## Turla - G0010

[Turla](<https://attack.mitre.org/groups/G0010>) is a Russian-based threat group that has infected victims in over 45 countries, spanning a range of industries including government, embassies, military, education, research and pharmaceutical companies since 2004. Heightened activity was seen in mid-2015. [Turla](<https://attack.mitre.org/groups/G0010>) is known for conducting watering hole and spearphishing campaigns and leveraging in-house tools and malware. [Turla](<https://attack.mitre.org/groups/G0010>)'s espionage platform is mainly used against Windows machines, but has also been seen used against macOS and Linux machines.(Citation: Kaspersky Turla)(Citation: ESET Gazer Aug 2017)(Citation: CrowdStrike VENOMOUS BEAR)(Citation: ESET Turla Mosquito Jan 2018)

## APT32 - G0050

[APT32](<https://attack.mitre.org/groups/G0050>) is a threat group that has been active since at least 2014. The group has targeted multiple private sector industries as well as with foreign governments, dissidents, and journalists with a strong focus on Southeast Asian countries like Vietnam, the Philippines, Laos, and Cambodia. They have extensively used strategic web compromises to compromise victims. The group is believed to be Vietnam-based.(Citation: FireEye APT32 May 2017)(Citation: Volexity OceanLotus Nov 2017)(Citation: ESET OceanLotus)

## TA505 - G0092

[TA505](<https://attack.mitre.org/groups/G0092>) is a financially motivated threat group that has been active since at least 2014. The group is known for frequently changing malware and driving global trends in criminal malware distribution.(Citation: Proofpoint TA505 Sep 2017)(Citation: Proofpoint TA505 June 2018)(Citation: Proofpoint TA505 Jan 2019)

## APT28 - G0007

[APT28](<https://attack.mitre.org/groups/G0007>) is a threat group that has been attributed to Russia's General Staff Main Intelligence Directorate (GRU) 85th Main Special Service Center (GTsSS) military unit 26165.(Citation: NSA/FBI Drovorub August 2020) This group has been active since at least 2004.(Citation: DOJ GRU Indictment Jul 2018) (Citation: Ars Technica GRU indictment Jul 2018) (Citation: Crowdstrike DNC June 2016) (Citation: FireEye APT28) (Citation: SecureWorks TG-4127) (Citation: FireEye APT28 January 2017) (Citation: GRIZZLY STEPPE JAR) (Citation: Sofacy DealersChoice) (Citation: Palo Alto Sofacy 06-2018) (Citation: Symantec APT28 Oct 2018) (Citation: ESET Zebrocy May 2019)

[APT28](<https://attack.mitre.org/groups/G0007>) reportedly compromised the Hillary Clinton campaign, the Democratic National Committee, and the Democratic Congressional Campaign Committee in 2016 in an attempt to interfere with the U.S. presidential election. (Citation: Crowdstrike DNC June 2016) In 2018, the US indicted five GRU Unit 26165 officers associated with [APT28](<https://attack.mitre.org/groups/G0007>) for cyber operations (including close-access operations) conducted between 2014 and 2018 against the World Anti-Doping Agency (WADA), the US Anti-Doping Agency, a US nuclear facility, the Organization for the Prohibition of Chemical Weapons (OPCW), the Spiez Swiss Chemicals Laboratory, and other organizations.(Citation: US District Court Indictment GRU Oct 2018) Some of these were conducted with the assistance of GRU Unit 74455, which is also referred to as [Sandworm Team](<https://attack.mitre.org/groups/G0034>).

## Equation - G0020

[Equation](<https://attack.mitre.org/groups/G0020>) is a sophisticated threat group that employs multiple remote access tools. The group is known to use zero-day exploits and has developed the capability to overwrite the firmware of hard disk drives. (Citation: Kaspersky Equation QA)

## Moafee - G0002

[Moafee](<https://attack.mitre.org/groups/G0002>) is a threat group that appears to operate from the Guandong Province of China. Due to overlapping TTPs, including similar custom tools, Moafee is thought to have a direct or indirect relationship with the threat group [DragonOK](<https://attack.mitre.org/groups/G0017>). ## Patchwork - G0040

[Patchwork](<https://attack.mitre.org/groups/G0040>) is a cyberespionage group that was first observed in December 2015. While the group has not been definitively attributed, circumstantial

evidence suggests the group may be a pro-Indian or Indian entity. [Patchwork](<https://attack.mitre.org/groups/G0040>) has been seen targeting industries related to diplomatic and government agencies. Much of the code used by this group was copied and pasted from online forums. [Patchwork](<https://attack.mitre.org/groups/G0040>) was also seen operating spearphishing campaigns targeting U.S. think tank groups in March and April of 2018. (Citation: Cymmetria Patchwork) (Citation: Symantec Patchwork) (Citation: TrendMicro Patchwork Dec 2017) (Citation: Volexity Patchwork June 2018)

## Carbanak - G0008

[Carbanak](<https://attack.mitre.org/groups/G0008>) is a threat group that mainly targets banks. It also refers to malware of the same name ([Carbanak](<https://attack.mitre.org/software/S0030>)). It is sometimes referred to as [FIN7](<https://attack.mitre.org/groups/G0046>), but these appear to be two groups using the same [Carbanak](<https://attack.mitre.org/software/S0030>) malware and are therefore tracked separately. (Citation: Kaspersky Carbanak) (Citation: FireEye FIN7 April 2017)

## APT19 - G0073

[APT19](<https://attack.mitre.org/groups/G0073>) is a Chinese-based threat group that has targeted a variety of industries, including defense, finance, energy, pharmaceutical, telecommunications, high tech, education, manufacturing, and legal services. In 2017, a phishing campaign was used to target seven law and investment firms. (Citation: FireEye APT19) Some analysts track [APT19](<https://attack.mitre.org/groups/G0073>) and [Deep Panda](<https://attack.mitre.org/groups/G0009>) as the same group, but it is unclear from open source information if the groups are the same. (Citation: ICIT China's Espionage Jul 2016) (Citation: FireEye APT Groups) (Citation: Unit 42 C0d0so0 Jan 2016)

## APT41 - G0096

[APT41](<https://attack.mitre.org/groups/G0096>) is a group that carries out Chinese state-sponsored espionage activity in addition to financially motivated activity. [APT41](<https://attack.mitre.org/groups/G0096>) has been active since as early as 2012. The group has been observed targeting healthcare, telecom, technology, and video game industries in 14 countries.(Citation: FireEye APT41 Aug 2019)

## Sharpshooter - G0104

Operation [Sharpshooter](<https://attack.mitre.org/groups/G0104>) is the name of a cyber espionage campaign discovered in October 2018 targeting nuclear, defense, energy, and financial companies. Though overlaps between this adversary and [Lazarus Group](<https://attack.mitre.org/groups/G0032>) have been noted, definitive links have not been established.(Citation: McAfee Sharpshooter December 2018)

## Rocke - G0106

[Rocke](<https://attack.mitre.org/groups/G0106>) is an alleged Chinese-speaking adversary whose primary objective appeared to be cryptojacking, or stealing victim system resources for the purposes of mining cryptocurrency. The name [Rocke](<https://attack.mitre.org/groups/G0106>) comes from the email address "[rocke@live.cn](mailto:rocke@live.cn)" used to create the wallet which held collected cryptocurrency. Researchers have detected overlaps between [Rocke](<https://attack.mitre.org/groups/G0106>) and the Iron Cybercrime Group, though this attribution has not been confirmed.(Citation: Talos Rocke August 2018)

## DragonOK - G0017

[DragonOK](<https://attack.mitre.org/groups/G0017>) is a threat group that has targeted Japanese organizations with phishing emails. Due to overlapping TTPs, including similar custom tools, [DragonOK](<https://attack.mitre.org/groups/G0017>) is thought to have a direct or indirect relationship with the threat group [Moafee](<https://attack.mitre.org/groups/G0002>). (Citation: Operation Quantum Entanglement) It is known to use a variety of malware, including Sysget/HelloBridge, PlugX, PoisonIvy, FormerFirstRat, NFlog, and NewCT. (Citation: New DragonOK)

## Whitefly - G0107

[Whitefly](<https://attack.mitre.org/groups/G0107>) is a cyber espionage group that has been operating since at least 2017. The group has targeted organizations based mostly in Singapore across a wide variety of sectors, and is primarily interested in stealing large amounts of sensitive information. The group has been linked to an attack against Singapore's largest public health organization, SingHealth.(Citation: Symantec Whitefly March 2019)

## Silence - G0091

[Silence](<https://attack.mitre.org/groups/G0091>) is a financially motivated threat actor targeting financial institutions in different countries. The group was first seen in June 2016. Their main targets reside in Russia, Ukraine, Belarus, Azerbaijan, Poland and Kazakhstan. They compromised various banking systems, including the Russian Central Bank's Automated Workstation Client,

ATMs, and card processing.(Citation: Cyber Forensic Silence Jan 2019)(Citation: SecureList Silence Nov 2017)

## APT3 - G0022

[APT3](<https://attack.mitre.org/groups/G0022>) is a China-based threat group that researchers have attributed to China's Ministry of State Security. (Citation: FireEye Clandestine Wolf) (Citation: Recorded Future APT3 May 2017) This group is responsible for the campaigns known as Operation

Clandestine Fox, Operation Clandestine Wolf, and Operation Double Tap. (Citation: FireEye Clandestine Wolf) (Citation: FireEye Operation Double Tap) As of June 2015, the group appears to have shifted from targeting primarily US victims to primarily political organizations in Hong Kong. (Citation: Symantec Buckeye)

MITRE has also developed an APT3 Adversary Emulation Plan.(Citation: APT3 Adversary Emulation Plan)

## APT38 - G0082

[APT38](<https://attack.mitre.org/groups/G0082>) is a financially-motivated threat group that is backed by the North Korean regime. The group mainly targets banks and financial institutions and has targeted more than 16 organizations in at least 13 countries since at least 2014.(Citation: FireEye APT38 Oct 2018)

North Korean group definitions are known to have significant overlap, and the name [Lazarus Group](<https://attack.mitre.org/groups/G0032>) is known to encompass a broad range of activity. Some organizations use the name Lazarus Group to refer to any activity attributed to North Korea.(Citation: US-CERT HIDDEN COBRA June 2017) Some organizations track North Korean clusters or groups such as Bluenoroff,(Citation: Kaspersky Lazarus Under The Hood Blog 2017) [APT37](<https://attack.mitre.org/groups/G0067>), and [APT38](<https://attack.mitre.org/groups/G0082>) separately, while other organizations may track some activity associated with those group names by the name Lazarus Group.

## APT34 - G0057

APT34 is an Iranian cyber espionage group that has been active since at least 2014. The group has

targeted a variety of industries, including financial, government, energy, chemical, and telecommunications, and has largely focused its operations within the Middle East. FireEye assesses that the group works on behalf of the Iranian government based on infrastructure details that contain references to Iran, use of Iranian infrastructure, and targeting that aligns with nation-state interests. APT34 loosely aligns with public reporting related to OilRig, but may not wholly align due to companies tracking threat groups in different ways. (Citation: FireEye APT34 Dec 2017)

## Group5 - G0043

[Group5](<https://attack.mitre.org/groups/G0043>) is a threat group with a suspected Iranian nexus, though this attribution is not definite. The group has targeted individuals connected to the Syrian opposition via spearphishing and watering holes, normally using Syrian and Iranian themes. [Group5](<https://attack.mitre.org/groups/G0043>) has used two commonly available remote access tools (RATs), [njRAT](<https://attack.mitre.org/software/S0385>) and [NanoCore](<https://attack.mitre.org/software/S0336>), as well as an Android RAT, DroidJack. ## FIN5 - G0053

[FIN5](<https://attack.mitre.org/groups/G0053>) is a financially motivated threat group that has targeted personally identifiable information and payment card information. The group has been active since at least 2008 and has targeted the restaurant, gaming, and hotel industries. The group is made up of actors who likely speak Russian. ## Dragonfly - G0035

[Dragonfly](<https://attack.mitre.org/groups/G0035>) Dragonfly is a cyber espionage group that has been active since at least 2011. They initially targeted defense and aviation companies but shifted to focus on the energy sector in early 2013. They have also targeted companies related to industrial control systems. (Citation: Symantec Dragonfly)(Citation: Secureworks IRON LIBERTY July 2019)

A similar group emerged in 2015 and was identified by Symantec as [Dragonfly 2.0](<https://attack.mitre.org/groups/G0074>). There is debate over the extent of the overlap between [Dragonfly](<https://attack.mitre.org/groups/G0035>) and [Dragonfly 2.0](<https://attack.mitre.org/groups/G0074>), but there is sufficient evidence to lead to these being tracked as two separate groups. (Citation: Symantec Dragonfly Sept 2017)(Citation: Fortune Dragonfly 2.0 Sept 2017)(Citation: Dragos DYMALLOY)

## APT37 - G0067

[APT37](<https://attack.mitre.org/groups/G0067>) is a suspected North Korean cyber espionage group that has been active since at least 2012. The group has targeted victims primarily in South Korea, but also in Japan, Vietnam, Russia, Nepal, China, India, Romania, Kuwait, and other parts of the Middle East. [APT37](<https://attack.mitre.org/groups/G0067>) has also been linked to following

campaigns between 2016-2018: Operation Daybreak, Operation Erebus, Golden Time, Evil New Year, Are you Happy?, FreeMilk, Northern Korean Human Rights, and Evil New Year 2018. (Citation: FireEye APT37 Feb 2018) (Citation: Securelist ScarCruft Jun 2016) (Citation: Talos Group123)

North Korean group definitions are known to have significant overlap, and the name [Lazarus Group](<https://attack.mitre.org/groups/G0032>) is known to encompass a broad range of activity. Some organizations use the name Lazarus Group to refer to any activity attributed to North Korea.(Citation: US-CERT HIDDEN COBRA June 2017) Some organizations track North Korean clusters or groups such as Bluenoroff,(Citation: Kaspersky Lazarus Under The Hood Blog 2017) [APT37](<https://attack.mitre.org/groups/G0067>), and [APT38](<https://attack.mitre.org/groups/G0082>) separately, while other organizations may track some activity associated with those group names by the name Lazarus Group.

## FIN7 - G0046

[FIN7](<https://attack.mitre.org/groups/G0046>) is a financially-motivated threat group that has primarily targeted the U.S. retail, restaurant, and hospitality sectors since mid-2015. They often use point-of-sale malware. A portion of [FIN7](<https://attack.mitre.org/groups/G0046>) was run out of a front company called Combi Security. [FIN7](<https://attack.mitre.org/groups/G0046>) is sometimes referred to as [Carbanak](<https://attack.mitre.org/groups/G0008>) Group, but these appear to be two groups using the same [Carbanak](<https://attack.mitre.org/software/S0030>) malware and are therefore tracked separately. (Citation: FireEye FIN7 March 2017) (Citation: FireEye FIN7 April 2017) (Citation: FireEye CARBANAK June 2017) (Citation: FireEye FIN7 Aug 2018)

## OilRig - G0049

[OilRig](<https://attack.mitre.org/groups/G0049>) is a suspected Iranian threat group that has targeted Middle Eastern and international victims since at least 2014. The group has targeted a variety of industries, including financial, government, energy, chemical, and telecommunications, and has largely focused its operations within the Middle East. It appears the group carries out supply chain attacks, leveraging the trust relationship between organizations to attack their primary targets. FireEye assesses that the group works on behalf of the Iranian government based on infrastructure details that contain references to Iran, use of Iranian infrastructure, and targeting that aligns with nation-state interests. (Citation: Palo Alto OilRig April 2017) (Citation: ClearSky OilRig Jan 2017) (Citation: Palo Alto OilRig May 2016) (Citation: Palo Alto OilRig Oct 2016) (Citation: Unit 42 Playbook Dec 2017) (Citation: FireEye APT34 Dec 2017)(Citation: Unit 42 QUADAGENT July 2018) This group was previously tracked under two distinct groups, APT34 and OilRig, but was combined due to additional reporting giving higher confidence about the overlap of the activity.

## NEODYMIUM - G0055

[NEODYMIUM](<https://attack.mitre.org/groups/G0055>) is an activity group that conducted a campaign in May 2016 and has heavily targeted Turkish victims. The group has demonstrated similarity to another activity group called [PROMETHIUM](<https://attack.mitre.org/groups/G0056>) due to overlapping victim and campaign characteristics. (Citation: Microsoft NEODYMIUM Dec 2016) (Citation: Microsoft SIR Vol 21) [NEODYMIUM](<https://attack.mitre.org/groups/G0055>) is reportedly associated closely with [BlackOasis](<https://attack.mitre.org/groups/G0063>) operations, but evidence that the group names are aliases has not been identified. (Citation: CyberScoop BlackOasis Oct 2017)

## MuddyWater - G0069

[MuddyWater](<https://attack.mitre.org/groups/G0069>) is an Iranian threat group that has primarily

targeted Middle Eastern nations, and has also targeted European and North American nations. The group's victims are mainly in the telecommunications, government (IT services), and oil sectors. Activity from this group was previously linked to [FIN7](<https://attack.mitre.org/groups/G0046>), but the group is believed to be a distinct group possibly motivated by espionage.(Citation: Unit 42 MuddyWater Nov 2017)(Citation: Symantec MuddyWater Dec 2018)(Citation: ClearSky MuddyWater Nov 2018)(Citation: ClearSky MuddyWater June 2019)(Citation: Reaqta MuddyWater November 2017)

## Agent Smith - S0440

[Agent Smith](<https://attack.mitre.org/software/S0440>) is mobile malware that generates financial gain by replacing legitimate applications on devices with malicious versions that include fraudulent ads. As of July 2019 [Agent Smith](<https://attack.mitre.org/software/S0440>) had infected around 25 million devices, primarily targeting India though effects had been observed in other Asian countries as well as Saudi Arabia, the United Kingdom, and the United States.(Citation: CheckPoint Agent Smith)

## Cobalt Strike - S0154

[Cobalt Strike](<https://attack.mitre.org/software/S0154>) is a commercial, full-featured, penetration testing tool which bills itself as “adversary simulation software designed to execute targeted attacks and emulate the post-exploitation actions of advanced threat actors”. Cobalt Strike’s interactive post-exploit capabilities cover the full range of ATT&CK tactics, all executed within a single, integrated system. (Citation: cobaltstrike manual)

In addition to its own capabilities, [Cobalt Strike](<https://attack.mitre.org/software/S0154>) leverages

the capabilities of other well-known tools such as Metasploit and [Mimikatz](<https://attack.mitre.org/software/S0002>). (Citation: cobaltstrike manual)

## Cardinal RAT - S0348

[Cardinal RAT](<https://attack.mitre.org/software/S0348>) is a potentially low volume remote access trojan (RAT) observed since December 2015. [Cardinal RAT](<https://attack.mitre.org/software/S0348>) is notable for its unique utilization of uncompiled C# source code and the Microsoft Windows built-in csc.exe compiler. ## Olympic Destroyer - S0365

[Olympic Destroyer](<https://attack.mitre.org/software/S0365>) is malware that was first seen infecting computer systems at the 2018 Winter Olympics, held in Pyeongchang, South Korea. The main purpose of the malware appears to be to cause destructive impact to the affected systems. The malware leverages various native Windows utilities and API calls to carry out its destructive tasks. The malware has worm-like features to spread itself across a computer network in order to maximize its destructive impact.(Citation: Talos Olympic Destroyer 2018)

## T9000 - S0098

[T9000](<https://attack.mitre.org/software/S0098>) is a backdoor that is a newer variant of the T5000 malware family, also known as Plat1. Its primary function is to gather information about the victim.

It has been used in multiple targeted attacks against U.S.-based organizations. (Citation: FireEye admin@338 March 2014) (Citation: Palo Alto T9000 Feb 2016)

The tag is: `misp-galaxy:mitre-malware="T9000 - S0098"`

T9000 - S0098 is also known as:

- T9000

T9000 - S0098 has relationships with:

- similar: `misp-galaxy:tool="T9000"` with `estimative-language:likelihood-probability="likely"`
- uses: `misp-galaxy:mitre-attack-pattern="Audio Capture - T1123"` with `estimative-language:likelihood-probability="almost-certain"`

## Shamoon - S0140

[Shamoon](<https://attack.mitre.org/software/S0140>) is wiper malware that was first used by an Iranian group known as the "Cutting Sword of Justice" in 2012. Other versions known as Shamoon 2 and Shamoon 3 were observed in 2016 and 2018. [Shamoon](<https://attack.mitre.org/software/S0140>) has also been seen leveraging [RawDisk](<https://attack.mitre.org/software/S0364>) and Filerase to carry out data wiping tasks. The term Shamoon is sometimes used to refer to the group using the malware as well as the malware itself.(Citation: Palo Alto Shamoon Nov 2016)(Citation: Unit 42 Shamoon3 2018)(Citation: Symantec Shamoon 2012)(Citation: FireEye Shamoon Nov 2016)

## CHOPSTICK - S0023

[CHOPSTICK](<https://attack.mitre.org/software/S0023>) is a malware family of modular backdoors used by [APT28](<https://attack.mitre.org/groups/G0007>). It has been used since at least 2012 and is usually dropped on victims as second-stage malware, though it has been used as first-stage malware in several cases. It has both Windows and Linux variants. (Citation: FireEye APT28) (Citation: ESET Sednit Part 2) (Citation: FireEye APT28 January 2017) (Citation: DOJ GRU Indictment Jul 2018) It is tracked separately from the [X-Agent for Android](<https://attack.mitre.org/software/S0314>).

## InvisiMole - S0260

[InvisiMole](<https://attack.mitre.org/software/S0260>) is a modular spyware program that has been used by the InvisiMole Group since at least 2013. [InvisiMole](<https://attack.mitre.org/software/S0260>) has two backdoor modules called RC2FM and RC2CL that are used to perform post-exploitation activities. It has been discovered on compromised victims in the Ukraine and Russia. [Gamaredon Group](<https://attack.mitre.org/groups/G0047>) infrastructure has been used to download and execute [InvisiMole](<https://attack.mitre.org/software/S0260>) against a small number of victims.(Citation: ESET InvisiMole June 2018)(Citation: ESET InvisiMole June 2020)

## SeaDuke - S0053

[SeaDuke](<https://attack.mitre.org/software/S0053>) is malware that was used by [APT29](<https://attack.mitre.org/groups/G0016>) from 2014 to 2015. It was used primarily as a secondary backdoor for victims that were already compromised with [CozyCar](<https://attack.mitre.org/software/S0046>). (Citation: F-Secure The Dukes)

The tag is: *misp-galaxy:mitre-malware="SeaDuke - S0053"*

SeaDuke - S0053 is also known as:

## Machete - S0409

[Machete](<https://attack.mitre.org/software/S0409>) is a cyber espionage toolset developed by a Spanish-speaking group known as El [Machete](<https://attack.mitre.org/groups/G0095>). It is a Python-based backdoor targeting Windows machines, and it was first observed in 2010.(Citation: ESET Machete July 2019)(Citation: Securelist Machete Aug 2014)

## BlackEnergy - S0089

[BlackEnergy](<https://attack.mitre.org/software/S0089>) is a malware toolkit that has been used by both criminal and APT actors. It dates back to at least 2007 and was originally designed to create botnets for use in conducting Distributed Denial of Service (DDoS) attacks, but its use has evolved to support various plug-ins. It is well known for being used during the confrontation between Georgia and Russia in 2008, as well as in targeting Ukrainian institutions. Variants include BlackEnergy 2 and BlackEnergy 3. ## Reaver - S0172

[Reaver](<https://attack.mitre.org/software/S0172>) is a malware family that has been in the wild since at least late 2016. Reporting indicates victims have primarily been associated with the "Five Poisons," which are movements the Chinese government considers dangerous. The type of malware is rare due to its final payload being in the form of [Control Panel Items](<https://attack.mitre.org/techniques/T1196>). (Citation: Palo Alto Reaver Nov 2017)

## FinFisher - S0182

[FinFisher](<https://attack.mitre.org/software/S0182>) is a government-grade commercial surveillance spyware reportedly sold exclusively to government agencies for use in targeted and lawful criminal investigations. It is heavily obfuscated and uses multiple anti-analysis techniques. It has other variants including [Wingbird](<https://attack.mitre.org/software/S0176>). (Citation: FinFisher Citation) (Citation: Microsoft SIR Vol 21) (Citation: FireEye FinSpy Sept 2017) (Citation: Securelist BlackOasis Oct 2017) (Citation: Microsoft FinFisher March 2018)

## POWERSOURCE - S0145

[POWERSOURCE](<https://attack.mitre.org/software/S0145>) is a PowerShell backdoor that is a heavily obfuscated and modified version of the publicly available tool DNS\_TXT\_Pwnage. It was observed in February 2017 in spearphishing campaigns against personnel involved with United States Securities and Exchange Commission (SEC) filings at various organizations. The malware was delivered when macros were enabled by the victim and a VBS script was dropped. (Citation: FireEye FIN7 March 2017) (Citation: Cisco DNSMessenger March 2017)

## SimBad - S0419

[SimBad](<https://attack.mitre.org/software/S0419>) was a strain of adware on the Google Play Store, distributed through the RXDroider Software Development Kit. The name "SimBad" was derived from the fact that most of the infected applications were simulator games. The adware was controlled using an instance of the open source framework Parse Server.(Citation: CheckPoint SimBad 2019)

## RawPOS - S0169

[RawPOS](<https://attack.mitre.org/software/S0169>) is a point-of-sale (POS) malware family that searches for cardholder data on victims. It has been in use since at least 2008. (Citation: Kroll RawPOS Jan 2017) (Citation: TrendMicro RawPOS April 2015) (Citation: Visa RawPOS March 2015) FireEye divides RawPOS into three components: FIENDCRY, DUEBREW, and DRIFTWOOD. (Citation: Mandiant FIN5 GrrCON Oct 2016) (Citation: DarkReading FireEye FIN5 Oct 2015)

The tag is: *misp-galaxy:mitre-malware="RawPOS - S0169"*

RawPOS - S0169 is also known as:

- RawPOS
- FIENDCRY
- DUEBREW
- DRIFTWOOD

RawPOS - S0169 has relationships with:

## Proxysvc - S0238

[Proxysvc](<https://attack.mitre.org/software/S0238>) is a malicious DLL used by [Lazarus Group](<https://attack.mitre.org/groups/G0032>) in a campaign known as Operation GhostSecret. It has appeared to be operating undetected since 2017 and was mostly observed in higher education organizations. The goal of [Proxysvc](<https://attack.mitre.org/software/S0238>) is to deliver additional payloads to the target and to maintain control for the attacker. It is in the form of a DLL that can also be executed as a standalone process. (Citation: McAfee GhostSecret)

## TrickMo - S0427

[TrickMo](<https://attack.mitre.org/software/S0427>) a 2FA bypass mobile banking trojan, most likely being distributed by [TrickBot](<https://attack.mitre.org/software/S0266>). [TrickMo](<https://attack.mitre.org/software/S0427>) has been primarily targeting users located in Germany.(Citation: SecurityIntelligence TrickMo)

[TrickMo](<https://attack.mitre.org/software/S0427>) is designed to steal transaction authorization numbers (TANs), which are typically used as one-time passwords.(Citation: SecurityIntelligence

# Mosquito - S0256

[Mosquito](<https://attack.mitre.org/software/S0256>) is a Win32 backdoor that has been used by [Turla](<https://attack.mitre.org/groups/G0010>). [Mosquito](<https://attack.mitre.org/software/S0256>) is made up of three parts: the installer, the launcher, and the backdoor. The main backdoor is called CommanderDLL and is launched by the loader program. (Citation: ESET Turla Mosquito Jan 2018)

## NOKKI - S0353

[NOKKI](<https://attack.mitre.org/software/S0353>) is a modular remote access tool. The earliest observed attack using [NOKKI](<https://attack.mitre.org/software/S0353>) was in January 2018. [NOKKI](<https://attack.mitre.org/software/S0353>) has significant code overlap with the [KONNI](<https://attack.mitre.org/software/S0356>) malware family. There is some evidence potentially linking [NOKKI](<https://attack.mitre.org/software/S0353>) to [APT37](<https://attack.mitre.org/groups/G0067>). (Citation: Unit 42 NOKKI Sept 2018)(Citation: Unit 42 Nokki Oct 2018)

## Azorult - S0344

[Azorult](<https://attack.mitre.org/software/S0344>) is a commercial Trojan that is used to steal information from compromised hosts. [Azorult](<https://attack.mitre.org/software/S0344>) has been observed in the wild as early as 2016. In July 2018, [Azorult](<https://attack.mitre.org/software/S0344>) was seen used in a spearphishing campaign against targets in North America. [Azorult](<https://attack.mitre.org/software/S0344>) has been seen used for cryptocurrency theft. (Citation: Unit42 Azorult Nov 2018)(Citation: Proofpoint Azorult July 2018)

## LightNeuron - S0395

[LightNeuron](<https://attack.mitre.org/software/S0395>) is a sophisticated backdoor that has targeted Microsoft Exchange servers since at least 2014. [LightNeuron](<https://attack.mitre.org/software/S0395>) has been used by [Turla](<https://attack.mitre.org/groups/G0010>) to target diplomatic and foreign affairs-related organizations. The presence of certain strings in the malware suggests a Linux variant of [LightNeuron](<https://attack.mitre.org/software/S0395>) exists.(Citation: ESET LightNeuron May 2019)

## Emotet - S0367

[Emotet](<https://attack.mitre.org/software/S0367>) is a modular malware variant which is primarily used as a downloader for other malware variants such as [TrickBot](<https://attack.mitre.org/software/S0266>) and [IcedID](<https://attack.mitre.org/software/S0483>). Emotet first emerged in June 2014 and has been primarily used to target the banking sector. (Citation: Trend Micro Banking Malware Jan 2019)

## NotPetya - S0368

[NotPetya](<https://attack.mitre.org/software/S0368>) is malware that was first seen in a worldwide attack starting on June 27, 2017. The main purpose of the malware appeared to be to effectively destroy data and disk structures on compromised systems. Though [NotPetya](<https://attack.mitre.org/software/S0368>) presents itself as a form of ransomware, it appears likely that the attackers never intended to make the encrypted data recoverable. As such, [NotPetya](<https://attack.mitre.org/software/S0368>) may be more appropriately thought of as a form of wiper malware. [NotPetya](<https://attack.mitre.org/software/S0368>) contains worm-like features to spread itself across a computer network using the SMBv1 exploits EternalBlue and EternalRomance.(Citation: Talos Nyetya June 2017)(Citation: Talos Nyetya June 2017)(Citation: US-CERT NotPetya 2017)(Citation: ESET Telebots June 2017)

## Maze - S0449

[Maze](<https://attack.mitre.org/software/S0449>) ransomware, previously known as "ChaCha", was discovered in May 2019. In addition to encrypting files on victim machines for impact, [Maze](<https://attack.mitre.org/software/S0449>) operators conduct information stealing campaigns prior to encryption and post the information online to extort affected companies.(Citation: FireEye Maze May 2020)(Citation: McAfee Maze March 2020)(Citation: Sophos Maze VM September 2020)

## Mandrake - S0485

[Mandrake](<https://attack.mitre.org/software/S0485>) is a sophisticated Android espionage platform that has been active in the wild since at least 2016. [Mandrake](<https://attack.mitre.org/software/S0485>) is very actively maintained, with sophisticated features and attacks that are executed with surgical precision.

[Mandrake](<https://attack.mitre.org/software/S0485>) has gone undetected for several years by providing legitimate, ad-free applications with social media and real reviews to back the apps. The malware is only activated when the operators issue a specific command.(Citation: Bitdefender Mandrake)

## Ramsay - S0458

[Ramsay](<https://attack.mitre.org/software/S0458>) is an information stealing malware framework designed to collect and exfiltrate sensitive documents, potentially from air-gapped systems. Researchers have identified overlaps between [Ramsay](<https://attack.mitre.org/software/S0458>) and the [Darkhotel](<https://attack.mitre.org/groups/G0012>)-associated Retro malware.(Citation: Eset Ramsay May 2020)

## WolfRAT - S0489

[WolfRAT](<https://attack.mitre.org/software/S0489>) is malware based on a leaked version of [Dendroid](<https://attack.mitre.org/software/S0301>) that has primarily targeted Thai users. [WolfRAT](<https://attack.mitre.org/software/S0489>) has most likely been operated by the now defunct organization Wolf Research.(Citation: Talos-WolfRAT)

## Invoke-PSImage - S0231

[Invoke-PSImage](<https://attack.mitre.org/software/S0231>) takes a PowerShell script and embeds the bytes of the script into the pixels of a PNG image. It generates a one liner for executing either from

a file of from the web. Example of usage is embedding the PowerShell code from the Invoke-Mimikatz module and embed it into an image file. By calling the image file from a macro for example, the macro will download the picture and execute the PowerShell code, which in this case will dump the passwords. (Citation: GitHub Invoke-PSImage)

## Net - S0039

The [Net](<https://attack.mitre.org/software/S0039>) utility is a component of the Windows operating system. It is used in command-line operations for control of users, groups, services, and network connections. (Citation: Microsoft Net Utility)

[Net](<https://attack.mitre.org/software/S0039>) has a great deal of functionality, (Citation: Savill 1999) much of which is useful for an adversary, such as gathering system and network information for Discovery, moving laterally through [Windows Admin Shares](<https://attack.mitre.org/techniques/T1077>) using `net use` commands, and interacting with services. The net1.exe utility is executed for certain functionality when net.exe is run and can be used directly in commands such as `net1 user`.

## Tor - S0183

[Tor](<https://attack.mitre.org/software/S0183>) is a software suite and network that provides increased anonymity on the Internet. It creates a multi-hop proxy network and utilizes multilayer encryption to protect both the message and routing information. [Tor](<https://attack.mitre.org/software/S0183>) utilizes "Onion Routing," in which messages are encrypted with multiple layers of encryption; at each step in the proxy network, the topmost layer is decrypted and the contents forwarded on to the next node until it reaches its destination. (Citation: Dingledine Tor The Second-Generation Onion Router)

The tag is: *misp-galaxy:mitre-tool="Tor - S0183"*

## Empire - S0363

[Empire](<https://attack.mitre.org/software/S0363>) is an open source, cross-platform remote administration and post-exploitation framework that is publicly available on GitHub. While the tool itself is primarily written in Python, the post-exploitation agents are written in pure [PowerShell](<https://attack.mitre.org/techniques/T1086>) for Windows and Python for Linux/macOS. [Empire](<https://attack.mitre.org/software/S0363>) was one of five tools singled out by a joint report on public hacking tools being widely used by adversaries.(Citation: NCSC Joint Report Public Tools)(Citation: Github PowerShell Empire)(Citation: GitHub ATTACK Empire)

## RawDisk - S0364

[RawDisk](<https://attack.mitre.org/software/S0364>) is a legitimate commercial driver from the EldoS Corporation that is used for interacting with files, disks, and partitions. The driver allows for direct modification of data on a local computer's hard drive. In some cases, the tool can enact these raw disk modifications from user-mode processes, circumventing Windows operating system security features.(Citation: EldoS RawDisk ITpro)(Citation: Novetta Blockbuster Destructive Malware)

## ShimRatReporter - S0445

[ShimRatReporter](<https://attack.mitre.org/software/S0445>) is a tool used by suspected Chinese adversary [Mofang](<https://attack.mitre.org/groups/G0103>) to automatically conduct initial discovery. The details from this discovery are used to customize follow-on payloads (such as [ShimRat](<https://attack.mitre.org/software/S0444>)) as well as set up faux infrastructure which mimics the adversary's targets. [ShimRatReporter](<https://attack.mitre.org/software/S0445>) has been used in campaigns targeting multiple countries and sectors including government, military, critical infrastructure, automobile, and weapons development.(Citation: FOX-IT May 2016 Mofang)

## Enforce UAC Prompt

Enforce administrative users to confirm an action that requires elevated rights

The tag is: *misp-galaxy:preventive-measure="Enforce UAC Prompt"*

Table 4107. Table References

Links
<a href="https://technet.microsoft.com/en-us/library/dd835564(WS.10).aspx">https://technet.microsoft.com/en-us/library/dd835564(WS.10).aspx</a>

## Remove Admin Privileges

Remove and restrict administrative rights whenever possible. Malware can only modify files that users have write access to.

The tag is: *misp-galaxy:preventive-measure="Remove Admin Privileges"*

## Restrict Workstation Communication

Activate the Windows Firewall to restrict workstation to workstation communication

The tag is: *misp-galaxy:preventive-measure="Restrict Workstation Communication"*

## Sandboxing Email Input

Using sandbox that opens email attachments and removes attachments based on behavior analysis

The tag is: *misp-galaxy:preventive-measure="Sandboxing Email Input"*

## Execution Prevention

Software that allows to control the execution of processes - sometimes integrated in Antivirus software Free: AntiHook, ProcessGuard, System Safety Monitor

The tag is: *misp-galaxy:preventive-measure="Execution Prevention"*

## Change Default "Open With" to Notepad

Force extensions primarily used for infections to open up in Notepad rather than Windows Script Host or Internet Explorer

The tag is: *misp-galaxy:preventive-measure="Change Default "Open With" to Notepad"*

## Marlboro Ransomware

It's directed to English speaking users, therefore is able to infect worldwide. It is spread using email spam, fake updates, attachments and so on. It encrypts all your files, including: music, MS Office, Open Office, pictures, videos, shared online files etc.. Ransom is .2 bitcoin, however there is no point of even trying to pay, since this damage is irreversible. Once the ransom is paid the hacker does not return decrypt the files. Another name is DeMarlboro and it is written in language C++. Pretend to encrypt using RSA-2048 and AES-128 (really it's just XOR)

The tag is: *misp-galaxy:ransomware="Marlboro Ransomware"*

## V8Locker Ransomware

It's directed to English speaking users, therefore is able to infect worldwide. It is spread using email spam, fake updates, attachments and so on. It encrypts all your files, including: music, MS Office, Open Office, pictures, videos, shared online files etc...

The tag is: *misp-galaxy:ransomware="V8Locker Ransomware"*

Table 4241. Table References

Links

<https://id-ransomware.blogspot.co.il/2016/12/v8locker-ransomware.html>

## Cryptorium (Fake Ransomware)

It's directed to English speaking users, therefore is able to infect worldwide. It is spread using email spam, fake updates, attachments and so on. It SUPPOSEDLY encrypts all your files, including: music, MS Office, Open Office, pictures, videos, shared online files etc., however your files are not really encrypted, only the names are changed.

The tag is: *misp-galaxy:ransomware="Cryptorium (Fake Ransomware)"*

Table 4242. Table References

Links

<https://id-ransomware.blogspot.co.il/2016/12/cryptorium-ransomware.html>

## Antihacker2017 Ransomware

It's directed to Russian speaking users, there fore is able to infect mostly the old USSR countries. It is spread using email spam, fake updates, attachments and so on. It encrypts all your files, including: music, MS Office, Open Office, pictures, videos, shared online files etc ... The hacker goes by the nickname Antihacker and requests the victim to send him an email for the decryption. He does not request any money only a warning about looking at porn (gay, incest and rape porn to be specific).

The tag is: *misp-galaxy:ransomware="Antihacker2017 Ransomware"*

Table 4243. Table References

# Booyah

Ransomware EXE was replaced to neutralize threat

The tag is: *misp-galaxy:ransomware="Booyah"*

Booyah is also known as:

- Salami

Booyah has relationships with:

- similar: *misp-galaxy:ransomware="MM Locker"* with *estimative-language:likelihood-probability="likely"*

# Brazilian

Ransomware Based on EDA2

The tag is: *misp-galaxy:ransomware="Brazilian"*

*Table 4358. Table References*

Links
<a href="http://www.nyxbone.com/malware/brazilianRansom.html">http://www.nyxbone.com/malware/brazilianRansom.html</a>

# CryLocker

Ransomware Identifies victim locations w/Google Maps API

The tag is: *misp-galaxy:ransomware="CryLocker"*

CryLocker is also known as:

- Cry
- CSTO
- Central Security Treatment Organization

CryLocker has relationships with:

- similar: *misp-galaxy:ransomware="Central Security Treatment Organization"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="CryLocker"* with *estimative-language:likelihood-probability="likely"*

## CryptoGraphic Locker

Ransomware Has a GUI. Subvariants: CoinVault BitCryptor

The tag is: *misp-galaxy:ransomware="CryptoGraphic Locker"*

## CryptoHost

Ransomware RAR's victim's files has a GUI

The tag is: *misp-galaxy:ransomware="CryptoHost"*

CryptoHost is also known as:

- Manamecrypt
- Telograph
- ROI Locker

CryptoHost has relationships with:

- similar: *misp-galaxy:malpedia="ManameCrypt"* with *estimative-language:likelihood-probability="likely"*

Table 4384. Table References

# Rakhni

Ransomware Files might be partially encrypted

The tag is: *misp-galaxy:ransomware="Rakhni"*

Rakhni is also known as:

- Agent.iih
- Aura
- Autoit
- Pletor
- Rotor
- Lamer
- Isda
- Cryptokluchen
- Bandarchor

Rakhni has relationships with:

- similar: *misp-galaxy:ransomware="Bandarchor"* with *estimative-language:likelihood-probability="likely"*

*Table 4534. Table References*

# Samas-Samsam

Ransomware Targeted attacks -Jexboss -PSExec -Hyena

The tag is: *misp-galaxy:ransomware="Samas-Samsam"*

Samas-Samsam is also known as:

- samsam.exe
- MIKOPONI.exe
- RikiRafael.exe
- showmehowto.exe
- SamSam Ransomware
- SamSam
- Samsam

Samas-Samsam has relationships with:

- similar: *misp-galaxy:malpedia="SamSam"* with *estimative-language:likelihood-probability="likely"*

# Jaff

We recently observed several large scale email campaigns that were attempting to distribute a new variant of ransomware that has been dubbed "Jaff". Interestingly we identified several characteristics that we have previously observed being used during Dridex and Locky campaigns. In a short period of time, we observed multiple campaigns featuring high volumes of malicious spam emails being distributed, each using a PDF attachment with an embedded Microsoft Word document functioning as the initial downloader for the Jaff ransomware.

The tag is: *misp-galaxy:ransomware="Jaff"*

## SynAck

The ransomware does not use a customized desktop wallpaper to signal its presence, and the only way to discover that SynAck has infected your PC is by the ransom notes dropped on the user's desktop, named in the format: RESTORE\_INFO-[id].txt. For example: RESTORE\_INFO-4ABFA0EF.txt. In addition, SynAck also appends its own extension at the end of all files it encrypted. This file

extensions format is ten random alpha characters for each file. For example: test.jpg.XbMiJQiuoh. Experts believe the group behind SynAck uses RDP brute-force attacks to access remote computers and manually download and install the ransomware.

The tag is: *misp-galaxy:ransomware="SynAck"*

SynAck is also known as:

- Syn Ack

SynAck has relationships with:

- similar: *misp-galaxy:malpedia="SynAck"* with *estimative-language:likelihood-probability="likely"*

## Bad Rabbit

On October 24, 2017, Cisco Talos was alerted to a widescale ransomware campaign affecting organizations across eastern Europe and Russia. As was the case in previous situations, we quickly mobilized to assess the situation and ensure that customers remain protected from this and other threats as they emerge across the threat landscape. There have been several large scale

ransomware campaigns over the last several months. This appears to have some similarities to Nyetya in that it is also based on Petya ransomware. Major portions of the code appear to have been rewritten. The distribution does not appear to have the sophistication of the supply chain attacks we have seen recently.

The tag is: *misp-galaxy:ransomware="Bad Rabbit"*

Bad Rabbit is also known as:

- BadRabbit
- Bad-Rabbit

Bad Rabbit has relationships with:

- similar: *misp-galaxy:malpedia="EternalPetya"* with *estimative-language:likelihood-probability="likely"*

## StorageCrypt

Recently BleepingComputer has received a flurry of support requests for a new ransomware being named StorageCrypt that is targeting NAS devices such as the Western Digital My Cloud. Victims have been reporting that their files have been encrypted and a note left with a ransom demand of

between .4 and 2 bitcoins to get their files back. User's have also reported that each share on their NAS device contains a Autorun.inf file and a Windows executable named 美女与野 .exe, which translates to Beauty and the beast. From the samples BleepingComputer has received, this Autorun.inf is an attempt to spread the 美女与野 .exe file to other computers that open the folders on the NAS devices.

The tag is: *misp-galaxy:ransomware="StorageCrypt"*

## HC7

A new ransomware called HC7 is infecting victims by hacking into Windows computers that are running publicly accessible Remote Desktop services. Once the developers gain access to the hacked computer, the HC7 ransomware is then installed on all accessible computers on the network. Originally released as HC6, victims began posting about it in the BleepingComputer forums towards the end of November. As this is a Python-to-exe executable, once the script was extracted ID Ransomware creator Michael Gillespie was able determine that it was decryptable and released a decryptor. Unfortunately, a few days later, the ransomware developers released a new version called HC7 that was not decryptable. This is because they removed the hard coded encryption key and instead switched to inputting the key as a command line argument when the attackers run the ransomware executable. Thankfully, there may be a way to get around that as well so that victims can recover their keys.

The tag is: *misp-galaxy:ransomware="HC7"*

## Scarab

The Scarab ransomware is a relatively new ransomware strain that was first spotted by security researcher Michael Gillespie in June this year. Written in Delphi, the first version was simplistic and was recognizable via the ".scarab" extension it appended after the names of encrypted files. Malwarebytes researcher Marcelo Rivera spotted a second version in July that used the ".scorpio" extension. The version spotted with the Necurs spam today has reverted back to using the .scarab extension. The current version of Scarab encrypts files but does not change original file names as previous versions. This Scarab version appends each file's name with the "[suupport@protonmail.com].scarab" extension. Scarab also deletes shadow volume copies and drops a ransom note named "IF YOU WANT TO GET ALL YOUR FILES BACK, PLEASE READ THIS.TXT" on users' computers, which it opens immediately.

The tag is: *misp-galaxy:ransomware="Scarab"*

## File Spider

A new ransomware called File Spider is being distributed through spam that targets victims in Bosnia and Herzegovina, Serbia, and Croatia. These spam emails contains malicious Word documents that will download and install the File Spider ransomware onto a victims computer. File Spider is currently being distributed through malspam that appears to be targeting countries such as Croatia, Bosnia and Herzegovina, and Serbia. The spam start with subjects like "Potrazivanje dugovanja", which translates to "Debt Collection" and whose message, according to Google Translate, appear to be in Serbian.

The tag is: *misp-galaxy:ransomware="File Spider"*

## Zenis Ransomware

A new ransomware was discovered this week by MalwareHunterTeam called Zenis Ransomware. While it is currently unknown how Zenis is being distributed, multiple victims have already become infected with this ransomware. What is most disturbing about Zenis is that it not encrypts your files, but also purposely deletes your backups.

The tag is: *misp-galaxy:ransomware="Zenis Ransomware"*

Table 4629. Table References

## Black Ruby

A new ransomware was discovered this week by MalwareHunterTeam called Black Ruby. This ransomware will encrypt the files on a computer, scramble the file name, and then append the BlackRuby extension. To make matters worse, Black Ruby will also install a Monero miner on the computer that utilizes as much of the CPU as it can. Discovered on February 6, 2018. May have been distributed through unknown vectors. Will not encrypt a machine if its IP address is identified as coming from Iran; this feature enables actors to avoid a particular Iranian cybercrime law that prohibits Iran-based actors from attacking Iranian victims. Encrypts files on the infected machine, scrambles files, and appends the .BlackRuby extension to them. Installs a Monero miner on the infected computer that utilizes the machine's maximum CPU power. Delivers a ransom note in English asking for US\$650 in Bitcoins. Might be installed via Remote Desktop Services.

The tag is: *misp-galaxy:ransomware="Black Ruby"*

## WhiteRose

A new ransomware has been discovered by MalwareHunterTeam that is based off of the InfiniteTear ransomware family, of which BlackRuby and Zenis are members. When this ransomware infects a computer it will encrypt the files, scramble the filenames, and append the .WHITEROSE extension to them.

The tag is: *misp-galaxy:ransomware="WhiteRose"*

## PUBG Ransomware

In what could only be a joke, a new ransomware has been discovered called "PUBG Ransomware" that will decrypt your files if you play the game called PlayerUnknown's Battlegrounds. Discovered by MalwareHunterTeam, when the PUBG Ransomware is launched it will encrypt a user's files and folders on the user's desktop and append the .PUBG extension to them. When it has finished encrypting the files, it will display a screen giving you two methods that you can use to decrypt the encrypted files.

The tag is: *misp-galaxy:ransomware="PUBG Ransomware"*

## LockCrypt

LockCrypt is an example of yet another simple ransomware created and used by unsophisticated attackers. Its authors ignored well-known guidelines about the proper use of cryptography. The internal structure of the application is also unprofessional. Sloppy, unprofessional code is pretty commonplace when ransomware is created for manual distribution. Authors don't take much time preparing the attack or the payload. Instead, they're rather focused on a fast and easy gain, rather than on creating something for the long run. Because of this, they could easily be defeated.

The tag is: *misp-galaxy:ransomware="LockCrypt"*

## Magniber Ransomware

Magniber is a new ransomware being distributed by the Magnitude Exploit Kit that appears to be the successor to the Cerber Ransomware. While many aspects of the Magniber Ransomware are different than Cerber, the payment system and the files it encrypts are very similar.

The tag is: *misp-galaxy:ransomware="Magniber Ransomware"*

## Reveton ransomware

A ransomware family that targets users from certain countries or regions. It locks the computer and displays a location-specific webpage that covers the desktop and demands that the user pay a fine for the supposed possession of illicit material. The Reveton ransomware is one of the first screen-locking ransomware strains, and it appeared when Bitcoin was still in its infancy, and before it became the cryptocurrency of choice in all ransomware operations. Instead, Reveton operators asked victims to buy GreenDot MoneyPak vouchers, take the code on the voucher and enter it in the Reveton screen locker.

The tag is: *misp-galaxy:ransomware="Reveton ransomware"*

## Fusob

Fusob is one of the major mobile ransomware families. Between April 2015 and March 2016, about 56 percent of accounted mobile ransomware was Fusob. Like a typical mobile ransomware, it employs scare tactics to extort people to pay a ransom. The program pretends to be an accusatory authority, demanding the victim to pay a fine from \$100 to \$200 USD or otherwise face a fictitious charge. Rather surprisingly, Fusob suggests using iTunes gift cards for payment. Also, a timer clicking down on the screen adds to the users' anxiety as well. In order to infect devices, Fusob masquerades as a pornographic video player. Thus, victims, thinking it is harmless, unwittingly download Fusob. When Fusob is installed, it first checks the language used in the device. If it uses Russian or certain Eastern European languages, Fusob does nothing. Otherwise, it proceeds on to lock the device and demand ransom. Among victims, about 40% of them are in Germany with the United Kingdom and the United States following with 14.5% and 11.4% respectively. Fusob has lots in common with Small, which is another major family of mobile ransomware. They represented over 93% of mobile ransoms between 2015 and 2016.

The tag is: *misp-galaxy:ransomware="Fusob"*

## NMCRYPT Ransomware

The NMCRYPT Ransomware is a generic file encryption Trojan that was detected in the middle of April 2018. The NMCRYPT Ransomware is a file encoder Trojan that is designed to make data unreadable and convince users to pay a fee for unlocking content on the infected computers. The NMCRYPT Ransomware is nearly identical to hundreds of variants of the HiddenTear open-source ransomware and compromised users are unable to use the Shadow Volume snapshots made by Windows to recover. Unfortunately, the NMCRYPT Ransomware disables the native recovery features on Windows, and you need third-party applications to rebuild your data.

The tag is: *misp-galaxy:ransomware="NMCRYPT Ransomware"*

## Iron

It is currently unknown if Iron is indeed a new variant by the same creators of Maktub, or if it was simply inspired by the latter, by copying the design for the payment portal for example. We know the Iron ransomware has mimicked at least three ransomware families: Maktub (payment portal design) DMA Locker (Iron Unlocker, decryption tool) Satan (exclusion list)

The tag is: *misp-galaxy:ransomware="Iron"*

## Unnamed ransomware 1

A new in-development ransomware was discovered that has an interesting characteristic. Instead of the distributed executable performing the ransomware functionality, the executables compiles an embedded encrypted C# program at runtime and launches it directly into memory.

The tag is: *misp-galaxy:ransomware="Unnamed ramsomware 1"*

Table 4648. Table References

Links

## HPE iLO 4 Ransomware

Attackers are targeting Internet accessible HPE iLO 4 remote management interfaces, supposedly encrypting the hard drives, and then demanding Bitcoins to get access to the data again. According to the victim, the attackers are demanding 2 bitcoins to gain access to the drives again. The attackers will also provide a bitcoin address to the victim that should be used for payment. These bitcoin addresses appear to be unique per victim as the victim's was different from other reported ones. An interesting part of the ransom note is that the attackers state that the ransom price is not negotiable unless the victim's are from Russia. This is common for Russian based attackers, who in many cases tries to avoid infecting Russian victims. Finally, could this be a decoy/wiper rather than an actual true ransomware attack? Ransomware attacks typically provide a unique ID to the victim in order to distinguish one victim from another. This prevents a victim from "stealing" another victim's payment and using it to unlock their computer. In a situation like this, where no unique ID is given to identify the encrypted computer and the email is publicly accessible, it could be a case where the main goal is to wipe a server or act as a decoy for another attack.

The tag is: *misp-galaxy:ransomware="HPE iLO 4 Ransomware"*

## Aurora Ransomware

Typical ransom software, Aurora virus plays the role of blackmailing PC operators. It encrypts files and the encryption cipher it uses is pretty strong. After encryption, the virus attaches .aurora at the end of the file names that makes it impossible to open the data. Thereafter, it dispatches the ransom note totaling 6 copies, without any change to the main objective i.e., victims must write an electronic mail addressed to [anonimus.mr@yahoo.com](mailto:anonimus.mr@yahoo.com) while stay connected until the criminals reply telling the ransom amount.

The tag is: *misp-galaxy:ransomware="Aurora Ransomware"*

Aurora Ransomware is also known as:

- Zorro Ransomware

## DBGer Ransomware

The authors of the Satan ransomware have rebranded their "product" and they now go by the name of DBGer ransomware, according to security researcher MalwareHunter, who spotted this new

version earlier today. The change was not only in name but also in the ransomware's modus operandi. According to the researcher, whose discovery was later confirmed by an Intezer code similarity analysis, the new (Satan) DBGer ransomware now also incorporates Mimikatz, an open-source password-dumping utility. The purpose of DBGer incorporating Mimikatz is for lateral movement inside compromised networks. This fits a recently observed trend in Satan's modus operandi.

The tag is: *misp-galaxy:ransomware="DBGer Ransomware"*

## TYRANT

DUMB variant discovered on November 16, 2017. Disguised itself as a popular virtual private network (VPN) in Iran known as Psiphon and infected Iranian users. Included Farsi-language ransom note, decryptable in the same way as previous DUMB-based variants. Message requested only US\$15 for unlock key. Advertised two local and Iran-based payment processors: exchange.ir and webmoney.ir. Shared unique and specialized indicators with RASTAKHIZ; iDefense threat intelligence analysts believe this similarity confirms that the same actor was behind the repurposing of both types of ransomware.

The tag is: *misp-galaxy:ransomware="TYRANT"*

TYRANT is also known as:

- Crypto Tyrant

# CryptoNar

When the CryptoNar, or Crypto Nar, Ransomware encrypts a victims files it will perform the encryption differently depending on the type of file being encrypted. If the targeted file has a .txt or .md extension, it will encrypt the entire file and append the .fully.cryptoNar extension to the encrypted file's name. All other files will only have the first 1,024 bytes encrypted and will have the .partially.cryptoNar extensions appended to the file's name.

The tag is: *misp-galaxy:ransomware="CryptoNar"*

CryptoNar has relationships with:

- similar: *misp-galaxy:ransomware="CryptoJoker"* with *estimative-language:likelihood-probability="likely"*

## Crypt0saur

The tag is: *misp-galaxy:ransomware="Crypt0saur"*

## Mongo Lock

An attack called Mongo Lock is targeting remotely accessible and unprotected MongoDB databases, wiping them, and then demanding a ransom in order to get the contents back. While this new campaign is using a name to identify itself, these types of attacks are not new and MongoDB databases have been targeted for a while now. These hijacks work by attackers scanning the Internet or using services such as Shodan.io to search for unprotected MongoDB servers. Once connected, the attackers may export the databases, delete them, and then create a ransom note

explaining how to get the databases back.

The tag is: *misp-galaxy:ransomware="Mongo Lock"*

*Table 4682. Table References*

Links

<https://www.bleepingcomputer.com/news/security/mongo-lock-attack-ransoming-deleted-mongodb-databases/>

## Kraken Cryptor Ransomware

The Kraken Cryptor Ransomware is a newer ransomware that was released in August 2018. A new version, called Kraken Cryptor 1.5, was recently released that is masquerading as the legitimate SuperAntiSpyware anti-malware program in order to trick users into installing it.

The tag is: *misp-galaxy:ransomware="Kraken Cryptor Ransomware"*

*Table 4683. Table References*

## Ryuk ransomware

Similar to Samas and BitPaymer, Ryuk is specifically used to target enterprise environments. Code comparison between versions of Ryuk and Hermes ransomware indicates that Ryuk was derived from the Hermes source code and has been under steady development since its release. Hermes is commodity ransomware that has been observed for sale on forums and used by multiple threat actors. However, Ryuk is only used by GRIM SPIDER and, unlike Hermes, Ryuk has only been used to target enterprise environments. Since Ryuk's appearance in August, the threat actors operating it have netted over 705.80 BTC across 52 transactions for a total current value of \$3,701,893.98 USD.

The tag is: *misp-galaxy:ransomware="Ryuk ransomware"*

Table 4711. Table References

## BitPaymer

In August 2017, a new ransomware variant identified as BitPaymer was reported to have ransomed the U.K.'s National Health Service (NHS), with a high ransom demand of 53 BTC (approximately \$200,000 USD). The targeting of an organization rather than individuals, and the high ransom demands, made BitPaymer stand out from other contemporary ransomware at the time. Though the encryption and ransom functionality of BitPaymer was not technically sophisticated, the malware contained multiple anti-analysis features that overlapped with Dridex. Later technical analysis of BitPaymer indicated that it had been developed by INDRIK SPIDER, suggesting the group had expanded its criminal operation to include ransomware as a monetization strategy.

The tag is: *misp-galaxy:ransomware="BitPaymer"*

BitPaymer is also known as:

- FriedEx
- IEncrypt

## Princess Evolution

We have been observing a malvertising campaign via Rig exploit kit delivering a cryptocurrency-mining malware and the GandCrab ransomware since July 25. On August 1, we found Rig's traffic stream dropping a then-unknown ransomware. Delving into this seemingly new ransomware, we checked its ransom payment page in the Tor network and saw it was called Princess Evolution (detected by Trend Micro as RANSOM\_PRINCESSLOCKER.B), and was actually a new version of the Princess Locker ransomware that emerged in 2016. Based on its recent advertisement in underground forums, it appears that its operators are peddling Princess Evolution as a ransomware as a service (RaaS) and are looking for affiliates. The new malvertising campaign we observed since July 25 is notable in that the malvertisements included Coinhive (COINMINER\_MALXMR.TIDBF). Even if users aren't diverted to the exploit kit and infected with the ransomware, the cybercriminals can still earn illicit profit through cryptocurrency mining. Another characteristic of this new campaign is that they hosted their malvertisement page on a free web hosting service and used domain name system canonical name (DNS CNAME) to map their advertisement domain on a malicious webpage on the service.

The tag is: *misp-galaxy:ransomware="Princess Evolution"*

Table 4714. Table References

## Links

<https://blog.trendmicro.com/trendlabs-security-intelligence/ransomware-as-a-service-princess-evolution-looking-for-affiliates/>

## Jokeroo

A new Ransomware-as-a-Service called Jokeroo is being promoted on underground hacking sites and via Twitter that allows affiliates to allegedly gain access to a fully functional ransomware and payment server. According to a malware researcher named Damian, the Jokeroo RaaS first started promoting itself as a GandCrab Ransomware RaaS on the underground hacking forum Exploit.in.

The tag is: *misp-galaxy:ransomware="Jokeroo"*

Jokeroo is also known as:

- Fake GandCrab

*Table 4715. Table References*

<https://www.bleepingcomputer.com/news/security/jokeroo-ransomware-as-a-service-offers-multiple-membership-packages/>

## GlobeImposter

During December 2017, a new variant of the GlobeImposter Ransomware was detected for the first time and reported on malware-traffic-analysis. At first sight this ransomware looks very similar to other ransomware samples and uses common techniques such as process hollowing. However, deeper inspection showed that like LockPoS, which was analyzed by CyberBit, GlobeImposter too bypasses user-mode hooks by directly invoking system calls. Given this evasion technique is being leveraged by new malware samples may indicate that this is a beginning of a trend aiming to bypass user-mode security products.

The tag is: *misp-galaxy:ransomware="GlobeImposter"*

*Table 4716. Table References*

## Links

<https://www.fortinet.com/blog/threat-research/analysis-of-new-globeimposter-ransomware-variant.html>

## BlackWorm

BlackWorm Ransomware is a malicious computer infection that encrypts your files, and then does everything it can to prevent you from restoring them. It needs you to pay \$200 for the decryption key, but there is no guarantee that the people behind this infection would really issue the decryption tool for you.

The tag is: *misp-galaxy:ransomware="BlackWorm"*
