify talent, recruit officers and collect intelligence. The university's Hangzhou campus, also known as the Zhejiang Second People's Police School, may carry out more practical training of MSS officers and has been described on a local government website as 'specialising in training special talent'. Some graduates of the Hangzhou campus have moved straight into MSS positions. The Hangzhou campus works closely with Zhejiang University on teaching and research.

University of Science and Technology Beijing (北京科技大学)

USTC is a leading university subordinate to the MOE. The university engages in high levels of defence research and claims to be among the top MOE universities for defence spending. Since 2018, it

has been under a joint-construction agreement between the MOE and defence industry agency SASTIND that is designed to expand its involvement in defence research. USTB is known as the ‘cradle of steel’ for its training and research on metallurgy. The university’s defence research appears to focus on metallurgy and materials science. It hosts at least three laboratories dedicated to defence research, including two that are jointly run with state-owned defence conglomerates. The head of USTB’s Institute of Advanced Materials and Technology also heads a SASTIND-supported defence science and technology innovation team. The university holds secret-level security credentials, allowing it participate in research and production for classified weapons and defence technology projects.

University of Science and Technology of China (中国科学院大学)

The University of Science and Technology of China is among China’s most prestigious universities in science and technology. Uniquely, it was established and is supervised by the Chinese Academy of Sciences, intended to serve national objectives in science and technology. Xi Jinping personally inspected USTC in 2016, urging it to pursue “even more outstanding achievements in teaching and innovation.” It is a member of the C9 League and in the “211 Project” and “985 Project.” While providing undergraduate and graduate-level education, USTC is also highly active in research across a number of major laboratories, including several that support research that is related to national defense and the development of dual-use technologies, such as brain-inspired approaches to artificial intelligence and quantum information science. USTC has a long history of contributions to science in the service of the state, and it has recently sought to deepen its contributions to military research, including through establishing a new center for military-civil fusion. Several USTC professors, including prominently Pan Jianwei, have partnered with the defense industry to pursue military applications of their technologies.

University of Shanghai for Science and Technology (上海科技大学)

USST describes itself as a ‘university with defence characteristics’. It has been under the joint

supervision of Shanghai and defence industry agency SASTIND since 2016. It is engaged in growing levels of defence research and holds second-class weapons research and development secrecy credentials, allowing it to undertake classified projects. In 2017, its spending on defence research reached RMB13 million (AUD2.6 million). SASTIND has designated areas with the fields of optics, energy and control science as defence disciplines at USST, indicating that the university's defence research focuses on these areas. In 2017, The university established a joint venture on terahertz radiation technology with subsidiaries of defence conglomerate Norinco Group.

University of South China (南大)

USC specialises in nuclear engineering. It has a well-developed defence research program and has been the subject of several joint-construction agreements between the Hunan Provincial Government and defence industry agency SASTIND since 2002. These agreements are designed to 'support USC in going a step further to display its defence characteristics based on the development needs of the defence technology industry.' USC is also supervised by China National Nuclear Corporation, a state-owned defence nuclear engineering conglomerate. USC carries out large amounts of defence research related to nuclear engineering, as well as work on information technology, communications engineering, control engineering and electrical engineering. The university received secret level security credentials in 2008, allowing it to work on classified defence projects.

Wuhan University (武大)

WHU is a leading Chinese university subordinate to the Ministry of Education. The university has close ties to the military and has been subject to a joint-supervision agreement between the Ministry of Education and defence industry agency SASTIND since 2016, an arrangement designed to increase its involvement in defence research. In 2015, WHU planned to spend RMB200 million (AUD42 million) on defence research for the year and described itself as 'a university with a strong reputation in the defence science and technology field'. WHU carries out defence research in a wide range of fields, including navigation, computer simulation, electronic information, electromagnetics, aerospace remote sensing, materials science, cyber security and explosions. The university is an important site of research for China's Beidou satellite navigation system. Aside from being involved in defence research, there are strong indications that WHU has carried out cyber

attacks for the People’s Liberation Army. One of the university’s two defence laboratories purportedly established by the Ministry of Education, the Key Laboratory of Aerospace Information Security and Trusted Computing, has been accused by unnamed US and Taiwanese officials of carrying out cyberattacks.

Wuhan University of Technology (武汉理工大学)

WHUT is subordinate to the Ministry of Education. The university originally specialised in research relating to construction, transport and automobiles. It engages in high levels of defence research and has been under a ‘joint-construction’ agreement between the Ministry of Education and defence industry agency SASTIND since 2016. It holds secret-level security credentials. The university hosts two Ministry of Education laboratories dedicated to defence research on materials science and ship technology. WHUT also works closely with the PLA Air Force on defensive engineering such as the construction of aircraft bunkers and underground shelters. Since 2001, WHUT and the Guangdong Military Region Air Force Engineering and Construction Bureau have run a joint research institute, which ‘takes advantage of [WHUT’s] State Key Laboratory of Advanced Technology for Materials Synthesis and Processing’. ‘In 2012, the PLA Air Force Logistics Department and WHUT held a signing ceremony inaugurating the “Air Force-level Military-Civil Fusion Air Defence Engineering Construction Technology Innovation Platform Cooperation Agreement” (军民融合空防工程技术创新平台合作框架协议)’. The same department in cooperation with WHUT also jointly established the Air Force Air Defence Engineering Construction Technology Innovation Platform (空防工程技术创新平台), with ‘the goal of innovating mutually beneficial technologies.’

Xi’an Jiaotong University (西安交通大学)

XJTU is subordinate to the Ministry of Education. It is also supervised by SASTIND as part of a program to develop defense research capabilities within Chinese universities. The university describes its strategy as being ‘based in Shaanxi, geared toward the needs of the nation, and serving the national defense industry.’ The university is advanced in its implementation of military-civil fusion and has established strategic partnerships with China Aerospace Science and Technology Corporation, China Aerospace Science and Industry Corporation, and the Aero Engine Corporation of China. It holds secret-level security credentials, allowing it to participate in classified defence technology projects.

Xi'an Technological University (西安理工大学)

XATU is a civilian university that primarily engages in defence research. XATU describes itself as 'having distinct defence-industrial characteristics' and is heavily involved in weapons development. Since 2016, it has been subject to a 'joint construction' agreement between the Shaanxi Provincial Government and defence industry agency SASTIND designed to deepen its defence links. The university's main areas of defence research include photoelectric imaging technology, manufacturing technology, materials science, detection and measurement technology and weapons systems. It holds secret-level security credentials. XATU is a member of the B8 Cooperation Innovation Alliance (B8联盟 or 联盟), a group of eight Chinese research institutions that specialize in weapons science—the 'B' in 'B8' stands for Chinese work for armaments, bingqi (兵器). Apart from Shenyang Ligong University, XATU is the only Chinese civilian university known to be supervised by state-owned arms manufacturers China North Industries Group (Norinco Group) and China South Industries Group.

Xi'an University of Posts and Telecommunications (西安邮电大学)

XUPT is a leading Chinese university supervised by the Shaanxi Provincial Government and the Department of Information Technology. The university was established in 1959 as an institution focused on communications and information technology. XUPT retains a focus on these discipline to this day. XUPT's faculties include college focusing on artificial intelligence, automation, cyber security and electrical engineering. XUPT maintains close links to China's Ministry of Public Security (MPS). The university has signed agreements and established joint laboratories with the MPS's local counterparts. In November 2013, XUPT partnered with the Shaanxi Municipal Government's public security ministry to establish the MPS Key Laboratory of Electronic Information Application Technology for Scene Investigation (公共安全信息应用电子技术重点实验室). This was the first such joint laboratory that the MPS established with a university in any of China's five north-western provinces. XUPT partnered with Xi'an's Yanta District Public Security Bureau branch in November 2018, establishing the 'Joint Laboratory for Smart Public Security Information Analysis and Applications' (公共安全信息智能分析应用重点实验室). The joint laboratory develops applications of artificial intelligence for analysing criminal information.

Xiamen University (厦门大学)

XMU is one of China's leading universities, but it does not appear to engage in high levels of defence research. However, in 2018 it came under a joint supervision agreement between the Ministry of Education, the Fujian Provincial Government and defence industry agency SASTIND that indicates XMU will expand its involvement in defence research. The arrangement is designed to 'upgrade the university's ability to innovate defence science and technology and actively integrate itself with the development of military-civil fusion.' In 2017, XMU allegedly conspired with Huawei to steal trade secrets from CNEX Labs Inc., an American semiconductor startup. CNEX claims that Huawei and XMU engaged in a multiyear conspiracy to steal the company's solid-state drive computer storage technology. The university appears to be involved in the development of military-use heavy-duty coatings. In 2017, XMU, Fujian Normal University, Fujian Liheng Paint Co. Ltd. (福建力恒涂料有限公司) and People's Liberation Army Unit 63983 jointly established the Haixi Liheng New Materials Research Institute (海西力恒新材料研究院). Fujian Liheng Paint specialises in heavy-duty coatings for warships and holds confidential-level security credentials, allowing it to participate in classified defence projects.

Xiangtan University (湘潭大学)

XTU is a university in Chairman Mao Zedong's hometown that has substantially expanded its participation in defence research in recent years. It has been subject to two 'joint construction' agreements between the Hunan Provincial Government and defence industry agency SASTIND that are designed to help the university 'draw out its national defence characteristics'. In the university's own words, its 'military-civil fusion characteristics are becoming clearer with each day', and it increased its spending on military-related projects by 60% from 2017 to 2018, spending over RMB31 million (AUD6 million) in 2018. XTU's defence research covers areas including materials science, energy, measurement technology and electromagnetic waves. The university has developed partnerships with a major PLA nuclear technology research institution, Northwest Institute of Nuclear Technology, and several defence companies, including subsidiaries of arms manufacturer Norinco Group and defence aviation conglomerate Aero Engine Corporation of China. XTU holds secret-level security credentials, allowing it to participate in classified defence technology projects.

Xidian University (西安电子科技大学)

Xidian University is among China's top universities for research on antennas, radar, electronic countermeasures and computer science. The university is subordinate to the Ministry of Education and is also jointly supervised by defence industry agency SASTIND and defence electronics conglomerate CETC. It claims it has 'made important contributions to military modernisation'. The university is closely tied to China's defence industry and the PLA. It runs at least five defence laboratories and partners with the PLA's signals intelligence organization. Xidian appears to be an important training ground for Chinese military hackers. According to Xidian's party secretary, the university has had an 'unbreakable bond with secret intelligence work since its beginning'. It also holds secret-level security credentials that allow it to work on classified weapons projects.

Yanshan University (燕山大学)

The university was formed as an offshoot of Harbin Institute of Technology, one of China's top defence universities, in 1960. The university continues to prioritise defence research and is jointly supervised by the Hebei Provincial Government together with the Ministry of Education, Ministry of Industry and Information Technology and defence industry agency SASTIND. YSU's Defense Science and Technology Institute was established in 2006 under the support of COSTIND (a defence industry agency that has been replaced by SASTIND) to expand and oversee defence research at the university. The institute has driven the university's involvement in space-related defence research through the establishment of laboratories such as the Key Laboratory of Fundamental Science of Mechanical Structure and Materials Science Under Extreme Conditions. Four fields of research at YSU are officially designated as defence disciplines: control theory and control science, electrical circuits and systems, mechanical design and theory, and materials science and engineering. The university holds secret-level security credentials.

Yunnan Normal University (云南省师范大学)

YNNU is a Chinese university subordinate to the Yunnan Provincial Government. Since 2013 it has also been supervised by the Ministry of Education. The university has been focused on training teacher since its inception as the Kunming Teachers College (昆明师范学院) in 1950. YNNU now has a broader focus on a variety of humanities, social and natural science disciplines. YNNU is organised into numerous faculties, some of which are relevant for communist party cadre training:

Zhejiang University (浙江大学)

ZJU is subordinate to the Ministry of Education and jointly constructed with defence industry agency SASTIND. This arrangement with SASTIND began in 2016 and is designed to deepen the university's involvement in defence research. The university holds secret-level security credentials, allowing it to work on classified military projects. The university's total research funding amounts to RMB4.56 billion (AUD940 million) in 2018. It has at least three defence laboratories, with one source claiming that the university had ten key national laboratories (国家重点实验室) as of 2015. These laboratories are involved in research on computer simulations, high-performance computing and control science. The university also carries out cyber security research and receives funding for this work from the MSS, China's civilian intelligence agency. ZJU cooperates extensively with international universities and companies, with upwards of 40 international joint S&T research labs. The College of Electrical Engineering has joint labs with U.S. companies in key industries, such as Rockwell Automation in the field of information technology, and the National Semiconductor Corporation. Additionally, the university has a joint research lab with U.S. company Microsoft.

Cryptominers

A list of cryptominer and cryptojacker malware..

Cryptominers is a cluster galaxy available in JSON format at [this location](#) The JSON format can be freely reused in your application or automatically enabled in [MISP](#).

authors

Cisco Talos - raw-data

Lemon Duck

The infection starts with a PowerShell loading script, which is copied from other infected systems via SMB, email or external USB drives. The actor also employs several exploits for vulnerabilities such as SMBGhost and Eternal Blue.

The tag is: *misp-galaxy:cryptominers="Lemon Duck"*

Lemon Duck is also known as:

Exploit-Kit

Exploit-Kit is an enumeration of some exploitation kits used by adversaries. The list includes document, browser and router exploit kits. It's not meant to be totally exhaustive but aim at covering the most seen in the past 5 years.

Exploit-Kit is a cluster galaxy available in JSON format at [this location](#) The JSON format can be freely reused in your application or automatically enabled in [MISP](#).

authors

Kafeine - Will Metcalf - KahuSecurity

Astrum

Astrum Exploit Kit is a private Exploit Kit used in massive scale malvertising campaigns. It's notable by its use of Steganography

The tag is: *misp-galaxy:exploit-kit="Astrum"*

Astrum is also known as:

- Stegano EK

Table 755. Table References

DealersChoice

DealersChoice is a Flash Player Exploit platform triggered by RTF.

DealersChoice is a platform that generates malicious documents containing embedded Adobe Flash files. Palo Alto Network researchers analyzed two variants—variant A, which is a standalone variant including Flash exploit code packaged with a payload, and variant B, which is a modular variant that loads exploit code on demand. This new component appeared in 2016 and is still in use.

The tag is: *misp-galaxy:exploit-kit="DealersChoice"*

DealersChoice is also known as:

- Sednit RTF EK

AndroRAT

Androrat is a remote administration tool developed in Java Android for the client side and in Java/Swing for the Server. The name Androrat is a mix of Android and RAT (Remote Access Tool). It has been developed in a team of 4 for a university project. The goal of the application is to give the control of the android system remotely and retrieve informations from it.

The tag is: *misp-galaxy:malpedia="AndroRAT"*

AndroRAT is also known as:

Catelites

Catelites Bot (identified by Avast and SfyLabs in December 2017) is an Android trojan, with ties to CronBot. Once the malicious app is installed, attackers use social engineering tricks and window overlays to get credit card details from the victim. The distribution vector seems to be fake apps from third-party app stores (not Google Play) or via malvertisement. After installation and activation, the app creates fake Gmail, Google Play and Chrome icons. Furthermore, the malware sends a fake system notification, telling the victim that they need to re-authenticate with Google Services and ask for their credit card details to be entered. Currently the malware has overlays for over 2,200 apps of banks and financial institutions.

FluBot

PRODAFT describes FluBot as a banking malware which originally targeted Spain. Since the first quarter of 2021 it has been targeting many other European countries as well as Japan. It uses a DGA for its C&C and relies on both DNS and DNS-over-HTTPS for name resolution. Despite arrests of multiple people suspected of involvement with this malware in March of 2021, the campaign has only intensified since.

The tag is: *misp-galaxy:malpedia="FluBot"*

FluBot is also known as:

- Cabassous
- FakeChat

FurBall

According to Check Point, they uncovered an operation dubbed "Domestic Kitten", which uses malicious Android applications to steal sensitive personal information from its victims:

screenshots, messages, call logs, surrounding voice recordings, and more. This operation managed to remain under the radar for a long time, as the associated files were not attributed to a known malware family and were only detected by a handful of security vendors.

Ginp

Ginp is a mobile banking software targeting Android devices that was discovered by Kaspersky. The malware is able to steal both user credentials and credit cards numbers by implementing overlay attacks. For this, overlay targets are for example the default SMS application. What makes Ginp a remarkable family is how its operators managed to have it remain undetected over time even and it receiving version upgrades over many years. According to ThreatFabric, Ginp has the following features:

Overlaying: Dynamic (local overlays obtained from the C2) SMS harvesting: SMS listing SMS harvesting: SMS forwarding Contact list collection Application listing Overlaying: Targets list update SMS: Sending Calls: Call forwarding C2 Resilience: Auxiliary C2 list Self-protection: Hiding the App icon Self-protection: Preventing removal Self-protection: Emulation-detection.

GPlayed

Cisco Talos identifies GPlayed as a malware written in .NET using the Xamarin environment for mobile applications. It is considered powerful because of its capability to adapt after its deployment. In order to achieve this adaptability, the operator has the capability to remotely load plugins, inject scripts and even compile new .NET code that can be executed.

Gustuff

Group-IB describes Gustuff as a mobile Android Trojan, which includes potential targets of customers in leading international banks, users of cryptocurrency services, popular ecommerce websites and marketplaces. Gustuff has previously never been reported. Gustuff is a new generation of malware complete with fully automated features designed to steal both fiat and crypto currency from user accounts en masse. The Trojan uses the Accessibility Service, intended to assist people with disabilities. The analysis of Gustuff sample revealed that the Trojan is equipped with web fakes designed to potentially target users of Android apps of top international banks including Bank of America, Bank of Scotland, J.P.Morgan, Wells Fargo, Capital One, TD Bank, PNC Bank, and crypto services such as Bitcoin Wallet, BitPay, Cryptopay, Coinbase etc. Group-IB specialists discovered that Gustuff could potentially target users of more than 100 banking apps, including 27 in the US, 16 in Poland, 10 in Australia, 9 in Germany, and 8 in India and users of 32 cryptocurrency apps.

RedAlert2

RedAlert 2 is an new Android malware used by an attacker to gain access to login credentials of various e-banking apps. The malware works by overlaying a login screen with a fake display that sends the credentials to a C2 server. The malware also has the ability to block incoming calls from banks, to prevent the victim of being notified. As a distribution vector RedAlert 2 uses third-party app stores and imitates real Android apps like Viber, Whatsapp or fake Adobe Flash Player updates.

Retefe (Android)

The Android app using for Retefe is a SMS stealer, used to forward mTAN codes to the threat actor. Further is a bank logo added to the specific Android app to trick users into thinking this is a legitimate app. Moreover, if the victim is not a real victim, the link to download the APK is not the malicious APK, but the real 'Signal Private Messenger' tool, hence the victim's phone doesn't get infected.

Triout

Bitdefender described Triout as a Android spyware, which appears to act as a framework for building extensive surveillance capabilities into seemingly benign applications. Found bundled with a repackaged app, the spyware's surveillance capabilities involve hiding its presence on the device, recording phone calls, logging incoming text messages, recoding videos, taking pictures and collecting GPS coordinates, then broadcasting all of that to an attacker-controlled C&C (command and control) server.

TwoFace

According to Unit42, TwoFace is a two-staged (loader+payload) webshell, written in C# and meant to run on web servers with ASP.NET. The author of the initial loader webshell included legitimate and expected content that will be displayed if a visitor accesses the shell in a browser, likely to remain undetected. The code in the loader webshell includes obfuscated variable names and the embedded payload is encoded and encrypted. To interact with the loader webshell, the threat actor uses HTTP POST requests to the compromised server.

The secondary webshell, which we call the payload, is embedded within the loader in encrypted form and contains additional functionality that we will discuss in further detail. When the threat actor wants to interact with the remote server, they provide data that the loader will use to modify a decryption key embedded within the loader that will be in turn used to decrypt the embedded TwoFace payload. Commands supported by the payload are execution of programs, up-, download and deletion of files and capability to manipulate MAC timestamps.

The tag is: *misp-galaxy:malpedia="TwoFace"*

TwoFace is also known as:

- HighShell
- HyperShell
- Minion
- SEASHARPEE

ACBackdoor (ELF)

A Linux backdoor that was apparently ported to Windows. This entry represents the Linux version. This version appears to have been written first and the Windows version was ported later, without full functionality. The Linux version offers persistence as well as some process manipulation techniques, though both versions apparently offer the ability to access the command line and execute programs as well as self-update.

Ebury

This payload has been used to compromise kernel.org back in August of 2011 and has hit cPanel Support which in turn, has infected quite a few cPanel servers. It is a credential stealing payload which steals SSH keys, passwords, and potentially other credentials.

This family is part of a wider range of tools which are described in detail in the operation windigo whitepaper by ESET.

The tag is: *misp-galaxy:malpedia="Ebury"*

Ebury is also known as:

Echobot

The latest in this long line of Mirai scourges is a new variant named Echobot. Coming to life in mid-May, the malware was first described by Palo Alto Networks in a report published at the start of June, and then again in a report by security researchers from Akamai, in mid-June.

When it was first spotted by Palo Alto Networks researchers in early June, Echobot was using exploits for 18 vulnerabilities. In the Akamai report, a week later, Echobot was at 26.

Kaiji

Surfaced in late April 2020, Intezer describes Kaiji as a DDoS malware written in Go that spreads through SSH brute force attacks. Recovered function names are an English representation of Chinese words, hinting about the origin. The name Kaiji was given by MalwareMustDie based on strings found in samples.

LiquorBot

BitDefender tracked the development of a Mirai-inspired botnet, dubbed LiquorBot, which seems to be actively in development and has recently incorporated Monero cryptocurrency mining features. Interestingly, LiquorBot is written in Go (also known as Golang), which offers some programming advantages over traditional C-style code, such as memory safety, garbage collection, structural typing, and even CSP-style concurrency.

Mirai (ELF)

Mirai is one of the first significant botnets targeting exposed networking devices running Linux. Found in August 2016 by MalwareMustDie, its name means "future" in Japanese. Nowadays it targets a wide range of networked embedded devices such as IP cameras, home routers (many

vendors involved), and other IoT devices. Since the source code was published on "Hack Forums" many variants of the Mirai family appeared, infecting mostly home networks all around the world.

The tag is: *misp-galaxy:malpedia="Mirai (ELF)"*

Mirai (ELF) is also known as:

- Katana

NOTROBIN

FireEye states that NOTROBIN is a utility written in Go 1.10 and compiled to a 64-bit ELF binary for BSD systems. It periodically scans for and deletes files matching filename patterns and content characteristics. The purpose seems to be to block exploitation attempts against the CVE-2019-19781 vulnerability; however, FireEye believes that NOTROBIN provides backdoor access to the compromised system.

pupy (ELF)

Pupy is an open-source, cross-platform RAT and post-exploitation framework mainly written in python. Pupy can be loaded from various loaders, including PE EXE, reflective DLL, Linux ELF, pure python, powershell and APK. Most of the loaders bundle an embedded python runtime, python library modules in source/compiled/native forms as well as a flexible configuration. They bootstrap a python runtime environment mostly in-memory for the later stages of pupy to run in. Pupy can communicate using various transports, migrate into processes, load remote python code, python packages and python C-extensions from memory.

The tag is: *misp-galaxy:malpedia="pupy (ELF)"*

pupy (ELF) is also known as:

QNAPCrypt

The QNAPCrypt ransomware works similarly to other ransomware, including encrypting all files and delivering a ransom note. However, there are several important differences:

1. The ransom note was included solely as a text file, without any message on the screen—naturally, because it is a server and not an endpoint.
2. Every victim is provided with a different, unique Bitcoin wallet—this could help the attackers avoid being traced.
3. Once a victim is compromised, the malware requests a wallet address and a public RSA key from the command and control server (C&C) before file encryption.

The tag is: *misp-galaxy:malpedia="QNAPCrypt"*

QNAPCrypt is also known as:

- eCh0raix

Roboto

P2P Botnet discovered by Netlab360. The botnet infects linux servers via the Webmin RCE vulnerability (CVE-2019-15107) which allows attackers to run malicious code with root privileges and take over older Webmin versions. Based on the Netlabs360 analysis, the botnet serves mainly 7 functions: reverse shell, self-uninstall, gather process' network information, gather Bot information, execute system commands, run encrypted files specified in URLs and four DDoS attack methods: ICMP Flood, HTTP Flood, TCP Flood, and UDP Flood.

sustes miner

Sustes Malware doesn't infect victims by itself (it's not a worm) but it is spread over exploitation and brute-force activities with special focus on IoT and Linux servers. The initial infection stage comes from a custom wget directly on the victim machine followed by a simple /bin/bash mr.sh. The script is a simple bash script which drops and executes additional software.

Unidentified Linux 001

According to Cybereason, these scripts have been used in an ongoing campaign exploiting a widespread vulnerability in the Exim MTA: CVE-2019-10149. This attack leverages a week-old vulnerability to gain remote command execution on the target machine, search the Internet for other machines to infect, and initiates a crypto miner.

WatchBog

According to Intezer, this is a spreader module used by WatchBog. It is a dynamically linked ELF executable, compiled with Cython. C&C addresses are fetched from Pastebin. C&C communication references unique identification keys per victim. It contains a BlueKeep scanner, reporting positively scanned hosts to the C&C server (RC4 encrypted within SSL/TLS). It contains 5 exploits targeting Jira, Exim, Solr, Jenkins and Nexus Repository Manager 3.

AdWind

Part of Malware-as-service platform Used as a generic name for Java-based RAT Functionality - collect general system and user information - terminate process -log keystroke -take screenshot and access webcam - steal cache password from local or web forms - download and execute Malware - modify registry - download components - Denial of Service attacks - Acquire VPN certificates

Initial infection vector 1. Email to JAR files attached 2. Malspam URL to download the malware

Persistence - Runkey - HKCU\Software\Microsoft\Windows\current version\run

Hiding Uses attrib.exe

Notes on Adwind The malware is not known to be proxy aware

The tag is: *misp-galaxy:malpedia="AdWind"*

AdWind is also known as:

- AlienSpy
- Frutas
- JBifrost
- JSocket
- Sockrat
- UNRECOM

EpicSplit RAT

EpicSplit RAT is a multiplatform Java RAT that is capable of running shell commands, downloading, uploading, and executing files, manipulating the file system, establishing persistence, taking screenshots, and manipulating keyboard and mouse events. EpicSplit is typically obfuscated with the commercial Allatori Obfuscator software. One unique feature of the malware is that TCP messages sent by EpicSplit RAT to its C2 are terminated with the string "packet" as a packet delimiter.

The tag is: *misp-galaxy:malpedia="EpicSplit RAT"*

JavaDispCash

JavaDispCash is a piece of malware designed for ATMs. The compromise happens by using the JVM attach-API on the ATM's local application and the goal is to remotely control its operation. The malware's primary feature is the ability to dispense cash. The malware also spawns a local port (65413) listening for commands from the attacker which needs to be located in the same internal network.

jRAT

jRAT, also known as Jacksbot, is a RAT with history, written in Java. It has support for macOS, Linux, Windows and various BSD. It also has functionality to participate in DDoS-attacks as well as to perform click fraud. Note that the Adwind family often is mistakenly labeled as jRAT, because of of a red hering reference to jrat.io.

The tag is: *misp-galaxy:malpedia="jRAT"*

jRAT is also known as:

Qarallax RAT

According to SpiderLabs, in May 2015 the "company" Quaverse offered a RAT known as Quaverse RAT or QRAT. At around May 2016, this QRAT evolved into another RAT which became known as Qarallax RAT, because its C2 is at qarallax.com. Quaverse also offers a service to encrypt Java payloads (Qrypter), and thus qrypted payloads are sometimes confused with Quaverse RATs (QRAT / Qarallax RAT).

QRat

QRat, also known as Quaverse RAT, was introduced in May 2015 as undetectable (because of multiple layers of obfuscation). It offers the usual functionality (password dumper, file browser, keylogger, screen shots/streaming, ...), and it comes as a SaaS. For additional historical context, please see [jar.qarallax](#).

The tag is: *misp-galaxy:malpedia="QRat"*

QRat is also known as:

STRRAT

According to G DATA, STRRAT is a Java-based RAT, which makes extensive use of plugins to provide full remote access to an attacker, as well as credential stealing, key logging and additional plugins. The RAT has a focus on stealing credentials of browsers and email clients, and passwords via keylogging. It supports the following browsers and email clients: Firefox, Internet Explorer, Chrome, Foxmail, Outlook, Thunderbird.

Older version of the malware came with a rudimentary ransomware module that appends ".crimson" to affected files. The affected files are not encrypted, but simply reamed. If the extension is removed, the files can be opened as usual.

As of at least version 1.5, STRRAT has an implemented encryption routine.

BELLHOP

- BELLHOP is a JavaScript backdoor interpreted using the native Windows Scripting Host(WSH). After performing some basic host information gathering, the BELLHOP dropper downloads a base64-encoded blob of JavaScript to disk and sets up persistence in three ways:
- Creating a Run key in the Registry
- Creating a RunOnce key in the Registry
- Creating a persistent named scheduled task
- BELLHOP communicates using HTTP and HTTPS with primarily benign sites such as Google Docs and PasteBin.

Griffon

GRIFFON is a lightweight JavaScript validator-style implant without any persistence mechanism. The malware is designed for receiving modules to be executed in-memory and sending the results to C2s. The first module downloaded by the GRIFFON malware to the victim's computer is an information-gathering JavaScript, which allows the cybercriminals to understand the context of the infected workstation.

The tag is: *misp-galaxy:malpedia="Griffon"*

Griffon is also known as:

magecart

Magecart is a malware framework intended to steal credit card information from compromised eCommerce websites. Used in criminal activities, it's a sophisticated implant built on top of relays, command and controls and anonymizers used to steal eCommerce customers' credit card information. The first stage is typically implemented in Javascript included into a compromised checkout page. It copies data from "input fields" and send them to a relay which collects credit cards coming from a subset of compromised eCommerce and forwards them to Command and Control servers.

ostap

Ostap is a commodity JScript downloader first seen in campaigns in 2016. It has been observed being delivered in ACE archives and VBA macro-enabled Microsoft Office documents. Recent versions of Ostap query WMI to check for a blacklist of running processes:

AgentSimulator.exe anti-virus.EXE BehaviorDumper BennyDB.exe ctfmon.exe fakepos_bin FrzState2k gemu-ga.exe (Possible misspelling of Qemu hypervisor's guest agent, qemu-ga.exe) ImmunityDebugger.exe KMS Server Service.exe ProcessHacker procexp Proxifier.exe python tcpdump VBoxService VBoxTray.exe VmRemoteGuest vmttoolsd VMware2B.exe VzService.exe winace Wireshark

If a blacklisted process is found, the malware terminates.

Ostap has been observed delivering other malware families, including Nymaim, Backswap and TrickBot.

SQLRat

SQLRat campaigns typically involve a lure document that includes an image overlaid by a VB Form trigger. Once a user has double-clicked the embedded image, the form executes a VB setup script. The script writes files to the path %appdata%\Roaming\Microsoft\Templates\, then creates

two task entries triggered to run daily. The scripts are responsible for deobfuscating and executing the main JavaScript file mspromo.dot. The file uses a character insertion obfuscation technique, making it appear to contain Chinese characters. After deobfuscating the file, the main JavaScript is easily recognizable. It contains a number of functions designed to drop files and execute scripts on a host system. The SQLRat script is designed to make a direct SQL connection to a Microsoft database controlled by the attackers and execute the contents of various tables.

The tag is: *misp-galaxy:malpedia="SQLRat"*

CoinThief

CoinThief was a malware package designed to steal Bitcoins from the victim, consisting of a binary patcher, browser extensions, and a backdoor component.

It was spreading in early 2014 from several different sources: - on Github (where the trojanized compiled binary didn't match the displayed source code), o - on popular and trusted download sites like CNET's Download.com or MacUpdate.com, and - as cracked applications via torrents camouflaged as Bitcoin Ticker TTM, BitVanity, StealthBit, Litecoin Ticker, BBEdit, Pixelmator, Angry Birds and Delicious Library.

The patcher's role was to locate and modify legitimate versions of the Bitcoin-Qt wallet application. The analyzed malware samples targeted versions of Bitcoin-Qt 0.8.1, 0.8.0 and 0.8.5. The earlier patch modified Bitcoin-Qt adding malicious code that would send nearly all the victim's Bitcoins to one of the hard-coded addresses belonging to the attacker.

The browser extensions targeted Chrome and Firefox and are disguised as a "Pop-up blocker". The extensions monitored visited websites, download malicious JavaScripts and injected them into various Bitcoin-related websites (mostly Bitcoin exchanges and online wallet sites). The injected JS scripts were able to modify transactions to redirect Bitcoin transfers to an attacker's address or simply harvest login credentials to the targeted online service.

The backdoor enabled the attacker to take full control over the victim's computer: - collect information about the infected computer - execute arbitrary shell scripts on the target computer - upload an arbitrary file from the victim's hard drive to a remote server - update itself to a newer version

Eleanor

Eleanor comes as a drag-and-drop file utility called EasyDoc Converter. This application bundle wraps a shell script that uses Dropbox name as a disguise and installs three components: a hidden Tor service, a Pastebin agent and a web service with a PHP-based graphical interface.

The Tor service transforms the victim's computer into a server that provides attackers with full anonymous access to the infected machine via Tor-generated address.

The Pastebin agent uploads the address in encrypted form to the Pastebin website where the attackers can obtain it.

The web service is the main malicious component that provides the attackers with the control over the infected machine. After successful authentication, the interface offers several control panels to the attackers, allowing them to do the following actions:

- Managing files
- Listing processes
- Connecting to various database management systems such as MySQL or SQLite
- Connecting via bind/reverse shell
- Executing shell command
- Capturing and browsing images and videos from the victim's webcam
- Sending emails with an attachment

iMuler

The threat was a multi-stage malware displaying a decoy that appeared to the victim as a Chinese language article on the long-running dispute over the Diaoyu Islands; an array of erotic pictures; or images of Tibetan organisations. It consisted of two stages: Revir was the dropper/downloader and iMuler was the backdoor capable of the following operations:

- capture screenshots
- exfiltrate files to a remote computer
- send various information about the infected computer
- extract ZIP archive
- download files from a remote computer and/or the Internet
- run executable files

Patcher

This crypto-ransomware for macOS was caught spreading via BitTorrent distribution sites in February 2017, masquerading as 'Patcher', an application used for pirating popular software like Adobe Premiere Pro or Microsoft Office for Mac.

The downloaded torrent contained an application bundle in the form of a single zip file. After launching the fake application, the main window of the fake cracking tool was displayed.

The file encryption process was launched after the misguided victim clicked 'Start'. Once executed, the ransomware generated a random 25-character string and set it as the key for RC4 encryption of all of the user's files. It then demanded ransom in Bitcoin, as instructed in the 'README!' .txt file copied all over the user's directories.

Despite the instructions being quite thorough, Patcher lacked the functionality to communicate with any C&C server, and therefore made it impossible for its operators to decrypt affected files. The randomly generated encryption key was also too long to be guessed via a brute-force attack, leaving the encrypted data unrecoverable in a reasonable amount of time.

The tag is: *misp-galaxy:malpedia="Patcher"*

Patcher is also known as:

- FileCoder
- Findzip

Dok

Dok a.k.a. Retefe is the macOS version of the banking trojan Retefe. It consists of a codesigned Mach-O dropper usually malspammed in an app bundle within a DMG disk image, posing as a document. The primary purpose of the dropper is to install a Tor client as well as a malicious CA certificate and proxy pac URL, in order to redirect traffic to targeted sites through their Tor node, effectively carrying out a MITM attack against selected web traffic. It also installs a custom hosts file to prevent access to Apple and VirusTotal. The macOS version shares its MO, many TTPs and infrastructure with the Windows counterpart.

HALFBAKED

The HALFBAKED malware family consists of multiple components designed to establish and maintain a foothold in victim networks, with the ultimate goal of gaining access to sensitive financial information. HALFBAKED listens for the following commands from the C2 server:

```
info: Sends victim machine information (OS, Processor, BIOS and running processes)
using WMI
    queries
processList: Send list of process running
screenshot: Takes screen shot of victim machine (using 58d2a83f777688.78384945.ps1)
runvbs: Executes a VB script
runexe: Executes EXE file
runps1: Executes PowerShell script
delete: Delete the specified file
update: Update the specified file
```

404 Keylogger

Snake Keylogger (aka 404 Keylogger) is a subscription-based keylogger that has many capabilities. The infostealer can steal a victim's sensitive information, log keyboard strokes, take screenshots and extract information from the system clipboard. It was initially released on a Russian hacking forum in August 2019. It is notable for its relatively unusual methods of data exfiltration, including via email, FTP, SMTP, Pastebin or the messaging app Telegram.

7ev3n

The NJCCIC describes 7ev3n as a ransomware "that targets the Windows OS and spreads via spam emails containing malicious attachments, as well as file sharing networks. It installs multiple files in the LocalAppData folder, each of which controls different functions including disabling bootup recovery options, deleting the ransomware installation file, encrypting data, and gaining administrator privileges. This variant also adds registry keys that disables various Windows function keys such as F1, F3, F4, F10, Alt, Num Lock, Ctrl, Enter, Escape, Shift, and Tab. Files encrypted by 7ev3n are labeled with a .R5A extension. It also locks victims out of Windows recovery options making it challenging to repair the damage done by 7ev3n."

9002 RAT

9002 RAT is a Remote Access Tool typically observed to be used by an APT to control a victim's machine. It has been spread over via zero day exploits (e.g. targeting Internet Explorer) as well as via email attachments. The infection chain starts by opening a .LNK (an OLE packager shell object) that executes a Powershell command.

The tag is: *misp-galaxy:malpedia="9002 RAT"*

ACBackdoor (Windows)

A Linux backdoor that was apparently ported to Windows. This entry represents the Windows version. It appears the Linux version was written first and the Windows version was ported later, without full functionality. The Linux version offers persistence as well as some process manipulation techniques, though both versions apparently offer the ability to access the command line and execute programs as well as self-update.

The tag is: *misp-galaxy:malpedia="ACBackdoor (Windows)"*

ACBackdoor (Windows) is also known as:

ACEHASH

ACEHASH is described by FireEye as combined credential harvester that consists of two components, a loader and encrypted/compressed payload. To execute, a password is necessary (e.g. 9839D7F1A0) and the individual modules are addressed with parameters (-m, -w, -h).

The tag is: *misp-galaxy:malpedia="ACEHASH"*

AcidBox

Unit42 found AcidBox in February 2019 and describes it as a malware family used by an unknown threat actor in 2017 against Russian entities, as stated by Dr.Web. It reused and improved an exploit for VirtualBox previously used by Turla. The malware itself is a modular toolkit, featuring both usermode and kernelmode components and anti-analysis techniques such as stack-based string obfuscation or dynamic XOR-encoded API usage.

The tag is: *misp-galaxy:malpedia="AcidBox"*

AcidBox is also known as:

- MagicScroll

AgfSpy

The agfSpy backdoor retrieves configuration and commands from its C&C server. These commands allow the backdoor to execute shell commands and send the execution results back to the server. It also enumerates directories and can list, upload, download, and execute files, among other functions. The capabilities of agfSpy are very similar to dneSpy, except each backdoor uses a

different C&C server and various formats in message exchanges.

Aldibot

According to Trend Micro Encyclopedia: ALDIBOT first appeared in late August 2012 in relevant forums. Variants can steal passwords from the browser Mozilla Firefox, instant messenger client Pidgin, and the download manager jDownloader. ALDIBOT variants send the gathered information to their command-and-control (C&C) servers.

This malware family can also launch Distributed Denial of Service (DDoS) attacks using different protocols such as HTTP, TCP, UDP, and SYN. It can also perform flood attacks via Slowloris and Layer 7.

This bot can also be set up as a SOCKS proxy to abuse the infected machine as a proxy for any protocols.

This malware family can download and execute arbitrary files, and update itself. Variants can steal information, gathering the infected machine's hardware identification (HWID), host name, local IP address, and OS version.

This backdoor executes commands from a remote malicious user, effectively compromising the

affected system.

AllaKore

AllaKore is a simple Remote Access Tool written in Delphi, first observed in 2015 but still in early stages of development. It implements the RFB protocol which uses frame buffers and thus is able to send back only the changes of screen frames to the controller, speeding up the transport and visualization control.

AlphaLocker

A new form of ransomware named AlphaLocker that is built by cybercriminals for cybercriminals. Like all incarnations of Ransomware As A Service (RaaS), the AlphaLocker malware program can be purchased and launched by pretty much anyone who wants to get into the ransomware business. What makes AlphaLocker different from other forms of RaaS is its relatively cheap cost. The ransomware can be purchased for just \$65 in bitcoin.

AlphaLocker, also known as Alpha Ransomware, is based on the EDA2 ransomware, an educational project open-sourced on GitHub last year by Turkish researcher Utku Sen. A Russian coder seems to have cloned this repository before it was taken down and used it to create his ransomware, a near-perfect clone of EDA2. The ransomware's author, is said to be paying a great deal of attention to updating the ransomware with new features, so it would always stay ahead of antivirus engines, and evade detection.

AlphaLocker's encryption process starts when the ransomware contacts its C&C server. The server generates a public and a private key via the RSA-2048 algorithm, sending the public key to the user's computer and saving the private key to its server. On the infected computer, the ransomware generates an AES-256 key for each file it encrypts, and then encrypts this key with the public RSA key, and sent to the C&C server.

To decrypt their files, users have to get ahold of the private RSA key which can decrypt the AES-encrypted files found on their computers. Users have to pay around 0.35 Bitcoin (~\$450) to get this key, packaged within a nice decrypter.

Anchor

Anchor is a sophisticated backdoor served as a module to a subset of TrickBot installations. Operating since August 2018 it is not delivered to everybody, but contrary is delivered only to high-profile targets. Since its C2 communication scheme is very similar to the one implemented in the early TrickBot, multiple experts believe it could be attributed to the same authors.

ARS VBS Loader

ARS Loader, also known as ARS VBS Loader, is written in Visual Basic Script and its main purpose is to control an infected machine via different available commands, acting as a remote access trojan (RAT). Its code is based on ASPC, another Visual Basic Script malware, which at the same time seems to be based on SafeLoader.

Attor

Attor is a cyberespionage platform used in targeted attacks against diplomatic missions and governmental institutions since at least 2013. Its most interesting features are a complex modular architecture, elaborate network communications, and a unique plugin to fingerprint GSM/GPRS devices.

Attor's core lies in its dispatcher, which serves as a management unit for additional plugins which provide all of malware's key capabilities. This allows the attackers to customize the platform on a per-victim basis. Plugins themselves are heavily synchronized. Network communication is based on Tor, aiming for anonymity and untraceability.

The most notable plugin can detect connected GSM/GPRS modems or mobile devices. Attor speaks to them directly using the AT command set, in order to collect sensitive information such as the IMEI, IMSI or MSISDN numbers, possibly identifying both the device and its subscriber. Other plugins provide persistence, an exfiltration channel, C&C communication and several further spying capabilities. The plugin responsible for capturing victim's screen targets social networks and blogging platforms, email services, office software, archiving utilities, file sharing and messaging services.

BabyShark

BabyShark is Microsoft Visual Basic (VB) script-based malware family first seen in November 2018. The malware is launched by executing the first stage HTA from a remote location, thus it can be delivered via different file types including PE files as well as malicious documents. It exfiltrates system information to C2 server, maintains persistence on the system, and waits for further instruction from the operator

BACKBEND

FireEye describes BACKBEND as a secondary downloader used as a backup mechanism in the case the primary backdoor is removed. When executed, BACKBEND checks for the presence of the mutexes MicrosoftZj or MicrosoftZjBak (both associated with BACKSPACE variants). If either of the mutexes exist, the malware exits.

BalkanDoor

According to ESET, BalkanDoor is a simple backdoor with a small number of commands (download and execute a file, create a remote shell, take a screenshot). It can be used to automate tasks on the compromised computer or to automatically control several affected computers at once. We have seen six versions of the backdoor, with a range of supported commands, evolve since 2016.

BalkanRAT

The goal of BalkanRAT which is a more complex part of the malicious Balkan-toolset (cf. BalkanDoor) is to deploy and leverage legitimate commercial software for remote administration. The malware has several additional components to help load, install and conceal the existence of the remote desktop software. A single long-term campaign involving BalkanRAT has been active at least from January 2016 and targeted accounting departments of organizations in Croatia, Serbia, Montenegro, and Bosnia and Herzegovina (considered that the contents of the emails, included links and decoy PDFs all were involving taxes). It was legitimaly signed and installed by an exploit of the WinRAR ACE vulnerability (CVE-2018-20250).

BazarBackdoor

BazarBackdoor is a small backdoor, probably by a TrickBot "spin-off" like anchor. Its called team9 backdoor (and the corresponding loader: team9 restart loader).

For now, it exclusively uses Emercoin domains (.bazar), thus the naming. FireEye uses KEGTAP as name for BazarLoader and BEERBOT for BazarBackdoor.

The tag is: *misp-galaxy:malpedia="BazarBackdoor"*

BazarBackdoor is also known as:

- BEERBOT
- KEGTAP
- Team9Backdoor
- bazaloader
- bazarloader

Belonard

Once set up in the system, Trojan.Belonard replaces the list of available game servers in the game client and creates proxies on the infected computer to spread the Trojan. As a rule, proxy servers show a lower ping, so other players will see them at the top of the list. By selecting one of them, a player gets redirected to a malicious server where their computer become infected with Trojan.Belonard.

BillGates

BillGates is a modularized malware, of supposedly Chinese origin. Its main functionality is to perform DDoS attacks, with support for DNS amplification. Often, BillGates is delivered with one or many backdoor modules.

BillGates is available for *nix-based systems as well as for Windows.

On Windows, the (Bill)Gates installer typically contains the various modules as linked resources.

Binanen

Binanen is a dropper that drops and executes a section of itself into a hidden dummy process. According to F-Secure, it executes command line tools such as (for example) asipconfig, which is useful to retrieve the network configuration. The malware aims to steal information about the machine, the username, installed software and, more generally speaking, it potentially can carry out actions on the compromised machine.

BlackEnergy

BlackEnergy, its first version shortened as BE1, started as a crimeware being sold in the Russian cyber underground as early as 2007. Initially, it was designed as a toolkit for creating botnets for conducting DDoS attacks. It supported a variety of flooding commands including protocols like ICMP, TCP SYN, UDP, HTTP and DNS. Among the high profile targets of cyber attacks utilising BE1 were a Norwegian bank and government websites in Georgia three weeks before Russo-Georgian War.

Version 2 of BlackEnergy, BE2, came in 2008 with a complete code rewrite that introduced a protective layer, a kernel-mode rootkit and a modular architecture. Plugins included mostly DDoS attacks, a spam plugin and two banking authentication plugins to steal from Russian and Ukrainian banks. The banking plugin was paired with a module designed to destroy the filesystem. Moreover, BE2 was able to - download and execute a remote file; - execute a local file on the infected computer; - update the bot and its plugins;

The Industrial Control Systems Cyber Emergency Response Team issued an alert warning that BE2 was leveraging the human-machine interfaces of industrial control systems like GE CIMPLICITY, Advantech/Broadwin WebAccess, and Siemens WinCC to gain access to critical infrastructure networks.

In 2014, the BlackEnergy toolkit, BE3, switched to a lighter footprint with no kernel-mode driver component. Its plugins included: - operations with victim's filesystem - spreading with a parasitic infector - spying features like keylogging, screenshots or a robust password stealer - Team viewer and a simple pseudo "remote desktop" - listing Windows accounts and scanning network - destroying the system

Typical for distribution of BE3 was heavy use of spear-phishing emails containing Microsoft Word or Excel documents with a malicious VBA macro, Rich Text Format (RTF) documents embedding exploits or a PowerPoint presentation with zero-day exploit CVE-2014-4114.

On 23 December 2015, attackers behind the BlackEnergy malware successfully caused power outages for several hours in different regions of Ukraine. This cyber sabotage against three energy companies has been confirmed by the Ukrainian government. The power grid compromise has become known as the first-of-its-kind cyber warfare attack affecting civilians.

BOOSTWRITE

FireEye describes BOOSTWRITE as a loader crafted to be launched via abuse of the DLL search order of applications which load the legitimate 'Dwrite.dll' provided by the Microsoft DirectX Typography Services. The application loads the 'gdi' library, which loads the 'gdiplus' library, which ultimately loads 'Dwrite'. Mandiant identified instances where BOOSTWRITE was placed on the file system alongside the RDFClient binary to force the application to import DWriteCreateFactory from it rather than the legitimate DWrite.dll.

Cardinal RAT

Cardinal RAT is a remote access Trojan capable of stealing username and credentials, cleaning out cookies from browsers, keylogging and capturing screenshots on targeted systems. It is delivered via a downloader dubbed “Carp” which uses malicious macros in Microsoft Excel documents to compile embedded source code into an executable, which then deploys the Cardinal RAT malware family.

The tag is: *misp-galaxy:malpedia="Cardinal RAT"*

Chaos

In-development ransomware family which was released in June 2021 by an unknown threat actor. The builder initially claimed to be a "Ryuk .Net Ransomware Builder" even though it was completely unrelated to the Ryuk malware family. Presently it appears to contain trojan-like features, but lacks features commonly found in ransomware such as data exfiltration.

Chaperone

According to Kaspersky GREAT and AMR, TajMahal is a previously unknown and technically sophisticated APT framework discovered by Kaspersky Lab in the autumn of 2018. This full-blown spying framework consists of two packages named Tokyo and Yokohama. It includes backdoors, loaders, orchestrators, C2 communicators, audio recorders, keyloggers, screen and webcam grabbers, documents and cryptography key stealers, and even its own file indexer for the victim's machine. We discovered up to 80 malicious modules stored in its encrypted Virtual File System, one of the highest numbers of plugins they have ever seen for an APT toolset.

CHEESETRAY

CHEESETRAY is a sophisticated proxy-aware backdoor that can operate in both active and passive mode depending on the passed command-line parameters. The backdoor is capable of enumerating files and processes, enumerating drivers, enumerating remote desktop sessions, uploading and downloading files, creating and terminating processes, deleting files, creating a reverse shell, acting as a proxy server, and hijacking processes among its other functionality. The backdoor communicates with its C&C server using a custom binary protocol over TCP with port specified as a command-line parameter.

CHINACHOPPER

a simple code injection webshell that executes Microsoft .NET code within HTTP POST commands. This allows the shell to upload and download files, execute applications with web server account permissions, list directory contents, access Active Directory, access databases, and any other action allowed by the .NET runtime.

The tag is: `misp-galaxy:malpedia="CHINACHOPPER"`

CHINACHOPPER is also known as:

ClipBanker

The ClipBanker Trojan is known as an information stealer and spy trojan, it aims to steal and record any type of sensitive information from the infected environment such as browser history, cookies, Outlook data, Skype, Telegram, or cryptocurrency wallet account addresses. The main goal

of this threat is to steal confidential information. The ClipBanker uses PowerShell commands for executing malicious activities. The thing that made the ClipBanker unique is its ability to record various banking actions of the user and manipulate them for its own benefit. The distribution method of the ClipBanker is through phishing emails or through social media posts that lure users to download malicious content.

The tag is: *misp-galaxy:malpedia="ClipBanker"*

Clop

Clop is a ransomware which uses the .clop extension after having encrypted the victim's files. Another unique characteristic belonging with Clop is in the string: "Dont Worry C|0P" included into the ransom notes. It is a variant of CryptoMix ransomware, but it additionally attempts to disable Windows Defender and to remove the Microsoft Security Essentials in order to avoid user space detection.

CloudEyE

CloudEyE (initially named GuLoader) is a small VB5/6 downloader. It typically downloads RATs/Stealers, such as Agent Tesla, Arkei/Vidar, Formbook, Lokibot, Netwire and Remcos, often but not always from Google Drive. The downloaded payload is xored.

The tag is: *misp-galaxy:malpedia="CloudEyE"*

CloudEyE is also known as:

- GuLoader
- vbdropper

Cobalt Strike

Cobalt Strike is a paid penetration testing product that allows an attacker to deploy an agent named 'Beacon' on the victim machine. Beacon includes a wealth of functionality to the attacker, including, but not limited to command execution, key logging, file transfer, SOCKS proxying, privilege escalation, mimikatz, port scanning and lateral movement. Beacon is in-memory/file-less, in that it consists of stageless or multi-stage shellcode that once loaded by exploiting a vulnerability or executing a shellcode loader, will reflectively load itself into the memory of a process without touching the disk. It supports C2 and staging over HTTP, HTTPS, DNS, SMB named pipes as well as forward and reverse TCP; Beacons can be daisy-chained. Cobalt Strike comes with a toolkit for developing shellcode loaders, called Artifact Kit.

The Beacon implant has become popular amongst targeted attackers and criminal users as it is well written, stable, and highly customizable.

The tag is: *misp-galaxy:malpedia="Cobalt Strike"*

Cobalt Strike is also known as:

- Agentemis
- BEACON
- CobaltStrike

CobInt

CobInt, is a self-developed backdoor of the Cobalt group. The modular tool has capabilities to collect initial intelligence information about the compromised machine and stream video from its desktop. If the operator decides that the system is of interest, the backdoor will download and launch

CobaltStrike framework stager. It's CRM mailslot module was also observed being downloaded by ISFB.

Coinminer

Coinminer is an unwanted malicious software which uses the victim's computational power (CPU and RAM mostly) to mine for coins (for example Monero or Zcash). The malware achieves persistence by adding one of the opensource miners on startup without the victim's consensus. Most sophisticated coin miners use timer settings or cap the CPU usage in order to remain stealthy.

Cold\$eal

Cold\$eal is a packer for encrypting (sealing) malware. It contains some AV-evasion techniques as well as some sandbox-detection. It was developed by \$@dok (aka Sadok aka Coldseal). It was available as a cryptor service under the url coldseal.us and was later sold as a toolkit consisting of the cryptor and a custom made cryptostub including a FuD guarantee backed by free update to the cryptostub. The payload was encrypted using RC4 and added to the cryptostub as a resource. The encryption key itself was stored inside the resource as well. Upon start the cryptostub would extract the key, decrypt the payload and perform a selfinjection using the now decrypted payload.

Note: The packed sample provided contains some harmless payload, while the unpacked sample is the bare cryptostub without a payload.

CrimsonIAS

According to ThreatConnect, CrimsonIAS is a Delphi-written backdoor dating back to at least 2017. It enables operators to run command line tools, exfiltrate files, and upload files to the infected machine. CrimsonIAS is notable as it listens for incoming connections only; making it different from typical Windows backdoors that beacons out.

The tag is: *misp-galaxy:malpedia="CrimsonIAS"*

CryptoLocker

CryptoLocker is a new sophisticated malware that was launched in the late 2013. It is designed to attack Windows operating system by encrypting all the files from the system using a RSA-2048 public key. To decrypt the mentioned files, the user has to pay a ransom (usually 300 USD/EUR) or 2 BitCoins.

CryptoPatronum

CryptoPatronum is a ransomware that encrypts user data through AES-256 (CBC) and it asks for BTC / ETH in order to get back the original files. In the ransom note there is not a title but only a reference to crsss.exe: its original file name. Once the files are encrypted, CryptoPatronum adds a .enc extension.

DADJOKE

DADJOKE was discovered as being distributed via email, targeting a South-East Asian Ministry of Defense. It is delivered as an embedded EXE file in a Word document using remote templates and a unique macro using multiple GET requests. The payload is deployed using load-order hijacking with a benign Windows Defender executable. Stage 1 has only beacon+download functionality, made to look like a PNG file. Additional analysis by Kaspersky found 8 campaigns over 2019 and no activity prior to January 2019, DADJOKE is attributed with medium confidence to APT40.

DanaBot

Proofpoints describes DanaBot as the latest example of malware focused on persistence and stealing useful information that can later be monetized rather than demanding an immediate ransom from victims. The social engineering in the low-volume DanaBot campaigns we have observed so far has been well-crafted, again pointing to a renewed focus on “quality over quantity” in email-based threats. DanaBot’s modular nature enables it to download additional components, increasing the flexibility and robust stealing and remote monitoring capabilities of this banker.

DarkComet

DarkComet is one of the most famous RATs, developed by Jean-Pierre Lesueur in 2008. After being used in the Syrian civil war in 2011, Lesueur decided to stop developing the trojan. Indeed, DarkComet is able to enable control over a compromised system through use of a simple graphic user interface. Experts think that this user friendliness is the key of its mass success.

Darksky

DarkSky is a botnet that is capable of downloading malware, conducting a number of network and application-layer distributed denial-of-service (DDoS) attacks, and detecting and evading security controls, such as sandboxes and virtual machines. It is advertised for sale on the dark web for \$20. Much of the malware that DarkSky has available to download onto targeted systems is associated with cryptocurrency-mining activity. The DDoS attacks that DarkSky can perform include DNS amplification attacks, TCP (SYN) flood, UDP flood, and HTTP flood. The botnet can also perform a check to determine whether or not the DDoS attack succeeded and turn infected systems into a SOCKS/HTTP proxy to route traffic to a remote server.

Defray

Defray is ransomware that appeared in 2017, and is targeted ransomware, mainly on the healthcare vertical.

The distribution of Defray has several notable characteristics: According to Proofpoint: " Defray is currently being spread via Microsoft Word document attachments in email The campaigns are as small as several messages each The lures are custom crafted to appeal to the intended set of potential victims The recipients are individuals or distribution lists, e.g., group@ and websupport@ Geographic targeting is in the UK and US Vertical targeting varies by campaign and is narrow and selective "

Deprimon

According to ESET Research, DePriMon is a malicious downloader, with several stages and using many non-traditional techniques. To achieve persistence, the malware registers a new local port monitor – a trick falling under the “Port Monitors” technique in the MITRE ATT&CK knowledgebase. For that, the malware uses the “Windows Default Print Monitor” name; that’s why we have named it DePriMon. Due to its complexity and modular architecture, researcher believe it to be a framework.

DePriMon has been active since at least March 2017. DePriMon was detected in a private company, based in Central Europe, and at dozens of computers in the Middle East.

Dharma

According to MalwareBytes, the Dharma Ransomware family is installed manually by attackers hacking into computers over Remote Desktop Protocol Services (RDP). The attackers will scan the Internet for computers running RDP, usually on TCP port 3389, and then attempt to brute force the password for the computer.

Once they gain access to the computer they will install the ransomware and let it encrypt the computer. If the attackers are able to encrypt other computers on the network, they will attempt to do so as well.

DMSniff

DMSniff is a point-of-sale malware previously only privately sold. It has been used in breaches of small- and medium-sized businesses in the restaurant and entertainment industries. It uses a domain generation algorithm (DGA) to create lists of command-and-control domains on the fly.

The tag is: *misp-galaxy:malpedia="DMSniff"*

DMSniff is also known as:

Table 1737. Table References

| Links |
|---|
| https://malpedia.caad.fkie.fraunhofer.de/details/win.dmsniff |
| https://www.flashpoint-intel.com/blog/dmsniff-pos-malware-actively-leveraged-target-medium-sized-businesses/ |

DneSpy

DneSpy collects information, takes screenshots, and downloads and executes the latest version of other malicious components in the infected system. The malware is designed to receive a “policy” file in JSON format with all the commands to execute. The policy file sent by the C&C server can be changed and updated over time, making dneSpy flexible and well-designed. The output of each executed command is zipped, encrypted, and exfiltrated to the C&C server. These characteristics make dneSpy a fully functional espionage backdoor.

The tag is: *misp-galaxy:malpedia="DneSpy "*

DneSpy is also known as:

Table 1738. Table References

| https://malpedia.caad.fkie.fraunhofer.de/details/win.dnschanger |
| https://www.johannesbader.ch/2016/01/the-dga-in-alureon-dnschanger/ |

DNSMessenger

DNSMessenger makes use of DNS TXT record queries and responses to create a bidirectional Command and Control (C2) channel. This allows the attacker to use DNS communications to submit new commands to be run on infected machines and return the results of the command execution to the attacker.

The tag is: *misp-galaxy:malpedia="DNSMessenger"*

DNSMessenger is also known as:

- TEXTMATE

Table 1740. Table References

DownPaper

DownPaper, sometimes delivered as *sami.exe*, is a Backdoor trojan. Its main functionality is to download and run a second stage. This malware has been observed in campaigns involving Charming Kitten, an Iranian cyberespionage group.

The tag is: *misp-galaxy:malpedia="DownPaper"*

DownPaper is also known as:

DreamBot

2010 Gozi v2.0, Gozi ISFB, ISFB, Pandemyia(*) 2014 Dreambot (Gozi ISFB variant)

In 2014, a variant of Gozi ISFB was developed. Mainly, the dropper performs additional anti-vm checks (vmware, vbox, qemu), while the actual bot-dll remains unchanged in most parts. New functionality, such as TOR support, was added though and often, the Fluxxy fast-flux network is used.

See win.gozi for additional historical information.

Dridex

OxCERT blog describes Dridex as "an evasive, information-stealing malware variant; its goal is to acquire as many credentials as possible and return them via an encrypted tunnel to a Command-and-Control (C&C) server. These C&C servers are numerous and scattered all over the Internet, if the malware cannot reach one server it will try another. For this reason, network-based measures such as blocking the C&C IPs is effective only in the short-term." According to MalwareBytes, "Dridex uses an older tactic of infection by attaching a Word document that utilizes macros to install malware. However, once new versions of Microsoft Office came out and users generally updated, such a threat subsided because it was no longer simple to infect a user with this method." IBM X-Force discovered "a new version of the Dridex banking Trojan that takes advantage of a code injection technique called AtomBombing to infect systems. AtomBombing is a technique for injecting malicious code into the 'atom tables' that almost all versions of Windows uses to store certain application data. It is a variation of typical code injection attacks that take advantage of input validation errors to insert and to execute malicious code in a legitimate process or application. Dridex v4 is the first malware that uses the AtomBombing process to try and infect systems."

The tag is: *misp-galaxy:malpedia="Dridex"*

DRIFTPIN

Driftpin is a small and simple backdoor that enables the attackers to assess the victim. When executed the trojan connects to a C&C server and receives commands to grab screenshots, enumerate running processes and get information about the system and campaign ID.

DUSTMAN

In 2019, multiple destructive attacks were observed targeting entities within the Middle East. The National Cyber Security Centre (NCSC), a part of the National Cybersecurity Authority (NCA), detected a new malware named "DUSTMAN" that was detonated on December 29, 2019. Based on analyzed evidence and artifacts found on machines in a victim's network that were not wiped by the malware. NCSC assess that the threat actor behind the attack had some kind of urgency on executing the files on the date of the attack due to multiple OPSEC failures observed on the infected network. NCSC is calling the malware used in this attack "DUSTMAN" after the filename and string embedded in the malware. "DUSTMAN" can be considered as a new variant of "ZeroCleare" malware, published in December 2019.

EASYNIGHT

FireEye describes EASYNIGHT is a loader observed used with several malware families, including HIGHNOON and HIGHNOON.LITE. The loader often acts as a persistence mechanism via search order hijacking.

Examples include a patched bcrypt.dll with no other modification than an additional import entry, in the observed case "printwin.dll!gzwrite64" (breaking the file signature).

ELECTRICFISH

The application is a command-line utility and its primary purpose is to tunnel traffic between two IP addresses. The application accepts command-line arguments allowing it to be configured with a destination IP address and port, a source IP address and port, a proxy IP address and port, and a user name and password, which can be utilized to authenticate with a proxy server. It will attempt to establish TCP sessions with the source IP address and the destination IP address. If a connection is made to both the source and destination IPs, this malicious utility will implement a custom protocol, which will allow traffic to rapidly and efficiently be tunneled between two machines. If necessary, the malware can authenticate with a proxy to be able to reach the destination IP address. A configured proxy server is not required for this utility.

ELMER

ELMER is a non-persistent proxy-aware HTTP backdoor written in Delphi, and is capable of performing file uploads and downloads, file execution, and process and directory listings. To retrieve commands, ELMER sends HTTP GET requests to a hard-coded CnC server, and parses the HTTP response packets received from the CnC server for an integer string corresponding to the command that needs to be executed.

Emotet

While Emotet historically was a banking malware organized in a botnet, nowadays Emotet is mostly seen as infrastructure as a service for content delivery. For example, since mid 2018 it is used by Trickbot for installs, which may also lead to ransomware attacks using Ryuk, a combination observed several times against high-profile targets. It is always stealing information from victims but what the criminal gang behind it did, was to open up another business channel by selling their infrastructure delivering additional malicious software. From malware analysts it has been classified into epochs depending on command and control, payloads, and delivery solutions which change over time. Emotet has been taken down in January 2021.

FatDuke

According to ESET Research, FatDuke is the current flagship backdoor of APT29 and is only deployed on the most interesting machines. It is generally dropped by the MiniDuke backdoor, but ESET also have seen the operators dropping FatDuke using lateral movement tools such as PsExec. The operators regularly repack this malware in order to evade detections. The most recent sample of FatDuke that ESET have seen was compiled on May 24, 2019. They have seen them trying to regain control of a machine multiple times in a few days, each time with a different sample. Their packer, described in a later section, adds a lot of code, leading to large binaries. While the effective code should not be larger than 1MB, ESET have seen one sample weighing in at 13MB, hence our name for this backdoor component: FatDuke.

FinFisher RAT

FinFisher is a commercial software used to steal information and spy on affected victims. It began with few functionalities which included password harvesting and information leakage, but now it is mostly known for its full Remote Access Trojan (RAT) capabilities. It is mostly known for being used in governmental targeted and lawful criminal investigations. It is well known for its anti-detection capabilities and use of VMProtect.

The tag is: *misp-galaxy:malpedia="FinFisher RAT"*

FinFisher RAT is also known as:

- FinSpy

Gameover P2P

Gameover Zeus is a peer-to-peer botnet based on components from the earlier Zeus trojan. According to a report by Symantec, Gameover Zeus has largely been used for banking fraud and distribution of the CryptoLocker ransomware. In early June 2014, the U.S. Department of Justice announced that an international inter-agency collaboration named Operation Tovar had succeeded in temporarily cutting communication between Gameover Zeus and its command and control servers.

Gandcrab

GandCrab was a Ransomware-as-a-Service (RaaS) emerged in January 28, 2018, managed by a criminal organization known to be confident and vocal, while running a rapidly evolving ransomware campaign. Through their aggressive, albeit unusual, marketing strategies and constant recruitment of affiliates, they were able to globally distribute a high volume of their malware.

In a surprising announcement on May 31, 2019, the GandCrab's operators posted on a dark web forum, announced the end of a little more than a year of ransomware operations, citing staggering profit figures. However, If there's one thing that sets these threat actors apart from other groups, it is that they are unpredictable; so there is always the possibility that they might re-surface in one form or another.

The tag is: *misp-galaxy:malpedia="Gandcrab"*

Gandcrab is also known as:

- GrandCrab

GEMCUTTER

According to FireEye, GEMCUTTER is used in a similar capacity as BACKBEND (downloader), but maintains persistence by creating a Windows registry run key. GEMCUTTER checks for the presence of the mutex MicrosoftGMMZJ to ensure only one copy of GEMCUTTER is executing. If the mutex doesn't exist, the malware creates it and continues execution; otherwise, the malware signals the MicrosoftGMMExit event.

GoldMax

Gold Max is a Golang written command and control backdoor used by the NOBELIUM threat actor group. It uses several different techniques to obfuscate its actions and evade detection. The malware writes an encrypted configuration file to disk, where the file name and AES-256 cipher keys are unique per implant and based on environmental variables and information about the network where it is running.

The tag is: *misp-galaxy:malpedia="GoldMax"*

GoldMax is also known as:

- SUNSHUTTLE

GoldDragon

GoldDragon was a second-stage backdoor which established a permanent presence on the victim's system once the first-stage, file-less, PowerShell-based attack leveraging steganography was executed. The initial attack was observed first in December 2017, when a Korean-language spear phishing campaign targeted organizations linked with Pyeongchang Winter Olympics 2018. GoldDragon was delivered once the attacker had gained an initial foothold in the targeted environment.

The malware was capable of a basic reconnaissance, data exfiltration and downloading of additional components from its C&C server.

The tag is: *misp-galaxy:malpedia="GoldDragon"*

GoldDragon is also known as:

Gozi

2000 Ursnif aka Snifula 2006 Gozi v1.0, Gozi CRM, CRM, Papras 2010 Gozi v2.0, Gozi ISFB, ISFB, Pandemyia(*) → 2010 Gozi Prinimalka → Vawtrak/Neverquest

In 2006, Gozi v1.0 ('Gozi CRM' aka 'CRM') aka Papras was first observed. It was offered as a CaaS, known as 76Service. This first version of Gozi was developed by Nikita Kurmin, and he borrowed code from Ursnif aka Snifula, a spyware developed by Alexey Ivanov around 2000, and some other kits. Gozi v1.0 thus had a formgrabber module and often is classified as Ursnif aka Snifula.

In September 2010, the source code of a particular Gozi CRM dll version was leaked, which led to Vawtrak/Neverquest (in combination with Pony) via Gozi Prinimalka (a slightly modified Gozi v1.0) and Gozi v2.0 (aka 'Gozi ISFB' aka 'ISFB' aka Pandemyia). This version came with a webinject module.

Grateful POS

POS malware targets systems that run physical point-of-sale device and operates by inspecting the process memory for data that matches the structure of credit card data (Track1 and Track2 data), such as the account number, expiration date, and other information stored on a card's magnetic stripe. After the cards are first scanned, the personal account number (PAN) and accompanying data sit in the point-of-sale system's memory unencrypted while the system determines where to send it for authorization. Masked as the LogMein software, the GratefulPOS malware appears to have emerged during the fall 2017 shopping season with low detection ratio according to some of

the earliest detections displayed on VirusTotal. The first sample was upload in November 2017. Additionally, this malware appears to be related to the Framework POS malware, which was linked to some of the high-profile merchant breaches in the past.

The tag is: *misp-galaxy:malpedia="Grateful POS"*

Grateful POS is also known as:

- FrameworkPOS
- SCRAPMINT
- trinity

GRIMAGENT

GRIMAGENT is a backdoor that can execute arbitrary commands, download files, create and delete scheduled tasks, and execute programs via scheduled tasks or via the ShellExecute API. The malware persists via a randomly named scheduled task and a registry Run key. The backdoor communicates to hard-coded C&C servers via HTTP requests with portions of its network communications encrypted using both asymmetric and symmetric cryptography. GRIMAGENT was used during some Ryuk Ransomware intrusions in 2020.

Havex RAT

Havex is a remote access trojan (RAT) that was discovered in 2013 as part of a widespread espionage campaign targeting industrial control systems (ICS) used across numerous industries and attributed to a hacking group referred to as "Dragonfly" and "Energetic Bear". Havex is estimated to have impacted thousands of infrastructure sites, a majority of which were located in Europe and the United States. Within the energy sector, Havex specifically targeted energy grid operators, major electricity generation firms, petroleum pipeline operators, and industrial equipment providers. Havex also impacted organizations in the aviation, defense, pharmaceutical, and petrochemical industries.

Once installed, Havex scanned the infected system to locate any Supervisory Control and Data Acquisition (SCADA) or ICS devices on the network and sent the data back to command and control servers. To do so, the malware leveraged the Open Platform Communications (OPC) standard, which is a universal communication protocol used by ICS components across many industries that facilitates open connectivity and vendor equipment interoperability. Havex used the Distributed Component Object Model (DCOM) to connect to OPC servers inside of an ICS network and collect information such as CLSID, server name, Program ID, OPC version, vendor information, running state, group count, and server bandwidth.

Havex was an intelligence-collection tool used for espionage and not for the disruption or destruction of industrial systems. However, the data collected by Havex would have aided efforts to design and develop attacks against specific targets or industries.

HAWKBALL

HAWKBALL is a backdoor that attackers can use to collect information from the victim, as well as to deliver payloads. HAWKBALL is capable of surveying the host, creating a named pipe to execute native Windows commands, terminating processes, creating, deleting and uploading files, searching for files, and enumerating drives.

HawkEye Keylogger

HawKeye is a keylogger that is distributed since 2013. Discovered by IBM X-Force, it is currently spread over phishing campaigns targeting businesses on a worldwide scale. It is designed to steal credentials from numerous applications but, in the last observed versions, new "loader capabilities" have been spotted. It is sold by its development team on dark web markets and hacking forums.

HiddenTear

HiddenTear is an open source ransomware developed by a Turkish programmer and later released as proof of concept on GitHub. The malware generates a local symmetric key in order to encrypt a configurable folder (/test was the default one) and it sends it to a centralized C&C server. Due to its small payload it was used as real attack vector over email phishing campaigns. Variants are still used in attacks.

Houdini

Houdini is a VBS-based RAT dating back to 2013. Past in the days, it used to be wrapped in an .exe but started being spamvertized or downloaded by other malware directly as .vbs in 2018. In 2019, WSHRAT appeared, a Javascript-based version of Houdini, recoded by the name of Kognito.

HyperBro

HyperBro is a RAT that has been observed to target primarily within the gambling industries, though it has been spotted in other places as well. The malware typically consists of 3 or more components: a) a genuine loader typically with a signed certification b) a malicious DLL loader loaded from the former component via DLL hijacking c) an encrypted and compressed blob that decrypts to a PE-based payload which has its C2 information hardcoded within.

The tag is: *misp-galaxy:malpedia="HyperBro"*

HyperBro is also known as:

IcedID

Analysis Observations:

- It sets up persistence by creating a Scheduled Task with the following characteristics:
- Name: Update
- Trigger: At Log on
- Action: %LocalAppData%\\$Example\\waroupada.exe /i
- Conditions: Stop if the computer ceases to be idle.
- The sub-directory within %LocalAppdata%, Appears to be randomly picked from the list of directories within %ProgramFiles%. This needs more verification.
- The filename remained static during analysis.
- The original malware exe (ex. waroupada.exe) will spawn an instance of svchost.exe as a sub-process and then inject/execute its malicious code within it
- If “/i” is not passed as an argument, it sets up persistence and waits for reboot.
- If “/I” is passed as an argument (as is the case when the scheduled task is triggered at login), it skips persistence setup and actually executes; resulting in C2 communication.
- Employs an interesting method for sleeping by calling the Sleep function of kernel32.dll from the shell, like so: rundll32.exe kernel32,Sleep -s
- Setup a local listener to proxy traffic on 127.0.0.1:50000

Ice IX

The ICE IX bot is a banking trojan derived of the Zeus botnet because it uses significant parts of Zeus's source code. ICE IX communicates using the HTTP protocol, so it can be considered to be a third-generation botnet. While it has been used for a variety of purposes, a primary threat of ICE IX comes from its manipulation of banking operations on compromised machines. As with any bot, execution of the bot results in establishing a master-slave relationship between the botmaster and the compromised computer.

win.innfirat

InnifirAT is coded in .NET and targets personal data on infected devices, with it's top priority appearing to be bitcoin and litecoin wallet data.

InffirAT also includes a backdoor which allows attackers to control the infected host remotely. Possibilities include loggin key stroke, taking pictures with webcam, accessing confidential information, formatting drives, and more.

It attempts to steal browser cookies to steal usernames and passwords and monitors the users activities with screenshot functionality.

InvisiMole

InvisiMole had a modular architecture, starting with a wrapper DLL, and performing its activities using two other modules that were embedded in its resources, named RC2FM and RC2CL. They were feature-rich backdoors and turned the affected computer into a video camera, letting the attackers to spy the victim. The malicious actors behind this malware were active at least since 2013 in highly targeted campaigns with only a few dozen compromised computers in Ukraine and Russia. The wrapper DLL posed as a legitimate mpr.dll library and was placed in the same folder as explorer.exe, which made it being loaded during the Windows startup into the Windows Explorer process instead of the legitimate library. Malware came in both 32-bit and 64-bit versions, which made this persistence technique functional on both architectures.

The smaller of the modules, RC2FM, contained a backdoor with fifteen supported commands indexed by numbers. The commands could perform simple changes on the system and spying features like capturing sounds, taking screenshots or monitoring all fixed and removable drives.

The second module, RC2CL, offered features for collecting as much data about the infected computer as possible, rather than for making system changes. The module supported up to 84 commands such as file system operations, file execution, registry key manipulation, remote shell activation, wireless network scanning, listing of installed software etc. Though the backdoor was capable of interfering with the system (e.g. to log off a user, terminate a process or shut down the system), it mostly provided passive operations. Whenever possible, it tried to hide its activities by restoring the original file access time or safe-deleting its traces.

IRONHALO

IRONHALO is a downloader that uses the HTTP protocol to retrieve a Base64 encoded payload from a hard-coded command-and-control (CnC) server and uniform resource locator (URL) path.

The encoded payload is written to a temporary file, decoded and executed in a hidden window. The encoded and decoded payloads are written to files named `igfxHK[%rand%].dat` and `igfxHK[%rand%].exe` respectively, where `[%rand%]` is a 4-byte hexadecimal number based on the current timestamp. It persists by copying itself to the current user's Startup folder.

ISFB

2006 Gozi v1.0, Gozi CRM, CRM, Papras 2010 Gozi v2.0, Gozi ISFB, ISFB, Pandemyia(*)

In September 2010, the source code of a particular Gozi CRM dll version was leaked. This led to two main branches: one became known as Gozi Prinimalka, which was merge with Pony and became Vawtrak/Neverquest.

The other branch became known as Gozi ISFB, or ISFB in short. Webinject functionality was added to this version.

There is one panel which often was used in combination with ISFB: IAP. The panel's login page comes with the title 'Login - IAP'. The body contains 'AUTHORIZATION', 'Name:', 'Password:' and a single button 'Sign in' in a minimal design. Often, the panel is directly accessible by entering the C2 IP address in a browser. But there are ISFB versions which are not directly using IAP. The bot accesses a gate, which is called the 'Dreambot' gate. See `win.dreambot` for further information.

ISFB often was protected by Rovnix. This led to a further complication in the naming scheme - many companies started to call ISFB Rovnix. Because the signatures started to look for Rovnix, other trojans protected by Rovnix (in particular ReactorBot and Rerdom) sometimes got wrongly labelled.

In April 2016 a combination of Gozi ISFB and Nymaim was detected. This breed became known as GozNym. The merge uses a shellcode-like version of Gozi ISFB, that needs Nymaim to run. The C2 communication is performed by Nymaim.

See win.gozi for additional historical information.

The tag is: *misp-galaxy:malpedia="ISFB"*

ISFB is also known as:

- Gozi ISFB
- IAP
- Pandemyia

Jason

Jason is a graphic tool implemented to perform Microsoft exchange account brute-force in order to “harvest” the highest possible emails and accounts information. Distributed in a ZIP container the interface is quite intuitive: the Microsoft exchange address and its version shall be provided. Three brute-force methods could be selected: EWS (Exchange Web Service), OAB (Offline Address Book) or both (All). Username and password list can be selected and threads number should be provided in order to optimize the attack balance.

JSOutProx

JSOutProx is a sophisticated attack framework built using both Javascript and .NET. It uses the .NET (de)serialization feature to interact with a Javascript file which is the core module running on a victim machine. Once the malware is run on the victim, the framework can load several plugins performing additional malicious activities on the target.

Kardon Loader

According to ASERT, Kardon Loader is a fully featured downloader, enabling the download and installation of other malware, eg. banking trojans/credential theft etc. This malware has been on sale by an actor under the username Yattaze, starting in late April. The actor offers the sale of the malware as a standalone build with charges for each additional rebuild, or the ability to set up a botshop in which case any customer can establish their own operation and further sell access to a new customer base.

Karius

According to checkpoint, Karius is a banking trojan in development, borrowing code from Ramnit, Vawtrack as well as Trickbot, currently implementing webinject attacks only.

It comes with an injector that loads an intermediate "proxy" component, which in turn loads the actual banker component.

Communication with the c2 are in json format and encrypted with RC4 with a hardcoded key.

In the initial version, observed in March 2018, the webinjects were hardcoded in the binary, while in subsequent versions, they were received by the c2.

KleptoParasite Stealer

KleptoParasite Stealer is advertised on Hackforums as a noob-friendly stealer. It is modular and comes with a IP retriever module, a Outlook stealer (32bit/64bit) and a Chrome/Firefox stealer (32bit/64bit). Earlier versions come bundled (loader plus modules), newer versions come with a loader (167k) that grabs the modules.

PDB-strings suggest a relationship to JogLog v6 and v7.

LimeRAT

Description

Simple yet powerful RAT for Windows machines. This project is simple and easy to understand, It should give you a general knowledge about dotNET malwares and how it behaves.

Main Features

- **.NET**
- Coded in Visual Basic .NET, Client required framework 2.0 or 4.0 dependency, And server is 4.0
- **Connection**
- Using pastebin.com as ip:port , Instead of noip.com DNS. And Also using multi-ports
- **Plugin**
- Using plugin system to decrease stub's size and lower the AV detection
- **Encryption**
- The communication between server & client is encrypted with AES
- **Spreading**
- Infecting all files and folders on USB drivers
- **Bypass**
- Low AV detection and undetected startup method
- **Lightweight**
- Payload size is about 25 KB
- **Anti Virtual Machines**
- Uninstall itself if the machine is virtual to avoid scanning or analyzing
- **Ransomware**
- Encrypting files on all HHD and USB with .Lime extension
- **XMR Miner**
- High performance Monero CPU miner with user idle\active optimizations
- **DDoS**

- Creating a powerful DDOS attack to make an online service unavailable
- **Crypto Stealer**
- Stealing Cryptocurrency sensitive data
- **Screen-Locker**
- Prevents user from accessing their Windows GUI
- **And more**
- On Connect Auto Task
- Force enable Windows RDP
- Persistence
- File manager
- Passowrds stealer
- Remote desktop
- Bitcoin grabber
- Downloader
- Keylogger

LiteDuke

According to CarbonBlack, LiteDuke is a third stage backdoor. It appears to use the same dropper as PolyglotDuke. Its payload makes use of an AES encrypted SQLite database to store its configuration. LiteDuke supports a large number of individual commands including host information retrieval,

file upload and download, and the ability to execute other code. LiteDuke C2 servers appear to be compromised servers, and the malware communicates with them using normal HTTP requests. It attempts to use a realistic User-Agent string to blend in better with normal HTTP traffic. ESET have dubbed it LiteDuke because it uses SQLite to store information such as its configuration.

LockerGoga

According to Trend Micro, LockerGoga is a ransomware that has been used in multiple attacks, most notably against Altran Technologies and Norsk Hydro. It encrypts a range of documents and source code files but certain versions had little to no whitelist that would protect import system files such as the Windows Boot Manager.

The tag is: *misp-galaxy:malpedia="LockerGoga"*

Locky

Locky is a high profile ransomware family that first appeared in early 2016 and was observed being active until end of 2017. It encrypts files on the victim system and asks for ransom in order to have back original files. In its first version it added a .locky extension to the encrypted files, and in recent versions it added the .lukitus extension. The ransom amount is defined in BTC and depends on the actor.

Loda

Loda is a previously undocumented AutoIT malware with a variety of capabilities for spying on victims. Proofpoint first observed Loda in September of 2016 and it has since grown in popularity. The name Loda is derived from a directory to which the malware author chose to write keylogger logs. It should be noted that some antivirus products currently detect Loda as “Trojan.Nymeria”, although the connection is not well-documented.

Loki Password Stealer (PWS)

"Loki Bot is a commodity malware sold on underground sites which is designed to steal private data from infected machines, and then submit that info to a command and control host via HTTP POST. This private data includes stored passwords, login credential information from Web browsers, and a variety of cryptocurrency wallets." - PhishMe

Loki-Bot employs function hashing to obfuscate the libraries utilized. While not all functions are hashed, a vast majority of them are.

Loki-Bot accepts a single argument/switch of '-u' that simply delays execution (sleeps) for 10 seconds. This is used when Loki-Bot is upgrading itself.

The Mutex generated is the result of MD5 hashing the Machine GUID and trimming to 24-characters. For example: "B7E1C2CC98066B250DDB2123".

Loki-Bot creates a hidden folder within the %APPDATA% directory whose name is supplied by the 8th thru 13th characters of the Mutex. For example: "%APPDATA%\ C98066".

There can be four files within the hidden %APPDATA% directory at any given time: ".exe," ".lck," ".hdb" and ".kdb." They will be named after characters 13 thru 18 of the Mutex. For example: "6B250D." Below is the explanation of their purpose:

| FILE EXTENSION | FILE DESCRIPTION |
|----------------|--|
| .exe | A copy of the malware that will execute every time the user account is logged into |
| .lck | A lock file created when either decrypting Windows Credentials or Keylogging to prevent resource conflicts |
| .hdb | A database of hashes for data that has already been exfiltrated to the C2 server |
| .kdb | A database of keylogger data that has yet to be sent to the C2 server |

If the user is privileged, Loki-Bot sets up persistence within the registry under HKEY_LOCAL_MACHINE. If not, it sets up persistence under HKEY_CURRENT_USER.

The first packet transmitted by Loki-Bot contains application data.

The second packet transmitted by Loki-Bot contains decrypted Windows credentials.

The third packet transmitted by Loki-Bot is the malware requesting C2 commands from the C2 server. By default, Loki-Bot will send this request out every 10 minutes after the initial packet it sent.

Communications to the C2 server from the compromised host contain information about the user and system including the username, hostname, domain, screen resolution, privilege level, system architecture, and Operating System.

The first WORD of the HTTP Payload represents the Loki-Bot version.

The second WORD of the HTTP Payload is the Payload Type. Below is the table of identified payload types:

BYTE PAYLOAD TYPE 0x26 Stolen Cryptocurrency Wallet 0x27 Stolen Application Data 0x28 Get C2 Commands from C2 Server 0x29 Stolen File 0x2A POS (Point of Sale?) 0x2B Keylogger Data 0x2C Screenshot

The 11th byte of the HTTP Payload begins the Binary ID. This might be useful in tracking campaigns or specific threat actors. This value is typically “ckav.ru”. If you come across a Binary ID that is different from this, take note!

Loki-Bot encrypts both the URL and the registry key used for persistence using Triple DES encryption.

The Content-Key HTTP Header value is the result of hashing the HTTP Header values that precede it. This is likely used as a protection against researchers who wish to poke and prod at Loki-Bot’s C2 infrastructure.

Loki-Bot can accept the following instructions from the C2 Server:

BYTE INSTRUCTION DESCRIPTION 0x00 Download EXE & Execute 0x01 Download DLL & Load #1 0x02 Download DLL & Load #2 0x08 Delete HDB File 0x09 Start Keylogger 0x0A Mine & Steal Data 0x0E Exit Loki-Bot 0x0F Upgrade Loki-Bot 0x10 Change C2 Polling Frequency 0x11 Delete Executables & Exit

looChiper

LooChiper is a Ransomware. It uses a nice but scary name: LooCipher. The name is at the same time an allusion to its capabilities (thank to the term “Cipher”) and to the popular mythological figure, Lucifer. Despite its evocative nickname, the functionalities of this malware are pretty straight forward, not very different from those belonging to many other ransomware families.

The tag is: *misp-galaxy:malpedia="looChiper"*

looChiper is also known as:

L0rdix

L0rdix is a multipurpose .NET remote access tool (RAT) first discovered being sold on underground forums in November 2018. Out of the box, L0rdix supports eight commands, although custom commands can be defined and added. These include:

Download and execute Update Open page (visible) Open page (invisible) Cmd Kill process Upload file HTTP Flood

L0rdix can extract credentials from common web browsers and steal data from crypto wallets and a target's clipboard. Optionally, L0rdix can deploy a cryptominer (XMRig) to its bots.

The tag is: *misp-galaxy:malpedia="L0rdix"*

L0rdix is also known as:

- lordix

Machete

According to ESET, Machete's dropper is a RAR SFX executable. Three py2exe components are dropped: GoogleCrash.exe, Chrome.exe and GoogleUpdate.exe. A single configuration file, jer.dll, is dropped, and it contains base64-encoded text that corresponds to AES-encrypted strings. GoogleCrash.exe is the main component of the malware. It schedules execution of the other two components and creates Windows Task Scheduler tasks to achieve persistence. Regarding the geolocation of victims, Chrome.exe collects data about nearby Wi-Fi networks and sends it to the Mozilla Location Service API. In short, this application provides geolocation coordinates when it's given other sources of data such as Bluetooth beacons, cell towers or Wi-Fi access points. Then the malware takes latitude and longitude coordinates to build a Google Maps URL. The GoogleUpdate.exe component is responsible for communicating with the remote C&C server. The configuration to set the connection is read from the jer.dll file: domain name, username and password. The principal means of communication for Machete is via FTP, although HTTP communication was implemented as a fallback in 2019.

The tag is: *misp-galaxy:malpedia="Machete"*

Machete is also known as:

- El Machete

MASS Logger

MassLogger is a .NET credential stealer. It starts with a launcher that uses simple anti-debugging techniques which can be easily bypassed when identified. This first stage loader eventually XOR-decrypts the second stage assembly which then decrypts, loads and executes the final MassLogger payload.

The tag is: *misp-galaxy:malpedia="MASS Logger"*

MASS Logger is also known as:

Maze

Maze Ransomware encrypts files and makes them inaccessible while adding a custom extension containing part of the ID of the victim. The ransom note is placed inside a text file and an htm file. There are a few different extensions appended to files which are randomly generated.

Actors are known to exfiltrate the data from the network for further extortion. It spreads mainly using email spam and various exploit kits (Spelevo, Fallout).

The code of Maze ransomware is highly complicated and obfuscated, which helps to evade security solutions using signature-based detections.

The tag is: *misp-galaxy:malpedia="Maze"*

Maze is also known as:

- ChaCha

MedusaLocker

A Windows ransomware that will run certain tasks to prepare the target system for the encryption of files. MedusaLocker avoids executable files, probably to avoid rendering the targeted system unusable for paying the ransom. It uses a combination of AES and RSA-2048, and reportedly appends extensions such as .encrypted, .bomber, .boroff, .breakingbad, .locker16, .newlock, .nlocker, and .skynet.

The tag is: *misp-galaxy:malpedia="MedusaLocker"*

MedusaLocker is also known as:

- AKO Doxware
- AKO Ransomware
- MedusaReborn

MegaCortex

Megacortex is a ransomware used in targeted attacks against corporations. Once the ransomware is run it tries to stop security related services and after that it starts its own encryption process adding a .aes128ctr or .megac0rtx extension to the encrypted files. It is used to be carried from downloaders and trojans, it has no own propagation capabilities.

The tag is: *misp-galaxy:malpedia="MegaCortex"*

MegaCortex is also known as:

Mispadu

According to ESET Research, Mispadu is an ambitious Latin American banking trojan that utilizes McDonald's malvertising and extends its attack surface to web browsers. It is used to target the general public and its main goals are monetary and credential theft. In Brazil, ESET has seen it distributing a malicious Google Chrome extension that attempts to steal credit card data and online banking data, and that compromises the Boleto payment system.

MoleNet

MoleNet is a .NET downloader malware used by the Molerats group in targeted attacks in the Middle East. Before downloading additional payloads, it first collects information about the infected machine using WMI queries and sends the data to its operators. It was first discovered in 2020, however, Cybereason researchers showed that it has been in use since at least 2019, with infrastructure that operated since 2017.

Moriya

This tool is a passive backdoor which allows attackers to inspect all incoming traffic to the infected machine, filter out packets that are marked as designated for the malware and respond to them. This forms a covert channel over which attackers are able to issue shell commands and receive back their outputs.

Nemty

Nemty is a ransomware that was discovered in September 2019. Fortinet states that they found it being distributed through similar ways as Sodinokibi and also noted artifacts they had seen before in Gandcrab.

NESTEGG

NESTEGG is a memory-only backdoor that can proxy commands to other infected systems using a custom routing scheme. It accepts commands to upload and download files, list and delete files, list and terminate processes, and start processes. NESTEGG also creates Windows Firewall rules that allows the backdoor to bind to a specified port number to allow for inbound traffic.

NetWire RC

Netwire is a RAT, its functionality seems focused on password stealing and keylogging, but includes remote control capabilities as well.

Keylog files are stored on the infected machine in an obfuscated form. The algorithm is:

```
for i in range(0,num_read):
    buffer[i] = ((buffer[i]-0x24)^0x9D)&0xFF
```

The tag is: *misp-galaxy:malpedia="NetWire RC"*

NetWire RC is also known as:

- NetWeird
- NetWire
- Recam

NjRAT

RedPacket Security describes NJRat as "a remote access trojan (RAT) has capabilities to log keystrokes, access the victim's camera, steal credentials stored in browsers, open a reverse shell, upload/download files, view the victim's desktop, perform process, file, and registry manipulations, and capabilities to let the attacker update, uninstall, restart, close, disconnect the RAT and rename its campaign ID. Through the Command & Control (CnC) server software, the attacker has capabilities to create and configure the malware to spread through USB drives."

It is supposedly popular with actors in the Middle East. Similar to other RATs, many leaked builders may be backdoored.

The tag is: `misp-galaxy:malpedia="NjRAT"`

NjRAT is also known as:

- Bladabindi

OrcaRAT

OrcaRAT is a Backdoor that targets the Windows platform. It has been reported that a variant of this malware has been used in a targeted attack. It contacts a remote server, sending system information. Moreover, it receives control commands to execute shell commands, and download/upload a file, among other actions.

The tag is: *misp-galaxy:malpedia="OrcaRAT"*

OrcaRAT is also known as:

Orcus RAT

Orcus has been advertised as a Remote Administration Tool (RAT) since early 2016. It has all the

features that would be expected from a RAT and probably more. The long list of the commands is documented on their website. But what separates Orcus from the others is its capability to load custom plugins developed by users, as well as plugins that are readily available from the Orcus repository. In addition to that, users can also execute C# and VB.net code on the remote machine in real-time.

The tag is: *misp-galaxy:malpedia="Orcus RAT"*

Orcus RAT is also known as:

- Schnorchel

Ordinypt

This malware claims to be a ransomware, but it's actually a wiper. After execution, this malware terminates a number of processes such as database processes, likely to allow access to any files that these programs may have held open. Ordinypt will avoid wiping certain files and folders in order to prevent the infected machine from becoming unusable. Affected files are overwritten with null character and receive a random 5 character file extension. Finally, shadow copies are removed and Windows startup repair is disabled to complicate recovery of data from the affected system. The desktop background is changed and a ransom note is dropped for the victim. A C2 check-in occurs to keep track of the file extension used on that specific machine, as well as which BitCoin address was randomly provided for payment to the victim (drawn from a long list stored in the ransomware configuration).

The tag is: *misp-galaxy:malpedia="Ordinypt"*

PandaBanker

According to Arbor, Forcepoint and Proofpoint, Panda is a variant of the well-known Zeus banking trojan(*). Fox IT discovered it in February 2016.

This banking trojan uses the infamous ATS (Automatic Transfer System/Scripts) to automate online bank portal actions.

The baseconfig (c2, crypto material, botnet name, version) is embedded in the malware itself. It then obtains a dynamic config from the c2, with further information about how to grab the webinjects and additional modules, such as vnc, backsocks and grabber.

Panda does have some DGA implemented, but according to Arbor, a bug prevents it from using it.

The tag is: *misp-galaxy:malpedia="PandaBanker"*

PandaBanker is also known as:

Peppy RAT

Peppy is a Python-based RAT with the majority of its appearances having similarities or definite overlap with MSIL/Crimson appearances. Peppy communicates to its C&C over HTTP and utilizes SQLite for much of its internal functionality and tracking of exfiltrated files. The primary purpose of Peppy may be the automated exfiltration of potentially interesting files and keylogs. Once Peppy successfully communicates to its C&C, the keylogging and exfiltration of files using configurable search parameters begins. Files are exfiltrated using HTTP POST requests.

PlugX

RSA describes PlugX as a RAT (Remote Access Trojan) malware family that is around since 2008 and is used as a backdoor to control the victim's machine fully. Once the device is infected, an attacker can remotely execute several kinds of commands on the affected system.

Notable features of this malware family are the ability to execute commands on the affected machine to retrieve: machine information capture the screen send keyboard and mouse events keylogging reboot the system manage processes (create, kill and enumerate) manage services (create, start, stop, etc.); and manage Windows registry entries, open a shell, etc.

The malware also logs its events in a text log file.

The tag is: *misp-galaxy:malpedia="PlugX"*

PlugX is also known as:

- Destroy RAT
- Kaba
- Korplug
- Sogu
- TIGERPLUG

poisonplug

According to FireEye, POISONPLUG is a highly obfuscated modular backdoor with plug-in capabilities. The malware is capable of registry or service persistence, self-removal, plug-in execution, and network connection forwarding. POISONPLUG has been observed using social platforms to host encoded C&C commands.

Predator The Thief

Predator is a feature-rich information stealer. It is sold on hacking forums as a bundle which includes: Payload builder and Command and Control web panel. It is able to grab passwords from browsers, replace cryptocurrency wallets, and take photos from the web-camera. It is developed by using a modular approach so that criminals may add more sophisticated tools on top of the it.

pupy (Windows)

Pupy is an open-source, cross-platform RAT and post-exploitation framework mainly written in python. Pupy can be loaded from various loaders, including PE EXE, reflective DLL, Linux ELF, pure python, powershell and APK. Most of the loaders bundle an embedded python runtime, python library modules in source/compiled/native forms as well as a flexible configuration. They bootstrap a python runtime environment mostly in-memory for the later stages of pupy to run in. Pupy can communicate using various transports, migrate into processes, load remote python code, python packages and python C-extensions from memory.

The tag is: *misp-galaxy:malpedia="pupy (Windows)"*

win.purplefox

Purple Fox uses msi.dll function, 'MsiInstallProductA', to download and execute its payload. The payload is a .msi file that contains encrypted shellcode including 32-bit and 64-bit versions. once executed the system will be restarted and uses the 'PendingFileRenameOperations' registry to rename it's components.

Upon restart the rootkit capability of Purple Fox is invoked. It creates a suspended svchost process and injects a DLL that will create a driver with the rootkit capability.

The latest version of Purple Fox abuses open-source code to enable it's rootkit components, which includes hiding and protecting its files and registry entries. It also abuses a file utility software to hide its DLL component, which deters reverse engineering.

The tag is: *misp-galaxy:malpedia="win.purplefox"*

PwndLocker

PwndLocker is a ransomware that was observed in late 2019 and is reported to have been used to target businesses and local governments/cities. According to one source, ransom amounts demanded as part of PwndLocker activity range from \$175k USD to \$650k USD depending on the size of the network. PwndLocker attempts to disable a variety of Windows services so that their data can be encrypted. Various processes will also be targeted, such as web browsers and software related to security, backups, and databases. Shadow copies are cleared by the ransomware, and encryption of files occurs once the system has been prepared in this way. Executable files and those that are likely to be important for the system to continue to function appear to be skipped by the ransomware, and a large number of folders mostly related to Microsoft Windows system files are also ignored. As of March 2020, encrypted files have been observed with the added extensions of .key and .pwnd. Ransom notes are dropped in folders where encrypted files are found and also on the user's desktop.

The tag is: *misp-galaxy:malpedia="PwndLocker"*

PwndLocker is also known as:

PyXie

Full-featured Python RAT compiled into an executable.

PyXie RAT functionality includes: * Man-in-the-middle (MITM) Interception * Web-injects * Keylogging * Credential harvesting * Network Scanning * Cookie theft * Clearing logs * Recording video * Running arbitrary payloads * Monitoring USB drives and exfiltrating data * WebDav server * Socks5 proxy * Virtual Network Connection (VNC) * Certificate theft * Inventorying software * Enumerating the domain with Sharpshound

The tag is: *misp-galaxy:malpedia="PyXie"*

PyXie is also known as:

- PyXie RAT

QakBot

QBot is a modular information stealer also known as Qakbot or Pinkslipbot. It has been active for years since 2007. It has historically been known as a banking Trojan, meaning that it steals financial data from infected systems, and a loader using C2 servers for payload targeting and download.

The tag is: *misp-galaxy:malpedia="QakBot"*

QakBot is also known as:

- Pinkslipbot
- Qbot
- Quakbot

Ragnarok

According to Bleeping Computer, the ransomware is used in targeted attacks against unpatched Citrix servers. It excludes Russian and Chinese targets using the system's Language ID for filtering. It also tries to disable Windows Defender and has a number of UNIX filepath references in its strings. Encryption method is AES using a dynamically generated key, then bundling this key up via RSA.

Reaver

Reaver is a type of malware discovered by researchers at Palo Alto Networks in November 2017, but its activity dates back to at least late 2016. Researchers identified only ten unique samples of the malware, indicating limited use, and three different variants, noted as versions 1, 2, and 3. The malware is unique as its final payload masquerades as a control panel link (CPL) file. The intended targets of this activity are unknown as of this writing; however, it was used concurrently with the SunOrcal malware and the same C2 infrastructure used by threat actors who primarily target based on the "Five Poisons" - five perceived threats deemed dangerous to, and working against the interests of, the Chinese government.

RedLine Stealer

RedLine Stealer is a malware available on underground forums for sale apparently as standalone versions or also on a subscription basis. This malware harvests information from browsers such as saved credentials, autocomplete data, and credit card information. A system inventory is also taken when running on a target machine, to include details such as the username, location data, hardware configuration, and information regarding installed security software. More recent versions of RedLine added the ability to steal cryptocurrency. FTP and IM clients are also apparently targeted by this family, and this malware has the ability to upload and download files, execute commands, and periodically send back information about the infected computer.

Regin

Regin is a sophisticated malware and hacking toolkit attributed to United States' National Security Agency (NSA) for government spying operations. It was first publicly revealed by Kaspersky Lab, Symantec, and The Intercept in November 2014. Regin malware targeted victims in a range of industries, telecom, government, and financial institutions. It was engineered to be modular and over time dozens of modules have been found and attributed to this family. Symantec observed around 100 infections in 10 different countries across a variety of organisations including private companies, government entities, and research institutes.

Remcos

Remcos (acronym of Remote Control & Surveillance Software) is a Remote Access Software used to remotely control computers. Remcos, once installed, opens a backdoor on the computer, granting full access to the remote user. Remcos can be used for surveillance and penetration testing purposes, and in some instances has been used in hacking campaigns.

Retefe (Windows)

Retefe is a Windows Banking Trojan that can also download and install additional malware onto the system using Windows PowerShell. It's primary functionality is to assist the attacker with stealing credentials for online banking websites. It is typically targeted against Swiss banks. The malware binary itself is primarily a dropper component for a Javascript file which builds a VBA file which in turn loads multiple tools onto the host including: 7zip and TOR. The VBA installs a new root certificate and then forwards all traffic via TOR to the attacker controlled host in order to effectively MITM TLS traffic.

REvil (Windows)

REvil Beta MD5: bed6fc04aeb785815744706239a1f243 SHA1:
3d0649b5f76dbbff9f86b926afbd18ae028946bf SHA256:
3641b09bf6eae22579d4fd5aae420476a134f5948966944189a70afd8032cb45 * Privilege escalation via
CVE-2018-8453 (64-bit only) * Rerun with RunAs to elevate privileges * Implements a requirement
that if "exp" is set, privilege escalation must be successful for full execution to occur * Implements
target whitelisting using GetKeyboardLayoutList * Contains debug console logging functionality *
Defines the REvil registry root key as SOFTWARE\!test * Includes two variable placeholders in the
ransom note: UID & KEY * Terminates processes specified in the "prc" configuration key prior to
encryption * Deletes shadow copies and disables recovery * Wipes contents of folders specified in
the "wfld" configuration key prior to encryption * Encrypts all non-whitelisted files on fixed drives
* Encrypts all non-whitelisted files on network mapped drives if it is running with System-level
privileges or can impersonate the security context of explorer.exe * Partially implements a
background image setting to display a basic "Image text" message * Sends encrypted system data to
a C2 domain via an HTTPS POST request (URI path building is not implemented.)

REvil 1.00

MD5: 65aa793c000762174b2f86077bdafaea

SHA1: 95a21e764ad0c98ea3d034d293aee5511e7c8457

SHA256: f0c60f62ef9ffc044d0b4aeb8cc26b971236f24a2611cb1be09ff4845c3841bc

- * Adds 32-bit implementation of CVE-2018-8453 exploit
- * Removes console debug logging
- * Changes the REvil registry root key to SOFTWARE\recfg
- * Removes the System/Impersonation success requirement for encrypting network mapped drives
- * Adds a "wipe" key to the configuration for optional folder wiping
- * Fully implements the background image setting and leverages values defined in the "img" configuration key
- * Adds an EXT variable placeholder to the ransom note to support UID, KEY, and EXT
- * Implements URI path building so encrypted system data is sent to a C2 pseudo-random URL
- * Fixes the function that returns the victim's username so the correct value is placed in the stats JSON data

REvil 1.01 MD5: 2abff29b4d87f30f011874b6e98959e9 SHA1:
9d1b61b1cba411ee6d4664ba2561fa59cdb0732c SHA256:
a88e2857a2f3922b44247316642f08ba8665185297e3cd958bbd22a83f380feb * Removes the
exp/privilege escalation requirement for full execution and encrypts data regardless of privilege
level * Makes encryption of network mapped drives optional by adding the "-nolan" argument

REvil 1.02

MD5: 4af953b20f3a1f165e7cf31d6156c035

SHA1: b859de5ffcb90e4ca8e304d81a4f81e8785bb299

SHA256: 89d80016fff4c6600e8dd8cfad1fa6912af4d21c5457b4e9866d1796939b48dc4

- * Enhances whitelisting validation by adding inspection of GetUserDefaultUILanguage and GetSystemDefaultUILanguage
- * Partially implements "lock file" logic by generating a lock filename based on the first four bytes of the Base64-decoded pk key, appending a .lock file extension, and adding the filename to the list of whitelisted files in the REvil configuration (It does not appear that this value is referenced after it is created and stored in memory. There is no evidence that a lock file is dropped to disk.)
- * Enhances folder whitelisting logic that take special considerations if the folder is associated with "program files" directories
- * Hard-codes whitelisting of all direct content within the Program Files or Program Files x86 directories
- * Hard-codes whitelisting of "sql" subfolders within program files
- * Encrypts program files sub-folders that does not contain "sql" in the path
- * Compares other folders to the list of whitelisted folders specified in the REvil configuration to determine if they are whitelisted
- * Encodes stored strings used for URI building within the binary and decodes them in memory right before use
- * Introduces a REvil registry root key "sub_key" registry value containing the attacker's public key

REvil 1.03 MD5: 3cae02306a95564b1fff4ea45a7dfc00 SHA1: 0ce2cae5287a64138d273007b34933362901783d SHA256:

78fa32f179224c46ae81252c841e75ee4e80b57e6b026d0a05bb07d34ec37bbf * Removes lock file logic that was partially implemented in 1.02 * Leverages WMI to continuously monitor for and kill newly launched processes whose names are listed in the prc configuration key (Previous versions performed this action once.) * Encodes stored shellcode * Adds the -path argument: * Does not wipe folders (even if wipe == true) * Does not set desktop background * Does not contact the C2 server (even if net == true) * Encrypts files in the specified folder and drops the ransom note * Changes the REvil registry root key to SOFTWARE\QtProject\OrganizationDefaults * Changes registry key values from -> to: * sub_key -> pvg * pk_key -> sxSP * sk_key -> BDDC8 * 0_key -> f7gVD7 * rnd_ext -> Xu7Nnkd * stat -> sMMnxpgk

REvil 1.04

MD5: 6e3efb83299d800edf1624ecbc0665e7

SHA1: 0bd22f204c5373f1a22d9a02c59f69f354a2cc0d

SHA256: 2ca64feaaf5ab6cf96677fbc2bc0e1995b3bc93472d7af884139aa757240e3f6

* Leverages PowerShell and WMI to delete shadow copies if the victim's operating system is newer than Windows XP (For Windows XP or older, it uses the original command that was executed in all previous REvil versions.)

* Removes the folder wipe capability

* Changes the REvil registry root key to SOFTWARE\GitForWindows

* Changes registry key values from --> to:

* pvq --> QPM

* sxsP --> cMtS

* BDDC8 --> WGg7j

* f7gVD7 --> zbhs8h

* Xu7Nnkd --> H85TP10

* sMMnxpgk --> GCZg2PXD

REvil v1.05 MD5: cfefcc2edc5c54c74b76e7d1d29e69b2 SHA1:
7423c57db390def08154b77e2b5e043d92d320c7 SHA256:
e430479d1ca03a1bc5414e28f6cddb301939c4c95547492cdbe27b0a123344ea * Add new 'arn'
configuration key that contains a boolean true/false value that controls whether or not to
implement persistence. * Implements persistence functionality via registry Run key. Data for value
is set to the full path and filename of the currently running executable. The executable is never
moved into any 'working directory' such as %AppData% or %TEMP% as part of the persistence
setup. The Reg Value used is the hardcoded value of 'INOWZyAWVv' : *
SOFTWARE\Microsoft\Windows\CurrentVersion\Run\INOWZyAWVv * Before exiting, REvil sets up
its malicious executable to be deleted upon reboot by issuing a call to MoveFileExW and setting the
destination to NULL and the flags to 4 (MOVEFILE_DELAY_UNTIL_REBOOT). This breaks persistence
however as the target executable specified in the Run key will no longer exist once this is done. *
Changes registry key values from -> to: * QPM -> tgE * cMtS -> 8K09 * WGg7j -> xMtNc * zbhs8h
-> CTgE4a * H85TP10 -> oE5bZg0 * GCZg2PXD -> DC408Qp4

REvil v1.06

MD5: 65ff37973426c09b9ff95f354e62959e

SHA1: b53bc09cfbd292af7b3609734a99d101bd24d77e

SHA256: 0e37d9d0a7441a98119eb1361a0605042c4db0e8369b54ba26e6ba08d9b62f1e

* Updated string decoding function to break existing yara rules. Likely the result of the blog posted by us.

* Modified handling of network file encryption. Now explicitly passes every possible "Scope" constant to the WNetOpenEnum function when looking for files to encrypt. It also changed the "Resource Type" from RESOURCE_TYPE_DISK to RESOURCE_TYPE_ANY which will now include things like mapped printers.

* Persistence registry value changed from 'lNOWZyAWVv' to 'sNpEShi30R'

* Changes registry key values from --> to:

* tgE --> 73g

* 8K09 --> vTGj

* xMtNc --> Q7PZe

* CTgE4a --> BuCrIp

* oE5bZg0 --> lcZd70Y

* DC408Qp4 --> sLF86MWC

REvil v1.07 MD5: ea4cae3d6d8150215a4d90593a4c30f2 SHA1:
8dcbcbefaedf5675b170af3fd44db93ad864894e SHA256:
6a2bd52a5d68a7250d1de481dcce91a32f54824c1c540f0a040d05f757220cd3 TBD

RMS

CyberInt states that Remote Manipulator System (RMS) is a legitimate tool developed by Russian organization TektonIT and has been observed in campaigns conducted by TA505 as well as numerous smaller campaigns likely attributable to other, disparate, threat actors. In addition to the availability of commercial licenses, the tool is free for non-commercial use and supports the remote administration of both Microsoft Windows and Android devices.

RokRAT

It is a backdoor commonly distributed as an encoded binary file downloaded and decrypted by shellcode following the exploitation of weaponized documents. DOGCALL is capable of capturing screenshots, logging keystrokes, evading analysis with anti-virtual machine detections, and leveraging cloud storage APIs such as Cloud, Box, Dropbox, and Yandex.

The tag is: *misp-galaxy:malpedia="RokRAT"*

RokRAT is also known as:

RoyalCli

RoyalCli is a backdoor which appears to be an evolution of BS2005 and uses familiar encryption and encoding routines. The name RoyalCli was chosen by us due to a debugging path left in the binary. RoyalCli and BS2005 both communicate with the attacker's command and control (C2) through Internet Explorer (IE) by using the COM interface IWebBrowser2.

The tag is: *misp-galaxy:malpedia="RoyalCli"*

RoyalCli is also known as:

RTM

RTM Banker also known as Redaman was first blogged about in February 2017 by ESET. The malware is written in Delphi and shows some similarities (like process list) with Buhtrap. It uses a slightly modified version of RC4 to encrypt its strings, network data, configuration and modules, according to ESET.

The tag is: *misp-galaxy:malpedia="RTM"*

RTM is also known as:

Ryuk

Ryuk is a ransomware which encrypts its victim's files and asks for a ransom via bitcoin to release the original files. It is has been observed being used to attack companies or professional environments. Cybersecurity experts figured out that Ryuk and Hermes ransomware shares pieces of codes. Hermes is commodity ransomware that has been observed for sale on dark-net forums and used by multiple threat actors.

The tag is: *misp-galaxy:malpedia="Ryuk"*

ServHelper

ServHelper is written in Delphi and according to ProofPoint best classified as a backdoor.

ProofPoint noticed two distinct variant - "tunnel" and "downloader" (citation): "The 'tunnel' variant has more features and focuses on setting up reverse SSH tunnels to allow the threat actor to access the infected host via Remote Desktop Protocol (RDP). Once ServHelper establishes remote desktop access, the malware contains functionality for the threat actor to 'hijack' legitimate user accounts or their web browser profiles and use them as they see fit. The 'downloader' variant is stripped of the tunneling and hijacking functionality and is used as a basic downloader."

SharpStage

The SharpStage backdoor is a .NET malware with backdoor capabilities. Its name is a derivative of the main activity class called "Stage_One". SharpStage can take screenshots, run arbitrary commands and downloads additional payloads. It exfiltrates data from the infected machine to a dropbox account by implementing a dropbox client in its code. SharpStage was seen used by the Molerats group in targeted attacks in the middle east.

The tag is: *misp-galaxy:malpedia="SharpStage"*

SharpStage is also known as:

SmokeLoader

The SmokeLoader family is a generic backdoor with a range of capabilities which depend on the modules included in any given build of the malware. The malware is delivered in a variety of ways and is broadly associated with criminal activity. The malware frequently tries to hide its C2 activity by generating requests to legitimate sites such as microsoft.com, bing.com, adobe.com, and others. Typically the actual Download returns an HTTP 404 but still contains data in the Response Body.

The tag is: *misp-galaxy:malpedia="SmokeLoader"*

SmokeLoader is also known as:

- Dofail
- Sharik
- Smoke
- Smoke Loader

Snake

Snake Ransomware is a Golang ransomware reportedly containing obfuscation not typically seen in Golang ransomware. This malware will remove shadow copies and kill processes related to SCADA/ICS devices, virtual machines, remote management tools, network management software, and others. After this, encryption of files on the device commences, while skipping Windows system folders and various system files. A random 5 character string is appended to encrypted files. According to Bleeping Computer, this ransomware takes an especially long time to encrypt files on a targeted machine. This ransomware is reported to target an entire network, rather than individual workstations.

Snatch

Snatch is a ransomware which infects victims by rebooting the PC into Safe Mode. Most of the existing security protections do not run in Safe Mode so that it the malware can act without expected countermeasures and it can encrypt as many files as it finds. It uses common packers such as UPX to hide its payload.

The tag is: *misp-galaxy:malpedia="Snatch"*

Snatch is also known as:

SodaMaster

This is a RAT that is usually loaded with one or more shellcode and/or reflective DLL injection techniques. The RAT uses RC4 or a hardcoded RSA key for traffic encryption/decryption. Its communication can either happen via a raw TCP socket or a HTTP POST request. Depending on the version, the RAT may remotely execute DLLs or shellcode.

SPACESHIP

SPACESHIP searches for files with a specified set of file extensions and copies them to a removable drive. FireEye believes that SHIPSHAPE is used to copy SPACESHIP to a removable drive, which could be used to infect another victim computer, including an air-gapped computer. SPACESHIP is then used to steal documents from the air-gapped system, copying them to a removable drive inserted into the SPACESHIP-infected system

SpyEye

SpyEye is a malware targeting both Microsoft Windows browsers and Apple iOS Safari. Originated in Russia, it was available in dark forums for \$500+ claiming to be the "The Next Zeus Malware". It performed many functionalities typical from bankers trojan such as keyloggers, auto-fill credit card modules, email backups, config files (encrypted), http access, Pop3 grabbers and FTP grabbers. SpyEye allowed hackers to steal money from online bank accounts and initiate transactions even while valid users are logged into their bank account.

STOP

STOP Djvu Ransomware it is a ransomware which encrypts user data through AES-256 and adds one of the dozen available extensions as marker to the encrypted file's name. It is not used to encrypt the entire file but only the first 5 MB. In its original version it was able to run offline and, in that case, it used a hard-coded key which could be extracted to decrypt files.

The tag is: *misp-galaxy:malpedia="STOP"*

SUNBURST

FireEye describes SUNBURST as a trojanized SolarWinds digitally-signed component of the Orion software framework that contains a backdoor that communicates via HTTP to third party servers. After an initial dormant period of up to two weeks, it uses a DGA to generate specific subdomains for a set C&C domain. The backdoor retrieves and executes commands, that include the ability to transfer files, execute files, profile the system, reboot the machine, and disable system services. The C2 traffic to the malicious domains is designed to mimic normal SolarWinds API communications: Orion Improvement Program (OIP) protocol. The backdoor uses multiple obfuscated blocklists to identify forensic and anti-virus tools running as processes, services, and drivers. Multiple trojanized updates were digitally signed from March - May 2020 and posted to the SolarWinds updates website.

Syscon

SYSCON is a Remote Access Trojan used in a targeted champing against US government agencies. It has been recently observed in conjunction with CARROTBAT and CARROTBALL downloaders and it uses the File Transfer Protocol as Command and Control channel. Use of the family is attributed by Unit 42 to the Konni Group.

Sysraw Stealer

Sysraw stealer got its name because at some point, it was started as "ZSysRaw\sysraw.exe". PDB strings suggest the name "Clipsa" though. First stage connects to /WPCoreLog/, the second one to /WPSecurity/. Its behavior suggest that it is an info stealer. It creates a rather large amount of files in a subdirectory (e.g. data) named "1?[-+].dat" and POSTs them.

The tag is: *misp-galaxy:malpedia="Sysraw Stealer"*

Sysraw Stealer is also known as:

TeamBot

Recently, Check Point researchers spotted a targeted attack against officials within government finance authorities and representatives in several embassies in Europe. The attack, which starts with a malicious attachment disguised as a top secret US document, weaponizes TeamViewer, the popular remote access and desktop sharing software, to gain full control of the infected computer. This is achieved by sideloading another DLL among the legit TeamViewer.

TEARDROP

TEARDROP is a memory only dropper that runs as a service, spawns a thread and reads from the file “gracious_truth.jpg”, which likely has a fake JPG header. Next it checks that HKU\SOFTWARE\Microsoft\CTF exists, decodes an embedded payload using a custom rolling XOR algorithm and manually loads into memory an embedded payload using a custom PE-like file format. TEARDROP does not have code overlap with any previously seen malware. FireEye believe that this was used to execute a customized Cobalt Strike BEACON.

The tag is: *misp-galaxy:malpedia="TEARDROP"*

TFlower

TFlower is a new ransomware targeting mostly corporate networks discovered in August, 2019. It is reportedly installed on networks by attackers after they gain access via RDP. TFlower displays a console showing activity being performed by the ransomware when it encrypts a machine, further indicating that this ransomware is triggered by the attacker post compromise, similar to Samsam/Samas in terms of TTP. Once encryption is started, the ransomware will conduct a status report to an apparently hard-coded C2. Shadow copies are deleted and the Windows 10 repair environment is disabled by this ransomware. This malware also will terminate any running

Outlook.exe process so that the mail files can be encrypted. This ransomware does not add an extension to encrypted files, but prepends the marker "tflower" and what may be the encrypted encryption key for the file to each affected file. Once encryption is completed, another status report is sent to the C2 server.

TinyNuke

TinyNuke (aka Nuclear Bot) is a fully-fledged banking trojan including HiddenDesktop/VNC server and a reverse socks4 server. It was for sale on underground marketplaces for \$2500 in 2016. The program's author claimed the malware was written from scratch, but that it functioned similarly to the Zeus banking trojan in that it could steal passwords and inject arbitrary content when victims visited banking Web sites. However, he then proceeded to destroy his own reputation on hacker forums by promoting his development too aggressively. As a displacement activity, he published his source code on Github. XBot is an off-spring of TinyNuke, but very similar to its ancestor.

The tag is: *misp-galaxy:malpedia="TinyNuke"*

TinyNuke is also known as:

- MicroBankingTrojan
- Nuclear Bot
- NukeBot
- Xbot
