These commands may also include pointers to command and control (C2) infrastructure. Adversaries may post content, known as a dead drop resolver, on Web services with embedded (and often obfuscated/encoded) domains or IP addresses. Once infected, victims will reach out to and be redirected by these resolvers.

Popular websites and social media acting as a mechanism for C2 may give a significant amount of cover due to the likelihood that hosts within a network are already communicating with them prior to a compromise. Using common services, such as those offered by Google or Twitter, makes it easier for adversaries to hide in expected noise. Web service providers commonly use SSL/TLS encryption, giving adversaries an added level of protection.

Use of Web services may also protect back-end C2 infrastructure from discovery through malware binary analysis while also enabling operational resiliency (since this infrastructure may be dynamically changed).

Detection: Host data that can relate unknown or suspicious process activity using a network connection is important to supplement any existing indicators of compromise based on malware command and control signatures and infrastructure or the presence of strong encryption. Packet capture analysis will require SSL/TLS inspection if data is encrypted. Analyze network data for uncommon data flows (e.g., a client sending significantly more data than it receives from a server). User behavior monitoring may help to detect abnormal patterns of activity. Analyze packet contents to detect communications that do not follow the expected protocol behavior for the port that is being used. (Citation: University of Birmingham C2)

Platforms: Linux, macOS, Windows

Data Sources: Host network interface, Netflow/Enclave netflow, Network protocol analysis, Packet capture, SSL/TLS inspection

Query Registry - T1012

Adversaries may interact with the Windows Registry to gather information about the system, configuration, and installed software.

The Registry contains a significant amount of information about the operating system, configuration, software, and security. (Citation: Wikipedia Windows Registry) Some of the information may help adversaries to further their operation within a network.

Detection: System and network discovery techniques normally occur throughout an operation as an adversary learns the environment. Data and events should not be viewed in isolation, but as part of a chain of behavior that could lead to other activities, such as Lateral Movement, based on the information obtained.

Interaction with the Windows Registry may come from the command line using utilities such as Reg or through running malware that may interact with the Registry through an API. Command-line invocation of utilities used to query the Registry may be detected through process and command-line monitoring. Remote access tools with built-in features may interact directly with the Windows API to gather information. Information may also be acquired through Windows system management tools such as Windows Management Instrumentation and PowerShell.

Platforms: Windows

Data Sources: Windows Registry, Process monitoring, Process command-line parameters

Permissions Required: User, Administrator, SYSTEM

Third-party Software - T1072

Third-party applications and software deployment systems may be in use in the network environment for administration purposes (e.g., SCCM, VNC, HBSS, Altiris, etc.). If an adversary gains access to these systems, then they may be able to execute code.

Adversaries may gain access to and use third-party application deployment systems installed within an enterprise network. Access to a network-wide or enterprise-wide software deployment

system enables an adversary to have remote code execution on all systems that are connected to such a system. The access may be used to laterally move to systems, gather information, or cause a specific effect, such as wiping the hard drives on all endpoints.

The permissions required for this action vary by system configuration; local credentials may be sufficient with direct access to the deployment server, or specific domain credentials may be required. However, the system may require an administrative account to log in or to perform software deployment.

Detection: Detection methods will vary depending on the type of third-party software or system and how it is typically used.

The same investigation process can be applied here as with other potentially malicious activities where the distribution vector is initially unknown but the resulting activity follows a discernible pattern. Analyze the process execution trees, historical activities from the third-party application (such as what types of files are usually pushed), and the resulting activities or events from the file/binary/script pushed to systems.

Often these third-party applications will have logs of their own that can be collected and correlated with other data from the environment. Audit software deployment logs and look for suspicious or unauthorized activity. A system not typically used to push software to clients that suddenly is used for such a task outside of a known admin function may be suspicious.

Perform application deployment at regular times so that irregular deployment activity stands out. Monitor process activity that does not correlate to known good software. Monitor account login activity on the deployment system.

Platforms: Linux, Windows, macOS

Remote File Copy - T1105

Files may be copied from one system to another to stage adversary tools or other files over the course of an operation. Files may be copied from an external adversary-controlled system through the Command and Control channel to bring tools into the victim network or through alternate protocols with another tool such as FTP. Files can also be copied over on Mac and Linux with native tools like scp, rsync, and sftp.

Adversaries may also copy files laterally between internal victim systems to support Lateral Movement with remote Execution using inherent file sharing protocols such as file sharing over SMB to connected network shares or with authenticated connections with Windows Admin Shares or Remote Desktop Protocol.

Detection: Monitor for file creation and files transferred within a network over SMB. Unusual processes with external network connections creating files on-system may be suspicious. Use of utilities, such as FTP, that does not normally occur may also be suspicious.

Analyze network data for uncommon data flows (e.g., a client sending significantly more data than it receives from a server). Processes utilizing the network that do not normally have network communication or have never been seen before are suspicious. Analyze packet contents to detect communications that do not follow the expected protocol behavior for the port that is being used. (Citation: University of Birmingham C2)

File System Logical Offsets - T1006

Windows allows programs to have direct access to logical volumes. Programs with direct access may read and write files directly from the drive by analyzing file system data structures. This technique bypasses Windows file access controls as well as file system monitoring tools. (Citation: Hakobyan 2009)

Utilities, such as NinjaCopy, exist to perform these actions in PowerShell. (Citation: Github PowerSploit Ninjacopy)

Detection: Monitor handle opens on drive volumes that are made by processes to determine when they may directly access logical drives. (Citation: Github PowerSploit Ninjacopy)

Monitor processes and command-line arguments for actions that could be taken to copy files from the logical drive and evade common file system protections. Since this technique may also be used through PowerShell, additional logging of PowerShell scripts is recommended.

Platforms: Windows

Data Sources: API monitoring

Defense Bypassed: File monitoring, File system access controls

Permissions Required: Administrator

The tag is: *misp-galaxy:mitre-enterprise-attack-attack-pattern="File System Logical Offsets - T1006"*

Input Prompt - T1141

When programs are executed that need additional privileges than are present in the current user context, it is common for the operating system to prompt the user for proper credentials to authorize the elevated privileges for the task. Adversaries can mimic this functionality to prompt users for credentials with a normal-looking prompt. This type of prompt can be accomplished with AppleScript:

```
<code>set thePassword to the text returned of (display dialog "AdobeUpdater needs permission to check for updates. Please authenticate." default answer "")</code> (Citation: OSX Keydnab malware)
```

Adversaries can prompt a user for a number of reasons that mimic normal usage, such as a fake installer requiring additional access or a fake malware removal suite. (Citation: OSX Malware Exploits MacKeeper)

Detection: This technique exploits users' tendencies to always supply credentials when prompted, which makes it very difficult to detect. Monitor process execution for unusual programs as well as AppleScript that could be used to prompt users for credentials.

Platforms: macOS

Data Sources: User interface, Process Monitoring

Permissions Required: User

The tag is: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Input Prompt - T1141"*

Shared Webroot - T1051

Adversaries may add malicious content to an internally accessible website through an open network file share that contains the website's webroot or Web content directory and then browse to that content with a Web browser to cause the server to execute the malicious content. The malicious content will typically run under the context and permissions of the Web server process, often resulting in local system or administrative privileges, depending on how the Web server is configured.

This mechanism of shared access and remote execution could be used for lateral movement to the system running the Web server. For example, a Web server running PHP with an open network share could allow an adversary to upload a remote access tool and PHP script to execute the RAT on the system running the Web server when a specific page is visited.

Detection: Use file and process monitoring to detect when files are written to a Web server by a process that is not the normal Web server process or when files are written outside of normal administrative time periods. Use process monitoring to identify normal processes that run on the Web server and detect processes that are not typically executed.

Platforms: Windows

Data Sources: File monitoring, Process monitoring

System Requirements: Shared webroot directory on remote system

The tag is: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Shared Webroot - T1051"*

Table 2679. Table References

https://attack.mitre.org/wiki/Technique/T1051

Indicator Blocking - T1054

An adversary may attempt to block indicators or events from leaving the host machine. In the case of network-based reporting of indicators, an adversary may block traffic associated with reporting to prevent central analysis. This may be accomplished by many means, such as stopping a local process or creating a host-based firewall rule to block traffic to a specific server.

Detection: Detect lack of reported activity from a host sensor. Different methods of blocking may cause different disruptions in reporting. Systems may suddenly stop reporting all data or only certain kinds of data.

Depending on the types of host information collected, an analyst may be able to detect the event that triggered a process to stop or connection to be blocked.

Platforms: Windows

Data Sources: Sensor health and status, Process command-line parameters, Process monitoring

Defense Bypassed: Anti-virus, Log analysis, Host intrusion prevention systems

The tag is: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Indicator Blocking - T1054"*

https://attack.mitre.org/wiki/Technique/T1054

Exfiltration Over Physical Medium - T1052

In certain circumstances, such as an air-gapped network compromise, exfiltration could occur via a physical medium or device introduced by a user. Such media could be an external hard drive, USB drive, cellular phone, MP3 player, or other removable storage and processing device. The physical medium or device could be used as the final exfiltration point or to hop between otherwise disconnected systems.

Detection: Monitor file access on removable media. Detect processes that execute when removable media are mounted.

Platforms: Linux, macOS, Windows

Data Sources: Data loss prevention, File monitoring

System Requirements: Presence of physical medium or device

Requires Network: No

The tag is: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Exfiltration Over Physical Medium - T1052"*

Table 2681. Table References

Links
https://attack.mitre.org/wiki/Technique/T1052

Access Token Manipulation - T1134

Windows uses access tokens to determine the ownership of a running process. A user can manipulate access tokens to make a running process appear as though it belongs to someone other than the user that started the process. When this occurs, the process also takes on the security context associated with the new token. For example, Microsoft promotes the use of access tokens as a security best practice. Administrators should log in as a standard user but run their tools with administrator privileges using the built-in access token manipulation command `runas`. (Citation: Microsoft runas)

Adversaries may use access tokens to operate under a different user or system security context to perform actions and evade detection. An adversary can use built-in Windows API functions to copy access tokens from existing processes; this is known as token stealing. An adversary must already be in a privileged user context (i.e. administrator) to steal a token. However, adversaries commonly

use token stealing to elevate their security context from the administrator level to the SYSTEM level. An adversary can use a token to authenticate to a remote system as the account for that token if the account has appropriate permissions on the remote system. (Citation: Pentestlab Token Manipulation)

Access tokens can be leveraged by adversaries through three methods: (Citation: BlackHat Atkinson Winchester Token Manipulation)

"Token Impersonation/Theft" - An adversary creates a new access token that duplicates an existing token using `DuplicateToken(Ex)`. The token can then be used with `ImpersonateLoggedOnUser` to allow the calling thread to impersonate a logged on user's security context, or with `SetThreadToken` to assign the impersonated token to a thread. This is useful for when the target user has a non-network logon session on the system.

"Create Process with a Token" - An adversary creates a new access token with `DuplicateToken(Ex)` and uses it with `CreateProcessWithTokenW` to create a new process running under the security context of the impersonated user. This is useful for creating a new process under the security context of a different user.

"Make and Impersonate Token" - An adversary has a username and password but the user is not logged onto the system. The adversary can then create a logon session for the user using the `LogonUser` function. The function will return a copy of the new session's access token and the adversary can use `SetThreadToken` to assign the token to a thread.

Any standard user can use the `runas` command, and the Windows API functions, to create impersonation tokens; it does not require access to an administrator account.

Metasploit's Meterpreter payload allows arbitrary token manipulation and uses token impersonation to escalate privileges. (Citation: Metasploit access token) The Cobalt Strike beacon payload allows arbitrary token impersonation and can also create tokens. (Citation: Cobalt Strike Access Token)

Detection: If an adversary is using a standard command-line shell, analysts can detect token manipulation by auditing command-line activity. Specifically, analysts should look for use of the `runas` command. Detailed command-line logging is not enabled by default in Windows. (Citation: Microsoft Command-line Logging)

If an adversary is using a payload that calls the Windows token APIs directly, analysts can detect token manipulation only through careful analysis of user network activity, examination of running processes, and correlation with other endpoint and network behavior.

There are many Windows API calls a payload can take advantage of to manipulate access tokens (e.g., `LogonUser` (Citation: Microsoft LogonUser), `DuplicateTokenEx` (Citation: Microsoft DuplicateTokenEx), and `ImpersonateLoggedOnUser` (Citation: Microsoft ImpersonateLoggedOnUser)). Please see the referenced Windows API pages for more information.

Query systems for process and thread token information and look for inconsistencies such as user owns processes impersonating the local SYSTEM account. (Citation: BlackHat Atkinson Winchester Token Manipulation)

System Time Discovery - T1124

The system time is set and stored by the Windows Time Service within a domain to maintain time synchronization between systems and services in an enterprise network. (Citation: MSDN System Time) (Citation: Technet Windows Time Service)

An adversary may gather the system time and/or time zone from a local or remote system. This information may be gathered in a number of ways, such as with Net on Windows by performing `net time \\hostname` to gather the system time on a remote system. The victim's time zone may also be inferred from the current system time or gathered by using `w32tm /tz`. (Citation: Technet Windows Time Service) The information could be useful for performing other techniques, such as executing a file with a Scheduled Task (Citation: RSA EU12 They're Inside), or to discover locality information based on time zone to assist in victim targeting.

Detection: Command-line interface monitoring may be useful to detect instances of net.exe or other command-line utilities being used to gather system time or time zone. Methods of detecting API use for gathering this information are likely less useful due to how often they may be used by legitimate software.

Platforms: Windows

Data Sources: Process monitoring, Process command-line parameters, API monitoring

Clear Command History - T1146

macOS and Linux both keep track of the commands users type in their terminal so that users can easily remember what they've done. These logs can be accessed in a few different ways. While logged in, this command history is tracked in a file pointed to by the environment variable `HISTFILE`. When a user logs off a system, this information is flushed to a file in the user's home directory called `~/.bash_history`. The benefit of this is that it allows users to go back to commands they've used before in different sessions. Since everything typed on the command-line is saved, passwords passed in on the command line are also saved. Adversaries can abuse this by searching these files for cleartext passwords. Additionally, adversaries can use a variety of methods to prevent their own commands from appear in these logs such as `unset HISTFILE`, `export HISTFILESIZE=0`, `history -c`, `rm ~/.bash_history`.

Detection: User authentication, especially via remote terminal services like SSH, without new entries in that user's `~/.bash_history` is suspicious. Additionally, the modification of the `HISTFILE` and `HISTFILESIZE` environment variables or the removal/clearing of the `~/.bash_history` file are indicators of suspicious activity.

Platforms: Linux, macOS

Data Sources: Authentication logs, File monitoring

Defense Bypassed: Log analysis, Host forensic analysis

Permissions Required: User

Execution through Module Load - T1129

The Windows module loader can be instructed to load DLLs from arbitrary local paths and arbitrary Universal Naming Convention (UNC) network paths. This functionality resides in NTDLL.dll and is part of the Windows Native API which is called from functions like CreateProcess(), LoadLibrary(), etc. of the Win32 API. (Citation: Wikipedia Windows Library Files)

The module loader can load DLLs:

*via specification of the (fully-qualified or relative) DLL pathname in the IMPORT directory;

*via EXPORT forwarded to another DLL, specified with (fully-qualified or relative) pathname (but without extension);

*via an NTFS junction or symlink program.exe.local with the fully-qualified or relative pathname of a directory containing the DLLs specified in the IMPORT directory or forwarded EXPORTs;

*via `<file name="filename.extension" loadFrom="fully-qualified or relative pathname"></code>` in an embedded or external "application manifest". The file name refers to an entry in the IMPORT directory or a forwarded EXPORT.

Adversaries can use this functionality as a way to execute arbitrary code on a system.

Detection: Monitoring DLL module loads may generate a significant amount of data and may not be directly useful for defense unless collected under specific circumstances, since benign use of Windows modules load functions are common and may be difficult to distinguish from malicious behavior. Legitimate software will likely only need to load routine, bundled DLL modules or Windows system DLLs such that deviation from known module loads may be suspicious. Limiting DLL module loads to `<code>%SystemRoot%</code>` and `<code>%ProgramFiles%</code>` directories will protect against module loads from unsafe paths.

Correlation of other events with behavior surrounding module loads using API monitoring and suspicious DLLs written to disk will provide additional context to an event that may assist in determining if it is due to malicious behavior.

Platforms: Windows

SSH Hijacking - T1184

Secure Shell (SSH) is a standard means of remote access on Linux and Mac systems. It allows a user to connect to another system via an encrypted tunnel, commonly authenticating through a password, certificate or the use of an asymmetric encryption key pair.

In order to move laterally from a compromised host, adversaries may take advantage of trust relationships established with other systems via public key authentication in active SSH sessions by hijacking an existing connection to another system. This may occur through compromising the SSH agent itself or by having access to the agent's socket. If an adversary is able to obtain root access, then hijacking SSH sessions is likely trivial. (Citation: Slideshare Abusing SSH) (Citation: SSHjack Blackhat) (Citation: Clockwork SSH Agent Hijacking) Compromising the SSH agent also provides access to intercept SSH credentials. (Citation: Welivesecurity Ebury SSH)

SSH Hijacking differs from use of Remote Services because it injects into an existing SSH session rather than creating a new session using Valid Accounts.

Detection: Use of SSH may be legitimate, depending upon the network environment and how it is used. Other factors, such as access patterns and activity that occurs after a remote login, may indicate suspicious or malicious behavior with SSH. Monitor for user accounts logged into systems they would not normally access or access patterns to multiple systems over a relatively short period of time. Also monitor user SSH-agent socket files being used by different users.

Install Root Certificate - T1130

Root certificates are used in public key cryptography to identify a root certificate authority (CA). When a root certificate is installed, the system or application will trust certificates in the root's chain of trust that have been signed by the root certificate. (Citation: Wikipedia Root Certificate) Certificates are commonly used for establishing secure TLS/SSL communications within a web browser. When a user attempts to browse a website that presents a certificate that is not trusted an error message will be displayed to warn the user of the security risk. Depending on the security settings, the browser may not allow the user to establish a connection to the website.

Installation of a root certificate on a compromised system would give an adversary a way to degrade the security of that system. Adversaries have used this technique to avoid security warnings prompting users when compromised systems connect over HTTPS to adversary controlled web servers that spoof legitimate websites in order to collect login credentials. (Citation: Operation Emmmental)

Atypical root certificates have also been pre-installed on systems by the manufacturer or in the software supply chain and were used in conjunction with malware/adware to provide a man-in-the-middle capability for intercepting information transmitted over secure TLS/SSL communications. (Citation: Kaspersky Superfish)

Root certificates (and their associated chains) can also be cloned and reinstalled. Cloned certificate chains will carry many of the same metadata characteristics of the source and can be used to sign malicious code that may then bypass signature validation tools (ex: Sysinternals, antivirus, etc.) used to block execution and/or uncover artifacts of Persistence. (Citation: SpectorOps Code Signing Dec 2017)

In macOS, the Ay MaMi malware uses `/usr/bin/security add-trusted-cert -d -r trustRoot -k /Library/Keychains/System.keychain /path/to/malicious/cert` to install a malicious certificate as a trusted root certificate into the system keychain. (Citation: objective-see ay mami 2018)

Detection: A system's root certificates are unlikely to change frequently. Monitor new certificates installed on a system that could be due to malicious activity. (Citation: SpectorOps Code Signing Dec 2017) Check pre-installed certificates on new systems to ensure unnecessary or suspicious certificates are not present. Microsoft provides a list of trustworthy root certificates online and through authroot.stl. (Citation: SpectorOps Code Signing Dec 2017) The Sysinternals Sigcheck utility can also be used (`sigcheck[64].exe -tuv`) to dump the contents of the certificate store and list valid certificates not rooted to the Microsoft Certificate Trust List. (Citation: Microsoft Sigcheck May 2017)

Installed root certificates are located in the Registry under `HKLM\SOFTWARE\Microsoft\EnterpriseCertificates\Root\Certificates\` and `[HKLM or HKCU]\Software[\Policies]\Microsoft\SystemCertificates\Root\Certificates\`. There are a subset of root certificates that are consistent across Windows systems and can be used for comparison: (Citation: Tripwire AppUNBlocker)

Data Transfer Size Limits - T1030

An adversary may exfiltrate data in fixed size chunks instead of whole files or limit packet sizes below certain thresholds. This approach may be used to avoid triggering network data transfer threshold alerts.

Detection: Analyze network data for uncommon data flows (e.g., a client sending significantly more data than it receives from a server). If a process maintains a long connection during which it consistently sends fixed size data packets or a process opens connections and sends fixed sized data packets at regular intervals, it may be performing an aggregate data transfer. Processes utilizing the network that do not normally have network communication or have never been seen before are suspicious. Analyze packet contents to detect communications that do not follow the expected protocol behavior for the port that is being used. (Citation: University of Birmingham C2)

Platforms: Linux, macOS, Windows

Data Sources: Packet capture, Netflow/Enclave netflow, Process use of network, Process monitoring

Requires Network: Yes

.bash_profile and .bashrc - T1156

`~/.bash_profile` and `~/.bashrc` are executed in a user's context when a new shell opens or when a user logs in so that their environment is set correctly. `~/.bash_profile` is executed for login shells and `~/.bashrc` is executed for interactive non-login shells. This means that when a user logs in (via username and password) to the console (either locally or remotely via something like SSH), `~/.bash_profile` is executed before the initial command prompt is returned to the user. After that, every time a new shell is opened, `~/.bashrc` is executed. This allows users more fine grained control over when they want certain commands executed.

Mac's Terminal.app is a little different in that it runs a login shell by default each time a new terminal window is opened, thus calling `~/.bash_profile` each time instead of `~/.bashrc`.

These files are meant to be written to by the local user to configure their own environment; however, adversaries can also insert code into these files to gain persistence each time a user logs in or opens a new shell (Citation: amnesia malware).

Detection: While users may customize their `~/.bashrc` and `~/.bash_profile` files, there are only certain types of commands that typically appear in these files. Monitor for abnormal commands such as execution of unknown programs, opening network sockets, or reaching out across the network when user profiles are loaded during the login process.

Platforms: Linux, macOS

Data Sources: File monitoring, Process Monitoring, Process command-line parameters, Process use of network

Permissions Required: User, Administrator

The tag is: *misp-galaxy:mitre-enterprise-attack-attack-pattern=".bash_profile and .bashrc - T1156"*

BITS Jobs - T1197

Windows Background Intelligent Transfer Service (BITS) is a low-bandwidth, asynchronous file transfer mechanism exposed through Component Object Model (COM) (Citation: Microsoft COM). (Citation: Microsoft BITS) BITS is commonly used by updaters, messengers, and other applications preferred to operate in the background (using available idle bandwidth) without interrupting other networked applications. File transfer tasks are implemented as BITS jobs, which contain a queue of one or more file operations.

The interface to create and manage BITS jobs is accessible through PowerShell (Citation: Microsoft BITS) and the BITSAdmin tool. (Citation: Microsoft BITS)Admin

Adversaries may abuse BITS to download, execute, and even clean up after malicious code. BITS tasks are self-contained in the BITS job database, without new files or registry modifications, and often permitted by host firewalls. (Citation: CTU BITS Malware June 2016) (Citation: Mondok Windows PiggyBack BITS May 2007) (Citation: Symantec BITS May 2007) BITS enabled execution may also allow Persistence by creating long-standing jobs (the default maximum lifetime is 90 days and extendable) or invoking an arbitrary program when a job completes or errors (including after system reboots). (Citation: PaloAlto UBoatRAT Nov 2017) (Citation: CTU BITS Malware June 2016)

BITS upload functionalities can also be used to perform Exfiltration Over Alternative Protocol. (Citation: CTU BITS Malware June 2016)

Detection: BITS runs as a service and its status can be checked with the Sc query utility (`sc query bits`). (Citation: Microsoft Issues with BITS July 2011) Active BITS tasks can be enumerated using the BITSAdmin tool (`bitsadmin /list /allusers /verbose`). (Citation: Microsoft BITS)

Monitor usage of the BITSAdmin tool (especially the 'Transfer', 'Create', 'AddFile', 'SetNotifyFlags', 'SetNotifyCmdLine', 'SetMinRetryDelay', 'SetCustomHeaders', and 'Resume' command options) (Citation: Microsoft BITS)Admin and the Windows Event log for BITS activity. Also consider investigating more detailed information about jobs by parsing the BITS job database. (Citation: CTU BITS Malware June 2016)

Monitor and analyze network activity generated by BITS. BITS jobs use HTTP(S) and SMB for remote connections and are tethered to the creating user and will only function when that user is logged on (this rule applies even if a user attaches the job to a service account). (Citation: Microsoft BITS)

Platforms: Windows

Data Sources: API monitoring, Packet capture, Windows event logs

Defense Bypassed: Firewall, Host forensic analysis

Permissions Required: User, Administrator, SYSTEM

Contributors: Ricardo Dias, Red Canary

MITRE

Component Object Model Hijacking Mitigation - T1122

Direct mitigation of this technique may not be recommended for a particular environment since COM objects are a legitimate part of the operating system and installed software. Blocking COM object changes may have unforeseen side effects to legitimate functionality.

Instead, identify and block potentially malicious software that may execute, or be executed by, this technique using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

Component Object Model Hijacking Mitigation - T1122 has relationships with:

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Component Object Model Hijacking - T1122"* with estimative-language:likelihood-probability="almost-certain"

Exfiltration Over Command and Control Channel Mitigation - T1041

Mitigations for command and control apply. Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific obfuscation technique used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool command and control signatures over time or construct protocols in such a way to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="Exfiltration Over Command and Control Channel Mitigation - T1041"*

Exfiltration Over Command and Control Channel Mitigation - T1041 has relationships with:

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Exfiltration Over Command and Control Channel - T1041"* with *estimative-language:likelihood-probability="almost-certain"*

Process Injection Mitigation - T1055

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of operating system design features. For example, mitigating specific Windows API calls will likely have unintended side effects, such as preventing legitimate software (i.e., security products) from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identification of subsequent malicious behavior. (Citation: GDSecurity Linux injection)

Identify or block potentially malicious software that may contain process injection functionality by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

Utilize Yama (Citation: Linux kernel Yama) to mitigate ptrace based process injection by restricting the use of ptrace to privileged users only. Other mitigation controls involve the deployment of security kernel modules that provide advanced access control and process restrictions such as SELinux (Citation: SELinux official), grsecurity (Citation: grsecurity official), and AppArmor (Citation: AppArmor official).

Bypass User Account Control Mitigation - T1088

Remove users from the local administrator group on systems. Although UAC bypass techniques exist, it is still prudent to use the highest enforcement level for UAC when possible and mitigate bypass opportunities that exist with techniques such as DLL Search Order Hijacking.

Check for common UAC bypass weaknesses on Windows systems to be aware of the risk posture and address issues where appropriate. (Citation: Github UACMe)

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="Bypass User Account Control Mitigation - T1088"*

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Command-Line Interface - T1059"* with *estimative-language:likelihood-probability="almost-certain"*

DLL Search Order Hijacking Mitigation - T1038

Disallow loading of remote DLLs. (Citation: Microsoft DLL Preloading) This is included by default in Windows Server 2012+ and is available by patch for XP+ and Server 2003+. (Citation: Microsoft DLL Search) Path Algorithm

Enable Safe DLL Search Mode to force search for system DLLs in directories with greater restrictions (e.g. `%SYSTEMROOT%`) to be used before local directory DLLs (e.g. a user's home directory). The Safe DLL Search Mode can be enabled via Group Policy at Computer Configuration > [Policies] > Administrative Templates > MSS (Legacy): MSS: (SafeDllSearchMode) Enable Safe DLL search mode. The associated Windows Registry key for this is located at `HKLM\SYSTEM\CurrentControlSet\Control\Session Manager\SafeDLLSearchMode` (Citation: Microsoft DLL Search)

Use auditing tools capable of detecting DLL search order hijacking opportunities on systems within an enterprise and correct them. Toolkits like the PowerSploit framework contain PowerUp modules that can be used to explore systems for DLL hijacking weaknesses. (Citation: Powersploit)

Identify and block potentially malicious software that may be executed through search order hijacking by using whitelisting (Citation: Beechey 2010) tools like AppLocker (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) that are capable of auditing and/or blocking unknown DLLs.

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="DLL Search Order Hijacking Mitigation - T1038"*

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Network Share Discovery - T1135"* with *estimative-language:likelihood-probability="almost-certain"*

Regsvcs/Regasm Mitigation - T1121

Regsvcs and Regasm may not be necessary within a given environment. Block execution of Regsvcs.exe and Regasm.exe if they are not required for a given system or network to prevent potential misuiss by adversaries.

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="Regsvcs/Regasm Mitigation - T1121"*

Regsvcs/Regasm Mitigation - T1121 has relationships with:

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Regsvcs/Regasm - T1121"* with *estimative-language:likelihood-probability="almost-certain"*

Application Deployment Software Mitigation - T1017

Grant access to application deployment systems only to a limited number of authorized administrators. Ensure proper system and access isolation for critical network systems through use of firewalls, account privilege separation, group policy, and multifactor authentication. Verify that account credentials that may be used to access deployment systems are unique and not used throughout the enterprise network. Patch deployment systems regularly to prevent potential remote access through Exploitation for Privilege Escalation.

If the application deployment system can be configured to deploy only signed binaries, then ensure that the trusted signing certificates are not co-located with the application deployment system and are instead located on a system that cannot be accessed remotely or to which remote access is tightly controlled.

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="Application Deployment Software Mitigation - T1017"*

Application Deployment Software Mitigation - T1017 has relationships with:

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Application Deployment Software - T1017"* with *estimative-language:likelihood-probability="almost-certain"*

Commonly Used Port Mitigation - T1043

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific protocol used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

Distributed Component Object Model Mitigation - T1175 has relationships with:

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Distributed Component Object Model - T1175"* with estimative-language:likelihood-probability="almost-certain"

Path Interception Mitigation - T1034

Eliminate path interception weaknesses in program configuration files, scripts, the PATH environment variable, services, and in shortcuts by surrounding PATH variables with quotation marks when functions allow for them (Citation: Microsoft CreateProcess). Be aware of the search order Windows uses for executing or loading binaries and use fully qualified paths wherever appropriate (Citation: MSDN DLL Security). Clean up old Windows Registry keys when software is uninstalled to avoid keys with no associated legitimate binaries.

Periodically search for and correct or report path interception weaknesses on systems that may have been introduced using custom or available tools that report software using insecure path configurations (Citation: Kanthak Sentinel).

Require that all executables be placed in write-protected directories. Ensure that proper permissions and directory access control are set to deny users the ability to write files to the top-level directory `C:` and system directories, such as `C:\Windows\`, to reduce places where malicious files could be placed for execution.

Identify and block potentially malicious software that may be executed through the path interception by using whitelisting (Citation: Beechey 2010) tools, like AppLocker (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies, (Citation: Corio 2008) that are capable of auditing and/or blocking unknown executables.

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="Path Interception Mitigation - T1034"*

Path Interception Mitigation - T1034 has relationships with:

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Path Interception - T1034"* with *estimative-language:likelihood-probability="almost-certain"*

Graphical User Interface Mitigation - T1061

Prevent adversaries from gaining access to credentials through Credential Access that can be used to log into remote desktop sessions on systems.

Identify unnecessary system utilities, third-party tools, or potentially malicious software that may be used to log into remote interactive sessions, and audit and/or block them by using whitelisting (Citation: Beechey 2010) tools, like AppLocker (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) and Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="Graphical User Interface Mitigation - T1061"*

PowerShell Mitigation - T1086

It may be possible to remove PowerShell from systems when not needed, but a review should be performed to assess the impact to an environment, since it could be in use for many legitimate purposes and administrative functions. When PowerShell is necessary, restrict PowerShell execution policy to administrators and to only execute signed scripts. Be aware that there are methods of bypassing the PowerShell execution policy, depending on environment configuration. (Citation: Netspi PowerShell Execution Policy Bypass) Disable/restrict the WinRM Service to help prevent uses of PowerShell for remote execution.

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="PowerShell Mitigation - T1086"*

PowerShell Mitigation - T1086 has relationships with:

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="PowerShell - T1086"* with *estimative-language:likelihood-probability="almost-certain"*

Forced Authentication Mitigation - T1187

Block SMB traffic from exiting an enterprise network with egress filtering or by blocking TCP ports 139, 445 and UDP port 137. Filter or block WebDAV protocol traffic from exiting the network. If access to external resources over SMB and WebDAV is necessary, then traffic should be tightly limited with whitelisting. (Citation: US-CERT SMB Security) (Citation: US-CERT APT Energy Oct 2017)

For internal traffic, monitor the workstation-to-workstation unusual (vs. baseline) SMB traffic. For many networks there should not be any, but it depends on how systems on the network are configured and where resources are located.

Use strong passwords to increase the difficulty of credential hashes from being cracked if they are obtained.

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="Forced Authentication Mitigation - T1187"*

Forced Authentication Mitigation - T1187 has relationships with:

Exploitation for Defense Evasion Mitigation - T1211

Update software regularly by employing patch management for internal enterprise endpoints and servers. Develop a robust cyber threat intelligence capability to determine what types and levels of threat may use software exploits and 0-days against a particular organization. Make it difficult for adversaries to advance their operation through exploitation of undiscovered or unpatched vulnerabilities by using sandboxing, if available. Other types of virtualization and application microsegmentation may also mitigate the impact of some types of exploitation. The risks of additional exploits and weaknesses in implementation may still exist. (Citation: Ars Technica Pwn2Own 2017 VM Escape)

Security applications that look for behavior used during exploitation such as Windows Defender Exploit Guard (WDEG) and the Enhanced Mitigation Experience Toolkit (EMET) can be used to mitigate some exploitation behavior. (Citation: TechNet Moving Beyond EMET) Control flow integrity checking is another way to potentially identify and stop a software exploit from occurring. (Citation: Wikipedia Control Flow Integrity) Many of these protections depend on the architecture and target application binary for compatibility and may not work for software targeted for defense evasion.

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="Exploitation for Defense Evasion Mitigation - T1211"*

Connection Proxy Mitigation - T1090

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific C2 protocol used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

Startup Items Mitigation - T1165

Since `StartupItems` are deprecated, preventing all users from writing to the `<code>/Library/StartupItems</code>` directory would prevent any startup items from getting registered. Similarly, appropriate permissions should be applied such that only specific users can edit the startup items so that they can't be leveraged for privilege escalation.

The tag is: `misp-galaxy:mitre-enterprise-attack-course-of-action="Startup Items Mitigation - T1165"`

Startup Items Mitigation - T1165 has relationships with:

- mitigates: `misp-galaxy:mitre-enterprise-attack-attack-pattern="Startup Items - T1165"` with `estimative-language:likelihood-probability="almost-certain"`

Execution through API Mitigation - T1106

Mitigating specific API calls will likely have unintended side effects, such as preventing legitimate software from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identifying subsequent malicious behavior. Audit and/or block potentially malicious software by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

The tag is: `misp-galaxy:mitre-enterprise-attack-course-of-action="Execution through API Mitigation - T1106"`

Execution through API Mitigation - T1106 has relationships with:

- mitigates: `misp-galaxy:mitre-enterprise-attack-attack-pattern="Execution through API - T1106"` with `estimative-language:likelihood-probability="almost-certain"`

Taint Shared Content Mitigation - T1080

Protect shared folders by minimizing users who have write access. Use utilities that detect or mitigate common features used in exploitation, such as the Microsoft Enhanced Mitigation Experience Toolkit (EMET).

Reduce potential lateral movement risk by using web-based document management and collaboration services that do not use network file and directory sharing.

Identify potentially malicious software that may be used to taint content or may result from it and audit and/or block the unknown programs by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. Domain Fronting Mitigation - T1172

If it is possible to inspect HTTPS traffic, the captures can be analyzed for connections that appear to be Domain Fronting.

In order to use domain fronting, attackers will likely need to deploy additional tools to compromised systems. (Citation: FireEye APT29 Domain Fronting With TOR March 2017) (Citation: Mandiant No Easy Breach) It may be possible to detect or prevent the installation of these tools with Host-based solutions.

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="Domain Fronting Mitigation - T1172"*

Domain Fronting Mitigation - T1172 has relationships with:

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Domain Fronting - T1172"* with *estimative-language:likelihood-probability="almost-certain"*

Spearphishing Attachment Mitigation - T1193

Network intrusion prevention systems and systems designed to scan and remove malicious email attachments can be used to block activity. Solutions can be signature and behavior based, but adversaries may construct attachments in a way to avoid these systems.

Block unknown or unused attachments by default that should not be transmitted over email as a best practice to prevent some vectors, such as .scr, .exe, .pif, .cpl, etc. Some email scanning devices can open and analyze compressed and encrypted formats, such as zip and rar that may be used to conceal malicious attachments in Obfuscated Files or Information.

Because this technique involves user interaction on the endpoint, it's difficult to fully mitigate. However, there are potential mitigations. Users can be trained to identify social engineering techniques and spearphishing emails. To prevent the attachments from executing, application whitelisting can be used. Anti-virus can also automatically quarantine suspicious files.

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="Spearphishing Attachment Mitigation - T1193"*

Spearphishing Attachment Mitigation - T1193 has relationships with:

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Spearphishing Attachment - T1193"* with estimative-language:likelihood-probability="almost-certain"

Audio Capture Mitigation - T1123

Mitigating this technique specifically may be difficult as it requires fine-grained API control. Efforts should be focused on preventing unwanted or unknown code from executing on a system.

Identify and block potentially malicious software that may be used to record audio by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Execution through Module Load - T1129"* with *estimative-language:likelihood-probability="almost-certain"*

Shared Webroot Mitigation - T1051

Networks that allow for open development and testing of Web content and allow users to set up their own Web servers on the enterprise network may be particularly vulnerable if the systems and Web servers are not properly secured to limit privileged account use, unauthenticated network share access, and network/system isolation.

Ensure proper permissions on directories that are accessible through a Web server. Disallow remote access to the webroot or other directories used to serve Web content. Disable execution on directories within the webroot. Ensure that permissions of the Web server process are only what is required by not using built-in accounts; instead, create specific accounts to limit unnecessary access or permissions overlap across multiple systems.

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="Shared Webroot Mitigation - T1051"*

Shared Webroot Mitigation - T1051 has relationships with:

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Shared Webroot - T1051"* with *estimative-language:likelihood-probability="almost-certain"*

Scheduled Task Mitigation - T1053

Limit privileges of user accounts and remediate Privilege Escalation vectors so only authorized administrators can create scheduled tasks on remote systems. Toolkits like the PowerSploit framework contain PowerUp modules that can be used to explore systems for permission weaknesses in scheduled tasks that could be used to escalate privileges. (Citation: Powersploit)

Configure settings for scheduled tasks to force tasks to run under the context of the authenticated account instead of allowing them to run as SYSTEM. The associated Registry key is located at `HKLM\SYSTEM\CurrentControlSet\Control\Lsa\SubmitControl`. The setting can be configured through GPO: Computer Configuration > [Policies] > Windows Settings > Security Settings > Local Policies > Security Options: Domain Controller: Allow server operators to schedule tasks, set to disabled. (Citation: TechNet Server Operator Scheduled Task)

Configure the Increase Scheduling Priority option to only allow the Administrators group the rights to schedule a priority process. This can be configured through GPO: Computer Configuration > [Policies] > Windows Settings > Security Settings > Local Policies > User Rights Assignment: Increase scheduling priority. (Citation: TechNet Scheduling Priority)

Identify and block unnecessary system utilities or potentially malicious software that may be used to schedule tasks using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation:

Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

Port Monitors Mitigation - T1013

Identify and block potentially malicious software that may persist in this manner by using whitelisting (Citation: Beechey 2010) tools capable of monitoring DLL loads by processes running under SYSTEM permissions.

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="Port Monitors Mitigation - T1013"*

Port Monitors Mitigation - T1013 has relationships with:

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Port Monitors - T1013"* with *estimative-language:likelihood-probability="almost-certain"*

Image File Execution Options Injection Mitigation - T1183

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of operating system design features. For example, mitigating all IFEO will likely have unintended side effects, such as preventing legitimate software (i.e., security products) from operating properly. (Citation: Microsoft IFEOorMalware July 2015) Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identifying subsequent malicious behavior.

Identify and block potentially malicious software that may be executed through IFEO by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) that are capable of auditing and/or blocking unknown executables.

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="Image File Execution Options Injection Mitigation - T1183"*

Image File Execution Options Injection Mitigation - T1183 has relationships with:

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Image File Execution Options Injection - T1183"* with *estimative-language:likelihood-probability="almost-certain"*

User Execution Mitigation - T1204

Use user training as a way to bring awareness to common phishing and spearphishing techniques and how to raise suspicion for potentially malicious events. Application whitelisting may be able to prevent the running of executables masquerading as other files.

If a link is being visited by a user, block unknown or unused files in transit by default that should not be downloaded or by policy from suspicious sites as a best practice to prevent some vectors, such as .scr, .exe, .pif, .cpl, etc. Some download scanning devices can open and analyze compressed and encrypted formats, such as zip and rar that may be used to conceal malicious files in Obfuscated Files or Information.

If a link is being visited by a user, network intrusion prevention systems and systems designed to

scan and remove malicious downloads can be used to block activity. Solutions can be signature and behavior based, but adversaries may construct files in a way to avoid these systems.

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="User Execution Mitigation - T1204"*

User Execution Mitigation - T1204 has relationships with:

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="User Execution - T1204"* with *estimative-language:likelihood-probability="almost-certain"*

LC_LOAD_DYLIB Addition Mitigation - T1161

Enforce that all binaries be signed by the correct Apple Developer IDs, and whitelist applications via known hashes. Binaries can also be baselined for what dynamic libraries they require, and if an app requires a new dynamic library that wasn't included as part of an update, it should be investigated.

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="LC_LOAD_DYLIB Addition Mitigation - T1161"*

LC_LOAD_DYLIB Addition Mitigation - T1161 has relationships with:

Valid Accounts Mitigation - T1078

Take measures to detect or prevent techniques such as Credential Dumping or installation of keyloggers to acquire credentials through Input Capture. Limit credential overlap across systems to prevent access if account credentials are obtained. Ensure that local administrator accounts have complex, unique passwords across all systems on the network. Do not put user or admin domain accounts in the local administrator groups across systems unless they are tightly controlled and use

of accounts is segmented, as this is often equivalent to having a local administrator account with the same password on all systems. Follow best practices for design and administration of an enterprise network to limit privileged account use across administrative tiers. (Citation: Microsoft Securing Privileged Access). Audit domain and local accounts as well as their permission levels routinely to look for situations that could allow an adversary to gain wide access by obtaining credentials of a privileged account. (Citation: TechNet Credential Theft) (Citation: TechNet Least Privilege)

Kernel Modules and Extensions Mitigation - T1215 has relationships with:

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Kernel Modules and Extensions - T1215"* with estimative-language:likelihood-probability="almost-certain"

File System Permissions Weakness Mitigation - T1044

Use auditing tools capable of detecting file system permissions abuse opportunities on systems within an enterprise and correct them. Limit privileges of user accounts and groups so that only authorized administrators can interact with service changes and service binary target path locations. Toolkits like the PowerSploit framework contain PowerUp modules that can be used to explore systems for service file system permissions weaknesses. (Citation: Powersploit)

Identify and block potentially malicious software that may be executed through abuse of file, directory, and service permissions by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) that are capable of auditing and/or blocking unknown programs. Deny execution from user directories such as file download directories and temp directories where able. (Citation: Seclists Kanthak 7zip Installer)

Turn off UAC's privilege elevation for standard users `[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System]` to automatically deny elevation requests, add: `"ConsentPromptBehaviorUser"=dword:00000000` (Citation: Seclists Kanthak 7zip Installer). Consider enabling installer detection for all users by adding: `"EnableInstallerDetection"=dword:00000001`. This will prompt for a password for installation and also log the attempt. To disable installer detection, instead add: `"EnableInstallerDetection"=dword:00000000`. This may prevent potential elevation of privileges through exploitation during the process of UAC detecting the installer, but will allow the installation process to continue without being logged.

Change Default File Association Mitigation - T1042

Direct mitigation of this technique is not recommended since it is a legitimate function that can be performed by users for software preferences. Follow Microsoft's best practices for file associations. (Citation: MSDN File Associations)

Identify and block potentially malicious software that may be executed by this technique using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

Control Panel Items Mitigation - T1196

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of operating system design features. For example, mitigating specific Windows API calls and/or execution of particular file extensions will likely have unintended side effects, such as preventing legitimate software (i.e., drivers and configuration tools) from operating properly.

Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identification of subsequent malicious behavior.

Restrict storage and execution of Control Panel items to protected directories, such as C:\Windows, rather than user directories.

Index known safe Control Panel items and block potentially malicious software using whitelisting (Citation: Beechey 2010) tools like AppLocker (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) that are capable of auditing and/or blocking unknown executable files.

Consider fully enabling User Account Control (UAC) to impede system-wide changes from illegitimate administrators. (Citation: Microsoft UAC)

Hypervisor Mitigation - T1062

Prevent adversary access to privileged accounts necessary to install a hypervisor.

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="Hypervisor Mitigation - T1062"*

Hypervisor Mitigation - T1062 has relationships with:

- mitigates: `misp-galaxy:mitre-enterprise-attack-attack-pattern="Hypervisor - T1062"` with `estimative-language:likelihood-probability="almost-certain"`

Automated Collection Mitigation - T1119

Encryption and off-system storage of sensitive information may be one way to mitigate collection of files, but may not stop an adversary from acquiring the information if an intrusion persists over a long period of time and the adversary is able to discover and access the data through other means. A keylogger installed on a system may be able to intercept passwords through Input Capture and be used to decrypt protected documents that an adversary may have collected. Strong passwords should be used to prevent offline cracking of encrypted documents through Brute Force techniques.

Identify unnecessary system utilities, third-party tools, or potentially malicious software that may be used to collect files and audit and/or block them by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. Application Shimming Mitigation - T1138

There currently aren't a lot of ways to mitigate application shimming. Disabling the Shim Engine isn't recommended because Windows depends on shimming for interoperability and software may become unstable or not work. Microsoft released an optional patch update - KB3045645 - that will remove the "auto-elevate" flag within the `sdbinst.exe`. This will prevent use of application shimming to bypass UAC.

Changing UAC settings to "Always Notify" will give the user more visibility when UAC elevation is

requested, however, this option will not be popular among users due to the constant UAC interruptions.

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="Application Shimming Mitigation - T1138"*

Application Shimming Mitigation - T1138 has relationships with:

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Application Shimming - T1138"* with *estimative-language:likelihood-probability="almost-certain"*

Local Job Scheduling Mitigation - T1168

Limit privileges of user accounts and remediate Privilege Escalation vectors so only authorized users can create scheduled jobs. Identify and block unnecessary system utilities or potentially malicious software that may be used to schedule jobs using whitelisting tools.

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="Local Job Scheduling Mitigation - T1168"*

Local Job Scheduling Mitigation - T1168 has relationships with:

Exploit Public-Facing Application Mitigation - T1190

Application Isolation and least privilege help lesson the impact of an exploit. Application isolation will limit what other processes and system features the exploited target can access, and least privilege for service accounts will limit what permissions the exploited process gets on the rest of the system. Web Application Firewalls may may be used to limit exposure of applications.

Segment externally facing servers and services from the rest of the network with a DMZ or on separate hosting infrastructure.

Use secure coding best practices when designing custom software that is meant for deployment to externally facing systems. Avoid issues documented by OWASP, CWE, and other software weakness identification efforts.

Regularly scan externally facing systems for vulnerabilities and establish procedures to rapidly patch systems when critical vulnerabilities are discovered through scanning and through public disclosure.

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="Exploit Public-Facing Application Mitigation - T1190"*

Exploit Public-Facing Application Mitigation - T1190 has relationships with:

Exploitation of Remote Services Mitigation - T1210

Segment networks and systems appropriately to reduce access to critical systems and services to controlled methods. Minimize available services to only those that are necessary. Regularly scan the internal network for available services to identify new and potentially vulnerable services. Minimize permissions and access for service accounts to limit impact of exploitation.

Update software regularly by employing patch management for internal enterprise endpoints and servers. Develop a robust cyber threat intelligence capability to determine what types and levels of threat may use software exploits and 0-days against a particular organization. Make it difficult for adversaries to advance their operation through exploitation of undiscovered or unpatched vulnerabilities by using sandboxing, if available. Other types of virtualization and application microsegmentation may also mitigate the impact of some types of exploitation. The risks of additional exploits and weaknesses in implementation may still exist. (Citation: Ars Technica Pwn2Own 2017 VM Escape)

Security applications that look for behavior used during exploitation such as Windows Defender Exploit Guard (WDEG) and the Enhanced Mitigation Experience Toolkit (EMET) can be used to mitigate some exploitation behavior. (Citation: TechNet Moving Beyond EMET) Control flow integrity checking is another way to potentially identify and stop a software exploit from occurring. (Citation: Wikipedia Control Flow Integrity) Many of these protections depend on the architecture and target application binary for compatibility and may not work for all software or services targeted.

Third-party Software Mitigation - T1072

Evaluate the security of third-party software that could be used to deploy or execute programs. Ensure that access to management systems for deployment systems is limited, monitored, and secure. Have a strict approval policy for use of deployment systems.

Grant access to application deployment systems only to a limited number of authorized administrators. Ensure proper system and access isolation for critical network systems through use of firewalls, account privilege separation, group policy, and multifactor authentication. Verify that account credentials that may be used to access deployment systems are unique and not used throughout the enterprise network. Patch deployment systems regularly to prevent potential remote access through Exploitation for Privilege Escalation.

If the application deployment system can be configured to deploy only signed binaries, then ensure that the trusted signing certificates are not co-located with the application deployment system and are instead located on a system that cannot be accessed remotely or to which remote access is tightly controlled.

Access Token Manipulation Mitigation - T1134

Access tokens are an integral part of the security system within Windows and cannot be turned off. However, an attacker must already have administrator level access on the local system to make full use of this technique; be sure to restrict users and accounts to the least privileges they require to do their job.

Any user can also spoof access tokens if they have legitimate credentials. Follow mitigation guidelines for preventing adversary use of Valid Accounts. Limit permissions so that users and user groups cannot create tokens. This setting should be defined for the local system account only. GPO: Computer Configuration > [Policies] > Windows Settings > Security Settings > Local Policies > User Rights Assignment: Create a token object. (Citation: Microsoft Create Token) Also define who can create a process level token to only the local and network service through GPO: Computer Configuration > [Policies] > Windows Settings > Security Settings > Local Policies > User Rights Assignment: Replace a process level token. (Citation: Microsoft Replace Process Token)

Also limit opportunities for adversaries to increase privileges by limiting Privilege Escalation opportunities.

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Windows Remote Management - T1028"* with *estimative-language:likelihood-probability="almost-certain"*

Web Shell Mitigation - T1100

Ensure that externally facing Web servers are patched regularly to prevent adversary access through Exploitation for Privilege Escalation to gain remote code access or through file inclusion weaknesses that may allow adversaries to upload files or scripts that are automatically served as

Web pages.

Audit account and group permissions to ensure that accounts used to manage servers do not overlap with accounts and permissions of users in the internal network that could be acquired through Credential Access and used to log into the Web server and plant a Web shell or pivot from the Web server into the internal network. (Citation: US-CERT Alert TA15-314A Web Shells)

The tag is: *misp-galaxy:mitre-enterprise-attack-course-of-action="Web Shell Mitigation - T1100"*

Web Shell Mitigation - T1100 has relationships with:

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Web Shell - T1100"* with *estimative-language:likelihood-probability="almost-certain"*

Process Doppelgänger Mitigation - T1186

This type of attack technique cannot be easily mitigated with preventive controls or patched since it is based on the abuse of operating system design features. For example, mitigating specific API calls will likely have unintended side effects, such as preventing legitimate process-loading mechanisms from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identifying subsequent malicious behavior.

Although Process Doppelgänger may be used to evade certain types of defenses, it is still good practice to identify potentially malicious software that may be used to perform adversarial actions and audit and/or block it by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

Process Doppelgänger Mitigation - T1186 has relationships with:

- mitigates: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Process Doppelgänger - T1186"* with *estimative-language:likelihood-probability="almost-certain"*

Data Obfuscation Mitigation - T1001

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific obfuscation technique used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

APT34 - G0057

APT34 is an Iranian cyber espionage group that has been active since at least 2014. The group has targeted a variety of industries, including financial, government, energy, chemical, and

telecommunications, and has largely focused its operations within the Middle East. FireEye assesses that the group works on behalf of the Iranian government based on infrastructure details that contain references to Iran, use of Iranian infrastructure, and targeting that aligns with nation-state interests. APT34 loosely aligns with public reporting related to OilRig, but may not wholly align due to companies tracking threat groups in different ways. (Citation: FireEye APT34 Dec 2017)

Charming Kitten - G0058

Charming Kitten is an Iranian cyber espionage group that has been active since approximately 2014. They appear to focus on targeting individuals of interest to Iran who work in academic research, human rights, and media, with most victims having been located in Iran, the US, Israel, and the UK. Charming Kitten usually tries to access private email and Facebook accounts, and sometimes establishes a foothold on victim computers as a secondary objective. The group's TTPs overlap extensively with another group, Rocket Kitten, resulting in reporting that may not distinguish between the two groups' activities. (Citation: ClearSky Charming Kitten Dec 2017)

APT3 - G0022

APT3 is a China-based threat group that researchers have attributed to China's Ministry of State Security. (Citation: FireEye Clandestine Wolf) (Citation: Recorded Future APT3 May 2017) This group is responsible for the campaigns known as Operation Clandestine Fox, Operation Clandestine Wolf, and Operation Double Tap. (Citation: FireEye Clandestine Wolf) (Citation: FireEye Operation Double Tap) As of June 2015, the group appears to have shifted from targeting primarily US victims to primarily political organizations in Hong Kong. (Citation: Symantec Buckeye)

Forfiles - S0193

Forfiles is a Windows utility commonly used in batch jobs to execute commands on one or more selected files or directories (ex: list all directories in a drive, read the first line of all files created yesterday, etc.). Forfiles can be executed from either the command line, Run window, or batch files/scripts. (Citation: Microsoft Forfiles Aug 2016)

Net - S0039

The Net utility is a component of the Windows operating system. It is used in command-line operations for control of users, groups, services, and network connections. (Citation: Microsoft Net Utility)

Net has a great deal of functionality, (Citation: Savill 1999) much of which is useful for an adversary, such as gathering system and network information for Discovery, moving laterally through Windows admin shares using `net use` commands, and interacting with services.

Invoke-PSImage - S0231

Invoke-PSImage takes a PowerShell script and embeds the bytes of the script into the pixels of a PNG image. It generates a one liner for executing either from a file or from the web. Example of usage is embedding the PowerShell code from the Invoke-Mimikatz module and embed it into an image file. By calling the image file from a macro for example, the macro will download the picture and execute the PowerShell code, which in this case will dump the passwords. (Citation: GitHub Invoke-PSImage)

Cobalt Group - G0080

[Cobalt Group](<https://attack.mitre.org/groups/G0080>) is a financially motivated threat group that has primarily targeted financial institutions. The group has conducted intrusions to steal money via targeting ATM systems, card processing, payment systems and SWIFT systems. [Cobalt Group](<https://attack.mitre.org/groups/G0080>) has mainly targeted banks in Eastern Europe, Central Asia, and Southeast Asia. One of the alleged leaders was arrested in Spain in early 2018, but the group still appears to be active. The group has been known to target organizations in order to use their access to then compromise additional victims. (Citation: Talos Cobalt Group July 2018) (Citation: PTSecurity Cobalt Group Aug 2017) (Citation: PTSecurity Cobalt Dec 2016) (Citation: Group IB Cobalt Aug 2017) (Citation: Proofpoint Cobalt June 2017) (Citation: RiskIQ Cobalt Nov 2017) (Citation: RiskIQ Cobalt Jan 2018) Reporting indicates there may be links between [Cobalt Group](<https://attack.mitre.org/groups/G0080>) and both the malware [Carbanak](<https://attack.mitre.org/software/S0030>) and the group [Carbanak](<https://attack.mitre.org/groups/G0008>). Deep Panda - G0009

[Deep Panda](<https://attack.mitre.org/groups/G0009>) is a suspected Chinese threat group known to target many industries, including government, defense, financial, and telecommunications. (Citation: Alperovitch 2014) The intrusion into healthcare company Anthem has been attributed to [Deep Panda](<https://attack.mitre.org/groups/G0009>). (Citation: ThreatConnect Anthem) This group is also known as Shell Crew, WebMasters, KungFu Kittens, and PinkPanther. (Citation: RSA Shell Crew) [Deep Panda](<https://attack.mitre.org/groups/G0009>) also appears to be known as Black Vine based on the attribution of both group names to the Anthem intrusion. (Citation: Symantec Black Vine) Some analysts track [Deep Panda](<https://attack.mitre.org/groups/G0009>) and [APT19](<https://attack.mitre.org/groups/G0073>) as the same group, but it is unclear from open source information if the groups are the same. Lazarus Group - G0032

[Lazarus Group](<https://attack.mitre.org/groups/G0032>) is a threat group that has been attributed to the North Korean government. (Citation: US-CERT HIDDEN COBRA June 2017) The group has been active since at least 2009 and was reportedly responsible for the November 2014 destructive wiper attack against Sony Pictures Entertainment as part of a campaign named Operation Blockbuster by Novetta. Malware used by [Lazarus Group](<https://attack.mitre.org/groups/G0032>) correlates to other reported campaigns, including Operation Flame, Operation 1Mission, Operation Troy, DarkSeoul, and Ten Days of Rain. (Citation: Novetta Blockbuster) In late 2017, [Lazarus Group](<https://attack.mitre.org/groups/G0032>) used KillDisk, a disk-wiping tool, in an attack against an online casino based in Central America. Scarlet Mimic - G0029

[Scarlet Mimic](<https://attack.mitre.org/groups/G0029>) is a threat group that has targeted minority rights activists. This group has not been directly linked to a government source, but the group's motivations appear to overlap with those of the Chinese government. While there is some overlap between IP addresses used by [Scarlet Mimic](<https://attack.mitre.org/groups/G0029>) and [Putter Panda](<https://attack.mitre.org/groups/G0024>), it has not been concluded that the groups are the

same. (Citation: Scarlet Mimic Jan 2016)

Winnti Group - G0044

[Winnti Group](<https://attack.mitre.org/groups/G0044>) is a threat group with Chinese origins that has been active since at least 2010. The group has heavily targeted the gaming industry, but it has also expanded the scope of its targeting. (Citation: Kaspersky Winnti April 2013) (Citation: Kaspersky Winnti June 2015) (Citation: Novetta Winnti April 2015) Some reporting suggests a number of other groups, including [Axiom](<https://attack.mitre.org/groups/G0001>), [APT17](<https://attack.mitre.org/groups/G0025>), and [Ke3chang](<https://attack.mitre.org/groups/G0004>), are closely linked to [Winnti Group](<https://attack.mitre.org/groups/G0044>). Charming Kitten - G0058

[Charming Kitten](<https://attack.mitre.org/groups/G0058>) is an Iranian cyber espionage group that has been active since approximately 2014. They appear to focus on targeting individuals of interest to Iran who work in academic research, human rights, and media, with most victims having been located in Iran, the US, Israel, and the UK. [Charming Kitten](<https://attack.mitre.org/groups/G0058>) usually tries to access private email and Facebook accounts, and sometimes establishes a foothold on victim computers as a secondary objective. The group's TTPs overlap extensively with another group, [Rocket Kitten](<https://attack.mitre.org/groups/G0059>), resulting in reporting that may not distinguish between the two groups' activities. (Citation: ClearSky Charming Kitten Dec 2017)

Axiom - G0001

[Axiom](<https://attack.mitre.org/groups/G0001>) is a cyber espionage group suspected to be associated with the Chinese government. It is responsible for the Operation SMN campaign. (Citation: Novetta-Axiom) Though both this group and [Winnti Group](<https://attack.mitre.org/groups/G0044>) use the malware [Winnti](<https://attack.mitre.org/software/S0141>), the two groups appear to be distinct based on differences in reporting on the groups' TTPs and targeting. (Citation: Kaspersky Winnti April 2013) (Citation: Kaspersky Winnti June 2015) (Citation: Novetta Winnti April 2015)

Turla - G0010

[Turla](<https://attack.mitre.org/groups/G0010>) is a Russian-based threat group that has infected victims in over 45 countries, spanning a range of industries including government, embassies, military, education, research and pharmaceutical companies since 2004. Heightened activity was seen in mid-2015. [Turla](<https://attack.mitre.org/groups/G0010>) is known for conducting watering hole and spearphishing campaigns and leveraging in-house tools and malware. [Turla](<https://attack.mitre.org/groups/G0010>)'s espionage platform is mainly used against Windows machines, but has also been seen used against macOS and Linux machines. APT32 - G0050

[APT32](<https://attack.mitre.org/groups/G0050>) is a threat group that has been active since at least 2014. The group has targeted multiple private sector industries as well as with foreign governments, dissidents, and journalists with a strong focus on Southeast Asian countries like Vietnam, Phillipines, Laos, and Cambodia. They have extensively used strategic web compromises to compromise victims. The group is believed to be Vietnam-based. APT28 - G0007

[APT28](<https://attack.mitre.org/groups/G0007>) is a threat group that has been attributed to Russia's Main Intelligence Directorate of the Russian General Staff by a July 2018 U.S. Department of Justice indictment. This group reportedly compromised the Hillary Clinton campaign, the Democratic National Committee, and the Democratic Congressional Campaign Committee in 2016 in an attempt to interfere with the U.S. presidential election. (Citation: DOJ GRU Indictment Jul 2018) (Citation: Ars Technica GRU indictment Jul 2018) (Citation: Crowdstrike DNC June 2016) (Citation: FireEye APT28) (Citation: SecureWorks TG-4127) (Citation: FireEye APT28 January 2017) (Citation: GRIZZLY STEPPE JAR) (Citation: Sofacy DealersChoice) (Citation: Palo Alto Sofacy 06-2018)

Equation - G0020

[Equation](<https://attack.mitre.org/groups/G0020>) is a sophisticated threat group that employs multiple remote access tools. The group is known to use zero-day exploits and has developed the capability to overwrite the firmware of hard disk drives. (Citation: Kaspersky Equation QA)

Patchwork - G0040

[Patchwork](<https://attack.mitre.org/groups/G0040>) is a cyberespionage group that was first observed in December 2015. While the group has not been definitively attributed, circumstantial evidence suggests the group may be a pro-Indian or Indian entity. [Patchwork](<https://attack.mitre.org/groups/G0040>) has been seen targeting industries related to diplomatic and government agencies. Much of the code used by this group was copied and pasted from online forums. [Patchwork](<https://attack.mitre.org/groups/G0040>) was also seen operating spearphishing campaigns targeting U.S. think tank groups in March and April of 2018. DragonOK - G0017

[DragonOK](<https://attack.mitre.org/groups/G0017>) is a threat group that has targeted Japanese organizations with phishing emails. Due to overlapping TTPs, including similar custom tools, [DragonOK](<https://attack.mitre.org/groups/G0017>) is thought to have a direct or indirect relationship with the threat group [Moafee](<https://attack.mitre.org/groups/G0002>). (Citation:

Operation Quantum Entanglement) It is known to use a variety of malware, including Sysget/HelloBridge, PlugX, PoisonIvy, FormerFirstRat, NFlog, and NewCT. (Citation: New DragonOK)

APT3 - G0022

[APT3](<https://attack.mitre.org/groups/G0022>) is a China-based threat group that researchers have attributed to China's Ministry of State Security. (Citation: FireEye Clandestine Wolf) (Citation: Recorded Future APT3 May 2017) This group is responsible for the campaigns known as Operation Clandestine Fox, Operation Clandestine Wolf, and Operation Double Tap. (Citation: FireEye Clandestine Wolf) (Citation: FireEye Operation Double Tap) As of June 2015, the group appears to have shifted from targeting primarily US victims to primarily political organizations in Hong Kong. APT34 - G0057

APT34 is an Iranian cyber espionage group that has been active since at least 2014. The group has targeted a variety of industries, including financial, government, energy, chemical, and telecommunications, and has largely focused its operations within the Middle East. FireEye assesses that the group works on behalf of the Iranian government based on infrastructure details that contain references to Iran, use of Iranian infrastructure, and targeting that aligns with nation-state interests. APT34 loosely aligns with public reporting related to OilRig, but may not wholly align due to companies tracking threat groups in different ways. (Citation: FireEye APT34 Dec 2017)

Dragonfly - G0035

[Dragonfly](<https://attack.mitre.org/groups/G0035>) is a cyber espionage group that has been active since at least 2011. They initially targeted defense and aviation companies but shifted to focus on the energy sector in early 2013. They have also targeted companies related to industrial control systems. (Citation: Symantec Dragonfly)

A similar group emerged in 2015 and was identified by Symantec as [Dragonfly 2.0](<https://attack.mitre.org/groups/G0074>). There is debate over the extent of the overlap between [Dragonfly](<https://attack.mitre.org/groups/G0035>) and [Dragonfly 2.0](<https://attack.mitre.org/groups/G0074>), but there is sufficient evidence to lead to these being tracked as two separate groups. menuPass - G0045

[menuPass](<https://attack.mitre.org/groups/G0045>) is a threat group that appears to originate from China and has been active since approximately 2009. The group has targeted healthcare, defense, aerospace, and government sectors, and has targeted Japanese victims since at least 2014. In 2016 and 2017, the group targeted managed IT service providers, manufacturing and mining companies, and a university. FIN7 - G0046

[FIN7](<https://attack.mitre.org/groups/G0046>) is a financially-motivated threat group that has primarily targeted the U.S. retail, restaurant, and hospitality sectors since mid-2015. They often use point-of-sale malware. A portion of [FIN7](<https://attack.mitre.org/groups/G0046>) was run out of a front company called Combi Security. [FIN7](<https://attack.mitre.org/groups/G0046>) is sometimes referred to as [Carbanak](<https://attack.mitre.org/groups/G0008>) Group, but these appear to be two groups using the same [Carbanak](<https://attack.mitre.org/software/S0030>) malware and are therefore tracked separately. (Citation: FireEye FIN7 March 2017) (Citation: FireEye FIN7 April 2017) (Citation: FireEye CARBANAK June 2017) (Citation: FireEye FIN7 Aug 2018)

OilRig - G0049

[OilRig](<https://attack.mitre.org/groups/G0049>) is a threat group with suspected Iranian origins that has targeted Middle Eastern and international victims since at least 2014. The group has targeted a variety of industries, including financial, government, energy, chemical, and telecommunications, and has largely focused its operations within the Middle East. It appears the group carries out supply chain attacks, leveraging the trust relationship between organizations to attack their primary targets. FireEye assesses that the group works on behalf of the Iranian government based on infrastructure details that contain references to Iran, use of Iranian infrastructure, and targeting that aligns with nation-state interests. (Citation: Palo Alto OilRig April 2017) (Citation: ClearSky OilRig Jan 2017) (Citation: Palo Alto OilRig May 2016) (Citation: Palo Alto OilRig Oct 2016) (Citation: Unit 42 Playbook Dec 2017) (Citation: FireEye APT34 Dec 2017) This group was previously tracked under two distinct groups, APT34 and OilRig, but was combined due to additional reporting giving higher confidence about the overlap of the activity.

NEODYMIUM - G0055

[NEODYMIUM](<https://attack.mitre.org/groups/G0055>) is an activity group that conducted a

campaign in May 2016 and has heavily targeted Turkish victims. The group has demonstrated similarity to another activity group called [PROMETHIUM](<https://attack.mitre.org/groups/G0056>) due to overlapping victim and campaign characteristics. (Citation: Microsoft NEODYMIUM Dec 2016) (Citation: Microsoft SIR Vol 21) [NEODYMIUM](<https://attack.mitre.org/groups/G0055>) is reportedly associated closely with [BlackOasis](<https://attack.mitre.org/groups/G0063>) operations, but evidence that the group names are aliases has not been identified. (Citation: CyberScoop BlackOasis Oct 2017)

DarkHydrus - G0079

[DarkHydrus](<https://attack.mitre.org/groups/G0079>) is a threat group that has targeted government agencies and educational institutions in the Middle East since at least 2016. The group heavily leverages open-source tools and custom payloads for carrying out attacks. (Citation: Unit 42 DarkHydrus July 2018) (Citation: Unit 42 Playbook Dec 2017)

Volgmer - S0180

[Volgmer](<https://attack.mitre.org/software/S0180>) is a backdoor Trojan designed to provide covert access to a compromised system. It has been used since at least 2013 to target the government, financial, automotive, and media industries. Its primary delivery mechanism is suspected to be spearphishing. CozyCar - S0046

[CozyCar](<https://attack.mitre.org/software/S0046>) is malware that was used by

[APT29](<https://attack.mitre.org/groups/G0016>) from 2010 to 2015. It is a modular malware platform, and its backdoor component can be instructed to download and execute a variety of modules with different functionality. (Citation: F-Secure The Dukes)

BlackEnergy - S0089

[BlackEnergy](<https://attack.mitre.org/software/S0089>) is a malware toolkit that has been used by both criminal and APT actors. It dates back to at least 2007 and was originally designed to create botnets for use in conducting Distributed Denial of Service (DDoS) attacks, but its use has evolved to support various plug-ins. It is well known for being used during the confrontation between Georgia and Russia in 2008, as well as in targeting Ukrainian institutions. Variants include BlackEnergy 2 and BlackEnergy 3. USBStealer - S0136

[USBStealer](<https://attack.mitre.org/software/S0136>) is malware that has used by [APT28](<https://attack.mitre.org/groups/G0007>) since at least 2005 to extract information from air-gapped networks. It does not have the capability to communicate over the Internet and has been used in conjunction with [ADVSTORESHELL](<https://attack.mitre.org/software/S0045>). (Citation: ESET Sednit USBStealer 2014) (Citation: Kaspersky Sofacy)

Matroyshka - S0167

[Matroyshka](<https://attack.mitre.org/software/S0167>) is a malware framework used by [CopyKittens](<https://attack.mitre.org/groups/G0052>) that consists of a dropper, loader, and RAT. It has multiple versions; v1 was seen in the wild from July 2016 until January 2017. v2 has fewer commands and other minor differences. (Citation: ClearSky Wilted Tulip July 2017) (Citation: CopyKittens Nov 2015)

More_eggs - S0284

[More_eggs](<https://attack.mitre.org/software/S0284>) is a JScript backdoor used by [Cobalt Group](<https://attack.mitre.org/groups/G0080>). Its name was given based on the variable "More_eggs" being present in its code. There are at least two different versions of the backdoor being used, version 2.0 and version 4.4. MITRE

Malicious SMS Message - MOB-T1057

An SMS message could contain content designed to exploit vulnerabilities in the SMS parser on the receiving device. For example, Mulliner and Miller demonstrated such an attack against the iPhone in 2009 as described in (Citation: Forbes-iPhoneSMS).

An SMS message could also contain a link to a web site containing malicious content designed to exploit the device web browser.

As described by SRLabs in (Citation: SRLabs-SIMCard), vulnerable SIM cards may be remotely exploited and reprogrammed via SMS messages.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Malicious SMS Message - MOB-T1057"*

Malicious SMS Message - MOB-T1057 has relationships with:

Eavesdrop on Insecure Network Communication - MOB-T1042

If network traffic between the mobile device and remote servers is unencrypted or is encrypted in an insecure manner, then an adversary positioned on the network can eavesdrop on communication. For example, He et al. (Citation: mHealth) describe numerous healthcare-related applications that did not properly protect network communication.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Eavesdrop on Insecure Network Communication - MOB-T1042"*

Disguise Root/Jailbreak Indicators - MOB-T1011

An adversary could use knowledge of the techniques used by security software to evade detection. For example, some mobile security products perform compromised device detection by searching for particular artifacts such as an installed "su" binary, but that check could be evaded by naming the binary something else. Similarly, polymorphic code techniques could be used to evade signature-based detection as described by (Citation: Rastogi) et al. (Citation: Rastogi).

(Citation: Brodie) (Citation: Brodie) describes limitations of jailbreak/root detection mechanisms.

(Citation: Tan) (Citation: Tan) describes his experience defeating the jailbreak detection used by the iOS version of Good for Enterprise.

Device Type Discovery - MOB-T1022

On Android, device type information is accessible to apps through the `android.os.Build` class (Citation: Android-Build). Device information could be used to target privilege escalation exploits.

Platforms: Android

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Device Type Discovery - MOB-T1022"*

Table 3357. Table References

Links

<https://attack.mitre.org/mobile/index.php/Technique/MOB-T1022>

<https://zeltser.com/third-party-keyboards-security/>

Premium SMS Toll Fraud - MOB-T1051

A malicious app could use standard Android APIs to send SMS messages. SMS messages could potentially be sent to premium numbers that charge the device owner and generate revenue for an adversary, for example as described by Lookout in (Citation: Lookout-SMS).

On iOS, apps cannot send SMS messages.

On Android, apps must hold the `SEND_SMS` permission to send SMS messages. Additionally, Android version 4.2 and above has mitigations against this threat by requiring user consent before allowing SMS messages to be sent to premium numbers (Citation: AndroidSecurity2014).

Detection: As described in Google's Android Security 2014 Year in Review Report (Citation: AndroidSecurity2014), starting with Android 4.2 the user is prompted and must provide consent before applications can send SMS messages to premium numbers.

On Android 6.0 and up, the user can view which applications have permission to send SMS messages through the device settings screen, and the user can choose to revoke the permissions.

Platforms: Android

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Premium SMS Toll Fraud - MOB-T1051"*

Obtain Device Cloud Backups - MOB-T1073

An adversary who is able to obtain unauthorized access to or misuse authorized access to cloud backup services (e.g. Google's Android backup service or Apple's iCloud) could use that access to obtain sensitive data stored in device backups. For example, the Elcomsoft Phone Breaker product advertises the ability to retrieve iOS backup data from Apple's iCloud (Citation: Elcomsoft-EPPB).

Detection: Google provides the ability for users to view their account activity. Apple iCloud also provides notifications to users of account activity.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Obtain Device Cloud Backups - MOB-T1073"*

https://www.elcomsoft.com/eppb.html

Access Sensitive Data in Device Logs - MOB-T1016

On versions of Android prior to 4.1, an adversary may use a malicious application that holds the READ_LOGS permission to obtain private keys, passwords, other credentials, or other sensitive data stored in the device's system log. On Android 4.1 and later, an adversary would need to attempt to perform an operating system privilege escalation attack to be able to access the log.

Platforms: Android

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Access Sensitive Data in Device Logs - MOB-T1016"*

Android Intent Hijacking - MOB-T1019

A malicious app can register to receive intents meant for other applications and may then be able to receive sensitive values such as OAuth authorization codes as described in (Citation: IETF-PKCE).

Platforms: Android

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Android Intent Hijacking - MOB-T1019"*

Table 3362. Table References

Links
https://attack.mitre.org/mobile/index.php/Technique/MOB-T1019
https://tools.ietf.org/html/rfc7636

URL Scheme Hijacking - MOB-T1018

An iOS application may be able to maliciously claim a URL scheme, allowing it to intercept calls that are meant for a different application. This technique, for example, could be used to capture OAuth authorization codes as described in (Citation: IETF-PKCE) or to phish user credentials as described in (Citation: MobileIron-XARA). Related potential security implications are described in (Citation: Dhanjani-URLScheme). FireEye researchers describe URL scheme hijacking in a blog post (Citation: FireEye-Masque2), including evidence of its use.

Platforms: iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="URL Scheme Hijacking - MOB-T1018"*

Exploit Enterprise Resources - MOB-T1031

Adversaries may attempt to exploit enterprise servers, workstations, or other resources over the network. This technique may take advantage of the mobile device's access to an internal enterprise network either through local connectivity or through a Virtual Private Network (VPN).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Exploit Enterprise Resources - MOB-T1031"*

Table 3364. Table References

Links
https://attack.mitre.org/mobile/index.php/Technique/MOB-T1031
https://pages.nist.gov/mobile-threat-catalogue/application-threats/APP-32.html

Modify System Partition - MOB-T1003

If an adversary can escalate privileges, he or she may be able to use those privileges to place malicious code in the device system partition, where it may persist after device resets and may not be easily removed by the device user.

Many Android devices provide the ability to unlock the bootloader for development purposes. An unlocked bootloader may provide the ability for an adversary to modify the system partition. Even if the bootloader is locked, it may be possible for an adversary to escalate privileges and then modify the system partition.

Detection: Android devices with the Verified Boot capability (Citation: Android-VerifiedBoot) perform cryptographic checks of the integrity of the system partition.

The Android SafetyNet API's remote attestation capability could potentially be used to identify and respond to compromised devices.

Samsung KNOX also provides a remote attestation capability on supported Samsung Android

devices.

As described in the iOS Security Guide (Citation: Apple-iOSSecurityGuide), iOS devices will fail to boot or fail to allow device activation if unauthorized modifications are detected.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Modify System Partition - MOB-T1003"*

Table 3365. Table References

System Information Discovery - MOB-T1029

An adversary may attempt to get detailed information about the operating system and hardware, including version, patches, and architecture.

On Android, much of this information is programmatically accessible to applications through the android.os.Build class (Citation: Android-Build).

On iOS, techniques exist for applications to programmatically access this information, for example as described in (Citation: StackOverflow-iOSVersion).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="System Information Discovery - MOB-T1029"*

Table 3366. Table References

http://stackoverflow.com/questions/7848766/how-can-we-programmatically-detect-which-ios-version-is-device-running-on

Network Service Scanning - MOB-T1026

Adversaries may attempt to get a listing of services running on remote hosts, including those that may be vulnerable to remote software exploitation. Methods to acquire this information include port scans and vulnerability scans from the mobile device. This technique may take advantage of the mobile device's access to an internal enterprise network either through local connectivity or through a Virtual Private Network (VPN).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Network Service Scanning - MOB-T1026"*

Table 3367. Table References

Links
https://attack.mitre.org/mobile/index.php/Technique/MOB-T1026

Access Call Log - MOB-T1036

On Android, an adversary could call standard operating system APIs from a malicious application to gather call log data, or with escalated privileges could directly access files containing call log data.

On iOS, applications do not have access to the call log, so privilege escalation would be required in order to access the data.

Detection: On Android 6.0 and up, the user can view which applications have permission to access call log information through the device settings screen, and the user can choose to revoke the permissions.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Access Call Log - MOB-T1036"*

https://pages.nist.gov/mobile-threat-catalogue/ecosystem-threats/ECO-13.html

Standard Application Layer Protocol - MOB-T1040

Adversaries may communicate using a common, standardized application layer protocol such as HTTP, HTTPS, SMTP, or DNS to avoid detection by blending in with existing traffic.

In the mobile environment, the Google Cloud Messaging (GCM; two-way) and Apple Push Notification Service (APNS; one-way server-to-device) are commonly used protocols on Android and iOS respectively that would blend in with routine device traffic and are difficult for enterprises to inspect. As described by Kaspersky (Citation: Kaspersky-MobileMalware), Google responds to reports of abuse by blocking access to GCM.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Standard Application Layer Protocol - MOB-T1040"*

Table 3374. Table References

File and Directory Discovery - MOB-T1023

On Android, command line tools or the Java file APIs can be used to enumerate file system contents. However, Linux file permissions and SELinux policies generally strongly restrict what can be accessed by apps (without taking advantage of a privilege escalation exploit). The contents of the external storage directory are generally visible, which could present concern if sensitive data is inappropriately stored there.

iOS's security architecture generally restricts the ability to perform file and directory discovery without use of escalated privileges.

Platforms: Android

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="File and Directory Discovery - MOB-T1023"*

Table 3375. Table References

User Interface Spoofing - MOB-T1014

At least three methods exist to perform User Interface Spoofing:

First, on both Android and iOS, an adversary could impersonate the user interface of a legitimate app or device function to trick a user into entering account credentials.

Second, on both Android and iOS, a malicious app could impersonate the identity of another app in order to trick users into installing and using it.

Third, on older versions of Android, a malicious app could abuse mobile operating system features to interfere with a running legitimate app as described in (Citation: Felt-PhishingOnMobileDevices) and (Citation: Hassell-ExploitingAndroid). However, this technique appears to have been addressed starting in Android 5.0 with the deprecation of the Android's `ActivityManager.getRunningTasks` method and modification of its behavior (Citation: Android-getRunningTasks) and further addressed in Android 5.1.1 (Citation: StackOverflow-getRunningAppProcesses) to prevent a malicious app from determining what app is currently in the foreground.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="User Interface Spoofing - MOB-T1014"*

Exploit Baseband Vulnerability - MOB-T1058

A message sent over a radio interface (typically cellular, but potentially Bluetooth, GPS, NFC, Wi-Fi or other) to the mobile device could exploit a vulnerability in code running on the device.

A. Komaromy and N. Golde demonstrated baseband exploitation of a Samsung mobile device at the PacSec 2015 security conference (Citation: Register-BaseStation).

Weinmann described and demonstrated "the risk of remotely exploitable memory corruptions in cellular baseband stacks." (Citation: Weinmann-Baseband)

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Exploit Baseband Vulnerability - MOB-T1058"*

Exploit Baseband Vulnerability - MOB-T1058 has relationships with:

- revoked-by: *misp-galaxy:mitre-attack-pattern="Exploit via Radio Interfaces - T1477"* with estimative-language:likelihood-probability="almost-certain"

Process Discovery - MOB-T1027

On Android versions prior to 5, applications can observe information about other processes that are running through methods in the ActivityManager class. On Android versions prior to 7, applications can obtain this information by executing the `ps` command, or by examining the `/proc` directory. Starting in Android version 7, use of the Linux kernel's `hidepid` feature prevents applications (without escalated privileges) from accessing this information (Citation: Android-SELinuxChanges).

Platforms: Android

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Process Discovery - MOB-T1027"*

App Delivered via Web Download - MOB-T1034

The application is downloaded from an arbitrary web site. A link to the application's download URI may be sent in an email or SMS, placed on another web site that the target is likely to view, or sent via other means (such as QR code).

Detection: An EMM/MDM or mobile threat protection solution can identify the presence of unwanted, known insecure, or malicious apps on devices.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="App Delivered via Web Download - MOB-T1034"*

App Delivered via Web Download - MOB-T1034 has relationships with:

- revoked-by: *misp-galaxy:mitre-attack-pattern="Deliver Malicious App via Other Means - T1476"* with estimative-language:likelihood-probability="almost-certain"

Table 3384. Table References

Capture SMS Messages - MOB-T1015

A malicious application could capture sensitive data sent via SMS, including authentication credentials. SMS is frequently used to transmit codes used for multi-factor authentication.

On Android, a malicious application must request and obtain permission (either at app install time or run time) in order to receive SMS messages. Alternatively, a malicious application could attempt to perform an operating system privilege escalation attack to bypass the permission requirement.

On iOS, applications cannot access SMS messages in normal operation, so an adversary would need to attempt to perform an operating system privilege escalation attack to potentially be able to access SMS messages.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Capture SMS Messages - MOB-T1015"*

Table 3385. Table References

Links
https://attack.mitre.org/mobile/index.php/Technique/MOB-T1015

Encrypt Files for Ransom - MOB-T1074

An adversary may encrypt files stored on the mobile device to prevent the user from accessing them, only unlocking access to the files after a ransom is paid. Without escalated privileges, the adversary is generally limited to only encrypting files in external/shared storage locations. This technique has been demonstrated on Android, and we are unaware of any demonstrated use on iOS.

Platforms: Android

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Encrypt Files for Ransom - MOB-T1074"*

Table 3386. Table References

Links
https://attack.mitre.org/mobile/index.php/Technique/MOB-T1074
https://pages.nist.gov/mobile-threat-catalogue/application-threats/APP-28.html

Abuse of iOS Enterprise App Signing Key - MOB-T1048

An adversary could abuse an iOS enterprise app signing key (intended for enterprise in-house distribution of apps) to sign malicious iOS apps so that they can be installed on iOS devices without the app needing to be published on Apple's App Store. For example, Xiao describes use of this technique in (Citation: Xiao-iOS).

Detection: iOS 9 and above typically requires explicit user consent before allowing installation of applications signed with enterprise distribution keys rather than installed from Apple's App Store.

Platforms: iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Abuse of iOS Enterprise App Signing Key - MOB-T1048"*

Abuse of iOS Enterprise App Signing Key - MOB-T1048 has relationships with:

- revoked-by: *misp-galaxy:mitre-attack-pattern="Deliver Malicious App via Other Means - T1476"* with estimative-language:likelihood-probability="almost-certain"

Exploit TEE Vulnerability - MOB-T1008

A malicious app or other attack vector could be used to exploit vulnerabilities in code running within the Trusted Execution Environment (TEE) (Citation: Thomas-TrustZone). The adversary could then obtain privileges held by the TEE potentially including the ability to access cryptographic keys or other sensitive data (Citation: QualcommKeyMaster). Escalated operating system privileges may be first required in order to have the ability to attack the TEE (Citation: EkbergTEE). If not, privileges within the TEE can potentially be used to exploit the operating system (Citation: luginimaineb-TEE).

Platforms: Android

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Exploit TEE Vulnerability - MOB-T1008"*

Remotely Track Device Without Authorization - MOB-T1071

An adversary who is able to obtain unauthorized access to or misuse authorized access to cloud services (e.g. Google's Android Device Manager or Apple iCloud's Find my iPhone) or to an enterprise mobility management (EMM) / mobile device management (MDM) server console could use that access to track mobile devices.

Detection: Google sends a notification to the device when Android Device Manager is used to locate it. Additionally, Google provides the ability for users to view their general account activity. Apple iCloud also provides notifications to users of account activity.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Remotely Track Device Without Authorization - MOB-T1071"*

Table 3394. Table References

https://pages.nist.gov/mobile-threat-catalogue/emm-threats/EMM-7.html

Biometric Spoofing - MOB-T1063

An adversary could attempt to spoof a mobile device's biometric authentication mechanism, for example by providing a fake fingerprint as described by SRLabs in (Citation: SRLabs-Fingerprint).

iOS partly mitigates this attack by requiring the device passcode rather than a fingerprint to unlock the device after every device restart and after 48 hours since the device was last unlocked (Citation: Apple-TouchID).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Biometric Spoofing - MOB-T1063"*

Biometric Spoofing - MOB-T1063 has relationships with:

- revoked-by: misp-galaxy:mitre-mobile-attack-attack-pattern="Lockscreen Bypass - MOB-T1064" with estimative-language:likelihood-probability="almost-certain"

Access Contact List - MOB-T1035

An adversary could call standard operating system APIs from a malicious application to gather contact list (i.e., address book) data, or with escalated privileges could directly access files containing contact list data.

Detection: On both Android (6.0 and up) and iOS, the user can view which applications have permission to access contact list information through the device settings screen, and the user can choose to revoke the permissions.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Access Contact List - MOB-T1035"*

Table 3398. Table References

Links
https://attack.mitre.org/mobile/index.php/Technique/MOB-T1035
https://pages.nist.gov/mobile-threat-catalogue/application-threats/APP-13.html

Stolen Developer Credentials or Signing Keys - MOB-T1044

An adversary could steal developer account credentials on an app store and/or signing keys to publish malicious updates to existing Android or iOS apps, or to abuse the developer's identity and reputation to publish new malicious applications. For example, Infoworld describes this technique and suggests mitigations in (Citation: Infoworld-Appstore).

Detection: Developers can regularly scan (or have a third party scan on their behalf) the app stores for presence of unauthorized apps that were submitted using the developer's identity.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Stolen Developer Credentials or Signing Keys - MOB-T1044"*

Stolen Developer Credentials or Signing Keys - MOB-T1044 has relationships with:

- revoked-by: *misp-galaxy:mitre-attack-pattern="Deliver Malicious App via Authorized App Store - T1475"* with estimative-language:likelihood-probability="almost-certain"

Table 3399. Table References

https://pages.nist.gov/mobile-threat-catalogue/ecosystem-threats/ECO-17.html

Network Traffic Capture or Redirection - MOB-T1013

An adversary may capture network traffic to and from the device to obtain credentials or other sensitive data, or redirect network traffic to flow through an adversary-controlled gateway to do the same.

A malicious app could register itself as a VPN client on Android or iOS to gain access to network packets. However, on both platforms, the user must grant consent to the app to act as a VPN client, and on iOS the app requires a special entitlement that must be granted by Apple.

Alternatively, if a malicious app is able to escalate operating system privileges, it may be able to use those privileges to gain access to network traffic.

An adversary could redirect network traffic to an adversary-controlled gateway by establishing a VPN connection or by manipulating the device's proxy settings. For example, Skycure (Citation: Skycure-Profiles) describes the ability to redirect network traffic by installing a malicious iOS Configuration Profile.

If applications encrypt their network traffic, sensitive data may not be accessible to an adversary, depending on the point of capture.

Detection: On both Android and iOS the user must grant consent to an app to act as a VPN. Both platforms also provide visual context to the user in the top status bar when a VPN connection is in place.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Network Traffic Capture or Redirection - MOB-T1013"*

Table 3400. Table References

Access Sensitive Data or Credentials in Files - MOB-T1012

An adversary could attempt to read files that contain sensitive data or credentials (e.g., private keys, passwords, access tokens). This technique requires either escalated privileges or for the targeted app to have stored the data in an insecure manner (e.g., with insecure file permissions or in an insecure location such as an external storage directory).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Access Sensitive Data or Credentials in Files - MOB-T1012"*

Table 3401. Table References

Links
https://attack.mitre.org/mobile/index.php/Technique/MOB-T1012
https://pages.nist.gov/mobile-threat-catalogue/authentication-threats/AUT-0.html

Modify Trusted Execution Environment - MOB-T1002

If an adversary can escalate privileges, he or she may be able to use those privileges to place malicious code in the device's Trusted Execution Environment (TEE) or other similar isolated execution environment where the code can evade detection, may persist after device resets, and may not be removable by the device user. Running code within the TEE may provide an adversary with the ability to monitor or tamper with overall device behavior.

Thomas Roth describes the potential for placing a rootkit within the TrustZone secure world (Citation: Roth-Rootkits).

Detection: Devices may perform cryptographic integrity checks of code running within the TEE at boot time.

As described in the iOS Security Guide (Citation: Apple-iOSSecurityGuide), iOS devices will fail to boot if the software running within the Secure Enclave does not pass signature verification.

Platforms: Android

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Modify Trusted Execution Environment - MOB-T1002"*

Downgrade to Insecure Protocols - MOB-T1069

An adversary could cause the mobile device to use less secure protocols, for example by jamming frequencies used by newer protocols such as LTE and only allowing older protocols such as GSM to communicate as described in draft NIST SP 800-187 (Citation: NIST-SP800187). Use of less secure protocols may make communication easier to eavesdrop upon or manipulate.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Downgrade to Insecure Protocols - MOB-T1069"*

Exploit SS7 to Redirect Phone Calls/SMS - MOB-T1052

An adversary could exploit signaling system vulnerabilities to redirect calls or text messages to a phone number under the attacker's control. The adversary could then act as a man-in-the-middle to intercept or manipulate the communication. These issues are discussed in (Citation: Engel-SS7), (Citation: Engel-SS7)-2008, (Citation: 3GPP-Security), (Citation: Positive-SS7), as well as in a report from the Communications, Security, Reliability, and Interoperability Council (CSRIC) (Citation: CSRIC5-WG10-FinalReport).

Detection: Network carriers may be able to use firewalls, Intrusion Detection Systems (IDS), or Intrusion Prevention Systems (IPS) to detect and/or block SS7 exploitation as described by the CSRIC (Citation: CSRIC5-WG10-FinalReport). The CSRIC also suggests threat information sharing between telecommunications industry members.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Exploit SS7 to Redirect Phone Calls/SMS - MOB-T1052"*

Modify OS Kernel or Boot Partition - MOB-T1001

If an adversary can escalate privileges, he or she may be able to use those privileges to place malicious code in the device kernel or other boot partition components, where the code may evade detection, may persist after device resets, and may not be removable by the device user. In some cases (e.g., the Samsung Knox warranty bit as described under Detection), the attack may be detected but could result in the device being placed in a state that no longer allows certain functionality.

Many Android devices provide the ability to unlock the bootloader for development purposes, but doing so introduces the potential ability for others to maliciously update the kernel or other boot partition code.

If the bootloader is not unlocked, it may still be possible to exploit device vulnerabilities to update the code.

Detection: The Android SafetyNet API's remote attestation capability could potentially be used to identify and respond to compromised devices. Samsung KNOX also provides a remote attestation capability on supported Samsung Android devices.

Samsung KNOX devices include a non-reversible Knox warranty bit fuse that is triggered "if a non-Knox kernel has been loaded on the device" (Citation: Samsung-KnoxWarrantyBit). If triggered, enterprise Knox container services will no longer be available on the device.

As described in the iOS Security Guide (Citation: Apple-iOSSecurityGuide), iOS devices will fail to boot or fail to allow device activation if unauthorized modifications are detected.

Many enterprise applications perform their own checks to detect and respond to compromised devices. These checks are not foolproof but can detect common signs of compromise.

Platforms: Android, iOS

Insecure Third-Party Libraries - MOB-T1028

Third-party libraries incorporated into mobile apps could contain malicious behavior, privacy-invasive behavior, or exploitable vulnerabilities. An adversary could deliberately insert malicious behavior or could exploit inadvertent vulnerabilities.

For example, Ryan Welton of NowSecure identified exploitable remote code execution vulnerabilities in a third-party advertisement library (Citation: NowSecure-RemoteCode). Grace et al. identified security issues in mobile advertisement libraries (Citation: Grace-Advertisement).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Insecure Third-Party Libraries - MOB-T1028"*

Insecure Third-Party Libraries - MOB-T1028 has relationships with:

- revoked-by: *misp-galaxy:mitre-attack-pattern="Supply Chain Compromise - T1474"* with estimative-language:likelihood-probability="almost-certain"

Download New Code at Runtime - MOB-T1010

An app could download and execute dynamic code (not included in the original application package) after installation to evade static analysis techniques (and potentially dynamic analysis techniques) used for application vetting or application store review (Citation: Poeplau-ExecuteThis).

On Android, dynamic code could include native code, Dalvik code, or JavaScript code that uses the Android WebView's JavascriptInterface capability (Citation: Bromium-AndroidRCE).

On iOS, techniques for executing dynamic code downloaded after application installation include JSPatch (Citation: FireEye-JSPatch). (Citation: Wang) et al. describe a related method of constructing malicious logic at app runtime on iOS (Citation: Wang).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Download New Code at Runtime - MOB-T1010"*

Exploit SS7 to Track Device Location - MOB-T1053

An adversary could exploit signaling system vulnerabilities to track the location of mobile devices, for example as described in (Citation: Engel-SS7), (Citation: Engel-SS7)-2008, (Citation: 3GPP-Security) and (Citation: Positive-SS7), as well as in a report from the Communications, Security, Reliability, and Interoperability Council (CSRIC) (Citation: CSRIC5-WG10-FinalReport).

Detection: Network carriers may be able to use firewalls, Intrusion Detection Systems (IDS), or Intrusion Prevention Systems (IPS) to detect and/or block SS7 exploitation as described by the CSRIC (Citation: CSRIC-WG1-FinalReport). The CSRIC also suggests threat information sharing between telecommunications industry members.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Exploit SS7 to Track Device Location - MOB-T1053"*

Malicious Third Party Keyboard App - MOB-T1020

A malicious app can register as a device keyboard and intercept keypresses containing sensitive values such as usernames and passwords. Zeltser (Citation: Zeltser-Keyboards) describes these risks.

Both iOS and Android require the user to explicitly authorize use of third party keyboard apps. Users should be advised to use extreme caution before granting this authorization when it is requested.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Malicious Third Party Keyboard App - MOB-T1020"*

Table 3416. Table References

Links
https://attack.mitre.org/mobile/index.php/Technique/MOB-T1020

Modify cached executable code - MOB-T1006

ART (the Android Runtime) compiles optimized code on the device itself to improve performance. If an adversary can escalate privileges, he or she may be able to use those privileges to modify the cached code in order to hide malicious behavior. Since the code is compiled on the device, it may not receive the same level of integrity checks that are provided to code running in the system partition.

Sabanal describes the potential use of this technique in (Citation: Sabanal-ART).

Platforms: Android

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Modify cached executable code - MOB-T1006"*

Table 3419. Table References

Application Discovery - MOB-T1021

Adversaries may seek to identify all applications installed on the device. One use case for doing so is to identify the presence of endpoint security applications that may increase the adversary's risk of detection. Another use case is to identify the presence of applications that the adversary may wish to target.

On Android, applications can use methods in the PackageManager class (Citation: Android-PackageManager) to enumerate other apps installed on device, or an entity with shell access can use the pm command line tool.

On iOS, apps can use private API calls to obtain a list of other apps installed on the device as described by Kurtz (Citation: Kurtz-MaliciousiOSApps), however use of private API calls will likely prevent the application from being distributed through Apple's App Store.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Application Discovery - MOB-T1021"*

https://threatpost.com/ios-10-passcode-bypass-can-access-photos-contacts/122033/

SIM Card Swap - MOB-T1054

An adversary could convince the mobile network operator (e.g. through social networking or

forged identification) to issue a new SIM card and associate it with an existing phone number and account (Citation: NYGov-Simswap). The adversary could then obtain SMS messages or hijack phone calls intended for someone else (Citation: Betanews-Simswap). One use case is intercepting authentication messages or phone calls to obtain illicit access to online banking or other online accounts (Citation: Guardian-Simswap).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="SIM Card Swap - MOB-T1054"*

Table 3422. Table References

Location Tracking - MOB-T1033

An adversary could use a malicious or exploited application to surreptitiously track the device's physical location through use of standard operating system APIs.

Detection: On both Android (6.0 and up) and iOS, the user can view which applications have permission to access device location through the device settings screen, and the user can choose to revoke the permissions.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Location Tracking - MOB-T1033"*

Table 3423. Table References

https://attack.mitre.org/mobile/index.php/Technique/MOB-T1033
https://pages.nist.gov/mobile-threat-catalogue/application-threats/APP-24.html

Exploit via Charging Station or PC - MOB-T1061

If the mobile device is connected (typically via USB) to a charging station or a PC, for example to charge the device's battery, then a compromised or malicious charging station or PC could attempt to exploit the mobile device via the connection.

Krebs described this technique in (Citation: Krebs-JuiceJacking). Lau et al. (Citation: Lau-Mactans) demonstrated the ability to inject malicious applications into an iOS device via USB. Hay (Citation: IBM-NexusUSB) demonstrated the ability to exploit a Nexus 6 or 6P device over USB and then gain the ability to perform actions including intercepting phone calls, intercepting network traffic, and

obtaining the device physical location.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Exploit via Charging Station or PC - MOB-T1061"*

Table 3424. Table References

Manipulate Device Communication - MOB-T1066

If network traffic between the mobile device and a remote server is not securely protected, then an attacker positioned on the network may be able to manipulate network communication without being detected. For example, FireEye researchers found in 2014 that 68% of the top 1,000 free applications in the Google Play Store had at least one Transport Layer Security (TLS) implementation vulnerability potentially opening the applications' network traffic to man-in-the-middle attacks (Citation: FireEye-SSL).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Manipulate Device Communication - MOB-T1066"*

Table 3425. Table References

Repackaged Application - MOB-T1047

An adversary could download a legitimate app, disassemble it, add malicious code, and then reassemble the app, for example as described by (Citation: Zhou) and Jiang in (Citation: Zhou). The app would appear to be the original app but contain additional malicious functionality. The adversary could then publish this app to app stores or use another delivery technique.

Detection: An EMM/MDM or mobile threat protection solution can identify the presence of unwanted, known insecure, or malicious apps on devices.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Repackaged Application - MOB-T1047"*

Table 3427. Table References

http://ieeexplore.ieee.org/document/6234407

Lock User Out of Device - MOB-T1049

An adversary may seek to lock the legitimate user out of the device, for example until a ransom is paid.

On Android versions prior to 7, apps can abuse Device Administrator access to reset the device lock passcode to lock the user out of the device.

On iOS devices, this technique does not work because mobile device management servers can only remove the screen lock passcode, they cannot set a new passcode. However, on jailbroken devices, malware has been demonstrated that can lock the user out of the device (Citation: KeyRaider).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Lock User Out of Device - MOB-T1049"*

MITRE

Deploy Compromised Device Detection Method - MOB-M1010

A variety of methods exist that can be used to enable enterprises to identify compromised (e.g. rooted/jailbroken) devices, whether using security mechanisms built directly into the device, third-party mobile security applications, enterprise mobility management (EMM)/mobile device management (MDM) capabilities, or other methods. Some methods may be trivial to evade while others may be more sophisticated.

The tag is: *misp-galaxy:mitre-mobile-attack-course-of-action="Deploy Compromised Device Detection Method - MOB-M1010"*

Deploy Compromised Device Detection Method - MOB-M1010 has relationships with:

- mitigates: *misp-galaxy:mitre-mobile-attack-attack-pattern="Lock User Out of Device - MOB-T1049"* with *estimative-language:likelihood-probability="almost-certain"*

Interconnection Filtering - MOB-M1014

In order to mitigate Signaling System 7 (SS7) exploitation, the Communications, Security, Reliability, and Interoperability Council (CSRIC) describes filtering interconnections between network operators to block inappropriate requests (Citation: CSRIC5-WG10-FinalReport).

The tag is: *misp-galaxy:mitre-mobile-attack-course-of-action="Interconnection Filtering - MOB-M1014"*

Lock Bootloader - MOB-M1003

On devices that provide the capability to unlock the bootloader (hence allowing any operating system code to be flashed onto the device), perform periodic checks to ensure that the bootloader is locked.

The tag is: *misp-galaxy:mitre-mobile-attack-course-of-action="Lock Bootloader - MOB-M1003"*

Lock Bootloader - MOB-M1003 has relationships with:

- mitigates: *misp-galaxy:mitre-mobile-attack-attack-pattern="Modify OS Kernel or Boot Partition -*

MOB-T1001" with estimative-language:likelihood-probability="almost-certain"

- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Exploit via Charging Station or PC - MOB-T1061" with estimative-language:likelihood-probability="almost-certain"

System Partition Integrity - MOB-M1004

Ensure that Android devices being used include and enable the Verified Boot capability, which cryptographically ensures the integrity of the system partition.

The tag is: *misp-galaxy:mitre-mobile-attack-course-of-action="System Partition Integrity - MOB-M1004"*

System Partition Integrity - MOB-M1004 has relationships with:

- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Modify System Partition - MOB-T1003" with estimative-language:likelihood-probability="almost-certain"

Attestation - MOB-M1002

Enable remote attestation capabilities when available (such as Android SafetyNet or Samsung Knox TIMA Attestation) and prohibit devices that fail the attestation from accessing enterprise resources.

The tag is: *misp-galaxy:mitre-mobile-attack-course-of-action="Attestation - MOB-M1002"*

Attestation - MOB-M1002 has relationships with:

- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Modify OS Kernel or Boot Partition - MOB-T1001" with estimative-language:likelihood-probability="almost-certain"

Caution with Device Administrator Access - MOB-M1007

Warn device users not to accept requests to grant Device Administrator access to applications without good reason.

Additionally, application vetting should include a check on whether the application requests Device Administrator access. Applications that do request Device Administrator access should be carefully scrutinized and only allowed to be used if a valid reason exists.

The tag is: *misp-galaxy:mitre-mobile-attack-course-of-action="Caution with Device Administrator Access - MOB-M1007"*

Caution with Device Administrator Access - MOB-M1007 has relationships with:

- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Wipe Device Data - MOB-T1050" with estimative-language:likelihood-probability="almost-certain"

Application Developer Guidance - MOB-M1013

This mitigation describes any guidance or training given to developers of applications to avoid introducing security weaknesses that an adversary may be able to take advantage of.

The tag is: *misp-galaxy:mitre-mobile-attack-course-of-action="Application Developer Guidance - MOB-M1013"*

Application Developer Guidance - MOB-M1013 has relationships with:

- mitigates: *misp-galaxy:mitre-attack-pattern="Deliver Malicious App via Other Means - T1476"* with *estimative-language:likelihood-probability="almost-certain"*

Encrypt Network Traffic - MOB-M1009

Application developers should encrypt all of their application network traffic using the Transport Layer Security (TLS) protocol to ensure protection of sensitive data and deter network-based attacks. If desired, application developers could perform message-based encryption of data before passing it for TLS encryption.

iOS's App Transport Security feature can be used to help ensure that all application network traffic is appropriately protected. Apple intends to mandate use of App Transport Security (Citation: TechCrunch-ATS) for all apps in the Apple App Store unless appropriate justification is given.

Android's Network Security Configuration feature similarly can be used by app developers to help ensure that all of their application network traffic is appropriately protected (Citation: Android-NetworkSecurityConfig).

Use of Virtual Private Network (VPN) tunnels, e.g. using the IPsec protocol, can help mitigate some types of network attacks as well.

MITRE

Test ability to evade automated mobile application security analysis performed by app stores - PRE-T1170

Many mobile devices are configured to only allow applications to be installed from the mainstream vendor app stores (e.g., Apple App Store and Google Play Store). An adversary can submit multiple code samples to these stores deliberately designed to probe the stores' security analysis capabilities, with the goal of determining effective techniques to place malicious applications in the stores that could then be delivered to targeted devices. (Citation: Android Bouncer) (Citation: Adventures in BouncerLand) (Citation: Jekyll on iOS) (Citation: Fruit vs Zombies)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: The app store operators (e.g., Apple and Google) may detect the attempts, but it would not be observable to those being attacked.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: An adversary can submit code remotely using throwaway accounts, although a registration fee may need to be paid for each new account (e.g., \$99 for Apple and \$25 for Google Play Store).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Test ability to evade automated mobile application security analysis performed by app stores - PRE-T1170"*

Table 3467. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1170

Obfuscate infrastructure - PRE-T1108

Obfuscation is hiding the day-to-day building and testing of new tools, chat servers, etc. (Citation: FireEyeAPT17)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defender will generally not have visibility into their infrastructure.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Building and testing infrastructure and obfuscating it to protect it against intrusions are a standard part of the adversary process in preparing to conduct an operation against a target.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Obfuscate infrastructure - PRE-T1108"*

Obfuscate infrastructure - PRE-T1108 has relationships with:

- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Obfuscate infrastructure - PRE-T1086"* with estimative-language:likelihood-probability="almost-certain"

Table 3468. Table References

Links

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1108

Create backup infrastructure - PRE-T1116

Backup infrastructure allows an adversary to recover from environmental and system failures. It also facilitates recovery or movement to other infrastructure if the primary infrastructure is discovered or otherwise is no longer viable. (Citation: LUCKYCAT2012)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Infrastructure is (typically) outside of control/visibility of defender and as such as tools are staged for specific campaigns, it will not be obvious to those being attacked.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: The adversary has control of the infrastructure and will likely be able to add/remove tools to infrastructure, whether acquired via hacking or standard computer acquisition (e.g., [<https://aws.amazon.com> AWS], commercial storage solutions).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Create backup infrastructure - PRE-T1116"*

Table 3469. Table References

Links

Assess targeting options - PRE-T1073

An adversary may assess a target's operational security (OPSEC) practices in order to identify targeting options. A target may share different information in different settings or be more or less cautious in different environments. (Citation: Scasny2015) (Citation: EverstineAirStrikes)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defender does not have access to information stored outside of defenders scope or visibility (e.g., log data for Facebook is not easily accessible). Defender has very infrequent visibility into an adversary's more detailed TTPs for developing people targets.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Information is out in the open for items that are available - part of this is ease of use for consumers to support the expected networking use case. OSINT can provide many avenues to gather intel which contain weaknesses. Developing and refining the methodology to exploit weak human targets has been done for years (e.g., spies).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Assess targeting options - PRE-T1073"*

Table 3470. Table References

Links

<https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1073>

Receive operator KITs/KIQs tasking - PRE-T1012

Analysts may receive intelligence requirements from leadership and begin research process to satisfy a requirement. Part of this process may include delineating between needs and wants and thinking through all the possible aspects associating with satisfying a requirement. (Citation: FBIIntelligencePrimer)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Receive operator KITs/KIQs tasking - PRE-T1012"*

Table 3471. Table References

Links

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1012

Procure required equipment and software - PRE-T1112

An adversary will require some physical hardware and software. They may only need a lightweight set-up if most of their activities will take place using on-line infrastructure. Or, they may need to build extensive infrastructure if they want to test, communicate, and control other aspects of their activities on their own systems. (Citation: NYTStuxnet)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Outside of highly specific or rare HW, nearly impossible to detect and track.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Ease and availability of current hardware and software, mobile phones (cash and go phones), and additional online technology simplifies adversary process to achieve this technique (and possibly without traceability). The adversary has control of the infrastructure and will likely be able to add/remove tools to infrastructure, whether acquired via hacking or standard computer acquisition (e.g., [<https://aws.amazon.com> AWS], VPS).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Procure required equipment and software - PRE-T1112"*

Table 3472. Table References

Links

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1112

Identify security defensive capabilities - PRE-T1040

Security defensive capabilities are designed to stop or limit unauthorized network traffic or other types of accesses. (Citation: OSFingerprinting2014) (Citation: NMAP WAF NSE)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Technically, the defender has the ability to detect. However, this is typically not performed as this type of traffic would likely not prompt the defender to take any actionable defense. In addition, this would require the defender to closely review their access logs for any suspicious activity (if the activity is even logged).

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: The adversary will have some insight into defenses based on dropped traffic or filtered responses. It is more difficult to pinpoint which defenses are implemented (e.g., [<https://www.fireeye.com> FireEye] WMPs, [<https://www.hpe.com> Hewlett Packard Enterprise] Tipping Point IPS).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify security defensive capabilities - PRE-T1040"*

Table 3473. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1040

Derive intelligence requirements - PRE-T1007

Leadership or key decision makers may derive specific intelligence requirements from Key Intelligence Topics (KITs) or Key Intelligence Questions (KIQs). Specific intelligence requirements assist analysts in gathering information to establish a baseline of information about a topic or question and collection managers to clarify the types of information that should be collected to satisfy the requirement. (Citation: LowenthalCh4) (Citation: Heffter)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Derive intelligence requirements - PRE-T1007"*

Table 3474. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1007

Domain Generation Algorithms (DGA) - PRE-T1100

The use of algorithms in malware to periodically generate a large number of domain names which function as rendezvous points for malware command and control servers. (Citation: DamballaDGA) (Citation: DamballaDGACyberCriminals)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: It is possible to detect the use of DGAs; however, defenders have largely not been successful at mitigating the domains because they are generally registered less than an hour before they are used and disposed of within 24 hours.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: This technique does not require a significant amount of sophistication while still being highly effective. It was popularized by the Conficker worms but is

prevalent in crimeware such as Murofet and BankPatch.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Domain Generation Algorithms (DGA) - PRE-T1100"*

Table 3475. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1100

Leverage compromised 3rd party resources - PRE-T1152

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

The utilization of resources not owned by the adversary to launch exploits or operations. This includes utilizing equipment that was previously compromised or leveraging access gained by other methods (such as compromising an employee at a business partner location). (Citation: CitizenLabGreatCannon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: While possible to detect, it requires a broader vantage point than is typical that provides increased insight and conducts extensive data analysis and correlation between events.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Conducting technique requires either nation-state level capabilities or large amounts of financing to coordinate multiple 3rd party resources to gain desired insight.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Leverage compromised 3rd party resources - PRE-T1152"*

Table 3476. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1152

Review logs and residual traces - PRE-T1135

Execution of code and network communications often result in logging or other system or network forensic artifacts. An adversary can run their code to identify what is recorded under different conditions. This may result in changes to their code or adding additional actions (such as deleting a record from a log) to the code. (Citation: EDB-39007) (Citation: infosec-covering-tracks)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary controls the test and defender likely has no visibility.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Adversary has full control of environment to determine what level of auditing and traces exist on a system after execution.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Review logs and residual traces - PRE-T1135"*

Table 3477. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1135

Identify job postings and needs/gaps - PRE-T1025

Job postings, on either company sites, or in other forums, provide information on organizational structure and often provide contact information for someone within the organization. This may give an adversary information on technologies within the organization which could be valuable in attack or provide insight in to possible security weaknesses or limitations in detection or protection mechanisms. (Citation: JobPostingThreat)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Impossible to differentiate between an adversary and a normal user when accessing open/public information.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Publicly posted information by design. Providing too much detail in the job posting could aid the adversary in learning more about the target's environment and possible technical weaknesses/deficiencies.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify job postings and needs/gaps - PRE-T1025"*

Identify job postings and needs/gaps - PRE-T1025 has relationships with:

- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify job postings and needs/gaps - PRE-T1055"* with estimative-language:likelihood-probability="almost-certain"

Table 3478. Table References

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1025

Spear phishing messages with malicious attachments - PRE-T1144

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Emails with malicious attachments are designed to get a user to open/execute the attachment in order to deliver malware payloads. (Citation: APT1)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Many technologies exist to scan content and/or emulate a workstation prior to the target receiving and executing the attachment (detonation chambers) in order to reduce malicious emails and attachments being delivered to the intended target. However, encryption continues to be a stumbling block. In addition, there are a variety of commercial technologies available that enable users to screen for phishing messages and which are designed to enhance email security.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Sending the emails is the simple part, ensuring they make it to the target (e.g., not being filtered) may be challenging. Over time, an adversary refines their techniques to minimize detection by making their emails seem legitimate in structure and content.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Spear phishing messages with malicious attachments - PRE-T1144"*

Table 3479. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1144

SSL certificate acquisition for trust breaking - PRE-T1115

Fake certificates can be acquired by legal process or coercion. Or, an adversary can trick a Certificate Authority into issuing a certificate. These fake certificates can be used as a part of Man-in-the-Middle attacks. (Citation: SubvertSSL)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: The certificate authority who is hacked cannot easily see they've been compromised, but [<https://www.google.com> Google] has caught on to this occurring in previous attacks such as DigiNotar (Citation: DigiNotar2016) and [<https://www.verisign.com> Verisign].

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: One example of it occurring in the real world is the

DigiNotar (Citation: DigiNotar2016) case. To be able to do this usually requires sophisticated skills and is traditionally done by a nation state to spy on its citizens.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="SSL certificate acquisition for trust breaking - PRE-T1115"*

Proxy/protocol relays - PRE-T1081

Proxies act as an intermediary for clients seeking resources from other systems. Using a proxy may make it more difficult to track back the origin of a network communication. (Citation: APT1)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defenders with standard capabilities will traditionally be able to see the first hop but not all the subsequent earlier hops an adversary takes to be able to conduct reconnaissance.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Proxies are readily available for the adversary with both free and cost-based options available.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Proxy/protocol relays - PRE-T1081"*

Determine domain and IP address space - PRE-T1027

Domain Names are the human readable names used to represent one or more IP addresses. IP addresses are the unique identifier of computing devices on a network. Both pieces of information are valuable to an adversary who is looking to understand the structure of a network. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Public or easily obtainable information by design.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: AS and IANA data are easily available, existing research tools.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Determine domain and IP address space -*

Table 3482. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1027

Remote access tool development - PRE-T1128

A remote access tool (RAT) is a piece of software that allows a remote user to control a system as if they had physical access to that system. An adversary may utilize existing RATs, modify existing RATs, or create their own RAT. (Citation: ActiveMalwareEnergy)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary will likely use code repositories, but development will be performed on their local systems.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Many successful RATs exist for re-use/tailoring in addition to those an adversary may choose to build from scratch. The adversary's capabilities, target sensitivity, and needs will likely determine whether a previous RAT is modified for use a new one is built from scratch.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Remote access tool development - PRE-T1128"*

Table 3483. Table References

Push-notification client-side exploit - PRE-T1150

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

A technique to push an [<https://www.apple.com/ios> iOS] or [<https://www.android.com> Android] MMS-type message to the target which does not require interaction on the part of the target to be successful. (Citation: BlackHat Stagefright) (Citation: WikiStagefright)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: For non-corporate cellular devices not joined to the corporate network, it is not possible to detect an adversary's use of the technique because messages traverse networks outside of the control of the employer. For corporate cellular devices which are joined to the corporate network, monitoring of messages and ability to patch against push attacks is possible, assuming they are fully monitored.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Easily executed technique to push an MMS-type message to the target which does not require interaction on the part of the target to be successful.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Push-notification client-side exploit - PRE-T1150"*

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1014

Misattributable credentials - PRE-T1099

The use of credentials by an adversary with the intent to hide their true identity and/or portray them self as another person or entity. An adversary may use misattributable credentials in an attack to convince a victim that credentials are legitimate and trustworthy when this is not actually the case. (Citation: FakeSSLCerts)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: If a previous incident identified the credentials used by an adversary, defenders can potentially use these credentials to track the adversary through reuse of the same credentials.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: An adversary can easily create and use misattributable credentials to obtain servers, build environment, [<https://aws.amazon.com> AWS] accounts, etc. Many service providers require some form of identifiable information such as a phone number or email address, but there are several avenues to acquire these consistent with the misattributable identity.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Misattributable credentials - PRE-T1099"*

Conduct active scanning - PRE-T1031

Active scanning is the act of sending transmissions to end nodes, and analyzing the responses, in order to identify information about the communications system. (Citation: RSA-APTRecon)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: This technique is an expected and voluminous activity when on the Internet. Active scanning techniques/tools typically generate benign traffic that does not require further investigation by a defender since there is no actionable defense to execute. The high volume of this activity makes it burdensome for any defender to chase and therefore often ignored.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Various available tools and data sources for scouting and detecting address, routing, version numbers, patch levels, protocols/services running, etc.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Conduct active scanning - PRE-T1031"*

Table 3493. Table References

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1031

Unconditional client-side exploitation/Injected Website/Driveby - PRE-T1149

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

A technique used to compromise victims wherein the victims visit a compromised website that redirects their browser to a malicious web site, such as an exploit kit's landing page. The exploit kit landing page will probe the victim's operating system, web browser, or other software to find an exploitable vulnerability to infect the victim. (Citation: GeorgeDriveBy) (Citation: BellDriveBy)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: With the use of malware detonation chambers (e.g., for web or email traffic), this improves detection. Encryption and other techniques reduces the efficacy of these defenses.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Placing an exploit on a public web site for driveby types of delivery is not impossible. However, gaining access to a web site with high enough traffic to meet specific objectives could be the challenge.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Unconditional client-side exploitation/Injected Website/Driveby - PRE-T1149"*

Table 3494. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1149

Test signature detection - PRE-T1069

An adversary can test the detections of malicious emails or files by using publicly available services, such as virus total, to see if their files or emails cause an alert. They can also use similar services that are not openly available and don't publicly publish results or they can test on their own internal infrastructure. (Citation: WiredVirusTotal)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: If using a common service like [\https://www.virustotal.com VirusTotal], it is possible to detect. If the adversary uses a hostile, less well-known service, the defender would not be aware.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Easy to automate upload/email of a wide range of data packages.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Test signature detection - PRE-T1069"*

Table 3495. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1069

Fast Flux DNS - PRE-T1102

A technique in which a fully qualified domain name has multiple IP addresses assigned to it which are swapped with extreme frequency, using a combination of round robin IP address and short Time-To-Live (TTL) for a DNS resource record. (Citation: HoneynetFastFlux) (Citation: MisnomerFastFlux) (Citation: MehtaFastFluxPt1) (Citation: MehtaFastFluxPt2)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: In general, detecting usage of fast flux DNS is difficult due to web traffic load balancing that services client requests quickly. In single flux cases only IP addresses change for static domain names. In double flux cases, nothing is static. Defenders such as IPS, domain registrars, and service providers are likely in the best position for detection.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Fast flux is generally simple for an adversary to set up and offers several advantages. Such advantages include limited audit trails for defenders to find, ease of operation for an adversary to maintain, and support for main nodes.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Fast Flux DNS - PRE-T1102"*

Table 3496. Table References

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1074

Distribute malicious software development tools - PRE-T1171

An adversary could distribute malicious software development tools (e.g., compiler) that hide malicious behavior in software built using the tools. (Citation: PA XcodeGhost) (Citation: Reflections on Trusting Trust)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Developers could check a hash or signature of their development tools to ensure that they match expected values (e.g., Apple provides instructions of how to do so for its Xcode developer tool), but developers may not always do so.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: The adversary would need to either replace the tools provided at the official download location or influence developers to download the tools from an adversary-controlled third-party download location. Desktop operating systems (e.g., Windows, macOS) are increasingly encouraging use of vendor-provided official app stores to distribute software, which utilize code signing and increase the difficulty of replacing development tools with malicious versions.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Distribute malicious software development tools - PRE-T1171"*

Table 3501. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1171

Acquire or compromise 3rd party signing certificates - PRE-T1109

Code signing is the process of digitally signing executables and scripts to confirm the software author and guarantee that the code has not been altered or corrupted. Users may trust a signed piece of code more than an unsigned piece of code even if they don't know who issued the certificate or who the author is. (Citation: DiginotarCompromise)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defender will not know what certificates an adversary acquires from a 3rd party. Defender will not know prior to public disclosure if a 3rd party has had their certificate compromised.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: It is trivial to purchase code signing certificates within an organization; many exist and are available at reasonable cost. It is complex to factor or steal 3rd party code signing certificates for use in malicious mechanisms

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Acquire or compromise 3rd party signing certificates - PRE-T1109"*

Acquire or compromise 3rd party signing certificates - PRE-T1109 has relationships with:

- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Acquire or compromise 3rd party signing certificates - PRE-T1087" with estimative-language:likelihood-probability="almost-certain"

Table 3502. Table References

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1104

Identify vulnerabilities in third-party software libraries - PRE-T1166

Many applications use third-party software libraries, often without full knowledge of the behavior of the libraries by the application developer. For example, mobile applications often incorporate advertising libraries to generate revenue for the application developer. Vulnerabilities in these third-party libraries could potentially be exploited in any application that uses the library, and even if the vulnerabilities are fixed, many applications may still use older, vulnerable versions of the library. (Citation: Flexera News Vulnerabilities) (Citation: Android Security Review 2015) (Citation: Android Multidex RCE)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: Open source software has great appeal mostly due to the time savings and that it is free. However, using this code without assessing its security is akin to blindly executing third party software. Companies often do not dedicate the time to appropriately detect and scan for vulnerabilities. The mainstream mobile application stores scan applications for some known vulnerabilities. For example, Google's Android Application Security Improvement Program identifies and alerts developers to vulnerabilities present in their applications from use of the Vungle, Apache Cordova, WebView SSL, GnuTLS, and Vitamio third-party libraries. However, these scans are not likely to cover all vulnerable libraries, developers may not always act on the results, and the results may not be made available to impacted end users of the applications.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Developers commonly use open source libraries such that where an adversary can easily discover known vulnerabilities and create exploits. It is also generally easy to decompile arbitrary mobile applications to determine what libraries they use, and similarly use this information to correlate against known CVEs and exploit packages.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify vulnerabilities in third-party software libraries - PRE-T1166"*

Obtain domain/IP registration information - PRE-T1028

For a computing resource to be accessible to the public, domain names and IP addresses must be registered with an authorized organization. (Citation: Google Domains WHOIS) (Citation: FunAndSun2012) (Citation: Scasny2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Open access to DNS registration/routing information is inherent in Internet architecture.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Proliferation of DNS information makes registration information functionally freely available.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Obtain domain/IP registration information - PRE-T1028"*

Table 3510. Table References

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1028

Identify business relationships - PRE-T1060

Business relationship information may be used by an adversary to shape social engineering attempts (exploiting who a target expects to hear from) or to plan for technical actions such as exploiting network trust relationship. (Citation: 11StepsAttackers)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Exception to the rule is if the adversary tips off the target that others have been asking about the relationship with them.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Requires an intensive process. In some industries, business relationships may be public in order to generate business, but this is not the case for all industries and all relationships.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify business relationships - PRE-T1060"*

Identify business relationships - PRE-T1060 has relationships with:

- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify business relationships - PRE-T1049"* with estimative-language:likelihood-probability="almost-certain"

Table 3511. Table References

Anonymity services - PRE-T1083

Anonymity services reduce the amount of information available that can be used to track an adversary's activities. Multiple options are available to hide activity, limit tracking, and increase anonymity. (Citation: TOR Design) (Citation: Stratfor2012)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Depends on service. Some are easy to detect, but are hard to trace (e.g., [<https://torproject.org> TOR]).

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Easy access to anonymizers, quasi-anonymous services like remailers, [<https://torproject.org> TOR], relays, burner phones, etc.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Anonymity services - PRE-T1083"*

Table 3512. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1083

C2 protocol development - PRE-T1129

Command and Control (C2 or C&C) is a method by which the adversary communicates with malware. An adversary may use a variety of protocols and methods to execute C2 such as a centralized server, peer to peer, IRC, compromised web sites, or even social media. (Citation: HAMMERTOSS2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary will likely use code repositories, but development will be performed on their local systems.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: C2 over commonly used and permitted protocols provides the necessary cover and access.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="C2 protocol development - PRE-T1129"*

Table 3513. Table References

Spearphishing for Information - PRE-T1174

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Spearphishing for information is a specific variant of spearphishing. Spearphishing for information is different from other forms of spearphishing in that it doesn't leverage malicious code. All forms of spearphishing are electronically delivered social engineering targeted at a specific individual, company, or industry. Spearphishing for information is an attempt to trick targets into divulging information, frequently credentials, without involving malicious code. Spearphishing for information frequently involves masquerading as a source with a reason to collect information (such as a system administrator or a bank) and providing a user with a website link to visit. The given website often closely resembles a legitimate site in appearance and has a URL containing elements from the real site. From the fake website, information is gathered in web forms and sent to the attacker. Spearphishing for information may also try to obtain information directly through the exchange of emails, instant messengers or other electronic conversation means. (Citation: ATTACKREF GRIZZLY STEPPE JAR)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: Depending on the specific method of phishing, the detections can vary. For emails, filtering based on DKIP+SPF or header analysis can help detect when the email sender is spoofed. When it comes to following links, network intrusion detection systems (NIDS), firewalls, removing links, exploding shortened links, proxy monitoring, blocking uncategorized sites, and site reputation based filtering can all provide detection opportunities.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Sending emails is trivial, and, over time, an adversary can refine their technique to minimize detection by making their emails seem legitimate in structure and content.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Spearphishing for Information - PRE-T1174"*

<https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1174>

Buy domain name - PRE-T1105

Domain Names are the human readable names used to represent one or more IP addresses. They can be purchased or, in some cases, acquired for free. (Citation: PWCSofacy2014)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: This is by design captured in public registration logs. Various tools and services exist to track/query/monitor domain name registration information.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Proliferation of DNS TLDs and registrars. Adversary may choose domains that are similar to legitimate domains (aka "domain typosquatting" or homoglyphs).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Buy domain name - PRE-T1105"*

Table 3517. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1105

Identify technology usage patterns - PRE-T1041

Technology usage patterns include identifying if users work offsite, connect remotely, or other possibly less restricted/secured access techniques. (Citation: SANSRemoteAccess)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Physical observations, OSINT for remote access instructions, and other techniques are not detectable.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Determine if users work offsite, connect remotely, or other possibly less restricted/secured access techniques.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify technology usage patterns - PRE-T1041"*

Table 3518. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1041

Identify business relationships - PRE-T1049

Business relationship information includes the associates of a target and may be discovered via social media sites such as [<https://www.linkedin.com> LinkedIn] or public press releases announcing new partnerships between organizations or people (such as key hire announcements in industry articles). This information may be used by an adversary to shape social engineering attempts (exploiting who a target expects to hear from) or to plan for technical actions such as exploiting network trust relationship. (Citation: RSA-APTRecon) (Citation: Scasny2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Searching publicly available sources that cannot be monitored by a defender. Much of this information is widely known and difficult to obscure.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Made easier by today's current social media.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify business relationships - PRE-T1049"*

Identify business relationships - PRE-T1049 has relationships with:

- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify business relationships - PRE-T1060"* with estimative-language:likelihood-probability="almost-certain"

Table 3519. Table References

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1049

Runtime code download and execution - PRE-T1172

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Many mobile devices are configured to only allow applications to be installed from the mainstream vendor app stores (e.g., Apple App Store and Google Play Store). These app stores scan submitted applications for malicious behavior. However, applications can evade these scans by downloading and executing new code at runtime that was not included in the original application package. (Citation: Fruit vs Zombies) (Citation: Android Hax) (Citation: Execute This!) (Citation: HT Fake News App) (Citation: Anywhere Computing kill 2FA) (Citation: Android Security Review 2015)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: Third-party mobile application security analysis services exist that scan for use of these techniques in iOS and Android applications. Additionally, Google specifically calls out the ability to "identify attacks that require connection to a server and dynamic downloading of code" in its Android Security 2015 Year in Review report. However, many applications use these techniques as part of their legitimate operation, increasing the difficulty of detecting or preventing malicious use.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Runtime code execution techniques and examples of their use are widely documented on both Apple iOS and Android.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Runtime code download and execution - PRE-T1172"*

Dynamic DNS - PRE-T1088

Dynamic DNS is a method of automatically updating a name in the DNS system. Providers offer this rapid reconfiguration of IPs to hostnames as a service. (Citation: DellMirage2012)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defender will not know at first use what is valid or hostile traffic without more context. It is possible, however, for defenders to see if the PTR record for an address is hosted by a known DDNS provider. There is potential to assign some level of risk based on this.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Flexible and re-configurable command and control servers, along with deniable ownership and reduced cost of ownership.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Dynamic DNS - PRE-T1088"*

Dynamic DNS - PRE-T1088 has relationships with:

- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Dynamic DNS - PRE-T1110"* with estimative-language:likelihood-probability="almost-certain"

Spear phishing messages with malicious links - PRE-T1146

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Emails with malicious links are designed to get a user to click on the link in order to deliver malware payloads. (Citation: GoogleDrive Phishing) (Citation: RSASETHreat)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Defenders can implement mechanisms to analyze links and identify levels of concerns. However, the adversary has the advantage of creating new links or finding ways to obfuscate the link so that common detection lists can not identify it. Detection of a malicious link could be identified once the file has been downloaded.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Sending emails is trivial and expected. The adversary needs to ensure links don't get tampered, removed, or flagged as a previously black-listed site.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Spear phishing messages with malicious links - PRE-T1146"*

Table 3524. Table References

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1146

Hardware or software supply chain implant - PRE-T1142

During production and distribution, the placement of software, firmware, or a CPU chip in a computer, handheld, or other electronic device that enables an adversary to gain illegal entrance. (Citation: McDRecall) (Citation: SeagateMaxtor)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: The number of elements and components in a supply chain of HW or SW is vast and detecting an implant is complex for SW, but more complex for HW.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Access to the supply chain by an adversary can be a challenging endeavor, depending on what element is attempting to be subverted.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Hardware or software supply chain implant - PRE-T1142"*

Table 3525. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1142

Determine secondary level tactical element - PRE-T1021

The secondary level tactical element the adversary seeks to attack is the specific network or area of a network that is vulnerable to attack. Within the corporate network example, the secondary level tactical element might be a SQL server or a domain controller with a known vulnerability. (Citation: CyberAdversaryBehavior) (Citation: JP3-60) (Citation: JP3-12 ®) (Citation: DoD Cyber 2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. May change for special use cases or adversary and defender overlays.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: This is the normal adversary targeting cycle where they utilize our poor OPSEC practices to their advantage.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Determine secondary level tactical element - PRE-T1021"*

Table 3526. Table References

Assign KITs/KIQs into categories - PRE-T1005

Leadership organizes Key Intelligence Topics (KITs) and Key Intelligence Questions (KIQs) into three types of categories and creates more if necessary. An example of a description of key players KIT would be when an adversary assesses the cyber defensive capabilities of a nation-state threat actor. (Citation: Herring1999)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies

and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Assign KITs/KIQs into categories - PRE-T1005"*

Table 3528. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1005

Analyze application security posture - PRE-T1070

An adversary can probe a victim's network to determine configurations. The configurations may provide opportunities to route traffic through the network in an undetected or less detectable way. (Citation: Li2014ExploitKits) (Citation: RecurlyGHOST)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This can be done offline after the data has been collected.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Analyze technical scanning results to identify weaknesses in the configuration or architecture. Many of the common tools highlight these weakness automatically (e.g., software security scanning tools or published vulnerabilities about commonly used libraries).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Analyze application security posture - PRE-T1070"*

Table 3529. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1070

Targeted social media phishing - PRE-T1143

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Sending messages through social media platforms to individuals identified as a target. These messages may include malicious attachments or links to malicious sites or they may be designed to establish communications for future actions. (Citation: APT1) (Citation: Nemucod Facebook)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Extremely hard to identify (in the launch phase) what message via social media is hostile versus what is not. Increased use of encrypted communications increases the difficulty average defender's have in detecting use of this technique.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Sending messages to individuals identified as a target follows normal tradecraft for using social media.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Targeted social media phishing - PRE-T1143"*

Table 3530. Table References

Links

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1143

Obtain Apple iOS enterprise distribution key pair and certificate - PRE-T1169

The adversary can obtain an Apple iOS enterprise distribution key pair and certificate and use it to distribute malicious apps directly to Apple iOS devices without the need to publish the apps to the Apple App Store (where the apps could potentially be detected). (Citation: Apple Developer Enterprise Program Apps) (Citation: Fruit vs Zombies) (Citation: WIRELURKER) (Citation: Sideloaded Change)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: Starting in iOS 9, Apple has changed the user interface when installing apps to better indicate to users the potential implications of installing apps signed by an enterprise distribution key rather than from Apple's App Store and to make it more difficult for users to inadvertently install these apps. Additionally, enterprise management controls are available that can be imposed to prevent installing these apps. Also, enterprise mobility management / mobile device management (EMM/MDM) systems can be used to scan for the presence of undesired apps on enterprise mobile devices.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Apple requires a DUNS number, corporate documentation, and \$299 to obtain an enterprise distribution certificate. Additionally, Apple revokes certificates if they discover malicious use. However, the enrollment information could be falsified to Apple by an adversary, or an adversary could steal an existing enterprise distribution certificate (and the corresponding private key) from a business that already possesses one.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Obtain Apple iOS enterprise distribution key pair and certificate - PRE-T1169"*

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1132

DNS poisoning - PRE-T1159

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

DNS (cache) poisoning is the corruption of an Internet server's domain name system table by replacing an Internet address with that of another, rogue address. When a Web user seeks the page with that address, the request is redirected by the rogue entry in the table to a different address. (Citation: Google DNS Poisoning) (Citation: DNS Poisoning China) (Citation: Mexico Modem DNS Poison)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: Tracking multiple DNS infrastructures will likely require multiple tools/services, more advanced analytics, and mature detection/response capabilities in order to be effective. Few defenders demonstrate the mature processes to immediately detect and mitigate against the use of this technique.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Adversary poisons DNS entry to redirect traffic designated for one site to route to an adversary controlled resource.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="DNS poisoning - PRE-T1159"*

Table 3536. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1159

Identify web defensive services - PRE-T1033

An adversary can attempt to identify web defensive services as [<https://www.cloudflare.com/> CloudFlare], [<https://github.com/jjxtra/Windows-IP-Ban-Service> IPBan], and [<https://www.snort.org/>

Snort]. This may be done by passively detecting services, like [<https://www.cloudflare.com/> CloudFlare] routing, or actively, such as by purposefully tripping security defenses. (Citation: NMAP WAF NSE)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Active service detection may trigger an alert. Passive service enumeration is not detected.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Adversary can passively detect services (e.g., [<https://www.cloudflare.com/> CloudFlare] routing) or actively detect services (e.g., by purposefully tripping security defenses)

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify web defensive services - PRE-T1033"*

Analyze architecture and configuration posture - PRE-T1065

An adversary may analyze technical scanning results to identify weaknesses in the configuration or architecture of a victim network. These weaknesses could include architectural flaws, misconfigurations, or improper security controls. (Citation: FireEyeAPT28)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This can be done offline after the data has been collected.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Many of the common tools highlight these weakness automatically.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Analyze architecture and configuration posture - PRE-T1065"*

Table 3538. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1065

Acquire and/or use 3rd party infrastructure services - PRE-T1084

A wide variety of cloud, virtual private services, hosting, compute, and storage solutions are available. Additionally botnets are available for rent or purchase. Use of these solutions allow an adversary to stage, launch, and execute an attack from infrastructure that does not physically tie back to them and can be rapidly provisioned, modified, and shut down. (Citation: LUCKYCAT2012)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: 3rd party services highly leveraged by legitimate services, hard to distinguish from background noise. While an adversary can use their own infrastructure, most know this is a sure- re way to get caught. To add degrees of separation, they can buy or rent from another adversary or accomplice.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Wide range of 3rd party services for hosting, rotating, or moving C2, static data, exploits, exfiltration, etc.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Acquire and/or use 3rd party infrastructure services - PRE-T1084"*

Acquire and/or use 3rd party infrastructure services - PRE-T1084 has relationships with:

- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Acquire and/or use 3rd party infrastructure services - PRE-T1106"* with *estimative-language:likelihood-probability="almost-certain"*

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1022

Research visibility gap of security vendors - PRE-T1067

If an adversary can identify which security tools a victim is using they may be able to identify ways around those tools. (Citation: CrowdStrike Putter Panda)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Public source external to the defender's organization.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Requires in-depth research and potentially other intrusions, requires unbounded amount of work to possibly find a return on investment

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Research visibility gap of security vendors - PRE-T1067"*

Table 3541. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1067

Analyze business processes - PRE-T1078

Business processes, such as who typically communicates with who, or what the supply chain is for a particular part, provide opportunities for social engineering or other (Citation: Warwick2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Social engineering and other attempts to learn about business practices and processes would not immediately be associated with an impending cyber event.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: To get any kind of fidelity into business processes would require insider access. Basic processes could be mapped, but understanding where in the organization these processes take place and who to target during any given phase of the process would generally be difficult.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Analyze business processes - PRE-T1078"*

Table 3542. Table References

<https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1078>

Assess security posture of physical locations - PRE-T1079

Physical access may be required for certain types of adversarial actions. (Citation: CyberPhysicalAssessment) (Citation: CriticalInfrastructureAssessment)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Physical security is often unaware of implications of physical access to network. However, some organizations have thorough physical security measures that would log and report attempted incursions, perimeter breaches, unusual RF at a site, etc.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Social engineering and OSINT are still generally successful. Physical locations of offices/sites are easily determined. Monitoring for other sites of interest, such as backup storage vendors, is also easy to accomplish.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Assess security posture of physical locations - PRE-T1079"*

Table 3543. Table References

Links

<https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1079>

Obtain booter/stressor subscription - PRE-T1173

Configure and setup booter/stressor services, often intended for server stress testing, to enable denial of service attacks. (Citation: Krebs-Anna) (Citation: Krebs-Booter) (Citation: Krebs-Bazaar)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Purchase of booster services is not observable; potentially can trace booster service used to origin of sale, yet not before attack is executed. Furthermore, subscription does not automatically mean foul intention.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Easily accessible and used to launch DDoS attacks by even novice Internet users, and can be purchased from providers for a nominal fee, some of which even accept credit cards and PayPal payments to do.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Obtain booter/stressor subscription - PRE-T1173"*

Table 3544. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1173

Analyze data collected - PRE-T1064

An adversary will assess collected information such as software/hardware versions, vulnerabilities, patch level, etc. They will analyze technical scanning results to identify weaknesses in the confirmation or architecture. (Citation: SurveyDetectionStrategies) (Citation: CyberReconPaper) (Citation: RSA-APTRecon) (Citation: FireEyeAPT28)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This can be done offline after the data has been collected.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Many of the common tools highlight these weaknesses automatically. Adversary can "dry run" against the target using known exploits or burner devices to determine key identifiers of software, hardware, and services.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Analyze data collected - PRE-T1064"*

Table 3545. Table References

Enumerate externally facing software applications technologies, languages, and dependencies - PRE-T1038

Software applications will be built using different technologies, languages, and dependencies. This information may reveal vulnerabilities or opportunities to an adversary. (Citation: CommonApplicationAttacks) (Citation: WebApplicationSecurity) (Citation: SANSTop25)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Impossible to differentiate between an adversary and a normal user when accessing a site to determine the languages/technologies used. If active scanning tools are employed, then the defender has the ability to detect. However, this is typically not acted upon due to the large volume of this type of traffic and it will likely not prompt the defender to take any actionable defense. Defender review of access logs may provide some insight based on trends or patterns.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Basic interaction with the site provides insight into the

programming languages/technologies used for a given web site. Additionally many of the active scanning tools will also provide some insight into this information.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Enumerate externally facing software applications technologies, languages, and dependencies - PRE-T1038"*

Port redirector - PRE-T1140

Redirecting a communication request from one address and port number combination to another. May be set up to obfuscate the final location of communications that will occur in later stages of an attack. (Citation: SecureWorks HTRAN Analysis)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Infrastructure is (typically) outside of control/visibility of defender and as such as tools are staged for specific campaigns, it will not be observable to those being attacked.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Adversary has control of the infrastructure and will likely be able to add/remove tools to infrastructure, whether acquired via hacking or standard computer acquisition (e.g., [<https://aws.amazon.com> AWS], VPS providers).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Port redirector - PRE-T1140"*

Table 3548. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1140

Identify business processes/tempo - PRE-T1057

Understanding an organizations business processes and tempo may allow an adversary to more effectively craft social engineering attempts or to better hide technical actions, such as those that generate network traffic. (Citation: Scasny2015) (Citation: Infosec-osint)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Current or previous employees may divulge information on the Internet. If insiders are used, the defender may have policies or tools in place to detect loss of this data or knowledge.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: In some cases, this requires some insider knowledge or specialized access to learn when critical operations occur in a corporation. For publicly traded US corporations, there is a lot of open source information about their financial reporting obligations (per SEC). Companies announce their annual shareholder meeting and their quarter phone calls with investors. Information such as this can help the adversary to glean certain aspects of the business processes and/or rhythm.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify business processes/tempo - PRE-T1057"*

Table 3549. Table References

Build and configure delivery systems - PRE-T1124

Delivery systems are the infrastructure used by the adversary to host malware or other tools used during exploitation. Building and configuring delivery systems may include multiple activities such as registering domain names, renting hosting space, or configuring previously exploited environments. (Citation: APT1)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: It is detectable once deployed to the public Internet,

used for adversarial purposes, discovered, and reported to defenders.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: It is easy to create and burn infrastructure. Otherwise, blacklisting would be more successful for defenders.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Build and configure delivery systems - PRE-T1124"*

Table 3550. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1124

Identify personnel with an authority/privilege - PRE-T1048

Personnel internally to a company may have non-electronic specialized access, authorities, or privilege that make them an attractive target for an adversary. One example of this is an individual with financial authority to authorize large transactions. An adversary who compromises this individual might be able to subvert large dollar transfers. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: The layers of data required and potential gaps of information to map a specific person to an authority or privilege on a network requires access to resources that may not tip off a defender.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Requires an adversary to undergo an intensive research process. It is resource intensive or requires special data access. May be easier for certain specialty use cases.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify personnel with an authority/privilege - PRE-T1048"*

Table 3551. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1048

Mine social media - PRE-T1050

An adversary may research available open source information about a target commonly found on social media sites such as [<https://www.facebook.com> Facebook], [<https://www.instagram.com> Instagram], or [<https://www.pinterest.com> Pinterest]. Social media is public by design and provides insight into the interests and potentially inherent weaknesses of a target for exploitation by the

adversary. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Searching publicly available sources that cannot be monitored by a defender.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Very public by design. Application of privacy settings is not a panacea.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Mine social media - PRE-T1050"*

Table 3552. Table References

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1050

Credential pharming - PRE-T1151

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Credential pharming a form of attack designed to steal users' credential by redirecting users to fraudulent websites. Pharming can be conducted either by changing the hosts file on a victim's computer or by exploitation of a vulnerability in DNS server software. (Citation: DriveByPharming) (Citation: GoogleDrive Phishing)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Fidelity of networking monitoring must be able to detect when traffic is diverted to non-normal sources at a site level. It is possible to identify some methods of pharming, but detection capabilities are limited and not commonly implemented.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Although it can be difficult to spoof/redirect content to a hostile service via DNS poisoning or MiTM attacks, current malware such as Zeus is able to successfully pharm credentials and end users are not well-versed in checking for certificate mismatches.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Credential pharming - PRE-T1151"*

Table 3553. Table References

Identify gap areas - PRE-T1002

Leadership identifies gap areas that generate a compelling need to generate a Key Intelligence Topic (KIT) or Key Intelligence Question (KIQ). (Citation: ODNIIntegration) (Citation: ICD115)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify gap areas - PRE-T1002"*

Table 3554. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1002

OS-vendor provided communication channels - PRE-T1167

Google and Apple provide Google Cloud Messaging and Apple Push Notification Service, respectively, services designed to enable efficient communication between third-party mobile app backend servers and the mobile apps running on individual devices. These services maintain an encrypted connection between every mobile device and Google or Apple that cannot easily be inspected and must be allowed to traverse networks as part of normal device operation. These services could be used by adversaries for communication to compromised mobile devices. (Citation: Securelist Mobile Malware 2013) (Citation: DroydSeuss)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: These services are heavily utilized by mainstream mobile app developers. High volume of communications makes it extremely hard for a defender to distinguish between legitimate and adversary communications.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: These are free services provided by Google and Apple to app developers, and information on how to use them is readily available.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="OS-vendor provided communication channels - PRE-T1167"*

Table 3555. Table References

Choose pre-compromised mobile app developer account credentials or signing keys - PRE-T1168

The adversary can use account credentials or signing keys of an existing mobile app developer to publish malicious updates of existing mobile apps to an application store, or to abuse the developer's identity and reputation to publish new malicious apps. Many mobile devices are configured to automatically install new versions of already-installed apps. (Citation: Fraudulent Apps Stolen Dev Credentials)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Possible to detect compromised credentials if alerting from a service provider is enabled and acted upon by the individual.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: The difficulty of obtaining useful developer credentials may vary. Well-organized, professional app developers whose credentials or signing keys would be the most useful to an adversary because of the large install bases of their apps, would likely strongly protect their credentials and signing keys. Less-organized app developers may not protect their credentials and signing keys as strongly, but the credentials and signing keys would also be less useful to an adversary. These less-organized app developers may reuse passwords across sites, fail to turn on multi-factor authentication features when available, or store signing keys in unprotected locations.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Choose pre-compromised mobile app developer account credentials or signing keys - PRE-T1168"*

Automated system performs requested action - PRE-T1161

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Users may be performing legitimate activity but using media that is compromised (e.g., using a USB drive that comes with malware installed during manufacture or supply). Upon insertion in the system the media auto-runs and the malware executes without further action by the user. (Citation: WSUSpect2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Environments without extensive endpoint sensing capabilities do not typically collect this level of detailed information.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Autoruns with USB keys and CDs traditionally were always on (e.g., [<http://windows.microsoft.com> Windows] 7 is now an exception with a new policy of limiting the always on nature of Autoruns), ensuring and automated system completes a requested action. Specialized use cases exist where automated systems are specifically designed against automatically performing certain actions (e.g., USB/CD insertion and automatically running is disabled in certain environments).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Automated system performs requested action - PRE-T1161"*

Table 3569. Table References

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1161

Obtain/re-use payloads - PRE-T1123

A payload is the part of the malware which performs a malicious action. The adversary may re-use payloads when the needed capability is already available. (Citation: SonyDestover)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary will likely use code repositories, but detecting an adversary acquiring a payload would require the defender to be monitoring the code repository where the payload is stored. If the adversary re-uses payloads, this allows the defender to create signatures to detect using these known indicators of compromise (e.g., hashes).

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Several exploit repositories and tool suites exist for re-use and tailoring.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Obtain/re-use payloads - PRE-T1123"*

Table 3570. Table References

Conduct passive scanning - PRE-T1030

Passive scanning is the act of looking at existing network traffic in order to identify information about the communications system. (Citation: SurveyDetectionStrategies) (Citation: CyberReconPaper)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Generates no network traffic that would enable detection.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Easy to do but it requires a vantage point conducive to accessing this data.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Conduct passive scanning - PRE-T1030"*

Table 3571. Table References

Links

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1030

Analyze social and business relationships, interests, and affiliations - PRE-T1072

Social media provides insight into the target's affiliations with groups and organizations. Certification information can explain their technical associations and professional associations. Personal information can provide data for exploitation or even blackmail. (Citation: Scasny2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Public sources are external to the defender's organization. Some social media sites have an option to show you when users are looking at your profile, but an adversary can evade this tracking depending on how they conduct the searches.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Social and business relationship information for an individual can be found by examining their social media contacts (e.g., [<https://www.facebook.com> Facebook] and [<https://www.linkedin.com> LinkedIn]). Social media also provides insight into the target's affiliations with groups and organizations. Finally, certification information can explain their technical associations and professional associations.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Analyze social and business relationships, interests, and affiliations - PRE-T1072"*

Table 3572. Table References

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1072

Network-based hiding techniques - PRE-T1092

Technical network hiding techniques are methods of modifying traffic to evade network signature detection or to utilize misattribution techniques. Examples include channel/IP/VLAN hopping, mimicking legitimate operations, or seeding with misinformation. (Citation: HAMMERTOSS2015)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Unless defender is dissecting protocols or performing network signature analysis on any protocol deviations/patterns, this technique is largely undetected.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Some of the hiding techniques require special accesses (network, proximity, physical, etc.) and/or may rely on knowledge of how the defender operates and/or awareness on what visibility the defender has and how it is obtained

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Network-based hiding techniques - PRE-T1092"*

Table 3573. Table References

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1121

Disseminate removable media - PRE-T1156

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Removable media containing malware can be injected in to a supply chain at large or small scale. It can also be physically placed for someone to find or can be sent to someone in a more targeted manner. The intent is to have the user utilize the removable media on a system where the adversary is trying to gain access. (Citation: USBMalwareAttacks) (Citation: FPDefendNewDomain) (Citation: ParkingLotUSB)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: From a technical perspective, detection of an adversary disseminating removable media is not possible as there is no technical element involved until the compromise phase. Most facilities generally do not perform extensive physical security patrols, which would be necessary in order to promptly identify an adversary deploying removable

media to be used in an attack.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Commonly executed technique by penetration testers to gain access to networks via end users who are innately trusting of newly found or available technology.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Disseminate removable media - PRE-T1156"*

Table 3575. Table References

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1156

Replace legitimate binary with malware - PRE-T1155

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Replacing a legitimate binary with malware can be accomplished either by replacing a binary on a legitimate download site or standing up a fake or alternative site with the malicious binary. The intent is to have a user download and run the malicious binary thereby executing malware. (Citation: FSecureICS)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: On the host end user system, integrity checking (e.g., hash verification, code signing enforcement), application whitelisting, sandboxing, or behavioral-based/heuristic-based systems are most likely to be successful in detecting this technique. On the source webserver, detecting binary changes is easy to detect if performed.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Requires the adversary to replace a binary on a website where users will download the binary (e.g., patch, firmware update, software application) as innately trusted. The additional challenge is the reduced set of vendor-trusted websites that are vulnerable.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Replace legitimate binary with malware - PRE-T1155"*

Table 3576. Table References

Determine firmware version - PRE-T1035

Firmware is permanent software programmed into the read-only memory of a device. As with other types of software, firmware may be updated over time and have multiple versions. (Citation: Abdelnur Advanced Fingerprinting)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: No easy way for defenders to detect when an adversary collects this information.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Depending upon the target device, there are variable ways for an adversary to determine the firmware version. In some cases, this information can be derived from easily obtained information. For example, in [<http://www.cisco.com> Cisco] devices, the firmware version is easily determined once the device model and OS version is known since it is included in the release notes.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Determine firmware version - PRE-T1035"*

Table 3579. Table References

Untargeted client-side exploitation - PRE-T1147

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

A technique that takes advantage of flaws in client-side applications without targeting specific users. For example, an exploit placed on an often widely used public web site intended for drive-by delivery to whomever visits the site. (Citation: CitizenLabGreatCannon)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Defensive technologies exist to scan web content before delivery to the requested end user. However, this is not fool proof as some sites encrypt web communications and the adversary constantly moves to sites not previously flagged as malicious thus defeating this defense. Host-based defenses can also aid in detection/mitigation as well as detection by the web site that got compromised.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Commonly executed technique to place an exploit on an often widely used public web site intended for driveby delivery.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Untargeted client-side exploitation - PRE-T1147"*

Compromise 3rd party or closed-source vulnerability/exploit information - PRE-T1131

There is usually a delay between when a vulnerability or exploit is discovered and when it is made public. An adversary may target the systems of those known to research vulnerabilities in order to gain that knowledge for use during a different attack. (Citation: TempertonDarkHotel)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: The compromise of unknown vulnerabilities would

provide little attack and warning against a defender, rendering it highly challenging to detect.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Finding, attacking, and compromising a 3rd party or closed vulnerability entity is challenging, because those containing the vulnerabilities should be very aware of attacks on their environments have a heightened awareness.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Compromise 3rd party or closed-source vulnerability/exploit information - PRE-T1131"*

Acquire OSINT data sets and information - PRE-T1024

Open source intelligence (OSINT) is intelligence gathered from publicly available sources. This can include both information gathered on-line, such as from search engines, as well as in the physical world. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This activity is indistinguishable from legitimate business uses and easy to obtain. Direct access to the selected target is not required for the adversary to conduct this technique. There is a limited ability to detect this by looking at referrer fields on local web site accesses (e.g., a person who has accessed your web servers from [<https://www.shodan.io> Shodan]).

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Possible to gather technical intelligence about Internet accessible systems/devices by obtaining various commercial data sets and supporting business intelligence tools for ease of analysis. Commercial data set examples include advertising content delivery networks, Internet mapping/traffic collections, system fingerprinting data sets, device fingerprinting data sets, etc.

Confirmation of launched compromise achieved - PRE-T1160

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Upon successful compromise the adversary may implement methods for confirming success including communication to a command and control server, exfiltration of data, or a verifiable intended effect such as a publicly accessible resource being inaccessible or a web page being defaced. (Citation: FireEye Malware Stages) (Citation: APTNetworkTrafficAnalysis)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Current commercial tools and sensitive analytics can be used to detect communications to command and control servers or data exfiltration.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Certainty of the confirmation of compromise is not guaranteed unless the adversary sees communication to a command and control server, exfiltration of data, or an intended effect occur.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Confirmation of launched compromise achieved - PRE-T1160"*

Conduct social engineering or HUMINT operation - PRE-T1153

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Social Engineering is the practice of manipulating people in order to get them to divulge information or take an action. Human Intelligence (HUMINT) is intelligence collected and provided by human sources. (Citation: 17millionScam) (Citation: UbiquityEmailScam)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Assuming an average company does not train its employees to be aware of social engineering techniques, it is not possible to detect the adversary's use unless a highly motivated or paranoid employee informs security. This assessment flips to a 1 in cases of environments where security trains employees to be vigilant or in specialized industries where competitive intelligence and business intelligence train employees to be highly aware. Most likely more complex for an adversary to detect as methods move to physical or non traditionally monitored mechanisms (such as phone calls outside of call centers). Furthermore, the content of such an interaction may be lost due to lack of collection.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Assuming an average adversary whose focus is social engineering, it is not difficult for an adversary. Assuming a HUMINT operation and specialized circumstances, the adversary difficulty becomes 1. Social engineering can be easily done remotely via email or phone. In contrast, HUMINT operations typically would require physical contact at some point in the process, increasing the difficulty.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Conduct social engineering or HUMINT operation - PRE-T1153"*

Discover new exploits and monitor exploit-provider forums - PRE-T1127

An exploit takes advantage of a bug or vulnerability in order to cause unintended or unanticipated behavior to occur on computer hardware or software. The adversary may need to discover new exploits when existing exploits are no longer relevant to the environment they are trying to compromise. An adversary may monitor exploit provider forums to understand the state of existing, as well as newly discovered, exploits. (Citation: EquationQA)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Public source external to the defender's organization.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Many public sources exist for this information.

The tag is: `misp-galaxy:mitre-pre-attack-attack-pattern="Discover new exploits and monitor exploit-provider forums - PRE-T1127"`

Table 3608. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1127

Choose pre-compromised persona and affiliated accounts - PRE-T1120

For attacks incorporating social engineering the utilization of an on-line persona is important. Utilizing an existing persona with compromised accounts may engender a level of trust in a potential victim if they have a relationship, or knowledge of, the compromised persona. (Citation: AnonHBGary) (Citation: Hacked Social Media Accounts)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Possible to detect compromised credentials if alerting from a service provider is enabled and acted upon by the individual.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: It is relatively easy and low cost to purchase compromised credentials. Mining social media sites offers open source information about a particular target. Most users tend to reuse passwords across sites and are not paranoid enough to check and see if spoofed sites from their persona exist across current social media.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Choose pre-compromised persona and affiliated accounts - PRE-T1120"*

Table 3609. Table References

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1120

Acquire OSINT data sets and information - PRE-T1043

Open source intelligence (OSINT) provides free, readily available information about a target while providing the target no indication they are of interest. Such information can assist an adversary in crafting a successful approach for compromise. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This activity is indistinguishable from legitimate business uses and easy to obtain.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Possible to gather digital intelligence about a person is easily aided by social networking sites, free/for fee people search engines, and publicly available information (e.g., county databases on tickets/DUIs).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Acquire OSINT data sets and information - PRE-T1043"*

Acquire OSINT data sets and information - PRE-T1043 has relationships with:

- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Acquire OSINT data sets and information - PRE-T1054"* with estimative-language:likelihood-probability="almost-certain"
- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Acquire OSINT data sets and information - PRE-T1024"* with estimative-language:likelihood-probability="almost-certain"

Table 3610. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1043

Identify people of interest - PRE-T1046

The attempt to identify people of interest or with an inherent weakness for direct or indirect targeting to determine an approach to compromise a person or organization. Such targets may

include individuals with poor OPSEC practices or those who have a trusted relationship with the intended target. (Citation: RSA-APTRecon) (Citation: Scasny2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Common defenses protecting against poor OPSEC practices are traditionally more policy-based in nature rather than technical. Policy-based mitigations are generally more difficult to enforce and track violations, making it more difficult that this technique can be detected by common defenses.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Specialty cases enable an adversary to use key words in order to search social media and identify personnel with poor OPSEC practices who may have access to specialized information which would make them a target of interest. In addition, the open nature of social media leads to a tendency among individuals to overshare, encouraging poor OPSEC and increasing the ease by which an adversary can identify interesting targets.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify people of interest - PRE-T1046"*

Table 3611. Table References

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1046

Determine external network trust dependencies - PRE-T1036

Network trusts enable communications between different networks with specific accesses and permissions. Network trusts could include the implementation of domain trusts or the use of virtual private networks (VPNs). (Citation: CuckoosEgg) (Citation: CuckoosEgg)Wikipedia (Citation: KGBComputerMe)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This is not easily performed remotely and therefore not a detectable event. If the adversary can sniff traffic to deduce trust relations, this is a passive activity and not detectable.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Determining trust relationships once internal to a network is trivial. Simple tools like trace route can show evidence of firewalls or VPNs and then hosts on the either side of the firewall indicating a different trusted network. Active Directory command line tools can also identify separate trusted networks.

If completely external to a network, sniffing traffic (if possible) could also reveal the communications protocols that could be guessed to be a trusted network connection (e.g., IPsec, maybe SSL, etc.) though this is error-prone.

With no other access, this is hard for an adversary to do completely from a remote vantage point.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Determine external network trust dependencies - PRE-T1036"*

Targeted client-side exploitation - PRE-T1148

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

A technique used to compromise a specific group of end users by taking advantage of flaws in client-side applications. For example, infecting websites that members of a targeted group are known to visit with the goal to infect a targeted user's computer. (Citation: RSASETHreat) (Citation:

WikiStagefright) (Citation: ForbesSecurityWeek) (Citation: StrongPity-waterhole)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Defensive technologies exist to scan web content before delivery to the requested end user. However, this is not foolproof as some sites encrypt web communications and the adversary constantly moves to sites not previously flagged as malicious thus defeating this defense. Host-based defenses can also aid in detection/mitigation as well as detection by the web site that got compromised. The added challenge for a conditional watering hole is the reduced scope and likely reduced ability to detect or be informed. Determining deltas in content (e.g., differences files type/size/number/hashes) downloaded could also aid in detection.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Commonly executed technique to place an exploit on an often widely used public web site intended for driveby delivery. The additional challenge is the reduced set of options for web sites to compromise since the set is reduced to those often visited by targets of interest.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Targeted client-side exploitation - PRE-T1148"*

Table 3618. Table References

Links

Create implementation plan - PRE-T1009

Implementation plans specify how the goals of the strategic plan will be executed. (Citation: ChinaCollectionPlan) (Citation: OrderOfBattle)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Create implementation plan - PRE-T1009"*

Table 3626. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1009

Non-traditional or less attributable payment options - PRE-T1093

Using alternative payment options allows an adversary to hide their activities. Options include crypto currencies, barter systems, pre-paid cards or shell accounts. (Citation: Goodin300InBitcoins)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defender likely will not have access to payment information. Monitoring crypto-currency or barter boards is resource intensive and not fully automatable.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Easy to use pre-paid cards or shell accounts to pay for services online. Crypto currencies and barter systems can avoid use of trace-able bank or credit apparatus.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Non-traditional or less attributable payment options - PRE-T1093"*

Table 3627. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1093

Aggregate individual's digital footprint - PRE-T1052

In addition to a target's social media presence may exist a larger digital footprint, such as accounts and credentials on e-commerce sites or usernames and logins for email. An adversary familiar with a target's username can mine to determine the target's larger digital footprint via publicly available sources. (Citation: DigitalFootprint) (Citation: trendmicro-vtech)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Searching publicly available sources that cannot be monitored by a defender.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Information readily available through searches

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Aggregate individual's digital footprint - PRE-T1052"*

Table 3628. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1052

Identify sensitive personnel information - PRE-T1051

An adversary may identify sensitive personnel information not typically posted on a social media site, such as address, marital status, financial history, and law enforcement infractions. This could be conducted by searching public records that are frequently available for free or at a low cost online. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Searching publicly available sources that cannot be monitored by a defender.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: This type of information is useful to understand the individual and their ability to be blackmailed. Searching public records is easy and most information can be purchased for a low cost if the adversary really wants it.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify sensitive personnel information - PRE-T1051"*

Table 3629. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1051

Human performs requested action of physical nature - PRE-T1162

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Through social engineering or other methods, an adversary can get users to perform physical actions that provide access to an adversary. This could include providing a password over the phone or inserting a 'found' CD or USB into a system. (Citation: AnonHBGary) (Citation: CSOInsideOutside)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Non-hypersensing environments do not typically collect this level of detailed information.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Ill-informed users insert devices into their network that they randomly find, despite training educating them why this is not a wise idea.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Human performs requested action of physical nature - PRE-T1162"*

Table 3630. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1162

Assess opportunities created by business deals - PRE-T1076

During mergers, divestitures, or other period of change in joint infrastructure or business processes there may be an opportunity for exploitation. During this type of churn, unusual requests, or other non standard practices may not be as noticeable. (Citation: RossiMergers) (Citation: MeidlHealthMergers)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Most of this activity would target partners and business processes. Partners would not report. Difficult to tie this activity to a cyber attack.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Mapping joint infrastructure and business processes is difficult without insider knowledge or SIGINT capability. While a merger creates and opportunity to exploit potentially cumbersome or sloppy business processes, advance notice of a merger is difficult; merger information is typically close-hold until the deal is done.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Assess opportunities created by business deals - PRE-T1076"*

Table 3631. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1076

Shadow DNS - PRE-T1117

The process of gathering domain account credentials in order to silently create subdomains pointed at malicious servers without tipping off the actual owner. (Citation: CiscoAngler) (Citation: ProofpointDomainShadowing)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: Detection of this technique requires individuals to monitor their domain registrant accounts routinely. In addition, defenders have had success with blacklisting sites or IP addresses, but an adversary can defeat this by rotating either the subdomains or the IP addresses associated with the campaign.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: To successfully conduct this attack, an adversary usually phishes the individual behind the domain registrant account, logs in with credentials, and creates a large amount of subdomains.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Shadow DNS - PRE-T1117"*

Table 3632. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1117

Create custom payloads - PRE-T1122

A payload is the part of the malware which performs a malicious action. The adversary may create custom payloads when none exist with the needed capability or when targeting a specific environment. (Citation: APT1)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: It is likely that an adversary will create and develop

payloads on inaccessible or unknown networks for OPSEC reasons.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Specialized tools exist for research, development, and testing of virus/malware payloads.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Create custom payloads - PRE-T1122"*

Table 3633. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1122

Conduct social engineering - PRE-T1045

Social Engineering is the practice of manipulating people in order to get them to divulge information or take an action. (Citation: SEAttackVectors) (Citation: BeachSE2003)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: No technical means to detect an adversary collecting information about a target. Any detection would be based upon strong OPSEC policy implementation.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Very effective technique for the adversary that does not require any formal training and relies upon finding just one person who exhibits poor judgement.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Conduct social engineering - PRE-T1045"*

Conduct social engineering - PRE-T1045 has relationships with:

- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Conduct social engineering - PRE-T1026"* with estimative-language:likelihood-probability="almost-certain"
- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Conduct social engineering - PRE-T1056"* with estimative-language:likelihood-probability="almost-certain"

Table 3634. Table References

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1045

SSL certificate acquisition for domain - PRE-T1114

Certificates are designed to instill trust. They include information about the key, information about its owner's identity, and the digital signature of an entity that has verified the certificate's contents are correct. If the signature is valid, and the person examining the certificate trusts the signer, then they know they can use that key to communicate with its owner. Acquiring a certificate for a

domain name similar to one that is expected to be trusted may allow an adversary to trick a user in to trusting the domain (e.g., vvachovia instead of [<https://www.wellsfargo.com/about/corporate/wachovia/> Wachovia] — homoglyphs). (Citation: SubvertSSL) (Citation: PaypalScam)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Defender can monitor for domains similar to popular sites (possibly leverage [<https://www.alexa.com> Alexa] top "N" lists as starting point).

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: SSL certificates are readily available at little to no cost.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="SSL certificate acquisition for domain - PRE-T1114"*

Table 3635. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1114

Test malware to evade detection - PRE-T1136

An adversary can run their code on systems with cyber security protections, such as antivirus products, in place to see if their code is detected. They can also test their malware on freely available public services. (Citation: MalwareQAZirtest)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary controls the testing and can ensure data does not leak with proper OPSEC on testing.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Adversary has the ability to procure products and not have reporting return to vendors or can choose to use freely available services

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Test malware to evade detection - PRE-T1136"*

Table 3636. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1136

Build or acquire exploits - PRE-T1126

An exploit takes advantage of a bug or vulnerability in order to cause unintended or unanticipated behavior to occur on computer hardware or software. The adversary may use or modify existing exploits when those exploits are still relevant to the environment they are trying to compromise.

(Citation: NYTStuxnet) (Citation: NationsBuying)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary will likely use code repositories, but development will be performed on their local systems.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Several exploit repositories and tool suites exist for re-use and tailoring.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Build or acquire exploits - PRE-T1126"*

Table 3637. Table References

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1126

Unauthorized user introduces compromise delivery mechanism - PRE-T1164

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

If an adversary can gain physical access to the target's environment they can introduce a variety of devices that provide compromise mechanisms. This could include installing keyboard loggers, adding routing/wireless equipment, or connecting computing devices. (Citation: Credit Card Skimmers)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This varies depending on the amount of monitoring within the environment. Highly secure environments might have more innate monitoring and catch an adversary doing this more easily.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: This likely requires the adversary to have close or insider access to introduce the mechanism of compromise.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Unauthorized user introduces compromise delivery mechanism - PRE-T1164"*

Table 3638. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1164

Common, high volume protocols and software - PRE-T1098

Certain types of traffic (e.g., Twitter14, HTTP) are more commonly used than others. Utilizing more common protocols and software may make an adversary's traffic more difficult to distinguish from legitimate traffic. (Citation: symantecNITRO)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: High level of entropy in communications. High volume of communications makes it extremely hard for a defender to distinguish between legitimate and adversary communications.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Communications are hidden (but not necessarily encrypted) in an attempt to make the content more difficult to decipher or to make the communication less conspicuous.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Common, high volume protocols and software - PRE-T1098"*

Table 3639. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1098

Data Hiding - PRE-T1097

Certain types of traffic (e.g., DNS tunneling, header inject) allow for user-defined fields. These fields can then be used to hide data. In addition to hiding data in network protocols, steganography techniques can be used to hide data in images or other file formats. Detection can be difficult unless a particular signature is already known. (Citation: BotnetsDNSC2) (Citation: HAMMERTOSS2015) (Citation: DNS-Tunnel)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Unless defender is dissecting protocols or performing network signature analysis on any protocol deviations/patterns, this technique is largely undetected.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: This technique requires a more advanced protocol understanding and testing to insert covert communication into legitimate protocol fields.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Data Hiding - PRE-T1097"*

Invoke-PSImage - S0231

[Invoke-PSImage](<https://attack.mitre.org/software/S0231>) takes a PowerShell script and embeds the bytes of the script into the pixels of a PNG image. It generates a one liner for executing either from

a file of from the web. Example of usage is embedding the PowerShell code from the Invoke-Mimikatz module and embed it into an image file. By calling the image file from a macro for example, the macro will download the picture and execute the PowerShell code, which in this case will dump the passwords. (Citation: GitHub Invoke-PSImage)

Tor - S0183

[Tor](<https://attack.mitre.org/software/S0183>) is a software suite and network that provides increased anonymity on the Internet. It creates a multi-hop proxy network and utilizes multilayer encryption to protect both the message and routing information. [Tor](<https://attack.mitre.org/software/S0183>) utilizes "Onion Routing," in which messages are encrypted with multiple layers of encryption; at each step in the proxy network, the topmost layer is decrypted and the contents forwarded on to the next node until it reaches its destination. (Citation: Dingedine Tor The Second-Generation Onion Router)

Preventive Measure

Preventive measures based on the ransomware document overview as published in <https://docs.google.com/spreadsheets/d/1TWS238xacAto-fLKh1n5uTsdijWdCEsGIM0Y0Hvmc5g/pubhtml#> . The preventive measures are quite generic and can fit any standard Windows infrastructure and their security measures..

Preventive Measure is a cluster galaxy available in JSON format at [this location](#) . The JSON format can be freely reused in your application or automatically enabled in [MISP](#) .

authors

Various

Backup and Restore Process

Make sure to have adequate backup processes on place and frequently test a restore of these backups. (Schrödinger's backup - it is both existent and non-existent until you've tried a restore)

The tag is: *misp-galaxy:preventive-measure="Backup and Restore Process"*

Enforce UAC Prompt

Enforce administrative users to confirm an action that requires elevated rights

The tag is: *misp-galaxy:preventive-measure="Enforce UAC Prompt"*

Table 3701. Table References

Links
https://technet.microsoft.com/en-us/library/dd835564(WS.10).aspx

Remove Admin Privileges

Remove and restrict administrative rights whenever possible. Malware can only modify files that users have write access to.

The tag is: *misp-galaxy:preventive-measure="Remove Admin Privileges"*

Restrict Workstation Communication

Activate the Windows Firewall to restrict workstation to workstation communication

The tag is: *misp-galaxy:preventive-measure="Restrict Workstation Communication"*

Sandboxing Email Input

Using sandbox that opens email attachments and removes attachments based on behavior analysis

The tag is: *misp-galaxy:preventive-measure="Sandboxing Email Input"*

Execution Prevention

Software that allows to control the execution of processes - sometimes integrated in Antivirus software Free: AntiHook, ProcessGuard, System Safety Monitor

The tag is: *misp-galaxy:preventive-measure="Execution Prevention"*

Change Default "Open With" to Notepad

Force extensions primarily used for infections to open up in Notepad rather than Windows Script Host or Internet Explorer

The tag is: *misp-galaxy:preventive-measure="Change Default "Open With" to Notepad"*

Table 3702. Table References

Telecrypt Ransomware

This is most likely to affect Russian speaking users, since the note is written in Russian. Therefore, residents of Russian speaking country are affected. The hacker spread the virus using email spam, fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc.. The ransomware's authors would request around \$75 from their victims to provide them with a decryptor (payments are accepted via Russian payment services Qiwi or Yandex.Money). Right from the start, however, researchers suggested that TeleCrypt was written by cybercriminals without advanced skills. Telecrypt will generate a random string to encrypt with that is between 10-20 length and only contain the letters vo,pr,bm,xu,zt,dq.

The tag is: *misp-galaxy:ransomware="Telecrypt Ransomware"*

WannaCry

According to numerous open-source reports, a widespread ransomware campaign is affecting various organizations with reports of tens of thousands of infections in as many as 74 countries, including the United States, United Kingdom, Spain, Russia, Taiwan, France, and Japan. The software can run in as many as 27 different languages. The latest version of this ransomware variant, known as WannaCry, WCry, or Wanna Decryptor, was discovered the morning of May 12, 2017, by an independent security researcher and has spread rapidly over several hours, with initial reports beginning around 4:00 AM EDT, May 12, 2017. Open-source reporting indicates a requested ransom of .1781 bitcoins, roughly \$300 U.S.

CryptoFinancial

Ransomware

The tag is: *misp-galaxy:ransomware="CryptoFinancial"*

CryptoFinancial is also known as:

- Ranscam

CryptoFinancial has relationships with:

- similar: *misp-galaxy:malpedia="Ranscam"* with *estimative-language:likelihood-probability="likely"*

Table 3974. Table References

CryptoGraphic Locker

Ransomware Has a GUI. Subvariants: CoinVault BitCryptor

The tag is: *misp-galaxy:ransomware="CryptoGraphic Locker"*

CryptoHost

Ransomware RAR's victim's files has a GUI

The tag is: *misp-galaxy:ransomware="CryptoHost"*

CryptoHost is also known as:

- Manamecrypt
- Telograph
- ROI Locker

CryptoHost has relationships with:

- similar: *misp-galaxy:malpedia="ManameCrypt"* with *estimative-language:likelihood-probability="likely"*

Table 3976. Table References

CryptoJoker

Ransomware

The tag is: *misp-galaxy:ransomware="CryptoJoker"*

CryptoJoker has relationships with:

- similar: *misp-galaxy:ransomware="CryptoNar"* with *estimative-language:likelihood-probability="likely"*

Table 3977. Table References

Links
https://id-ransomware.blogspot.com/2017/07/cryptojoker-2017-ransomware.html

CryptoLocker

Ransomware no longer relevant

The tag is: *misp-galaxy:ransomware="CryptoLocker"*

CryptoLocker has relationships with:

- similar: *misp-galaxy:malpedia="CryptoLocker"* with *estimative-language:likelihood-probability="likely"*

Table 3978. Table References

Jaff

We recently observed several large scale email campaigns that were attempting to distribute a new variant of ransomware that has been dubbed "Jaff". Interestingly we identified several characteristics that we have previously observed being used during Dridex and Locky campaigns. In a short period of time, we observed multiple campaigns featuring high volumes of malicious spam emails being distributed, each using a PDF attachment with an embedded Microsoft Word document functioning as the initial downloader for the Jaff ransomware.

The tag is: *misp-galaxy:ransomware="Jaff"*

Jaff has relationships with:

SynAck

The ransomware does not use a customized desktop wallpaper to signal its presence, and the only way to discover that SynAck has infected your PC is by the ransom notes dropped on the user's desktop, named in the format: RESTORE_INFO-[id].txt. For example: RESTORE_INFO-4ABFA0EF.txt. In addition, SynAck also appends its own extension at the end of all files it encrypted. This file

extensions format is ten random alpha characters for each file. For example: test.jpg.XbMiJQiuoh. Experts believe the group behind SynAck uses RDP brute-force attacks to access remote computers and manually download and install the ransomware.

The tag is: *misp-galaxy:ransomware="SynAck"*

SynAck is also known as:

- Syn Ack

SynAck has relationships with:

- similar: *misp-galaxy:malpedia="SynAck"* with *estimative-language:likelihood-probability="likely"*

Bad Rabbit

On October 24, 2017, Cisco Talos was alerted to a widescale ransomware campaign affecting organizations across eastern Europe and Russia. As was the case in previous situations, we quickly mobilized to assess the situation and ensure that customers remain protected from this and other threats as they emerge across the threat landscape. There have been several large scale

ransomware campaigns over the last several months. This appears to have some similarities to Nyetya in that it is also based on Petya ransomware. Major portions of the code appear to have been rewritten. The distribution does not appear to have the sophistication of the supply chain attacks we have seen recently.

The tag is: *misp-galaxy:ransomware="Bad Rabbit"*

Bad Rabbit is also known as:

- BadRabbit
- Bad-Rabbit

Bad Rabbit has relationships with:

- similar: misp-galaxy:malpedia="EternalPetya" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:tool="NotPetya" with estimative-language:likelihood-probability="likely"

StorageCrypt

Recently BleepingComputer has received a flurry of support requests for a new ransomware being named StorageCrypt that is targeting NAS devices such as the Western Digital My Cloud. Victims have been reporting that their files have been encrypted and a note left with a ransom demand of between .4 and 2 bitcoins to get their files back. User's have also reported that each share on their NAS device contains a Autorun.inf file and a Windows executable named 美女与野 .exe, which translates to Beauty and the beast. From the samples BleepingComputer has received, this Autorun.inf is an attempt to spread the 美女与野 .exe file to other computers that open the folders

on the NAS devices.

The tag is: `misp-galaxy:ransomware="StorageCrypt"`

HC7

A new ransomware called HC7 is infecting victims by hacking into Windows computers that are running publicly accessible Remote Desktop services. Once the developers gain access to the hacked computer, the HC7 ransomware is then installed on all accessible computers on the network. Originally released as HC6, victims began posting about it in the BleepingComputer forums towards the end of November. As this is a Python-to-exe executable, once the script was extracted ID Ransomware creator Michael Gillespie was able determine that it was decryptable and released a decryptor. Unfortunately, a few days later, the ransomware developers released a new version called HC7 that was not decryptable. This is because they removed the hard coded encryption key and instead switched to inputting the key as a command line argument when the attackers run the ransomware executable. Thankfully, there may be a way to get around that as well so that victims can recover their keys.

The tag is: `misp-galaxy:ransomware="HC7"`

qkG

Security researchers have discovered a new ransomware strain named qkG that targets only Office documents for encryption and infects the Word default document template to propagate to new Word documents opened through the same Office suite on the same computer.

The tag is: *misp-galaxy:ransomware="qkG"*

Table 4210. Table References

http://id-ransomware.blogspot.com/2017/11/qkg-ransomware.html

Scarab

The Scarab ransomware is a relatively new ransomware strain that was first spotted by security researcher Michael Gillespie in June this year. Written in Delphi, the first version was simplistic and was recognizable via the ".scarab" extension it appended after the names of encrypted files. Malwarebytes researcher Marcelo Rivera spotted a second version in July that used the ".scorpio" extension. The version spotted with the Necurs spam today has reverted back to using the .scarab extension. The current version of Scarab encrypts files but does not change original file names as previous versions. This Scarab version appends each file's name with the ".[suupport@protonmail.com].scarab" extension. Scarab also deletes shadow volume copies and drops a ransom note named "IF YOU WANT TO GET ALL YOUR FILES BACK, PLEASE READ THIS.TXT" on users' computers, which it opens immediately.

The tag is: *misp-galaxy:ransomware="Scarab"*

File Spider

A new ransomware called File Spider is being distributed through spam that targets victims in Bosnia and Herzegovina, Serbia, and Croatia. These spam emails contains malicious Word documents that will download and install the File Spider ransomware onto a victims computer. File Spider is currently being distributed through malspam that appears to be targeting countries such as Croatia, Bosnia and Herzegovina, and Serbia. The spam start with subjects like "Potrazivanje dugovanja", which translates to "Debt Collection" and whose message, according to Google Translate, appear to be in Serbian.

The tag is: *misp-galaxy:ransomware="File Spider"*

Qwerty Ransomware

A new ransomware has been discovered that utilizes the legitimate GnuPG, or GPG, encryption program to encrypt a victim's files. Currently in the wild, this ransomware is called Qwerty Ransomware and will encrypt a victims files, overwrite the originals, and the append the .qwerty extension to an encrypted file's name.

The tag is: *misp-galaxy:ransomware="Qwerty Ransomware"*

Table 4220. Table References

Links
https://www.bleepingcomputer.com/news/security/qwerty-ransomware-utilizes-gnupg-to-encrypt-a-victims-files/

Zenis Ransomware

A new ransomware was discovered this week by MalwareHunterTeam called Zenis Ransomware.

While it is currently unknown how Zenis is being distributed, multiple victims have already become infected with this ransomware. What is most disturbing about Zenis is that it not encrypts your files, but also purposely deletes your backups.

The tag is: *misp-galaxy:ransomware="Zenis Ransomware"*

Table 4221. Table References

http://id-ransomware.blogspot.com/2017/03/flotera-ransomware.html

Black Ruby

A new ransomware was discovered this week by MalwareHunterTeam called Black Ruby. This ransomware will encrypt the files on a computer, scramble the file name, and then append the BlackRuby extension. To make matters worse, Black Ruby will also install a Monero miner on the computer that utilizes as much of the CPU as it can. Discovered on February 6, 2018. May have been distributed through unknown vectors. Will not encrypt a machine if its IP address is identified as coming from Iran; this feature enables actors to avoid a particular Iranian cybercrime law that prohibits Iran-based actors from attacking Iranian victims. Encrypts files on the infected machine, scrambles files, and appends the .BlackRuby extension to them. Installs a Monero miner on the infected computer that utilizes the machine's maximum CPU power. Delivers a ransom note in English asking for US\$650 in Bitcoins. Might be installed via Remote Desktop Services.

The tag is: *misp-galaxy:ransomware="Black Ruby"*

Table 4223. Table References

http://id-ransomware.blogspot.com/2018/03/whiterose-ransomware.html

PUBG Ransomware

In what could only be a joke, a new ransomware has been discovered called "PUBG Ransomware" that will decrypt your files if you play the game called PlayerUnknown's Battlegrounds. Discovered by MalwareHunterTeam, when the PUBG Ransomware is launched it will encrypt a user's files and folders on the user's desktop and append the .PUBG extension to them. When it has finished encrypting the files, it will display a screen giving you two methods that you can use to decrypt the encrypted files.

The tag is: *misp-galaxy:ransomware="PUBG Ransomware"*

Table 4225. Table References

https://id-ransomware.blogspot.com/2018/04/pubg-ransomware.html

LockCrypt

LockCrypt is an example of yet another simple ransomware created and used by unsophisticated attackers. Its authors ignored well-known guidelines about the proper use of cryptography. The internal structure of the application is also unprofessional. Sloppy, unprofessional code is pretty commonplace when ransomware is created for manual distribution. Authors don't take much time preparing the attack or the payload. Instead, they're rather focused on a fast and easy gain, rather than on creating something for the long run. Because of this, they could easily be defeated.

The tag is: *misp-galaxy:ransomware="LockCrypt"*

Reveton ransomware

A ransomware family that targets users from certain countries or regions. It locks the computer and displays a location-specific webpage that covers the desktop and demands that the user pay a fine for the supposed possession of illicit material. The Reveton ransomware is one of the first screen-locking ransomware strains, and it appeared when Bitcoin was still in its infancy, and before it became the cryptocurrency of choice in all ransomware operations. Instead, Reveton operators asked victims to buy GreenDot MoneyPak vouchers, take the code on the voucher and enter it in the Reveton screen locker.

The tag is: *misp-galaxy:ransomware="Reveton ransomware"*

Fusob

Fusob is one of the major mobile ransomware families. Between April 2015 and March 2016, about 56 percent of accounted mobile ransomware was Fusob. Like a typical mobile ransomware, it employs scare tactics to extort people to pay a ransom. The program pretends to be an accusatory authority, demanding the victim to pay a fine from \$100 to \$200 USD or otherwise face a fictitious charge. Rather surprisingly, Fusob suggests using iTunes gift cards for payment. Also, a timer clicking down on the screen adds to the users' anxiety as well. In order to infect devices, Fusob masquerades as a pornographic video player. Thus, victims, thinking it is harmless, unwittingly download Fusob. When Fusob is installed, it first checks the language used in the device. If it uses Russian or certain Eastern European languages, Fusob does nothing. Otherwise, it proceeds on to lock the device and demand ransom. Among victims, about 40% of them are in Germany with the United Kingdom and the United States following with 14.5% and 11.4% respectively. Fusob has lots in common with Small, which is another major family of mobile ransomware. They represented over 93% of mobile ransoms between 2015 and 2016.

NMCRYPT Ransomware

The NMCRYPT Ransomware is a generic file encryption Trojan that was detected in the middle of April 2018. The NMCRYPT Ransomware is a file encoder Trojan that is designed to make data unreadable and convince users to pay a fee for unlocking content on the infected computers. The NMCRYPT Ransomware is nearly identical to hundreds of variants of the HiddenTear open-source ransomware and compromised users are unable to use the Shadow Volume snapshots made by Windows to recover. Unfortunately, the NMCRYPT Ransomware disables the native recovery features on Windows, and you need third-party applications to rebuild your data.

The tag is: *misp-galaxy:ransomware="NMCRYPT Ransomware"*

Unnamed ransomware 1

A new in-development ransomware was discovered that has an interesting characteristic. Instead of the distributed executable performing the ransomware functionality, the executables compiles an embedded encrypted C# program at runtime and launches it directly into memory.

The tag is: *misp-galaxy:ransomware="Unnamed ramsomware 1"*

Table 4240. Table References

Links
https://www.bleepingcomputer.com/news/security/new-c-ransomware-compiles-itself-at-runtime/

HPE iLO 4 Ransomware

Attackers are targeting Internet accessible HPE iLO 4 remote management interfaces, supposedly encrypting the hard drives, and then demanding Bitcoins to get access to the data again. According to the victim, the attackers are demanding 2 bitcoins to gain access to the drives again. The attackers will also provide a bitcoin address to the victim that should be used for payment. These bitcoin addresses appear to be unique per victim as the victim's was different from other reported ones. An interesting part of the ransom note is that the attackers state that the ransom price is not negotiable unless the victim's are from Russia. This is common for Russian based attackers, who in many cases tries to avoid infecting Russian victims. Finally, could this be a decoy/wiper rather than an actual true ransomware attack? Ransomware attacks typically provide a unique ID to the victim in order to distinguish one victim from another. This prevents a victim from "stealing" another victim's payment and using it to unlock their computer. In a situation like this, where no unique ID is given to identify the encrypted computer and the email is publicly accessible, it could be a case where the main goal is to wipe a server or act as a decoy for another attack.

The tag is: *misp-galaxy:ransomware="HPE iLO 4 Ransomware"*

https://id-ransomware.blogspot.com/2018/06/redeye-ransomware.html

Aurora Ransomware

Typical ransom software, Aurora virus plays the role of blackmailing PC operators. It encrypts files and the encryption cipher it uses is pretty strong. After encryption, the virus attaches .aurora at the end of the file names that makes it impossible to open the data. Thereafter, it dispatches the ransom note totaling 6 copies, without any change to the main objective i.e., victims must write an electronic mail addressed to anonimus.mr@yahoo.com while stay connected until the criminals reply telling the ransom amount.

The tag is: *misp-galaxy:ransomware="Aurora Ransomware"*

Aurora Ransomware is also known as:

- Zorro Ransomware

DBGer Ransomware

The authors of the Satan ransomware have rebranded their "product" and they now go by the name of DBGer ransomware, according to security researcher MalwareHunter, who spotted this new

version earlier today. The change was not only in name but also in the ransomware's modus operandi. According to the researcher, whose discovery was later confirmed by an Intezer code similarity analysis, the new (Satan) DBGer ransomware now also incorporates Mimikatz, an open-source password-dumping utility. The purpose of DBGer incorporating Mimikatz is for lateral movement inside compromised networks. This fits a recently observed trend in Satan's modus operandi.

The tag is: *misp-galaxy:ransomware="DBGer Ransomware"*

TYRANT

DUMB variant discovered on November 16, 2017. Disguised itself as a popular virtual private network (VPN) in Iran known as Psiphon and infected Iranian users. Included Farsi-language ransom note, decryptable in the same way as previous DUMB-based variants. Message requested only US\$15 for unlock key. Advertised two local and Iran-based payment processors: exchange.ir and webmoney.ir. Shared unique and specialized indicators with RASTAKHIZ; iDefense threat intelligence analysts believe this similarity confirms that the same actor was behind the repurposing of both types of ransomware.

The tag is: *misp-galaxy:ransomware="TYRANT"*

TYRANT is also known as:

- Crypto Tyrant

WeChat Ransom

Over 100,000 thousand computers in China have been infected in just a few days with poorly-written ransomware that encrypts local files and steals credentials for multiple Chinese online services. The crooks show a screen titled UNNAMED1989 and demand the victim a ransom of 110 yuan (\$16) in exchange for decrypting the files, payable via Tencent's WeChat payment service by scanning a QR code.

The tag is: *misp-galaxy:ransomware="WeChat Ransom"*

WeChat Ransom is also known as:

- UNNAMED1989

Ryuk ransomware

Similar to Samas and BitPaymer, Ryuk is specifically used to target enterprise environments. Code comparison between versions of Ryuk and Hermes ransomware indicates that Ryuk was derived from the Hermes source code and has been under steady development since its release. Hermes is commodity ransomware that has been observed for sale on forums and used by multiple threat actors. However, Ryuk is only used by GRIM SPIDER and, unlike Hermes, Ryuk has only been used to target enterprise environments. Since Ryuk's appearance in August, the threat actors operating it have netted over 705.80 BTC across 52 transactions for a total current value of \$3,701,893.98 USD.

The tag is: *misp-galaxy:ransomware="Ryuk ransomware"*

Table 4303. Table References

Links
https://www.crowdstrike.com/blog/big-game-hunting-with-ryuk-another-lucrative-targeted-ransomware/

BitPaymer

In August 2017, a new ransomware variant identified as BitPaymer was reported to have ransomed the U.K.'s National Health Service (NHS), with a high ransom demand of 53 BTC (approximately \$200,000 USD). The targeting of an organization rather than individuals, and the high ransom demands, made BitPaymer stand out from other contemporary ransomware at the time. Though the encryption and ransom functionality of BitPaymer was not technically sophisticated, the malware contained multiple anti-analysis features that overlapped with Dridex. Later technical analysis of BitPaymer indicated that it had been developed by INDRIK SPIDER, suggesting the group had expanded its criminal operation to include ransomware as a monetization strategy.

The tag is: *misp-galaxy:ransomware="BitPaymer"*

Table 4304. Table References

Princess Evolution

We have been observing a malvertising campaign via Rig exploit kit delivering a cryptocurrency-mining malware and the GandCrab ransomware since July 25. On August 1, we found Rig's traffic stream dropping a then-unknown ransomware. Delving into this seemingly new ransomware, we checked its ransom payment page in the Tor network and saw it was called Princess Evolution (detected by Trend Micro as RANSOM_PRINCESSLOCKER.B), and was actually a new version of the Princess Locker ransomware that emerged in 2016. Based on its recent advertisement in underground forums, it appears that its operators are peddling Princess Evolution as a ransomware as a service (RaaS) and are looking for affiliates. The new malvertising campaign we observed since July 25 is notable in that the malvertisements included Coinhive (COINMINER_MALXMR.TIDBF). Even if users aren't diverted to the exploit kit and infected with the ransomware, the cybercriminals can still earn illicit profit through cryptocurrency mining. Another characteristic of this new campaign is that they hosted their malvertisement page on a free web hosting service and used domain name system canonical name (DNS CNAME) to map their advertisement domain on a malicious webpage on the service.

The tag is: *misp-galaxy:ransomware="Princess Evolution"*

Table 4306. Table References

Links
https://blog.trendmicro.com/trendlabs-security-intelligence/ransomware-as-a-service-princess-evolution-looking-for-affiliates/

Jokeroo

A new Ransomware-as-a-Service called Jokeroo is being promoted on underground hacking sites and via Twitter that allows affiliates to allegedly gain access to a fully functional ransomware and payment server. According to a malware researcher named Damian, the Jokeroo RaaS first started promoting itself as a GandCrab Ransomware RaaS on the underground hacking forum Exploit.in.

The tag is: *misp-galaxy:ransomware="Jokeroo"*

Jokeroo is also known as:

- Fake GandCrab

Table 4307. Table References

https://www.bleepingcomputer.com/news/security/jokeroo-ransomware-as-a-service-offers-multiple-membership-packages/

GlobeImposter

During December 2017, a new variant of the GlobeImposter Ransomware was detected for the first time and reported on malware-traffic-analysis. At first sight this ransomware looks very similar to other ransomware samples and uses common techniques such as process hollowing. However, deeper inspection showed that like LockPoS, which was analyzed by CyberBit, GlobeImposter too bypasses user-mode hooks by directly invoking system calls. Given this evasion technique is being leveraged by new malware samples may indicate that this is a beginning of a trend aiming to bypass user-mode security products.

The tag is: `misp-galaxy:ransomware="GlobeImposter"`

Back Orifice 2000

Back Orifice 2000 (often shortened to BO2k) is a computer program designed for remote system administration. It enables a user to control a computer running the Microsoft Windows operating system from a remote location. The name is a pun on Microsoft BackOffice Server software. Back Orifice 2000 is a new version of the famous Back Orifice backdoor trojan (hacker's remote access tool). It was created by the Cult of Dead Cow hackers group in July 1999. Originally the BO2K was released as a source code and utilities package on a CD-ROM. There are reports that some files on that CD-ROM were infected with CIH virus, so the people who got that CD might get infected and spread not only the compiled backdoor, but also the CIH virus.

The tag is: *misp-galaxy:rat="Back Orifice 2000"*

Back Orifice 2000 is also known as:

- BO2k

NJRat

NJRat is a remote access trojan (RAT), first spotted in June 2013 with samples dating back to November 2012. It was developed and is supported by Arabic speakers and mainly used by cybercrime groups against targets in the Middle East. In addition to targeting some governments in the region, the trojan is used to control botnets and conduct other typical cybercrime activity. It infects victims via phishing attacks and drive-by downloads and propagates through infected USB keys or networked drives. It can download and execute additional malware, execute shell commands, read and write registry keys, capture screenshots, log keystrokes, and spy on webcams.

The tag is: *misp-galaxy:rat="NJRat"*

NJRat is also known as:

- Njw0rm

Pandora

Remote administrator tool that has been developed for Windows operation system. With advanced features and stable structure, Pandora's structure is based on advanced client / server architecture. was configured using modern technology.

The tag is: *misp-galaxy:rat="Pandora"*

Table 4340. Table References

Links
https://www.rekings.com/pandora-rat-2-2/

Predator Pain

Unlike Zeus, Predator Pain and Limitless are relatively simple keyloggers. They indiscriminately steal web credentials and mail client credentials, as well as capturing keystrokes and screen captures. The output is human readable, which is good if you are managing a few infected machines only, but the design doesn't scale well when there are a lot of infected machines and logs involved.

The tag is: *misp-galaxy:rat="Predator Pain"*

Predator Pain is also known as:

- PredatorPain

Predator Pain has relationships with:

- similar: *misp-galaxy:malpedia="HawkEye Keylogger"* with *estimative-language:likelihood-probability="likely"*

Dendroid

Dendroid is malware that affects Android OS and targets the mobile platform. It was first discovered in early of 2014 by Symantec and appeared in the underground for sale for \$300. Some things were noted in Dendroid, such as being able to hide from emulators at the time. When first discovered in 2014 it was one of the most sophisticated Android remote administration tools known at that time. It was one of the first Trojan applications to get past Google's Bouncer and caused researchers to warn about it being easier to create Android malware due to it. It also seems to have follow in the footsteps of Zeus and SpyEye by having simple-to-use command and control panels. The code appeared to be leaked somewhere around 2014. It was noted that an apk binder was included in the leak, which provided a simple way to bind Dendroid to legitimate applications.

The tag is: *misp-galaxy:rat="Dendroid"*

Dendroid has relationships with:

- similar: *misp-galaxy:mitre-mobile-attack-malware="Dendroid - MOB-S0017"* with estimative-language:likelihood-probability="likely"

Kiler RAT

This remote access trojan (RAT) has capabilities ranging from manipulating the registry to opening a reverse shell. From stealing credentials stored in browsers to accessing the victims webcam. Through the Command & Control (CnC) server software, the attacker has capabilities to create and configure the malware to spread utilizing physic devices, such as USB drives, but also to use the victim as a pivot point to gain more access laterally throughout the network. This remote access trojan could be classified as a variant of the well known njrat, as they share many similar features such as their display style, several abilities and a general template for communication methods . However, where njrat left off KilerRat has taken over. KilerRat is a very feature rich RAT with an active development force that is rapidly gaining in popularity amongst the middle eastern community and the world.

The tag is: *misp-galaxy:rat="Kiler RAT"*

Kiler RAT is also known as:

- Njw0rm

Kiler RAT has relationships with:

NanoCore

In September of 2015, a DigiTrust client visited a web link that was providing an Adobe Flash Player update. The client, an international retail organization, attempted to download and run what appeared to be a regular update. The computer trying to download this update was a back office system that processed end of day credit card transactions. This system also had the capability of connecting to the corporate network which contained company sales reports. DigiTrust experts were alerted to something malicious and blocked the download. The investigation found that what appeared to be an Adobe Flash Player update, was a Remote Access Trojan called NanoCore. If installation had been successful, customer credit card data, personal information, and internal sales information could have been captured and monetized. During the analysis of NanoCore, our experts found that there was much more to this RAT than simply being another Remote Access Trojan.

The tag is: *misp-galaxy:rat="NanoCore"*

NanoCore has relationships with:

- similar: `misp-galaxy:tool="NanoCoreRAT"` with `estimative-language:likelihood-probability="likely"`

Cobian RAT

The Zscaler ThreatLabZ research team has been monitoring a new remote access Trojan (RAT) family called Cobian RAT since February 2017. The RAT builder for this family was first advertised on multiple underground forums where cybercriminals often buy and sell exploit and malware kits. This RAT builder caught our attention as it was being offered for free and had lot of similarities to the njRAT/H-Worm family

Xsser

Xsser mRAT is a piece of malware that targets iOS devices that have software limitations removed. The app is installed via a rogue repository on Cydia, the most popular third-party application store

for jailbroken iPhones. Once the malicious bundle has been installed and executed, it gains persistence - preventing the user from deleting it. The mRAT then makes server-side checks and proceeds to steal data from the user's device and executes remote commands as directed by its command-and-control (C2) server.

The tag is: *misp-galaxy:rat="Xsser"*

Xsser is also known as:

- mRAT

Quaverse

Quaverse RAT or QRAT is a fairly new Remote Access Tool (RAT) introduced in May 2015. This RAT is marketed as an undetectable Java RAT. As you might expect from a RAT, the tool is capable of grabbing passwords, key logging and browsing files on the victim's computer. On a regular basis for the past several months, we have observed the inclusion of QRAT in a number of spam campaigns.

The tag is: *misp-galaxy:rat="Quaverse"*

Quaverse is also known as:

- QRAT

The tag is: *misp-galaxy:rat="Heseber"*

Cardinal

Cardinal is a remote access trojan (RAT) discovered by Palo Alto Networks in 2017 and has been active for over two years. It is delivered via a downloader, known as Carp, and uses malicious macros in Microsoft Excel documents to compile embedded C# programming language source code into an executable that runs and deploys the Cardinal RAT. The malicious Excel files use different tactics to get the victims to execute it.

The tag is: *misp-galaxy:rat="Cardinal"*

Cardinal has relationships with:

- similar: `misp-galaxy:tool="EVILNUM"` with `estimative-language:likelihood-probability="likely"`

Trochilus

Trochilus is a remote access trojan (RAT) first identified in October 2015 when attackers used it to infect visitors of a Myanmar website. It was then used in a 2016 cyber-espionage campaign, dubbed "the Seven Pointed Dagger," managed by another group, "Group 27," who also uses the PlugX trojan. Trochilus is primarily spread via emails with a malicious .RAR attachment containing the malware. The trojan's functionality includes a shellcode extension, remote uninstall, a file manager, and the ability to download and execute, upload and execute, and access the system information. Once present on a system, Trochilus can move laterally in the network for better access. This trojan operates in memory only and does not write to the disk, helping it evade detection.

The tag is: `misp-galaxy:rat="Trochilus"`

Trochilus has relationships with:

- similar: `misp-galaxy:tool="Trochilus"` with `estimative-language:likelihood-probability="likely"`

Matryoshka

Their most commonly used initial attack vector is a simple, yet alarmingly effective, spearphishing attack, infecting unsuspecting victims via a malicious email attachment (usually an executable that has been disguised as something else). From there, Matryoshka runs second stage malware via a dropper and covertly installs a Remote Access Toolkit (RAT). This is done using a reflective loader technique that allows the malware to run in process memory, rather than being written to disk. This not only hides the install of the RAT but also ensures that the RAT will be ‘reinstalled’ after system restart.

The tag is: `misp-galaxy:rat="Matryoshka"`

Matryoshka has relationships with:

- similar: `misp-galaxy:tool="Matryoshka"` with `estimative-language:likelihood-probability="likely"`

Table 4472. Table References

Mangit

First discovered by Trend Micro in June, Mangit is a new malware family being marketed on both the Dark web and open internet. Users have the option to rent the trojan’s infrastructure for about \$600 per 10-day period or buy the source code for about \$8,800. Mangit was allegedly developed by "Ric", a Brazilian hacker, who makes himself available via Skype to discuss rental agreements. Once the malware is rented or purchased, the user controls a portion of the Mangit botnet, the trojan, the dropper, an auto-update system, and the server infrastructure to run their attacks. Mangit contains support for nine Brazillian banks including Citibank, HSBC, and Santander. The malware can also be used to steal user PayPal credentials. Mangit has the capability to collect banking credentials, receive SMS texts when a victim is accessing their bank account, and take over victim’s browsers. To circumvent two-factor authentication, attackers can use Mangit to lock victim’s browsers and push pop-ups to the victim asking for the verification code they just received.

Revenge-RAT

Revenge v0.1 was a simple tool, according to a researcher known as Rui, who says the malware's author didn't bother obfuscating the RAT's source code. This raised a question mark with the researchers, who couldn't explain why VirusTotal scanners couldn't pick it up as a threat right away. Revenge, which was written in Visual Basic, also didn't feature too many working features, compared to similar RATs. Even Napoleon admitted that his tool was still in the early development stages, a reason why he provided the RAT for free.

rokrat

ROKRAT is a remote access trojan (RAT) that leverages a malicious Hangual Word Processor (HWP) document sent in spearphishing emails to infect hosts. The HWP document contains an embedded

Encapsulated PostScript (EPS) object. The object exploits an EPS buffer overflow vulnerability and downloads a binary disguised as a .JPG file. The file is then decoded and the ROKRAT executable is initiated. The trojan uses legitimate Twitter, Yandex, and Mediafire websites for its command and control communications and exfiltration platforms, making them difficult to block globally. Additionally, the platforms use HTTPS connections, making it more difficult to gather additional data on its activities. Cisco's Talos Group identified two email campaigns. In one, attackers send potential victims emails from an email server of a private university in Seoul, South Korea with a sender email address of "kgf2016@yonsei.ac.kr," the contact email for the Korea Global Forum, adding a sense of legitimacy to the email. It is likely that the email address was compromised and used by the attackers in this campaign. The second is less sophisticated and sends emails claiming to be from a free Korean mail service with a the subject line, "Request Help" and attached malicious HWP filename, "I'm a munchon person in Gangwon-do, North Korea." The ROKRAT developer uses several techniques to hinder analysis, including identifying tools usually used by malware analysts or within sandbox environments. Once it has infected a device, this trojan can execute commands, move a file, remove a file, kill a process, download and execute a file, upload documents, capture screenshots, and log keystrokes. Researchers believe the developer is a native Korean speaker and the campaign is currently targeting Korean-speakers.

The tag is: *misp-galaxy:rat="rokrat"*

rokrat is also known as:

- ROKRAT

RATAttack

RATAttack is a remote access trojan (RAT) that uses the Telegram protocol to support encrypted communication between the victim's machine and the attacker. The Telegram protocol also provides a simple method to communicate to the target, negating the need for port forwarding. Before using RATAttack, the attacker must create a Telegram bot and embed the bot's Telegram token into the trojan's configuration file. When a system is infected with RATAttack, it connects to the bot's Telegram channel. The attacker can then connect to the same channel and manage the RATAttack clients on the infected host machines. The trojan's code was available on GitHub then was taken down by the author on April 19, 2017.

The tag is: `misp-galaxy:rat="RATAttack"`

Table 4485. Table References

DNSMessenger

Talos recently analyzed an interesting malware sample that made use of DNS TXT record queries and responses to create a bidirectional Command and Control (C2) channel. This allows the attacker to use DNS communications to submit new commands to be run on infected machines and return the results of the command execution to the attacker. This is an extremely uncommon and evasive way of administering a RAT. The use of multiple stages of Powershell with various stages being completely fileless indicates an attacker who has taken significant measures to avoid detection.

htpRAT

On November 8, 2016 a non-disclosed entity in Laos was spear-phished by a group closely related to known Chinese adversaries and most likely affiliated with the Chinese government. The attackers utilized a new kind of Remote Access Trojan (RAT) that has not been previously observed or reported. The new RAT extends the capabilities of traditional RATs by providing complete remote execution of custom commands and programming. htpRAT, uncovered by RiskIQ cyber investigators, is the newest weapon in the Chinese adversary's arsenal in a campaign against Association of Southeast Asian Nations (ASEAN). Most RATs can log keystrokes, take screenshots, record audio and video from a webcam or microphone, install and uninstall programs and manage files. They support a fixed set of commands operators can execute using different command IDs —'file download' or 'file upload,' for example—and must be completely rebuilt to have different functionality. htpRAT, on the other hand, serves as a conduit for operators to do their job with

greater precision and effect. On the Command and Control (C2) server side, threat actors can build new functionality in commands, which can be sent to the malware to execute. This capability makes httpRAT a small, agile, and incredibly dynamic piece of malware. Operators can change functionality, such as searching for a different file on the victim's network, simply by wrapping commands.

The tag is: *misp-galaxy:rat="httpRAT"*

httpRAT has relationships with:

FALLCHILL

According to trusted third-party reporting, HIDDEN COBRA actors have likely been using FALLCHILL malware since 2016 to target the aerospace, telecommunications, and finance industries. The malware is a fully functional RAT with multiple commands that the actors can issue from a command and control (C2) server to a victim's system via dual proxies. FALLCHILL typically infects a system as a file dropped by other HIDDEN COBRA malware or as a file downloaded unknowingly by users when visiting sites compromised by HIDDEN COBRA actors. HIDDEN COBRA actors use an external tool or dropper to install the FALLCHILL malware-as-a-service to establish persistence. Because of this, additional HIDDEN COBRA malware may be present on systems compromised with FALLCHILL.

H-worm

H-worm is a VBS (Visual Basic Script) based RAT written by an individual going by the name Houdini. We believe the author is based in Algeria and has connections to njq8, the author of njw0rm [1] and njRAT/LV [2] through means of a shared or common code base. We have seen the H-worm RAT being employed in targeted attacks against the international energy industry; however, we also see it being employed in a wider context as run of the mill attacks through spammed email attachments and malicious links.

The tag is: *misp-galaxy:rat="H-worm"*

Parasite-HTTP-RAT

The RAT, dubbed Parasite HTTP, is especially notable for the extensive array of techniques it incorporates for sandbox detection, anti-debugging, anti-emulation, and other protections. The malware is also modular in nature, allowing actors to add new capabilities as they become available or download additional modules post infection.

raw-data

Nocturnal Stealer

It is designed to steal data found within multiple Chromium and Firefox based browsers, it can also steal many popular cryptocurrency wallets as well as any saved FTP passwords within FileZilla. Nocturnal Stealer uses several anti-VM and anti-analysis techniques, which include but are not limited to: environment fingerprinting, checking for debuggers and analyzers, searching for known virtual machine registry keys, and checking for emulation software.

The tag is: *misp-galaxy:stealer="Nocturnal Stealer"*

Stalker Panda

The group appears to have close ties to the Chinese National University of Defense and Technology, which is possibly linked to the PLA. Stalker Panda has been observed conducting targeted attacks against Japan, Taiwan, Hong Kong, and the United States. The attacks appear to be centered on political, media, and engineering sectors. The group appears to have been active since around 2010 and they maintain and upgrade their tools regularly.

Nitro

These attackers were the subject of an extensive report by Symantec in 2011, which termed the attackers Nitro and stated: 'The goal of the attackers appears to be to collect intellectual property such as design documents, formulas, and manufacturing processes. In addition, the same attackers appear to have a lengthy operation history including attacks on other industries and organizations. Attacks on the chemical industry are merely their latest attack wave. As part of our investigations,

we were also able to identify and contact one of the attackers to try and gain insights into the motivations behind these attacks.' Palo Alto Networks reported on continued activity by the attackers in 2014.

Tropic Trooper

TrendMicro described Tropic Trooper in a 2015 report as: 'Taiwan and the Philippines have become the targets of an ongoing campaign called Operation TropicTrooper. Active since 2012, the attackers behind the campaign have set their sights on the Taiwanese government as well as a number of companies in the heavy industry. The same campaign has also targeted key Philippine military agencies.'

The tag is: *misp-galaxy:threat-actor="Tropic Trooper"*

Tropic Trooper is also known as:

- Operation Tropic Trooper
- Operation TropicTrooper
- TropicTrooper

Axiom

The Winnti grouping of activity is large and may actually be a number of linked groups rather than a single discrete entity. Kaspersky describe Winnti as: 'The Winnti group has been attacking companies in the online video game industry since 2009 and is currently still active. The groups objectives are stealing digital certificates signed by legitimate software vendors in addition to intellectual property theft, including the source code of online game projects. The majority of the victims are from South East Asia.'

The tag is: *misp-galaxy:threat-actor="Axiom"*

Axiom is also known as:

- Winnti Group
- Tailgater Team
- Group 72
- Group72
- Tailgater
- Ragebeast
- Blackfly
- Lead

- Wicked Spider
- APT17
- APT 17
- Dogfish
- Deputy Dog
- Wicked Panda
- Barium

Axiom has relationships with:

- similar: `misp-galaxy:mitre-intrusion-set="Winnti Group - G0044"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:mitre-pre-attack-intrusion-set="APT17 - G0025"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:threat-actor="Aurora Panda"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:mitre-intrusion-set="Axiom - G0001"` with `estimative-language:likelihood-probability="likely"`

Cutting Kitten

While tracking a suspected Iran-based threat group known as Threat Group-2889[1] (TG-2889), Dell SecureWorks Counter Threat Unit™ (CTU) researchers uncovered a network of fake LinkedIn profiles. These convincing profiles form a self-referenced network of seemingly established LinkedIn users. CTU researchers assess with high confidence the purpose of this network is to target potential victims through social engineering. Most of the legitimate LinkedIn accounts associated with the fake accounts belong to individuals in the Middle East, and CTU researchers assess with medium confidence that these individuals are likely targets of TG-2889. One of the threat actors responsible for the denial of service attacks against U.S in 2012–2013. Three individuals associated with the group—believed to be have been working on behalf of Iran’s Islamic Revolutionary Guard Corps—were indicted by the Justice Department in 2016.

The tag is: `misp-galaxy:threat-actor="Cutting Kitten"`

Cutting Kitten is also known as:

- ITSecTeam
- Threat Group 2889
- TG-2889
- Ghambar

Cleaver

A group of cyber actors utilizing infrastructure located in Iran have been conducting computer network exploitation activity against public and private U.S. organizations, including Cleared Defense Contractors (CDCs), academic institutions, and energy sector companies. This threat actor targets entities in the government, energy, and technology sectors that are located in or do business with Saudi Arabia.

The tag is: *misp-galaxy:threat-actor="Cleaver"*

Cleaver is also known as:

- Operation Cleaver
- Tarh Andishan
- Alibaba
- 2889
- TG-2889
- Cobalt Gypsy
- Ghambar
- Cutting Kitten
- Group 41
- Magic Hound

Sands Casino

The tag is: `misp-galaxy:threat-actor="Sands Casino"`

Rebel Jackal

This is a pro-Islamist organization that generally conducts attacks motivated by real world events in which its members believe that members of the Muslim faith were wronged. Its attacks generally involve website defacements; however, the group did develop a RAT that it refers to as Fallaga RAT, but which appears to simply be a fork of the njRAT malware popular amongst hackers in the Middle East/North Africa region.

The tag is: `misp-galaxy:threat-actor="Rebel Jackal"`

Rebel Jackal is also known as:

- FallagaTeam

Viking Jackal

The tag is: *misp-galaxy:threat-actor="Viking Jackal"*

Viking Jackal is also known as:

- Vikingdom

Sofacy

The Sofacy Group (also known as APT28, Pawn Storm, Fancy Bear and Sednit) is a cyber espionage group believed to have ties to the Russian government. Likely operating since 2007, the group is known to target government, military, and security organizations. It has been characterized as an advanced persistent threat.

The tag is: *misp-galaxy:threat-actor="Sofacy"*

Sofacy is also known as:

- APT 28
- APT28
- Pawn Storm
- PawnStorm

APT 29

A 2015 report by F-Secure describe APT29 as: "The Dukes are a well-resourced, highly dedicated and organized cyberespionage group that we believe has been working for the Russian Federation since at least 2008 to collect intelligence in support of foreign and security policy decision-making. The Dukes show unusual confidence in their ability to continue successfully compromising their targets, as well as in their ability to operate with impunity. The Dukes primarily target Western governments and related organizations, such as government ministries and agencies, political think tanks, and governmental subcontractors. Their targets have also included the governments of members of the Commonwealth of Independent States;Asian, African, and Middle Eastern governments;organizations associated with Chechen extremism;and Russian speakers engaged in the illicit trade of controlled substances and drugs. The Dukes are known to employ a vast arsenal of malware toolsets, which we identify as MiniDuke, CosmicDuke, OnionDuke, CozyDuke, CloudDuke, SeaDuke, HammerDuke, PinchDuke, and GeminiDuke. In recent years, the Dukes have engaged in apparently biannual large - scale spear - phishing campaigns against hundreds or even thousands of recipients associated with governmental institutions and affiliated organizations. These campaigns utilize a smash - and - grab approach involving a fast but noisy breakin followed by the rapid collection and exfiltration of as much data as possible.If the compromised target is discovered to be of value, the Dukes will quickly switch the toolset used and move to using stealthier tactics focused on persistent compromise and long - term intelligence gathering. This threat actor targets government ministries and agencies in the West, Central Asia, East Africa, and the Middle East; Chechen extremist groups; Russian organized crime; and think tanks. It is suspected to be behind the 2015 compromise of unclassified networks at the White House,

Department of State, Pentagon, and the Joint Chiefs of Staff. The threat actor includes all of the Dukes tool sets, including MiniDuke, CosmicDuke, OnionDuke, CozyDuke, SeaDuke, CloudDuke (aka MiniDionis), and HammerDuke (aka Hammertoss). '

The tag is: *misp-galaxy:threat-actor="APT 29"*

APT 29 is also known as:

- Dukes
- Group 100
- Cozy Duke
- CozyDuke
- EuroAPT
- CozyBear
- CozyCar
- Cozer
- Office Monkeys
- OfficeMonkeys
- APT29
- Cozy Bear

Turla Group

A 2014 Guardian article described Turla as: 'Dubbed the Turla hackers, initial intelligence had indicated western powers were key targets, but it was later determined embassies for Eastern Bloc nations were of more interest. Embassies in Belgium, Ukraine, China, Jordan, Greece, Kazakhstan, Armenia, Poland, and Germany were all attacked, though researchers from Kaspersky Lab and Symantec could not confirm which countries were the true targets. In one case from May 2012, the office of the prime minister of a former Soviet Union member country was infected, leading to 60 further computers being affected, Symantec researchers said. There were some other victims, including the ministry for health of a Western European country, the ministry for education of a Central American country, a state electricity provider in the Middle East and a medical organisation in the US, according to Symantec. It is believed the group was also responsible for a much - documented 2008 attack on the US Central Command. The attackers - who continue to operate - have ostensibly sought to carry out surveillance on targets and pilfer data, though their use of encryption across their networks has made it difficult to ascertain exactly what the hackers took. Kaspersky Lab, however, picked up a number of the attackers searches through their victims emails, which included terms such as Nato and EU energy dialogue. Though attribution is difficult to substantiate, Russia has previously been suspected of carrying out the attacks and Symantec's Gavin O' Gorman told the Guardian a number of the hackers appeared to be using Russian names and language in their notes for their malicious code. Cyrillic was also seen in use.'

The tag is: *misp-galaxy:threat-actor="Turla Group"*

Sandworm

This threat actor targets industrial control systems, using a tool called Black Energy, associated with electricity and power generation for espionage, denial of service, and data destruction purposes. Some believe that the threat actor is linked to the 2015 compromise of the Ukrainian electrical grid and a distributed denial of service prior to the Russian invasion of Georgia. Believed to be responsible for the 2008 DDoS attacks in Georgia and the 2015 Ukraine power grid outage

The tag is: *misp-galaxy:threat-actor="Sandworm"*

Sandworm is also known as:

- Sandworm Team

Deadeye Jackal

The Syrian Electronic Army (SEA) is a group of computer hackers which first surfaced online in 2011 to support the government of Syrian President Bashar al-Assad. Using spamming, website defacement, malware, phishing, and denial of service attacks, it has targeted political opposition groups, western news organizations, human rights groups and websites that are seemingly neutral to the Syrian conflict. It has also hacked government websites in the Middle East and Europe, as well as US defense contractors. As of 2011 the SEA has been **the first Arab country to have a public Internet Army hosted on its national networks to openly launch cyber attacks on its enemies**. The precise nature of SEA's relationship with the Syrian government has changed over time and is unclear

ScarCruft

ScarCruft is a relatively new APT group; victims have been observed in several countries, including Russia, Nepal, South Korea, China, India, Kuwait and Romania. The group has several ongoing operations utilizing multiple exploits — two for Adobe Flash and one for Microsoft Internet Explorer.

The tag is: *misp-galaxy:threat-actor="ScarCruft"*

ScarCruft is also known as:

- Operation Daybreak
- Operation Erebus

ScarCruft has relationships with:

- similar: *misp-galaxy:mitre-intrusion-set="APT37 - G0067"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:threat-actor="APT37"* with *estimative-language:likelihood-probability="likely"*

Pacifier APT

Bitdefender detected and blocked an ongoing cyber-espionage campaign against Romanian institutions and other foreign targets. The attacks started in 2014, with the latest reported occurrences in May of 2016. The APT, dubbed Pacifier by Bitdefender researchers, makes use of malicious .doc documents and .zip files distributed via spear phishing e-mail.

The tag is: *misp-galaxy:threat-actor="Pacifier APT"*

Pacifier APT is also known as:

- Skipper
- Popeye

Table 4596. Table References

Dropping Elephant

Dropping Elephant (also known as “Chinastrats” and “Patchwork”) is a relatively new threat actor that is targeting a variety of high profile diplomatic and economic targets using a custom set of attack tools. Its victims are all involved with China’s foreign relations in some way, and are generally caught through spear-phishing or watering hole attacks.

The tag is: *misp-galaxy:threat-actor="Dropping Elephant"*

Dropping Elephant is also known as:

- Chinastrats
- Patchwork
- Monsoon
- Sarit
- Quilted Tiger

Dropping Elephant has relationships with:

- similar: *misp-galaxy:mitre-intrusion-set="Patchwork - G0040"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:mitre-intrusion-set="MONSOON - G0042"* with *estimative-language:likelihood-probability="likely"*

Scarlet Mimic

Scarlet Mimic is a threat group that has targeted minority rights activists. This group has not been directly linked to a government source, but the group’s motivations appear to overlap with those of the Chinese government. While there is some overlap between IP addresses used by Scarlet Mimic and Putter Panda, it has not been concluded that the groups are the same.

The tag is: *misp-galaxy:threat-actor="Scarlet Mimic"*

Scarlet Mimic has relationships with:

- similar: `misp-galaxy:mitre-intrusion-set="Scarlet Mimic - G0029"` with `estimative-language:likelihood-probability="likely"`

ProjectSauron

ProjectSauron is the name for a top level modular cyber-espionage platform, designed to enable and manage long-term campaigns through stealthy survival mechanisms coupled with multiple exfiltration methods. Technical details show how attackers learned from other extremely advanced actors in order to avoid repeating their mistakes. As such, all artifacts are customized per given target, reducing their value as indicators of compromise for any other victim. Usually APT campaigns have a geographical nexus, aimed at extracting information within a specific region or from a given industry. That usually results in several infections in countries within that region, or in the targeted industry around the world. Interestingly, ProjectSauron seems to be dedicated to just a couple of countries, focused on collecting high value intelligence by compromising almost all key entities it could possibly reach within the target area. The name, ProjectSauron reflects the fact that the code authors refer to 'Sauron' in the Lua scripts.

The tag is: *misp-galaxy:threat-actor="ProjectSauron"*

ProjectSauron is also known as:

- Strider
- Sauron
- Project Sauron

ProjectSauron has relationships with:

- similar: *misp-galaxy:mitre-intrusion-set="Strider - G0041"* with *estimative-language:likelihood-probability="likely"*

Libyan Scorpions

Libyan Scorpions is a malware operation in use since September 2015 and operated by a politically motivated group whose main objective is intelligence gathering, spying on influentials and political figures and operate an espionage campaign within Libya.

The tag is: *misp-galaxy:threat-actor="Libyan Scorpions"*

TeamXRat

The tag is: *misp-galaxy:threat-actor="TeamXRat"*

TeamXRat is also known as:

- CorporacaoXRat
- CorporationXRat

Table 4609. Table References

OilRig

OilRig is an Iranian threat group operating primarily in the Middle East by targeting organizations in this region that are in a variety of different industries; however, this group has occasionally targeted organizations outside of the Middle East as well. It also appears OilRig carries out supply chain attacks, where the threat group leverages the trust relationship between organizations to attack their primary targets.

OilRig is an active and organized threat group, which is evident based on their systematic targeting of specific organizations that appear to be carefully chosen for strategic purposes. Attacks attributed to this group primarily rely on social engineering to exploit the human rather than software vulnerabilities; however, on occasion this group has used recently patched vulnerabilities in the delivery phase of their attacks. The lack of software vulnerability exploitation does not necessarily suggest a lack of sophistication, as OilRig has shown maturity in other aspects of their operations. Such maturities involve:

-Organized evasion testing used the during development of their tools. -Use of custom DNS Tunneling protocols for command and control (C2) and data exfiltration. -Custom web-shells and backdoors used to persistently access servers.

OilRig relies on stolen account credentials for lateral movement. After OilRig gains access to a system, they use credential dumping tools, such as Mimikatz, to steal credentials to accounts logged into the compromised system. The group uses these credentials to access and to move laterally to other systems on the network. After obtaining credentials from a system, operators in this group prefer to use tools other than their backdoors to access the compromised systems, such as remote desktop and putty. OilRig also uses phishing sites to harvest credentials to individuals at targeted organizations to gain access to internet accessible resources, such as Outlook Web Access.

The tag is: *misp-galaxy:threat-actor="OilRig"*

OilRig is also known as:

- Twisted Kitten
- Cobalt Gypsy
- Crambus
- Helix Kitten

OilRig has relationships with:

- similar: *misp-galaxy:mitre-pre-attack-intrusion-set="Clever - G0003"* with *estimative-language:likelihood-probability="likely"*

Volatile Cedar

Beginning in late 2012, a carefully orchestrated attack campaign we call Volatile Cedar has been targeting individuals, companies and institutions worldwide. This campaign, led by a persistent attacker group, has successfully penetrated a large number of targets using various attack techniques, and specifically, a custom-made malware implant codenamed Explosive .

The tag is: *misp-galaxy:threat-actor="Volatile Cedar"*

Table 4611. Table References

Links

<https://www.checkpoint.com/downloads/volatile-cedar-technical-report.pdf>

Malware reusers

Threat Group conducting cyber espionage while re-using tools from other teams; like those of Hacking Team, and vmprotect to obfuscate.

The tag is: *misp-galaxy:threat-actor="Malware reusers"*

Malware reusers is also known as:

- Reuse team
- Dancing Salome

TERBIUM

Microsoft Threat Intelligence identified similarities between this recent attack and previous 2012 attacks against tens of thousands of computers belonging to organizations in the energy sector. Microsoft Threat Intelligence refers to the activity group behind these attacks as TERBIUM, following our internal practice of assigning rogue actors chemical element names.

The tag is: *misp-galaxy:threat-actor="TERBIUM"*

TERBIUM has relationships with:

- similar: *misp-galaxy:microsoft-activity-group="TERBIUM"* with *estimative-language:likelihood-probability="likely"*

Table 4612. Table References

Links

Molerats

In October 2012, malware attacks against Israeli government targets grabbed media attention as officials temporarily cut off Internet access for its entire police force and banned the use of USB memory sticks. Security researchers subsequently linked these attacks to a broader, yearlong campaign that targeted not just Israelis but Palestinians as well. and as discovered later, even the U.S. and UK governments. Further research revealed a connection between these attacks and members of the so-called “Gaza Hackers Team.” We refer to this campaign as “Molerats.”

The tag is: *misp-galaxy:threat-actor="Molerats"*

Molerats is also known as:

- Gaza Hackers Team
- Gaza cybergang
- Operation Molerats
- Extreme Jackal
- Moonlight

Molerats has relationships with:

- similar: *misp-galaxy:mitre-intrusion-set="Molerats - G0021"* with *estimative-language:likelihood-probability="likely"*

Table 4613. Table References

https://ti.360.net/blog/articles/suspected-molerats-new-attack-in-the-middle-east/

PROMETHIUM

PROMETHIUM is an activity group that has been active as early as 2012. The group primarily uses Truvasys, a first-stage malware that has been in circulation for several years. Truvasys has been involved in several attack campaigns, where it has masqueraded as one of server common computer utilities, including WinUtils, TrueCrypt, WinRAR, or SanDisk. In each of the campaigns, Truvasys malware evolved with additional features—this shows a close relationship between the activity groups behind the campaigns and the developers of the malware.

The tag is: *misp-galaxy:threat-actor="PROMETHIUM"*

PROMETHIUM is also known as:

- StrongPity

PROMETHIUM has relationships with:

- similar: `misp-galaxy:mitre-intrusion-set="PROMETHIUM - G0056"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:microsoft-activity-group="PROMETHIUM"` with `estimative-language:likelihood-probability="likely"`

PassCV

The PassCV group continues to be one of the most successful and active threat groups that leverage a wide array of stolen Authenticode-signing certificates. Snorre Fagerland of Blue Coat Systems first coined the term PassCV in a blog post. His post provides a good introduction to the group and covers some of the older infrastructure, stolen code-signing certificate reuse, and other connections associated with the PassCV malware. There are several clues alluding to the possibility that multiple groups may be utilizing the same stolen signing certificates, but at this time SPEAR believes the current attacks are more likely being perpetrated by a single group employing multiple publicly available Remote Administration Tools (RATs). The PassCV group has been operating with

continued success and has already started to expand their malware repertoire into different off-the-shelf RATs and custom code. SPEAR identified eighteen previously undisclosed stolen Authenticode certificates. These certificates were originally issued to companies and individuals scattered across China, Taiwan, Korea, Europe, the United States and Russia. In this post we expand the usage of the term 'PassCV' to encompass the malware mentioned in the Blue Coat Systems report, as well as the APT group behind the larger C2 infrastructure and stolen Authenticode certificates. We'd like to share some of our findings as they pertain to the stolen certificates, command and control infrastructure, and some of the newer custom RATs they've begun development on.

The tag is: *misp-galaxy:threat-actor="PassCV"*

Sath-ı Müdafaa

A Turkish hacking group, Sath-ı Müdafaa, is encouraging individuals to join its DDoS-for-Points platform that features points and prizes for carrying out distributed denial-of-service (DDoS) attacks against a list of predetermined targets. Their DDoS tool also contains a backdoor to hack the hackers. So the overarching motivation and allegiance of the group is not entirely clear.

The tag is: *misp-galaxy:threat-actor="Sath-ı Müdafaa"*

Aslan Neferler Tim

Turkish nationalist hacktivist group that has been active for roughly one year. According to Domaintools, the group's site has been registered since December 2015, with an active Twitter account since January 2016. The group carries out distributed denial-of-service (DDoS) attacks and defacements against the sites of news organizations and governments perceived to be critical of Turkey's policies or leadership, and purports to act in defense of Islam

The tag is: *misp-galaxy:threat-actor="Aslan Neferler Tim"*

Aslan Neferler Tim is also known as:

- Lion Soldiers Team
- Phantom Turk

Ayyıldız Tim

Ayyıldız (Crescent and Star) Tim is a nationalist hacking group founded in 2002. It performs defacements and DDoS attacks against the websites of governments that it considers to be repressing Muslim minorities or engaged in Islamophobic policies.

The tag is: *misp-galaxy:threat-actor="Ayyıldız Tim"*

Ayyıldız Tim is also known as:

- Crescent and Star

TurkHackTeam

Founded in 2004, Turkhackteam is one of Turkey's oldest and most high-profile hacking collectives. According to a list compiled on Turkhackteam's forum, the group has carried out almost 30 highly publicized hacking campaigns targeting foreign government and commercial websites, including websites of international corporations.

The tag is: *misp-galaxy:threat-actor="TurkHackTeam"*

TurkHackTeam is also known as:

- Turk Hack Team

Equation Group

The Equation Group is a highly sophisticated threat actor described by its discoverers at Kaspersky Labs as one of the most sophisticated cyber attack groups in the world, operating alongside but always from a position of superiority with the creators of Stuxnet and Flame

The tag is: *misp-galaxy:threat-actor="Equation Group"*

Equation Group is also known as:

- Tilded Team
- Lamberts
- EQGRP

Equation Group has relationships with:

- similar: *misp-galaxy:threat-actor="Longhorn"* with *estimative-language:likelihood-probability="likely"*

Gamaredon Group

Unit 42 threat researchers have recently observed a threat group distributing new, custom developed malware. We have labelled this threat group the Gamaredon Group and our research shows that the Gamaredon Group has been active since at least 2013. In the past, the Gamaredon Group has relied heavily on off-the-shelf tools. Our new research shows the Gamaredon Group have made a shift to custom-developed malware. We believe this shift indicates the Gamaredon Group have improved their technical capabilities.

The tag is: `misp-galaxy:threat-actor="Gamaredon Group"`

Gamaredon Group has relationships with:

- similar: `misp-galaxy:mitre-intrusion-set="Gamaredon Group - G0047"` with `estimative-language:likelihood-probability="likely"`

Groundbait

Groundbait is a group targeting anti-government separatists in the self-declared Donetsk and Luhansk People's Republics.

The tag is: *misp-galaxy:threat-actor="Groundbait"*

Table 4627. Table References

Links
http://www.welivesecurity.com/2016/05/18/groundbait

Longhorn

Longhorn has been active since at least 2011. It has used a range of back door Trojans in addition to zero-day vulnerabilities to compromise its targets. Longhorn has infiltrated governments and internationally operating organizations, in addition to targets in the financial, telecoms, energy, aerospace, information technology, education, and natural resources sectors. All of the organizations targeted would be of interest to a nation-state attacker. Longhorn has infected 40 targets in at least 16 countries across the Middle East, Europe, Asia, and Africa. On one occasion a computer in the United States was compromised but, following infection, an uninstaller was launched within hours, which may indicate this victim was infected unintentionally. According to cfr, this threat actor compromises governments, international organizations, academic institutions, and financial, telecommunications, energy, aerospace, information technology, and natural resource industries for espionage purposes. Some of the tools used by this threat actor were released by Wikileaks under the name "Vault 7."

The tag is: *misp-galaxy:threat-actor="Longhorn"*

Longhorn is also known as:

- Lamberts
- the Lamberts

Longhorn has relationships with:

- similar: *misp-galaxy:threat-actor="Equation Group"* with *estimative-language:likelihood-probability="likely"*

APT32

Cyber espionage actors, now designated by FireEye as APT32 (OceanLotus Group), are carrying out intrusions into private sector companies across multiple industries and have also targeted foreign governments, dissidents, and journalists. FireEye assesses that APT32 leverages a unique suite of fully-featured malware, in conjunction with commercially-available tools, to conduct targeted operations that are aligned with Vietnamese state interests.

The tag is: *misp-galaxy:threat-actor="APT32"*

APT32 is also known as:

- OceanLotus Group
- Ocean Lotus
- Cobalt Kitty
- APT-C-00
- SeaLotus
- APT-32
- APT 32
- Ocean Buffalo

APT32 has relationships with:

- similar: `misp-galaxy:mitre-intrusion-set="APT32 - G0050"` with `estimative-language:likelihood-probability="likely"`

SilverTerrier

As these tools rise and fall in popularity (and more importantly, as detection rates by antivirus vendors improve), SilverTerrier actors have consistently adopted new malware families and shifted to the latest packing tools available.

The tag is: `misp-galaxy:threat-actor="SilverTerrier"`

Table 4631. Table References

Links
https://www.paloaltonetworks.com/content/dam/pan/en_US/assets/pdf/reports/Unit_42/silverterrier-next-evolution-in-nigerian-cybercrime.pdf

WildNeutron

A corporate espionage group has compromised a string of major corporations over the past three years in order to steal confidential information and intellectual property. The gang, which Symantec calls Butterfly, is not-state sponsored, rather financially motivated. It has attacked multi-billion dollar companies operating in the internet, IT software, pharmaceutical, and commodities sectors. Twitter, Facebook, Apple, and Microsoft are among the companies who have publicly acknowledged attacks.

The tag is: `misp-galaxy:threat-actor="WildNeutron"`

WildNeutron is also known as:

- Butterfly
- Morpho
- Sphinx Moth

PLATINUM

PLATINUM has been targeting its victims since at least as early as 2009, and may have been active for several years prior. Its activities are distinctly different not only from those typically seen in untargeted attacks, but from many targeted attacks as well. A large share of targeted attacks can be characterized as opportunistic: the activity group changes its target profiles and attack geographies based on geopolitical seasons, and may attack institutions all over the world. Like many such groups, PLATINUM seeks to steal sensitive intellectual property related to government interests, but its range of preferred targets is consistently limited to specific governmental organizations, defense institutes, intelligence agencies, diplomatic institutions, and telecommunication providers in South and Southeast Asia. The group's persistent use of spear phishing tactics (phishing attempts aimed at specific individuals) and access to previously undiscovered zero-day exploits have made it a highly resilient threat.

The tag is: *misp-galaxy:threat-actor="PLATINUM"*

PLATINUM is also known as:

- TwoForOne

PLATINUM has relationships with:

- similar: *misp-galaxy:mitre-intrusion-set="PLATINUM - G0068"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:microsoft-activity-group="PLATINUM"* with *estimative-language:likelihood-probability="likely"*

RASPITE

Dragos has identified a new activity group targeting access operations in the electric utility sector. We call this activity group RASPITE. Analysis of RASPITE tactics, techniques, and procedures (TTPs) indicate the group has been active in some form since early- to mid-2017. RASPITE targeting includes entities in the US, Middle East, Europe, and East Asia. Operations against electric utility organizations appear limited to the US at this time. RASPITE leverages strategic website compromise to gain initial access to target networks. RASPITE uses the same methodology as DYMALLOY and ALLANITE in embedding a link to a resource to prompt an SMB connection, from which it harvests Windows credentials. The group then deploys install scripts for a malicious service to beacon back to RASPITE-controlled infrastructure, allowing the adversary to remotely access the victim machine.

The tag is: *misp-galaxy:threat-actor="RASPITE"*

RASPITE is also known as:

- LeafMiner

El Machete

El Machete is one of these threats that was first publicly disclosed and named by Kaspersky here. We've found that this group has continued to operate successfully, predominantly in Latin America, since 2014. All attackers simply moved to new C2 infrastructure, based largely around dynamic DNS domains, in addition to making minimal changes to the malware in order to evade signature-based detection.

The tag is: *misp-galaxy:threat-actor="El Machete"*

El Machete is also known as:

- Machete

Microcin

We're already used to the fact that complex cyberattacks use 0-day vulnerabilities, bypassing digital signature checks, virtual file systems, non-standard encryption algorithms and other tricks. Sometimes, however, all of this may be done in much simpler ways, as was the case in the malicious campaign that we detected a while ago – we named it 'Microcin' after microini, one of the malicious components used in it.

The tag is: *misp-galaxy:threat-actor="Microcin"*

https://www.cfr.org/interactive/cyber-operations/leviathan

APT34

Since at least 2014, an Iranian threat group tracked by FireEye as APT34 has conducted reconnaissance aligned with the strategic interests of Iran. The group conducts operations primarily in the Middle East, targeting financial, government, energy, chemical, telecommunications and other industries. Repeated targeting of Middle Eastern financial, energy and government organizations leads FireEye to assess that those sectors are a primary concern of APT34. The use of infrastructure tied to Iranian operations, timing and alignment with the national interests of Iran also lead FireEye to assess that APT34 acts on behalf of the Iranian government.

The tag is: *misp-galaxy:threat-actor="APT34"*

APT34 is also known as:

- APT 34

APT34 has relationships with:

- similar: *misp-galaxy:mitre-intrusion-set="APT34 - G0057"* with *estimative-language:likelihood-probability="likely"*

Orangeworm

Symantec has identified a previously unknown group called Orangeworm that has been observed installing a custom backdoor called Trojan.Kwampirs within large international corporations that operate within the healthcare sector in the United States, Europe, and Asia. First identified in January 2015, Orangeworm has also conducted targeted attacks against organizations in related industries as part of a larger supply-chain attack in order to reach their intended victims. Known victims include healthcare providers, pharmaceuticals, IT solution providers for healthcare and equipment manufacturers that serve the healthcare industry, likely for the purpose of corporate espionage.

The tag is: *misp-galaxy:threat-actor="Orangeworm"*

RANCOR

The Rancor group's attacks use two primary malware families which are naming DDKONG and PLAINTEE. DDKONG is used throughout the campaign and PLAINTEE appears to be new addition to these attackers' toolkit. Countries Unit 42 has identified as targeted by Rancor with these malware families include, but are not limited to Singapore and Cambodia.

The tag is: *misp-galaxy:threat-actor="RANCOR"*

RANCOR is also known as:

- Rancor group

Table 4696. Table References

https://www.cfr.org/interactive/cyber-operations/rancor

The Big Bang

While it is not clear exactly what the attacker is looking for, what is clear is that once he finds it, a second stage of the attack awaits, fetching additional modules and/or malware from the Command and Control server. This then is a surveillance attack in progress and has been dubbed ‘Big Bang’ due to the attacker’s fondness for the ‘Big Bang Theory’ TV show, after which some of the malware’s modules are named.

The tag is: *misp-galaxy:threat-actor="The Big Bang"*

Subaat

In mid-July, Palo Alto Networks Unit 42 identified a small targeted phishing campaign aimed at a government organization. While tracking the activities of this campaign, we identified a repository of additional malware, including a web server that was used to host the payloads used for both this attack as well as others.

The tag is: *misp-galaxy:threat-actor="Subaat"*

Table 4698. Table References

Links
https://researchcenter.paloaltonetworks.com/2017/10/unit42-tracking-subaat-targeted-phishing-attacks-point-leader-threat-actors-repository/

The Gorgon Group

Unit 42 researchers have been tracking Subaat, an attacker, since 2017. Recently Subaat drew our attention due to renewed targeted attack activity. Part of monitoring Subaat included realizing the actor was possibly part of a larger crew of individuals responsible for carrying out targeted attacks against worldwide governmental organizations. Technical analysis on some of the attacks as well as attribution links with Pakistan actors have been already depicted by 360 and Tuisec, in which they found interesting connections to a larger group of attackers Unit 42 researchers have been tracking,

which we are calling Gorgon Group.

The tag is: *misp-galaxy:threat-actor="The Gorgon Group"*

Table 4699. Table References

Links
https://researchcenter.paloaltonetworks.com/2018/08/unit42-gorgon-group-slithering-nation-state-cybercrime/

DarkHydrus

In July 2018, Unit 42 analyzed a targeted attack using a novel file type against at least one government agency in the Middle East. It was carried out by a previously unpublished threat group we track as DarkHydrus. Based on our telemetry, we were able to uncover additional artifacts leading us to believe this adversary group has been in operation with their current playbook since early 2016. This attack diverged from previous attacks we observed from this group as it involved spear-phishing emails sent to targeted organizations with password protected RAR archive attachments that contained malicious Excel Web Query files (.iqy).

The tag is: *misp-galaxy:threat-actor="DarkHydrus"*

DarkHydrus is also known as:

- LazyMeerkat

PowerPool

Malware developers have started to use the zero-day exploit for Task Scheduler component in Windows, two days after proof-of-concept code for the vulnerability appeared online.

A security researcher who uses the online name SandboxEscaper on August 27 released the source code for exploiting a security bug in the Advanced Local Procedure Call (ALPC) interface used by Windows Task Scheduler.

More specifically, the problem is with the SchRpcSetSecurity API function, which fails to properly check user's permissions, allowing write privileges on files in C:\Windows\Task.

The vulnerability affects Windows versions 7 through 10 and can be used by an attacker to escalate their privileges to all-access SYSTEM account level.

A couple of days after the exploit code became available (source and binary), malware researchers at ESET noticed its use in active malicious campaigns from a threat actor they call PowerPool, because of their tendency to use tools mostly written in PowerShell for lateral movement.

The group appears to have a small number of victims in the following countries: Chile, Germany, India, the Philippines, Poland, Russia, the United Kingdom, the United States, and Ukraine.

The researchers say that PowerPool developers did not use the binary version of the exploit, deciding instead to make some subtle changes to the source code before recompiling it.

The tag is: *misp-galaxy:threat-actor="PowerPool"*

Domestic Kitten

An extensive surveillance operation targets specific groups of individuals with malicious mobile apps that collect sensitive information on the device along with surrounding voice recordings.

Researchers with CheckPoint discovered the attack and named it Domestic Kitten. The targets are Kurdish and Turkish natives, and ISIS supporters, all Iranian citizens.

The tag is: *misp-galaxy:threat-actor="Domestic Kitten"*

Table 4720. Table References

Links
https://www.bleepingcomputer.com/news/security/domestic-kitten-apt-operates-in-silence-since-2016/

FASTCash

Treasury has identified a sophisticated cyber-enabled ATM cash out campaign we are calling FASTCash. FASTCash has been active since late 2016 targeting banks in Africa and Asia to remotely compromise payment switch application servers within banks to facilitate fraudulent transactions, primarily involving ATMs, to steal cash equivalent to tens of millions of dollars. FBI has attributed malware used in this campaign to the North Korean government. We expect FASTCash to continue targeting retail payment systems vulnerable to remote exploitation.

The tag is: *misp-galaxy:threat-actor="FASTCash"*

Roaming Mantis

According to new research by Kaspersky's GREAT team, the online criminal activities of the Roaming Mantis Group have continued to evolve since they were first discovered in April 2018. As part of their activities, this group hacks into exploitable routers and changes their DNS configuration. This allows the attackers to redirect the router user's traffic to malicious Android apps disguised as Facebook and Chrome or to Apple phishing pages that were used to steal Apple ID credentials. Recently, Kaspersky has discovered that this group is testing a new monetization scheme by redirecting iOS users to pages that contain the Coinhive in-browser mining script rather than the normal Apple phishing page. When users are redirected to these pages, they will be shown a blank page in the browser, but their CPU utilization will jump to 90% or higher.

The tag is: *misp-galaxy:threat-actor="Roaming Mantis"*

Roaming Mantis is also known as:

- Roaming Mantis Group

Table 4721. Table References

DNSpionage

Cisco Talos recently discovered a new campaign targeting Lebanon and the United Arab Emirates (UAE) affecting .gov domains, as well as a private Lebanese airline company. Based on our research, it's clear that this adversary spent time understanding the victims' network infrastructure in order to remain under the radar and act as inconspicuous as possible during their attacks. Based on this actor's infrastructure and TTPs, we haven't been able to connect them with any other campaign or actor that's been observed recently. This particular campaign utilizes two fake, malicious websites

containing job postings that are used to compromise targets via malicious Microsoft Office documents with embedded macros. The malware utilized by this actor, which we are calling "DNSpionage," supports HTTP and DNS communication with the attackers. In a separate campaign, the attackers used the same IP to redirect the DNS of legitimate .gov and private company domains. During each DNS compromise, the actor carefully generated Let's Encrypt certificates for the redirected domains. These certificates provide X.509 certificates for TLS free of charge to the user. We don't know at this time if the DNS redirections were successful. In this post, we will break down the attackers' methods and show how they used malicious documents to attempt to trick users into opening malicious websites that are disguised as "help wanted" sites for job seekers. Additionally, we will describe the malicious DNS redirection and the timeline of the events.

The tag is: *misp-galaxy:threat-actor="DNSpionage"*

Operation Poison Needles

What's noteworthy is that according to the introduction on the compromised website of the polyclinic (<http://www.p2f.ru>), the institution was established in 1965 and it was founded by the Presidential Administration of Russia. The multidisciplinary outpatient institution mainly serves the civil servants of the highest executive, legislative, judicial authorities of the Russian Federation, as well as famous figures of science and art. Since it is the first detection of this APT attack by 360 Security on a global scale, we code-named it as "Operation Poison Needles", considering that the target was a medical institution. Currently, the attribution of the attacker is still under investigation. However, the special background of the polyclinic and the sensitiveness of the group it served both indicate the attack is highly targeted. Simultaneously, the attack occurred at a very sensitive timing of the Kerch Strait Incident, so it also aroused the assumption on the political attribution of the attack.

The tag is: *misp-galaxy:threat-actor="Operation Poison Needles"*

Operation Sharpshooter

The McAfee Advanced Threat Research team and McAfee Labs Malware Operations Group have discovered a new global campaign targeting nuclear, defense, energy, and financial companies, based on McAfee® Global Threat Intelligence. This campaign, Operation Sharpshooter, leverages an in-memory implant to download and retrieve a second-stage implant—which we call Rising Sun—for further exploitation. According to our analysis, the Rising Sun implant uses source code from the Lazarus Group’s 2015 backdoor Trojan Duuzer in a new framework to infiltrate these key industries. Operation Sharpshooter’s numerous technical links to the Lazarus Group seem too obvious to immediately draw the conclusion that they are responsible for the attacks, and instead indicate a potential for false flags. Our research focuses on how this actor operates, the global impact, and how to detect the attack. We shall leave attribution to the broader security community.

The tag is: *misp-galaxy:threat-actor="Operation Sharpshooter"*

Operation Sharpshooter has relationships with:

- similar: *misp-galaxy:threat-actor="Lazarus Group"* with *estimative-language:likelihood-probability="likely"*

GRIM SPIDER

GRIM SPIDER is a sophisticated eCrime group that has been operating the Ryuk ransomware since August 2018, targeting large organizations for a high-ransom return.

The tag is: *misp-galaxy:threat-actor="GRIM SPIDER"*

Table 4734. Table References

Links
https://www.crowdstrike.com/blog/big-game-hunting-with-ryuk-another-lucrative-targeted-ransomware/

WIZARD SPIDER

GRIM SPIDER is a sophisticated eCrime group that has been operating the Ryuk ransomware since August 2018, targeting large organizations for a high-ransom return. This methodology, known as “big game hunting,” signals a shift in operations for WIZARD SPIDER, a criminal enterprise of which GRIM SPIDER appears to be a cell. The WIZARD SPIDER threat group, known as the Russia-based operator of the TrickBot banking malware, had focused primarily on wire fraud in the past.

The tag is: *misp-galaxy:threat-actor="WIZARD SPIDER"*

Table 4735. Table References

Links
https://www.crowdstrike.com/blog/big-game-hunting-with-ryuk-another-lucrative-targeted-ransomware/

MUMMY SPIDER

MUMMY SPIDER is a criminal entity linked to the core development of the malware most commonly known as Emotet or Geodo. First observed in mid-2014, this malware shared code with the Bugat (aka Feodo) banking Trojan. However, MUMMY SPIDER swiftly developed the malware’s capabilities to include an RSA key exchange for command and control (C2) communication and a modular architecture.

The tag is: *misp-galaxy:threat-actor="MUMMY SPIDER"*

Cold River

In short, “Cold River” is a sophisticated threat (actor) that utilizes DNS subdomain hijacking, certificate spoofing, and covert tunneled command and control traffic in combination with complex and convincing lure documents and custom implants.

The tag is: *misp-galaxy:threat-actor="Cold River"*

Cold River is also known as:

- Nahr Elbard
- Nahr el bared

Table 4738. Table References

Links

<https://www.lastline.com/labsblog/threat-actor-cold-river-network-traffic-analysis-and-a-deep-dive-on-agent-drable/>

Silence group

a relatively new threat actor that’s been operating since mid-2016

The tag is: *misp-galaxy:threat-actor="Silence group"*

Table 4739. Table References

Links

<https://reaqta.com/2019/01/silence-group-targeting-russian-banks/>

APT39

APT39 was created to bring together previous activities and methods used by this actor, and its activities largely align with a group publicly referred to as "Chafer." However, there are differences

in what has been publicly reported due to the variances in how organizations track activity. APT39 primarily leverages the SEAWEED and CACHEMONEY backdoors along with a specific variant of the POWBAT backdoor. While APT39's targeting scope is global, its activities are concentrated in the Middle East. APT39 has prioritized the telecommunications sector, with additional targeting of the travel industry and IT firms that support it and the high-tech industry.

The tag is: *misp-galaxy:threat-actor="APT39"*

APT39 is also known as:

- APT 39

Table 4740. Table References

Links
https://www.fireeye.com/blog/threat-research/2019/01/apt39-iranian-cyber-espionage-group-focused-on-personal-information.html

Siesta

FireEye recently looked deeper into the activity discussed in TrendMicro's blog and dubbed the "Siesta" campaign. The tools, modus operandi, and infrastructure used in the campaign present two possibilities: either the Chinese cyber-espionage unit APT1 is perpetrating this activity, or another group is using the same tactics and tools as the legacy APT1. The Siesta campaign reinforces the fact that analysts and network defenders should remain on the lookout for known, public indicators and for shared attributes that allow security experts to detect multiple actors with one signature.

The tag is: *misp-galaxy:threat-actor="Siesta"*

Table 4741. Table References

Links
https://www.fireeye.com/blog/threat-research/2014/03/a-detailed-examination-of-the-siesta-campaign.html

Gallmaker

Symantec researchers have uncovered a previously unknown attack group that is targeting government and military targets, including several overseas embassies of an Eastern European country, and military and defense targets in the Middle East. This group eschews custom malware and uses living off the land (LotL) tactics and publicly available hack tools to carry out activities that bear all the hallmarks of a cyber espionage campaign. The group, which we have given the name Gallmaker, has been operating since at least December 2017, with its most recent activity observed in June 2018.

The tag is: *misp-galaxy:threat-actor="Gallmaker"*

Table 4742. Table References

IRIDIUM

Resecurity's research indicates that the attack on Parliament is a part of a multi-year cyberespionage campaign orchestrated by a nation-state actor whom we are calling IRIDIUM. This actor targets sensitive government, diplomatic, and military resources in the countries comprising the Five Eyes intelligence alliance (which includes Australia, Canada, New Zealand, the United Kingdom and the United States)

The tag is: *misp-galaxy:threat-actor="IRIDIUM"*

SandCat

SandCat, on the other hand, is a group that was discovered more recently by Kaspersky. One of the Windows vulnerabilities patched by Microsoft in December had been exploited by both FruityArmor and SandCat in attacks targeting the Middle East and Africa. SandCat has been using FinFisher/FinSpy spyware and CHAINSHOT, a piece of malware analyzed earlier this year by Palo Alto Networks. The group has also used the CVE-2018-8589 and CVE-2018-8611 Windows vulnerabilities in its attacks, both of which had a zero-day status when Microsoft released fixes.

The tag is: *misp-galaxy:threat-actor="SandCat"*

Table 4759. Table References

Operation Comando

Operation Comando is a pure cybercrime campaign, possibly with Brazilian origin, with a concrete and persistent focus on the hospitality sector, which proves how a threat actor can be successful in pursuing its objectives while maintaining a cheap budget. The use of DDNS services, publicly available remote access tools, and having a minimum knowledge on software development (in this case VB.NET) has been enough for running a campaign lasting month, and potentially gathering credit card information and other possible data.

The tag is: *misp-galaxy:threat-actor="Operation Comando"*

Table 4760. Table References

Links
https://unit42.paloaltonetworks.com/operation-comando-or-how-to-run-a-cheap-and-effective-credit-card-business/

APT-C-27

On March 17, 2019, 360 Threat Intelligence Center captured a target attack sample against the Middle East by exploiting WinRAR vulnerability (CVE-2018-20250[6]), and it seems that the attack is carried out by the Goldmouse APT group (APT-C-27). There is a decoy Word document inside the archive regarding terrorist attacks to lure the victim into decompressing. When the archive gets decompressed on the vulnerable computer, the embedded njRAT backdoor (Telegram Desktop.exe) will be extracted to the startup folder and then triggered into execution if the victim restarts the computer or performs re-login. After that, the attacker is capable to control the compromised device.

The tag is: *misp-galaxy:threat-actor="APT-C-27"*

APT-C-27 is also known as:

- GoldMouse

Table 4761. Table References

Links
https://ti.360.net/blog/articles/apt-c-27-(goldmouse):-suspected-target-attack-against-the-middle-east-with-winrar-exploit-en/

Operation ShadowHammer

Newly discovered supply chain attack that leveraged ASUS Live Update software. The goal of the attack was to surgically target an unknown pool of users, which were identified by their network adapters' MAC addresses. To achieve this, the attackers had hardcoded a list of MAC addresses in the trojanized samples and this list was used to identify the actual intended targets of this massive operation. We were able to extract more than 600 unique MAC addresses from over 200 samples used in this attack. Of course, there might be other samples out there with different MAC addresses in their list.

The tag is: *misp-galaxy:threat-actor="Operation ShadowHammer"*

Table 4762. Table References

Links

EVILTOSS

backdoor used by apt28

Sedreco serves as a spying backdoor; its functionalities can be extended with dynamically loaded plugins. It is made up of two distinct components: a dropper and the persistent payload installed by this dropper. We have not seen this component since April 2016.

The tag is: `misp-galaxy:tool="EVILTOSS"`

EVILTOSS is also known as:

- Sedreco
- AZZY
- ADVSTORESHELL
- NETUI

EVILTOSS has relationships with:

- similar: `misp-galaxy:mitre-malware="ADVSTORESHELL - S0045"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:malpedia="Sedreco"` with `estimative-language:likelihood-probability="likely"`

Regin

Regin (also known as Prax or WarriorPride) is a sophisticated malware toolkit revealed by Kaspersky Lab, Symantec, and The Intercept in November 2014. The malware targets specific users of Microsoft Windows-based computers and has been linked to the US intelligence gathering agency NSA and its British counterpart, the GCHQ. The Intercept provided samples of Regin for download including malware discovered at Belgian telecommunications provider, Belgacom. Kaspersky Lab says it first became aware of Regin in spring 2012, but that some of the earliest samples date from 2003. The name Regin is first found on the VirusTotal website on 9 March 2011.

The tag is: *misp-galaxy:tool="Regin"*

Regin is also known as:

- Prax
- WarriorPride

Regin has relationships with:

Htran

HUC Packet Transmitter (HTran) is a proxy tool, used to intercept and redirect Transmission Control Protocol (TCP) connections from the local host to a remote host. This makes it possible to obfuscate an attacker's communications with victim networks. The tool has been freely available on the internet since at least 2009. HTran facilitates TCP connections between the victim and a hop point controlled by an attacker. Malicious cyber actors can use this technique to redirect their packets through multiple compromised hosts running HTran, to gain greater access to hosts in a network

X-Agent

APT28's second-stage persistent macOS backdoor. This backdoor component is known to have a modular structure featuring various espionage functionalities, such as key-logging, screen grabbing and file exfiltration. This component is available for OSX, Windows, Linux and iOS operating systems.

Xagent is a modular backdoor with spying functionalities such as keystroke logging and file exfiltration. Xagent is the group's flagship backdoor and heavily used in their operations. Early versions for Linux and Windows were seen years ago, then in 2015 an iOS version came out. One year later, an Android version was discovered and finally, in the beginning of 2017, an Xagent sample for OS X was described.

The tag is: *misp-galaxy:tool="X-Agent"*

BASHLITE

The tag is: *misp-galaxy:tool="BASHLITE"*

BlackEnergy

BlackEnergy is a trojan which has undergone significant functional changes since it was first publicly analysed by Arbor Networks in 2007. It has evolved from a relatively simple DDoS trojan into a relatively sophisticated piece of modern malware with a modular architecture, making it a suitable tool for sending spam and for online bank fraud, as well as for targeted attacks. BlackEnergy version 2, which featured rootkit techniques, was documented by SecureWorks in 2010. The targeted attacks recently discovered are proof that the trojan is still alive and kicking in 2014. We provide a technical analysis of the BlackEnergy family, focusing on novel functionality and the differences introduced by new lite variants. We describe the most notable aspects of the malware, including its techniques for bypassing UAC, defeating the signed driver requirement in Windows and a selection of BlackEnergy2 plug-ins used for parasitic file infections, network discovery and remote code execution and data collection.

The tag is: *misp-galaxy:tool="BlackEnergy"*

BlackEnergy has relationships with:

- similar: *misp-galaxy:mitre-malware="BlackEnergy - S0089"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="BlackEnergy"* with *estimative-language:likelihood-probability="likely"*

Trochilus

The Trochilus RAT is a threatening RAT (Remote Access Trojan) that may evade many anti-virus programs. The Trochilus RAT is currently being used as part of an extended threat campaign in South East Asia. The first appearance of the Trochilus RAT in this campaign, which has been active since August of 2015, was first detected in the summer of 2015. The Trochilus RAT is currently being

used against civil society organizations and government computers in the South East Asia region, particularly in attacks directed towards the government of Myanmar.

The tag is: *misp-galaxy:tool="Trochilus"*

Trochilus has relationships with:

- similar: *misp-galaxy:rat="Trochilus"* with *estimative-language:likelihood-probability="likely"*

AURIGA

The AURIGA malware family shares a large amount of functionality with the BANGAT backdoor. The malware family contains functionality for keystroke logging, creating and killing processes, performing file system and registry modifications, spawning interactive command shells, performing process injection, logging off the current user or shutting down the local machine. The AURIGA malware contains a driver component which is used to inject the malware DLL into other processes. This driver can also perform process and IP connection hiding. The malware family will create a copy of cmd.exe to perform its C2 activity, and replace the "Microsoft corp" strings in the cmd.exe binary with different values. The malware family typically maintains persistence through installing itself as a service.

The tag is: `misp-galaxy:tool="AURIGA"`

Table 4926. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

BANGAT

The BANGAT malware family shares a large amount of functionality with the AURIGA backdoor. The malware family contains functionality for keylogging, creating and killing processes, performing filesystem and registry modifications, spawning interactive command shells, performing process injection, logging off the current user or shutting down the local machine. In addition, the malware also implements a custom VNC like protocol which sends screenshots of the desktop to the C2 server and accepts keyboard and mouse input. The malware communicates to its C2 servers using SSL, with self signed SSL certificates. The malware family will create a copy of cmd.exe to perform its C2 activity, and replace the "Microsoft corp" strings in the cmd.exe binary with different values. The malware family typically maintains persistence through installing itself as a service.

The tag is: *misp-galaxy:tool="BANGAT"*

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

BISCUIT

BISCUIT provides attackers with full access to an infected host. BISCUIT capabilities include launching an interactive command shell, enumerating servers on a Windows network, enumerating and manipulating process, and transferring files. BISCUIT communicates using a custom protocol, which is then encrypted using SSL. Once installed BISCUIT will attempt to beacon to its command/control servers approximately every 10 or 30 minutes. It will beacon its primary server first, followed by a secondary server. All communication is encrypted with SSL (OpenSSL 0.9.8i).

The tag is: *misp-galaxy:tool="BISCUIT"*

BISCUIT has relationships with:

- similar: *misp-galaxy:mitre-malware="BISCUIT - S0017"* with *estimative-language:likelihood-probability="likely"*

Table 4928. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

BOUNCER

BOUNCER will load an extracted DLL into memory, and then will call the DLL's dump export. The dump export is called with the parameters passed via the command line to the BOUNCER executable. It requires at least two arguments, the IP and port to send the password dump information. It can accept at most five arguments, including a proxy IP, port and an x.509 key for SSL authentication. The DLL backdoor has the capability to execute arbitrary commands, collect database and server information, brute force SQL login credentials, launch arbitrary programs, create processes and threads, delete files, and redirect network traffic.

The tag is: *misp-galaxy:tool="BOUNCER"*

Table 4929. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

CALENDAR

This family of malware uses Google Calendar to retrieve commands and send results. It retrieves event feeds associated with Google Calendar, where each event contains commands from the attacker for the malware to perform. Results are posted back to the event feed. The malware authenticates with Google using the hard coded email address and passwords. The malware uses the deprecated ClientLogin authentication API from Google. The malware is registered as a service dll as a persistence mechanism. Artifacts of this may be found in the registry.

The tag is: *misp-galaxy:tool="CALENDAR"*

CALENDAR has relationships with:

- similar: *misp-galaxy:mitre-malware="CALENDAR - S0025"* with *estimative-language:likelihood-probability="likely"*

Table 4930. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

COMBOS

The COMBOS malware family is an HTTP based backdoor. The backdoor is capable of file upload, file download, spawning a interactive reverse shell, and terminating its own process. The backdoor may decrypt stored Internet Explorer credentials from the local system and transmit the credentials to the C2 server. The COMBOS malware family does not have any persistence mechanisms built into itself.

The tag is: *misp-galaxy:tool="COMBOS"*

Table 4931. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

COOKIEBAG

This family of malware is a backdoor capable of file upload and download as well as providing remote interactive shell access to the compromised machine. Communication with the Command & Control (C2) servers uses a combination of single-byte XOR and Base64 encoded data in the Cookie and Set-Cookie HTTP header fields. Communication with the C2 servers is over port 80. Some variants install a registry key as means of a persistence mechanism. The hardcoded strings cited include a string of a command in common with several other APT1 families.

The tag is: *misp-galaxy:tool="COOKIEBAG"*

COOKIEBAG is also known as:

- TROJAN.COOKIEBAG

Table 4932. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

DAIRY

Members of this malware family are backdoors that provide file downloading, process listing, process killing, and reverse shell capabilities. This malware may also add itself to the Authorized Applications list for the Windows Firewall.

The tag is: *misp-galaxy:tool="DAIRY"*

Table 4933. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

GETMAIL

Members of this family of malware are utilities designed to extract email messages and attachments from Outlook PST files. One part of this utility set is an executable, one is a dll. The malware may create a registry artifact related to the executable.

The tag is: *misp-galaxy:tool="GETMAIL"*

Table 4934. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

GDOCUPLOAD

This family of malware is a utility designed to upload files to Google Docs. Nearly all communications are with docs.google.com are SSL encrypted. The malware does not use Google's published API to interact with their services. The malware does not currently work with Google Docs. It does not detect HTTP 302 redirections and will get caught in an infinite loop attempting to parse results from Google that are not present.

The tag is: *misp-galaxy:tool="GDOCUPLOAD"*

Table 4935. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

GLOOXMAIL

GLOOXMAIL communicates with Google's Jabber/XMPP servers and authenticates with a hard-coded username and password. The malware can accept commands over XMPP that includes file upload and download, provide a remote shell, sending process listings, and terminating specified processes. The malware makes extensive use of the open source gloox library (<http://camaya.net/gloox/>, version 0.9.9.12) to communicate using the Jabber/XMPP protocol. All communications with the Google XMPP server are encrypted.

The tag is: *misp-galaxy:tool="GLOOXMAIL"*

GLOOXMAIL is also known as:

- TROJAN.GTALK

GLOOXMAIL has relationships with:

- similar: *misp-galaxy:mitre-malware="GLOOXMAIL - S0026" with estimative-language:likelihood-probability="likely"*

Table 4936. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

GOGGLES

A family of downloader malware, that retrieves an encoded payload from a fixed location, usually in the form of a file with the .jpg extension. Some variants have just an .exe that acts as a downloader, others have an .exe launcher that runs as a service and then loads an associated .dll of the same name that acts as the downloader. This IOC is targeted at the downloaders only. After downloading the file, the malware decodes the downloaded payload into an .exe file and launches it. The malware usually stages the files it uses in the %TEMP% directory or the %WINDIR%\Temp directory.

The tag is: *misp-galaxy:tool="GOGGLES"*

GOGGLES is also known as:

- TROJAN.FOXY

Table 4937. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

GREENCAT

Members of this family are full featured backdoors that communicates with a Web-based Command & Control (C2) server over SSL. Features include interactive shell, gathering system info, uploading and downloading files, and creating and killing processes, Malware in this family usually communicates with a hard-coded domain using SSL on port 443. Some members of this family rely on launchers to establish persistence mechanism for them. Others contains functionality that allows it to install itself, replacing an existing Windows service, and uninstall itself. Several variants use %SystemRoot%\Tasks or %WinDir%\Tasks as working directories, additional malware artifacts may be found there.

The tag is: *misp-galaxy:tool="GREENCAT"*

Table 4938. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

HACKFASE

This family of malware is a backdoor that provides reverse shell, process creation, system statistics collection, process enumeration, and process termination capabilities. This family is designed to be a service DLL and does not contain an installation mechanism. It usually communicates over port 443. Some variants use their own encryption, others use SSL.

The tag is: *misp-galaxy:tool="HACKFASE"*

Table 4939. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

HELAUTO

This family of malware is designed to operate as a service and provides remote command execution and file transfer capabilities to a fixed IP address or domain name. All communication with the C2 server happens over port 443 using SSL. This family can be installed as a service DLL. Some variants allow for uninstallation.

The tag is: *misp-galaxy:tool="HELAUTO"*

Table 4940. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

KURTON

This family of malware is a backdoor that tunnels its connection through a preconfigured proxy. The malware communicates with a remote command and control server over HTTPS via the proxy. The malware installs itself as a Windows service with a service name supplied by the attacker but defaults to IPRIP if no service name is provided during install.

The tag is: *misp-galaxy:tool="KURTON"*

Table 4941. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

LIGHTBOLT

LIGHTBOLT is a utility with the ability to perform HTTP GET requests for a list of user-specified URLs. The responses of the HTTP requests are then saved as MHTML files, which are added to encrypted RAR files. LIGHTBOLT has the ability to use software certificates for authentication.

The tag is: *misp-galaxy:tool="LIGHTBOLT"*

Table 4942. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

LIGHTDART

LIGHTDART is a tool used to access a pre-configured web page that hosts an interface to query a database or data set. The tool then downloads the results of a query against that web page to an encrypted RAR file. This RAR file (1.rar) is renamed and uploaded to an attacker controlled FTP server, or uploaded via an HTTP POST with a .jpg extension. The malware will execute this search once a day. The target webpage usually contains information useful to the attacker, which is updated on a regular basis. Examples of targeted information include weather information or ship coordinates.

The tag is: *misp-galaxy:tool="LIGHTDART"*

Table 4943. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

LONGRUN

LONGRUN is a backdoor designed to communicate with a hard-coded IP address and provide the attackers with a custom interactive shell. It supports file uploads and downloads, and executing arbitrary commands on the compromised machine. When LONGRUN executes, it first loads configuration data stored as an obfuscated string inside the PE resource section. The distinctive string thequickbrownfxjimpsvalzydg is used as part of the input to the decoding algorithm. When the configuration data string is decoded it is parsed and treated as an IP and port number. The malware then connects to the host and begins interacting with it over a custom protocol.

The tag is: *misp-galaxy:tool="LONGRUN"*

Table 4944. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

MANITSME

This family of malware will beacon out at random intervals to the remote attacker. The attacker can run programs, execute arbitrary commands, and easily upload and download files. This IOC looks for both the dropper file and the backdoor.

The tag is: *misp-galaxy:tool="MANITSME"*

Table 4945. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

MAPIGET

This malware utility is a set of two files that operate in conjunction to extract email messages and attachments from an Exchange server. In order to operate successfully, these programs require authentication credentials for a user on the Exchange server, and must be run from a machine joined to the domain that has Microsoft Outlook installed (or equivalent software that provides the Microsoft 'Messaging API' (MAPI) service).

The tag is: *misp-galaxy:tool="MAPIGET"*

Table 4946. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html
http://contagiodump.blogspot.com/2010/06/these-days-i-see-spike-in-number-of.html

MINIASP

This family of malware consists of backdoors that attempt to fetch encoded commands over HTTP. The malware is capable of downloading a file, downloading and executing a file, executing arbitrary shell commands, or sleeping a specified interval.

The tag is: *misp-galaxy:tool="MINIASP"*

Table 4947. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

NEWSREELS

The NEWSREELS malware family is an HTTP based backdoor. When first started, NEWSREELS decodes two strings from its resources section. These strings are both used as C2 channels, one URL is used as a beacon URL (transmitting) and the second URL is used to get commands (receiving). The NEWSREELS malware family is capable of performing file uploads, downloads, creating processes or creating an interactive reverse shell.

The tag is: *misp-galaxy:tool="NEWSREELS"*

Table 4948. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

SEASALT

The SEASALT malware family communicates via a custom binary protocol. It is capable of gathering some basic system information, file system manipulation, file upload and download, process creation and termination, and spawning an interactive reverse shell. The malware maintains persistence by installing itself as a service.

The tag is: *misp-galaxy:tool="SEASALT"*

Table 4949. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

STARSYPOUND

STARSYPOUND provides an interactive remote shell over an obfuscated communications channel. When it is first run, it loads a string (from the executable PE resource section) containing the beacon IP address and port. The malware sends the beacon string "(SY)# <HOSTNAME>" to the remote system, where <HOSTNAME> is the hostname of the victim system. The remote host responds with a packet that also begins with the string "(SY)# cmd". This causes the malware to launch a new cmd.exe child process. Further communications are forwarded to the cmd.exe child process to execute. The commands sent to the shell and their responses are obfuscated when sent over the network.

The tag is: *misp-galaxy:tool="STARSYPOUND"*

Table 4950. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

SWORD

This family of malware provides a backdoor over the network to the attackers. It is configured to connect to a single host and offers file download over HTTP, program execution, and arbitrary execution of commands through a cmd.exe instance.

The tag is: *misp-galaxy:tool="SWORD"*

Table 4951. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

TABMSGSQL

This malware family is a full-featured backdoor capable of file uploading and downloading, arbitrary execution of programs, and providing a remote interactive command shell. All communications with the C2 server are sent over HTTP to a static URL, appending various URL parameters to the request. Some variants use a slightly different URL.

The tag is: *misp-galaxy:tool="TABMSGSQL"*

TABMSGSQL is also known as:

- TROJAN LETSGO

Table 4952. Table References

Links

TARSIP-ECLIPSE

The TARSIP malware family is a backdoor which communicates over encoded information in HTTPS headers. Typical TARSIP malware samples will only beacon out to their C2 servers if the C2 DNS address resolves to a specific address. The capability of TARSIP backdoors includes file uploading, file downloading, interactive command shells, process enumeration, process creation, process termination. The TARSIP-ECLIPSE family is distinguished by the presence of 'eclipse' in .pdb debug strings present in the malware samples. It does not provide a built in mechanism to maintain persistence.

The tag is: *misp-galaxy:tool="TARSIP-ECLIPSE"*

WARP

The WARP malware family is an HTTP based backdoor written in C++, and the majority of its code base is borrowed from source code available in the public domain. Network communications are implemented using the same WWW client library (w3c.cpp) available from www.dankrusi.com/file_69653F3336383837.html. The malware has system survey functionality (collects hostname, current user, system uptime, CPU speed, etc.) taken directly from the BO2K backdoor available from www.bo2k.com. It also contains the hard disk identification code found at www.winsim.com/diskid32/diskid32.cpp. When the WARP executing remote commands, the malware creates a copy of the `?%SYSTEMROOT%\system32\cmd.exe?` file as `'%USERPROFILE%\Temp\~ISUN32.EXE'`. The version signature information of the duplicate executable is zeroed out. Some WARP variants maintain persistence through the use of DLL search

order hijacking.

The tag is: *misp-galaxy:tool="WARP"*

WEBC2-ADSPACE

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This family of malware is capable of downloading and executing a file. All variants represented here are the same file with different MD5 signatures. This malware attempts to contact its C2 once a week (Thursday at 10:00 AM). It looks for commands inside a set of HTML tags, part of which are in the File Strings indicator term below.

The tag is: *misp-galaxy:tool="WEBC2-ADSPACE"*

Table 4956. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

WEBC2-AUSOV

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This malware family is a only a downloader which operates over the HTTP protocol with a hard-coded URL. If directed, it has the capability to download, decompress, and execute compressed binaries.

The tag is: *misp-galaxy:tool="WEBC2-AUSOV"*

Table 4957. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

WEBC2-BOLID

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This family of malware is a backdoor capable of downloading files and updating its configuration. Communication with the command and control (C2) server uses a combination of single-byte XOR and Base64 encoded data wrapped in standard HTML tags. The malware family installs a registry key as a persistence mechanism.

The tag is: *misp-galaxy:tool="WEBC2-BOLID"*

Table 4958. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

WEBC2-CLOVER

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The family of malware provides the attacker with an interactive command shell, the ability to upload and download files, execute commands on the system, list processes and DLLs, kill processes, and ping hosts on the local network. Responses to these commands are encrypted and compressed before being POSTed to the server. Some variants copy cmd.exe to Updatasched.exe in a temporary directory, and then may launch that in a process if an interactive shell is called. On initial invocation, the malware also attempts to delete previous copies of the Updatasched.exe file.

The tag is: *misp-galaxy:tool="WEBC2-CLOVER"*

Table 4959. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

WEBC2-CSON

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. Members of this family of malware act only as downloaders and droppers for other malware. They communicate with a hard-coded C2 server, reading commands embedded in HTML comment fields. Some variants are executables which act upon execution, others are DLLs which can be attached to services or loaded through search order hijacking.

The tag is: *misp-galaxy:tool="WEBC2-CSON"*

Table 4960. Table References

Links

WEBC2-DIV

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-DIV variant searches for the strings "div safe:" and "balance" to delimit encoded C2 information. If the decoded string begins with the letter "J" the malware will parse additional arguments in the decoded string to specify the sleep interval to use. WEBC2-DIV is capable of downloading a file, downloading and executing a file, or sleeping a specified interval.

The tag is: *misp-galaxy:tool="WEBC2-DIV"*

Table 4961. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

WEBC2-GREENCAT

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This malware is a variant on the GREENCAT family, using a fixed web C2. This family is a full featured backdoor which provides remote command execution, file transfer, process and service enumeration and manipulation. It installs itself persistently through the current user's registry Run key.

The tag is: *misp-galaxy:tool="WEBC2-GREENCAT"*

Table 4962. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

WEBC2-HEAD

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-HEAD variant communicates over HTTPS, using the system's SSL implementation to encrypt all communications with the C2 server. WEBC2-HEAD first issues an HTTP GET to the host, sending the Base64-encoded string containing the name of the compromised machine running the malware.

The tag is: *misp-galaxy:tool="WEBC2-HEAD"*

Table 4963. Table References

Links

WEBC2-KT3

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-KT3 variant searches for commands in a specific comment tag. Network traffic starting with `*!Kt3+v|` may indicate WEBC2-KT3 activity.

The tag is: `misp-galaxy:tool="WEBC2-KT3"`

Table 4964. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

WEBC2-QBP

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-QBP variant will search for two strings in a HTML comment. The first will be "2010QBP " followed by " 2010QBP/--". Inside these tags will be a DES-encrypted string.

The tag is: `misp-galaxy:tool="WEBC2-QBP"`

Table 4965. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

WEBC2-RAVE

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This family of malware will set itself up as a service and connect out to a hardcoded web page and read a modified base64 string from this webpage. The later versions of this malware supports three commands (earlier ones are just downloaders or reverse shells). The first commands will sleep the malware for N number of hours. The second command will download a binary from the encoded HTML comment and execute it on the infected host. The third will spawn an encoded reverse shell to an attacker specified location and port.

The tag is: `misp-galaxy:tool="WEBC2-RAVE"`

Table 4966. Table References

Links

<http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html>

WEBC2-TABLE

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-TABLE variant looks for web pages containing 'background', 'align', and 'bgcolor' tags to be present in the requested Web page. If the data in these tags are formatted correctly, the malware will decode a second URL and a filename. This URL is then retrieved, written to the decoded filename and executed.

The tag is: *misp-galaxy:tool="WEBC2-TABLE"*

WEBC2-TOCK

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-TABLE variant looks for web pages containing 'background', 'align', and 'bgcolor' tags to be present in the requested Web page. If the data in these tags are formatted correctly, the malware will decode a second URL and a filename. This URL is then retrieved, written to the decoded filename and executed.

The tag is: *misp-galaxy:tool="WEBC2-TOCK"*

Table 4968. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

WEBC2-UGX

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. Members of this family of malware provide remote command shell and remote file download and execution capabilities. The malware downloads a web page containing a crafted HTML comment that subsequently contains an encoded command. The contents of this command tell the malware whether to download and execute a program, launch a reverse shell to a specific host and port number, or to sleep for a period of time.

The tag is: *misp-galaxy:tool="WEBC2-UGX"*

Table 4969. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

WEBC2-Y21K

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. Members of this family of backdoor malware talk to specific Web-based Command & Control (C2) servers. The backdoor has a limited command set, depending on version. It is primarily a downloader, but it classified as a backdoor because it can accept a limited command set, including changing local directories, downloading and executing additional files, sleeping, and connecting to a specific IP & port not initially included in the instruction set for the malware. Each version of the malware has at least one hardcoded URL to which it connects to receive its initial commands. This family of malware installs itself as a service, with the malware either being the executable run by the service, or the service DLL loaded by a legitimate service. The same core code is seen recompiled on different dates or with different names, but the same functionality. Key signatures include a specific set of functions (some of which can be used with the OS-provided rundll32.exe tool to install the malware as a service), and hardcoded strings used in communication with C2 servers to issue commands to the implant.

The tag is: *misp-galaxy:tool="WEBC2-Y21K"*

Table 4970. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

WEBC2-YAHOO

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-YAHOO variant enters a loop where every ten minutes it attempts to download a web page that may contain an encoded URL. The encoded URL will be found in the pages returned inside an attribute named 'sb' or 'ex' within a tag named 'yahoo'. The embedded link can direct the malware to download and execute files.

The tag is: *misp-galaxy:tool="WEBC2-YAHOO"*

Table 4971. Table References

Links
http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html

HAYMAKER

HAYMAKER is a backdoor that can download and execute additional payloads in the form of modules. It also conducts basic victim profiling activity, collecting the computer name, running process IDs, %TEMP% directory path and version of Internet Explorer. It communicates encoded system information to a single hard coded command and control (C2) server, using the system's default User-Agent string.

The tag is: *misp-galaxy:tool="HAYMAKER"*

HAYMAKER has relationships with:

- similar: *misp-galaxy:mitre-malware="ChChes - S0144"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="ChChes"* with *estimative-language:likelihood-probability="likely"*

BUGJUICE

BUGJUICE is a backdoor that is executed by launching a benign file and then hijacking the search order to load a malicious dll into it. That malicious dll then loads encrypted shellcode from the binary, which is decrypted and runs the final BUGJUICE payload. BUGJUICE defaults to TCP using a custom binary protocol to communicate with the C2, but can also use HTTP and HTTPS if directed by the C2. It has the capability to find files, enumerate drives, exfiltrate data, take screenshots and provide a reverse shell.

The tag is: *misp-galaxy:tool="BUGJUICE"*

BUGJUICE has relationships with:

- similar: *misp-galaxy:rat="RedLeaves"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:mitre-malware="RedLeaves - S0153"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="RedLeaves"* with *estimative-language:likelihood-probability="likely"*

Cardinal RAT

Palo Alto Networks has discovered a previously unknown remote access Trojan (RAT) that has been

active for over two years. It has a very low volume in this two-year period, totaling roughly 27 total samples. The malware is delivered via an innovative and unique technique: a downloader we are calling Carp uses malicious macros in Microsoft Excel documents to compile embedded C# (C Sharp) Programming Language source code into an executable that in turn is run to deploy the Cardinal RAT malware family. These malicious Excel files use a number of different lures, providing evidence of what attackers are using to entice victims into executing them.

The tag is: *misp-galaxy:tool="Cardinal RAT"*

Cardinal RAT has relationships with:

- similar: *misp-galaxy:tool="EVILNUM"* with *estimative-language:likelihood-probability="likely"*

Table 5010. Table References

Links
http://researchcenter.paloaltonetworks.com/2017/04/unit42-cardinal-rat-active-two-years/

REDLEAVES

The REDLEAVES implant consists of three parts: an executable, a loader, and the implant shellcode. The REDLEAVES implant is a remote administration Trojan (RAT) that is built in Visual C++ and makes heavy use of thread generation during its execution. The implant contains a number of functions typical of RATs, including system enumeration and creating a remote shell back to the C2.

The tag is: *misp-galaxy:tool="REDLEAVES"*

Table 5011. Table References

https://www.us-cert.gov/ncas/alerts/TA17-117A

Kazuar

Kazuar is a fully featured backdoor written using the .NET Framework and obfuscated using the open source packer called ConfuserEx. Unit 42 researchers have uncovered a backdoor Trojan used in an espionage campaign. The developers refer to this tool by the name Kazuar, which is a Trojan written using the Microsoft .NET Framework that offers actors complete access to compromised systems targeted by its operator. Kazuar includes a highly functional command set, which includes the ability to remotely load additional plugins to increase the Trojan's capabilities. During our analysis of this malware we uncovered interesting code paths and other artifacts that may indicate a Mac or Unix variant of this same tool also exists. Also, we discovered a unique feature within Kazuar: it exposes its capabilities through an Application Programming Interface (API) to a built-in webserver. We suspect the Kazuar tool may be linked to the Turla threat actor group (also known as Uroburos and Snake), who have been reported to have compromised embassies, defense contractors, educational institutions, and research organizations across the globe. A hallmark of Turla operations is iterations of their tools and code lineage in Kazuar can be traced back to at least 2005. If the hypothesis is correct and the Turla threat group is using Kazuar, we believe they may be using it as a replacement for Carbon and its derivatives. Of the myriad of tools observed in use by

Turla Carbon and its variants were typically deployed as a second stage backdoor within targeted environments and we believe Kazuar may now hold a similar role for Turla operations.

The tag is: *misp-galaxy:tool="Kazuar"*

Kazuar has relationships with:

- similar: *misp-galaxy:malpedia="Kazuar"* with *estimative-language:likelihood-probability="likely"*

Hackshit

Netskope Threat Research Labs recently discovered a Phishing-as-a-Service (PhaaS) platform named Hackshit, that records the credentials of the phished bait victims. The phished bait pages are

packaged with base64 encoding and served from secure (HTTPS) websites with “.moe” top level domain (TLD) to evade traditional scanners. “.moe” TLD is intended for the purpose of ‘The marketing of products or services deemed’. The victim’s credentials are sent to the Hackshit PhaaS platform via websockets. The Netskope Active Platform can proactively protect customers by creating custom applications and a policy to block all the activities related to Hackshit PhaaS.

The tag is: *misp-galaxy:tool="Hackshit"*

KONNI

Talos has discovered an unknown Remote Administration Tool that we believe has been in use for over 3 years. During this time it has managed to avoid scrutiny by the security community. The current version of the malware allows the operator to steal files, keystrokes, perform screenshots, and execute arbitrary code on the infected host. Talos has named this malware KONNI. Throughout the multiple campaigns observed over the last 3 years, the actor has used an email attachment as the initial infection vector. They then use additional social engineering to prompt the target to open a .scr file, display a decoy document to the users, and finally execute the malware on the victim's machine. The malware infrastructure of the analysed samples was hosted by a free web hosting provider: 000webhost. The malware has evolved over time. In this article, we will analyse this evolution:

The tag is: *misp-galaxy:tool="KONNI"*

KONNI has relationships with:

- similar: *misp-galaxy:rat="Konni"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="Konni"* with *estimative-language:likelihood-probability="likely"*

<https://www.bleepingcomputer.com/news/security/report-ties-north-korean-attacks-to-new-malware-linked-by-word-macros/>

NOKKI

Beginning in early 2018, Unit 42 observed a series of attacks using a previously unreported malware family, which we have named ‘NOKKI’. The malware in question has ties to a previously reported malware family named KONNI, however, after careful consideration, we believe enough differences are present to introduce a different malware family name. To reflect the close relationship with KONNI, we chose NOKKI, swapping KONNI’s Ns and Ks. Because of code overlap found within both malware families, as well as infrastructure overlap, we believe the threat actors responsible for KONNI are very likely also responsible for NOKKI. Previous reports stated it was likely KONNI had been in use for over three years in multiple campaigns with a heavy interest in the Korean peninsula and surrounding areas. As of this writing, it is not certain if the KONNI or NOKKI operators are related to known adversary groups operating in the regions of interest, although there is evidence of a tenuous relationship with a group known as Reaper.

The tag is: *misp-galaxy:tool="NOKKI"*

https://securelist.com/a-new-era-in-mobile-banking-trojans/79198/

TwoFace

While investigating a recent security incident, Unit 42 found a webshell that we believe was used by the threat actor to remotely access the network of a targeted Middle Eastern organization. The construction of the webshell was interesting by itself, as it was actually two separate webshells: an initial webshell that was responsible for saving and loading the second fully functional webshell. It is this second webshell that enabled the threat actor to run a variety of commands on the compromised server. Due to these two layers, we use the name TwoFace to track this webshell. During our analysis, we extracted the commands executed by the TwoFace webshell from the server logs on the compromised server. Our analysis shows that the commands issued by the threat actor date back to June 2016; this suggests that the actor had access to this shell for almost an entire year. The commands issued show the actor was interested in gathering credentials from the compromised server using the Mimikatz tool. We also saw the attacker using the TwoFace webshell to move laterally through the network by copying itself and other webshells to other servers.

The tag is: *misp-galaxy:tool="TwoFace"*

Table 5026. Table References

Links

<https://researchcenter.paloaltonetworks.com/2017/07/unit42-twoface-webshell-persistent-access-point-lateral-movement/>

IntrudingDivisor

Like TwoFace, the IntrudingDivisor webshell requires the threat actor to authenticate before issuing commands. To authenticate, the actor must provide two pieces of information, first an integer that is divisible by 5473 and a string whose MD5 hash is “9A26A0E7B88940DAA84FC4D5E6C61AD0”. Upon successful authentication, the webshell has a command handler that uses integers within the request to determine the command to execute - To complete

ShadowPad

ShadowPad is a modular cyber-attack platform that attackers deploy in victim networks to gain flexible remote control capabilities. The platform is designed to run in two stages. The first stage is a shellcode that was embedded in a legitimate `nssock2.dll` used by Xshell, Xmanager and other software packages produced by NetSarang. This stage is responsible for connecting to "validation" command and control (C&C) servers and getting configuration information including the location of the real C&C server, which may be unique per victim. The second stage acts as an orchestrator for five main modules responsible for C&C communication, working with the DNS protocol, loading

and injecting additional plugins into the memory of other processes.

The tag is: *misp-galaxy:tool="ShadowPad"*

ShadowPad has relationships with:

- similar: *misp-galaxy:malpedia="ShadowPad"* with *estimative-language:likelihood-probability="likely"*

Table 5032. Table References

ALMA Communicator

The ALMA Communicator Trojan is a backdoor Trojan that uses DNS tunneling exclusively to receive commands from the adversary and to exfiltrate data. This Trojan specifically reads in a configuration from the cfg file that was initially created by the Clayslide delivery document. ALMA does not have an internal configuration, so the Trojan does not function without the cfg file created by the delivery document.

The tag is: *misp-galaxy:tool="ALMA Communicator"*

Table 5036. Table References

Links
https://researchcenter.paloaltonetworks.com/2017/11/unit42-oilrig-deploys-alma-communicator-dns-tunneling-trojan/

Silence

In September 2017, we discovered a new targeted attack on financial institutions. Victims are mostly Russian banks but we also found infected organizations in Malaysia and Armenia. The attackers were using a known but still very effective technique for cybercriminals looking to make money: gaining persistent access to an internal banking network for a long period of time, making video recordings of the day to day activity on bank employees' PCs, learning how things works in their target banks, what software is being used, and then using that knowledge to steal as much money as possible when ready. We saw that technique before in Carbanak, and other similar cases worldwide. The infection vector is a spear-phishing email with a malicious attachment. An interesting point in the Silence attack is that the cybercriminals had already compromised banking infrastructure in order to send their spear-phishing emails from the addresses of real bank employees and look as unsuspecting as possible to future victims.

The tag is: *misp-galaxy:tool="Silence"*

Silence has relationships with:

TRISIS

(Dragos Inc.) The team identifies this malware as TRISIS because it targets Schneider Electric's Triconex safety instrumented system (SIS) enabling the replacement of logic in final control elements. TRISIS is highly targeted and likely does not pose an immediate threat to other Schneider Electric customers, let alone other SIS products. (FireEye Inc.) This malware, which we call TRITON, is an attack framework built to interact with Triconex Safety Instrumented System (SIS) controllers. We have not attributed the incident to a threat actor, though we believe the activity is consistent with a nation state preparing for an attack. TRITON is one of a limited number of publicly identified malicious software families targeted at industrial control systems (ICS). It follows Stuxnet which was used against Iran in 2010 and Industroyer which we believe was deployed by Sandworm Team against Ukraine in 2016.

The tag is: *misp-galaxy:tool="TRISIS"*

TRISIS is also known as:

- TRITON

GratefulPOS

GratefulPOS has the following functions 1. Access arbitrary processes on the target POS system 2. Scrape track 1 and 2 payment card data from the process(es) 3. Exfiltrate the payment card data via lengthy encoded and obfuscated DNS queries to a hardcoded domain registered and controlled by the perpetrators, similar to that described by Paul Rascagneres in his analysis of FrameworkPOS in 2014[iii], and more recently by Luis Mendieta of Anomoli in analysis of a precursor to this sample.

The tag is: *misp-galaxy:tool="GratefulPOS"*

GratefulPOS has relationships with:

- similar: *misp-galaxy:banker="GratefulPOS"* with *estimative-language:likelihood-probability="likely"*

Table 5050. Table References

PRILEX

Prilex malware steals the information of the infected ATM's users. In this case, it was a Brazilian bank, but consider the implications of such an attack in your region, whether you're a customer or the bank.

The tag is: *misp-galaxy:tool="PRILEX"*

Table 5051. Table References

Links
http://blog.trendmicro.com/trendlabs-security-intelligence/dissecting-prilex-cutlet-maker-atm-malware-families/

CUTLET MAKER

Cutlet Maker is an ATM malware designed to empty the machine of all its banknotes. Interestingly, while its authors have been advertising its sale, their competitors have already cracked the program, allowing anybody to use it for free.

The tag is: *misp-galaxy:tool="CUTLET MAKER"*

Table 5052. Table References

Links
http://blog.trendmicro.com/trendlabs-security-intelligence/dissecting-prilex-cutlet-maker-atm-malware-families/

Satori

According to a report Li shared with Bleeping Computer today, the Mirai Satori variant is quite different from all previous pure Mirai variants. Previous Mirai versions infected IoT devices and then downloaded a Telnet scanner component that attempted to find other victims and infect them with the Mirai bot. The Satori variant does not use a scanner but uses two embedded exploits that will try to connect to remote devices on ports 37215 and 52869. Effectively, this makes Satori an IoT worm, being able to spread by itself without the need for separate components.

The tag is: *misp-galaxy:tool="Satori"*

Satori is also known as:

- Okiru

Satori has relationships with:

- similar: *misp-galaxy:botnet="Satori"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="Satori"* with *estimative-language:likelihood-probability="likely"*

PowerSpritz

PowerSpritz is a Windows executable that hides both its legitimate payload and malicious PowerShell command using a non-standard implementation of the already rarely used Spritz encryption algorithm (see the Attribution section for additional analysis of the Spritz implementation). This malicious downloader has been observed being delivered via spearphishing attacks using the TinyCC link shortener service to redirect to likely attacker-controlled servers hosting the malicious PowerSpritz payload.

The tag is: *misp-galaxy:tool="PowerSpritz"*

Table 5054. Table References

Links

<https://www.proofpoint.com/sites/default/files/pfpt-us-wp-north-korea-bitten-by-bitcoin-bug.pdf>

PowerRatankba

PowerRatankba is used for the same purpose as Ratankba: as a first stage reconnaissance tool and for the deployment of further stage implants on targets that are deemed interesting by the actor. Similar to its predecessor, PowerRatankba utilizes HTTP for its C&C communication.

The tag is: *misp-galaxy:tool="PowerRatankba"*

PowerRatankba has relationships with:

- similar: *misp-galaxy:malpedia="PowerRatankba"* with *estimative-language:likelihood-probability="likely"*

Table 5055. Table References

Links

<https://www.proofpoint.com/sites/default/files/pfpt-us-wp-north-korea-bitten-by-bitcoin-bug.pdf>

Ratankba

In one instance we observed, one of the initial malware delivered to the victim, RATANKBA, connects to a legitimate but compromised website from which a hack tool (*nbt_scan.exe*) is also downloaded. The domain also serves as one of the campaign's platform for C&C communication. The threat actor uses RATANKBA to survey the lay of the land as it looks into various aspects of the host machine where it has been initially downloaded—the machine that has been victim of the watering hole attack. Information such as the running tasks, domain, shares, user information, if the host has default internet connectivity, and so forth.

The tag is: *misp-galaxy:tool="Ratankba"*

CpuMeaner

A macOS crypto-currency mining trojan.

The tag is: *misp-galaxy:tool="CpuMeaner"*

CpuMeaner has relationships with:

- similar: `misp-galaxy:malpedia="CpuMeaner"` with `estimative-language:likelihood-probability="likely"`

Table 5066. Table References

Links
https://objective-see.com/blog/blog_0x25.html

Travle

The Travle sample found during our investigation was a DLL with a single exported function (MSOProtect). The malware name Travle was chosen given a string found in early samples of this family: “Travle Path Failed!”. This typo was replaced with correct word “Travel” in newer releases. We believe that Travle could be a successor to the NetTraveler family.

The tag is: `misp-galaxy:tool="Travle"`

Travle is also known as:

- PYLOT

Table 5067. Table References

Links
https://securelist.com/travle-aka-pylot-backdoor-hits-russian-speaking-targets/83455/

Digmine

Digmine is coded in AutoIt, and sent to would-be victims posing as a video file but is actually an AutoIt executable script. If the user’s Facebook account is set to log in automatically, Digmine will manipulate Facebook Messenger in order to send a link to the file to the account’s friends. The abuse of Facebook is limited to propagation for now, but it wouldn’t be implausible for attackers to hijack the Facebook account itself down the line. This functionality’s code is pushed from the command-and-control (C&C) server, which means it can be updated.

The tag is: `misp-galaxy:tool="Digmine"`

Table 5068. Table References

Links
https://blog.trendmicro.com/trendlabs-security-intelligence/digmine-cryptocurrency-miner-spreading-via-facebook-messenger/

TSCookie

TSCookie itself only serves as a downloader. It expands functionality by downloading modules from C&C servers. The sample that was examined downloaded a DLL file which has exfiltrating function among many others (hereafter “TSCookieRAT”). Downloaded modules only runs on memory.

The tag is: *misp-galaxy:tool="TSCookie"*

TSCookie has relationships with:

- similar: *misp-galaxy:malpedia="PLEAD"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:tool="PLEAD"* with *estimative-language:likelihood-probability="likely"*

Aurora

You probably have heard the recent news about a widespread attack that was carried out using a 0-Day exploit for Internet Explorer as one of the vectors. This exploit is also known as the "Aurora Exploit". The code has recently gone public and it was also added to the Metasploit framework. This exploit was used to deliver a malicious payload, known by the name of Trojan.Hydraq, the main purpose of which was to steal information from the compromised computer and report it back to the attackers. The exploit code makes use of known techniques to exploit a vulnerability that exists in the way Internet Explorer handles a deleted object. The final purpose of the exploit itself is to access an object that was previously deleted, causing the code to reference a memory location over which the attacker has control and in which the attacker dropped his malicious code.

The tag is: *misp-galaxy:tool="Aurora"*

Aurora is also known as:

- Hydraq

Aurora has relationships with:

- similar: *misp-galaxy:mitre-malware="Hydraq - S0203"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="9002 RAT"* with *estimative-language:likelihood-probability="likely"*

Cheshire Cat

Oldest Cheshire Cat malware compiled in 2002. It's a very old family of malware. The time stamps may be forged but the malware does have support for very old operating systems. The 2002 implant retrieves a handle for an asr2892 drives that they never got their hands on. It checks for a NE header which is a header type used before PE headers even existed. References to 16bit or DOS on a non 9x platform. This malware implant IS REALLY for old systems. The malware is for espionage - it's very carefully made to stay hidden. Newer versions install as icon handler shell extension for .lnk files. Shell in this case means the program manager because windows explorer was not yet a thing. It sets up COM server objects. It looks like it was written in pure C, but made to look like C++. A sensitive implant as well: it checks for all kinds of old MS platforms including Windows NT, win95, win98, winME and more. It checks the patch level as well. A lot of effort was put into adapting this malware to a lot of different operating systems with very granular decision chains.

The tag is: *misp-galaxy:tool="Cheshire Cat"*

Neuron

Neuron consists of both client and server components. The Neuron client and Neuron service are written using the .NET framework with some codebase overlaps. The Neuron client is used to infect victim endpoints and extract sensitive information from local client machines. The Neuron server is used to infect network infrastructure such as mail and web servers, and acts as local Command & Control (C2) for the client component. Establishing a local C2 limits interaction with the target network and remote hosts. It also reduces the log footprint of actor infrastructure and enables client interaction to appear more convincing as the traffic is contained within the target network.

The tag is: *misp-galaxy:tool="Neuron"*

Neuron has relationships with:

- similar: *misp-galaxy:malpedia="Neuron"* with *estimative-language:likelihood-*

probability="likely"

Table 5078. Table References

Links
https://www.ncsc.gov.uk/content/files/protected_files/article_files/Turla%20group%20using%20Neuron%20and%20Nautilus%20tools%20alongside%20Snake%20malware_0.pdf

Nautilus

Nautilus is very similar to Neuron both in the targeting of mail servers and how client communications are performed. This malware is referred to as Nautilus due to its embedded internal DLL name “nautilus-service.dll”, again sharing some resemblance to Neuron. The Nautilus service listens for HTTP requests from clients to process tasking requests such as executing commands, deleting files and writing files to disk

The tag is: *misp-galaxy:tool="Nautilus"*

Nautilus has relationships with:

- similar: *misp-galaxy:malpedia="Nautilus"* with *estimative-language:likelihood-probability="likely"*

Gamut Botnet

Gamut was found to be downloaded by a Trojan Downloader that arrives as an attachment from a spam email message. The bot installation is quite simple. After the malware binary has been downloaded, it launches itself from its current directory, usually the Windows %Temp% folder and installs itself as a Windows service. The malware utilizes an anti-VM (virtual machine) trick and terminates itself if it detects that it is running in a virtual machine environment. The bot uses INT 03h trap sporadically in its code, an anti-debugging technique which prevents its code from running within a debugger environment. It can also determine if it is being debugged by using the Kernel32 API - IsDebuggerPresent function.

The tag is: *misp-galaxy:tool="Gamut Botnet"*

DOGCALL

DOGCALL is a backdoor commonly distributed as an encoded binary file downloaded and decrypted by shellcode following the exploitation of weaponized documents. DOGCALL is capable of capturing screenshots, logging keystrokes, evading analysis with anti-virtual machine detections, and leveraging cloud storage APIs such as Cloud, Box, Dropbox, and Yandex. DOGCALL was used to target South Korean Government and military organizations in March and April 2017. The malware is typically dropped using an HWP exploit in a lure document. The wiper tool, RUHAPPY, was found on some of the systems targeted by DOGCALL. While DOGCALL is primarily an espionage tool, RUHAPPY is a destructive wiper tool meant to render systems inoperable.

The tag is: *misp-galaxy:tool="DOGCALL"*

DOGCALL is also known as:

- FE_APT_RAT_DOGCALL
- FE_APT_Backdoor_Win32_DOGCALL_1
- APT.Backdoor.Win.DOGCALL

DOGCALL has relationships with:

- similar: misp-galaxy:mitre-malware="DOGCALL - S0213" with estimative-language:likelihood-probability="likely"

Table 5082. Table References

HAPPYWORK

HAPPYWORK is a malicious downloader that can download and execute a second-stage payload, collect system information, and beacon it to the command and control domains. The collected system information includes: computer name, user name, system manufacturer via registry, IsDebuggerPresent state, and execution path. In November 2016, HAPPYWORK targeted government and financial targets in South Korea.

The tag is: *misp-galaxy:tool="HAPPYWORK"*

HAPPYWORK is also known as:

- FE_APT_Downloader_HAPPYWORK
- FE_APT_Exploit_HWP_Happy
- Downloader.APT.HAPPYWORK

HAPPYWORK has relationships with:

- similar: *misp-galaxy:mitre-malware="HAPPYWORK - S0214" with estimative-language:likelihood-probability="likely"*

Table 5084. Table References

Links
https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf

KARAE

Karae backdoors are typically used as first-stage malware after an initial compromise. The backdoors can collect system information, upload and download files, and may be used to retrieve a second-stage payload. The malware uses public cloud-based storage providers for command and control. In March 2016, KARAE malware was distributed through torrent file-sharing websites for South Korean users. During this campaign, the malware used a YouTube video downloader application as a lure.

The tag is: *misp-galaxy:tool="KARAE"*

KARAE is also known as:

- FE_APT_Backdoor_Karae_enc
- FE_APT_Backdoor_Karae
- Backdoor.APT.Karae

KARAE has relationships with:

- similar: *misp-galaxy:mitre-malware="KARAE - S0215"* with *estimative-language:likelihood-probability="likely"*

Table 5085. Table References

Links
https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf

MILKDROP

MILKDROP is a launcher that sets a persistence registry key and launches a backdoor.

The tag is: *misp-galaxy:tool="MILKDROP"*

MILKDROP is also known as:

- FE_Trojan_Win32_MILKDROP_1

Table 5086. Table References

Links
https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf

POORAIM

POORAIM malware is designed with basic backdoor functionality and leverages AOL Instant Messenger for command and control communications. POORAIM includes the following capabilities: System information enumeration, File browsing, manipulation and exfiltration, Process enumeration, Screen capture, File execution, Exfiltration of browser favorites, and battery status. Exfiltrated data is sent via files over AIM. POORAIM has been involved in campaigns against

South Korean media organizations and sites relating to North Korean refugees and defectors since early 2014. Compromised sites have acted as watering holes to deliver newer variants of POORAIM.

The tag is: *misp-galaxy:tool="POORAIM"*

POORAIM is also known as:

- Backdoor.APT.POORAIM

POORAIM has relationships with:

- similar: *misp-galaxy:mitre-malware="POORAIM - S0216"* with *estimative-language:likelihood-probability="likely"*

Table 5087. Table References

Links
https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf

RICECURRY

RICECURRY is a Javascript based profiler used to fingerprint a victim's web browser and deliver malicious code in return. Browser, operating system, and Adobe Flash version are detected by RICECURRY, which may be a modified version of PluginDetect.

The tag is: *misp-galaxy:tool="RICECURRY"*

RICECURRY is also known as:

- Exploit.APT.RICECURRY

Table 5088. Table References

Links
https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf

RUHAPPY

RUHAPPY is a destructive wiper tool seen on systems targeted by DOGCALL. It attempts to overwrite the MBR, causing the system not to boot. When victims' systems attempt to boot, the string 'Are you Happy?' is displayed. The malware is believed to be tied to the developers of DOGCALL and HAPPYWORK based on similar PDB paths in all three.

The tag is: *misp-galaxy:tool="RUHAPPY"*

RUHAPPY is also known as:

- FE_APT_Trojan_Win32_RUHAPPY_1

Table 5089. Table References

Links

https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf

SHUTTERSPEED

SHUTTERSPEED is a backdoor that can collect system information, acquire screenshots, and download/execute an arbitrary executable. SHUTTERSPEED typically requires an argument at runtime in order to execute fully. Observed arguments used by SHUTTERSPEED include: 'help', 'console', and 'sample'. The spear phishing email messages contained documents exploiting RTF vulnerability CVE-2017-0199. Many of the compromised domains in the command and control infrastructure are linked to South Korean companies. Most of these domains host a fake webpage pertinent to targets.

The tag is: *misp-galaxy:tool="SHUTTERSPEED"*

SHUTTERSPEED is also known as:

- FE_APT_Backdoor_SHUTTERSPEED
- APT.Backdoor.SHUTTERSPEED

SHUTTERSPEED has relationships with:

- similar: *misp-galaxy:mitre-malware="SHUTTERSPEED - S0217" with estimative-language:likelihood-probability="likely"*

Table 5090. Table References

SLOWDRIFT

SLOWDRIFT is a launcher that communicates via cloud based infrastructure. It sends system information to the attacker command and control and then downloads and executes additional payloads. Lure documents distributing SLOWDRIFT were not tailored for specific victims, suggesting that TEMP.Reaper is attempting to widen its target base across multiple industries and in the private sector. SLOWDRIFT was seen being deployed against academic and strategic targets in South Korea using lure emails with documents leveraging the HWP exploit. Recent SLOWDRIFT samples were uncovered in June 2017 with lure documents pertaining to cyber crime prevention and news stories. These documents were last updated by the same actor who developed KARAE, POORAIM and ZUMKONG.

The tag is: *misp-galaxy:tool="SLOWDRIFT"*

SLOWDRIFT is also known as:

- FE_APT_Downloader_Win_SLOWDRIFT_1
- FE_APT_Downloader_Win_SLOWDRIFT_2

- APT.Downloader.SLOWDRIFT

SLOWDRIFT has relationships with:

- similar: misp-galaxy:mitre-malware="SLOWDRIFT - S0218" with estimative-language:likelihood-probability="likely"

Table 5091. Table References

https://www2.fireeye.com/rs/848-DID-242/images/rpt_APT37.pdf

RoyalCli

The RoyalCli backdoor appears to be an evolution of BS2005 and uses familiar encryption and encoding routines. The name RoyalCli was chosen by us due to a debugging path left in the binary: 'c:\users\wizard\documents\visual studio 2010\Projects\RoyalCli\Release\RoyalCli.pdb' RoyalCli and BS2005 both communicate with the attacker's command and control (C2) through Internet Explorer (IE) by using the COM interface IWebBrowser2. Due to the nature of the technique, this results in C2 data being cached to disk by the IE process; we'll get to this later.

The tag is: *misp-galaxy:tool="RoyalCli"*

RoyalCli has relationships with:

- similar: *misp-galaxy:malpedia="RoyalCli"* with *estimative-language:likelihood-probability="likely"*

KillDisk Wiper

KillDisk, along with the multipurpose, cyberespionage-related BlackEnergy, was used in cyberattacks in late December 2015 against Ukraine's energy sector as well as its banking, rail, and mining industries. The malware has since metamorphosed into a threat used for digital extortion, affecting Windows and Linux platforms. The note accompanying the ransomware versions, like in the case of Petya, was a ruse: Because KillDisk also overwrites and deletes files (and don't store the encryption keys on disk or online), recovering the scrambled files was out of the question. The new variant we found, however, does not include a ransom note.

The tag is: *misp-galaxy:tool="KillDisk Wiper"*

KillDisk Wiper is also known as:

- KillDisk

KillDisk Wiper has relationships with:

- similar: *misp-galaxy:malpedia="KillDisk"* with *estimative-language:likelihood-probability="likely"*

Table 5098. Table References

https://www.bleepingcomputer.com/news/security/the-diskwriter-or-uselessdisk-bootlocker-may-be-a-wiper/

GoScanSSH

During a recent Incident Response (IR) engagement, Talos identified a new malware family that was being used to compromise SSH servers exposed to the internet. This malware, which we have named GoScanSSH, was written using the Go programming language, and exhibited several interesting characteristics. This is not the first malware family that Talos has observed that was written using Go. However, it is relatively uncommon to see malware written in this programming language. In this particular case, we also observed that the attacker created unique malware binaries for each host that was infected with the GoScanSSH malware. Additionally, the GoScanSSH command and control (C2) infrastructure was observed leveraging the Tor2Web proxy service in an attempt to make tracking the attacker-controlled infrastructure more difficult and resilient to takedowns.

The tag is: *misp-galaxy:tool="GoScanSSH"*

Table 5100. Table References

Links
http://blog.talosintelligence.com/2018/03/goscanssh-analysis.html

BabaYaga

The group behind BabaYaga —believed to be Russian-speaking hackers— uses this malware to inject sites with special keyboards to drive SEO traffic to hidden pages on compromised sites. These pages are then used to redirect users to affiliate marketing links, where if the user purchases advertised goods, the hackers also make a profit. The malware per-se is comprised of two modules —one that injects the spam content inside the compromised sites, and a backdoor module that gives attackers control over an infected site at any time. The intricacies of both modules are detailed in

much more depth in this 26-page report authored by Defiant (formerly known as WordFence), the security firm which dissected the malware's more recent versions. "[BabaYaga] is relatively well-written, and it demonstrates that the author has some understanding of software development challenges, like code deployment, performance and management," Defiant researchers say. "It can also infect Joomla and Drupal sites, or even generic PHP sites, but it is most fully developed around Wordpress."

The tag is: *misp-galaxy:tool="BabaYaga"*

Table 5116. Table References

Links
https://www.bleepingcomputer.com/news/security/lol-babayaga-wordpress-malware-updates-your-site/

InvisiMole

Except for the malware's binary file, very little is known of who's behind it, how it spreads, or in what types of campaigns has this been used.

"Our telemetry indicates that the malicious actors behind this malware have been active at least since 2013, yet the cyber-espionage tool was never analyzed nor detected until discovered by ESET products on compromised computers in Ukraine and Russia," said ESET researcher Zuzana Hromcová, who recently penned an in-depth report about this new threat.

"All infection vectors are possible, including installation facilitated by physical access to the machine," Hromcová added.

Typical to malware used in highly-targeted attacks, the malware has been stripped of most clues that could lead researchers back to its author. With the exception of one file (dating to October 13, 2013), all compilation dates have been stripped and replaced with zeros, giving little clues regarding its timeline and lifespan.

Furthermore, the malware is some clever piece of coding in itself, as it's comprised of two modules, both with their own set of spying features, but which can also help each other in exfiltrating data.

The tag is: *misp-galaxy:tool="InvisiMole"*

InvisiMole has relationships with:

- similar: *misp-galaxy:malpedia="InvisiMole"* with *estimative-language:likelihood-probability="likely"*

Table 5117. Table References

https://www.bleepingcomputer.com/news/security/invisimole-is-a-complex-spyware-that-can-take-pictures-and-record-audio/

Roaming Mantis

Roaming Mantis malware is designed for distribution through a simple, but very efficient trick based on a technique known as DNS hijacking. When a user attempts to access any website via a compromised router, they will be redirected to a malicious website. For example, if a user were to navigate to www.securelist.com using a web browser, the browser would be redirected to a rogue server which has nothing to do with the security research blog. As long as the browser displays the original URL, users are likely to believe the website is genuine. The web page from the rogue server displays the popup message: To better experience the browsing, update to the latest chrome version.

The tag is: *misp-galaxy:tool="Roaming Mantis"*

Olympic Destroyer

The Winter Olympics this year is being held in Pyeongchang, South Korea. The Guardian, a UK Newspaper reported an article that suggested the Olympic computer systems suffered technical issues during the opening ceremony. Officials at the games confirmed some technical issues to non-critical systems and they completed recovery within around 12 hours. Sunday 11th February the Olympic games officials confirmed a cyber attack occurred but did not comment or speculate further. Talos have identified the samples, with moderate confidence, used in this attack. The infection vector is currently unknown as we continue to investigate. The samples identified, however, are not from adversaries looking for information from the games but instead they are aimed to disrupt the games. The samples analysed appear to perform only destructive functionality. There does not appear to be any exfiltration of data. Analysis shows that actors are again favouring legitimate pieces of software as PsExec functionality is identified within the sample. The destructive nature of this malware aims to render the machine unusable by deleting shadow copies, event logs and trying to use PsExec & WMI to further move through the environment. This is something we have witnessed previously with BadRabbit and Nyetya.

DDKONG

The malware in question is configured with the following three exported functions: ServiceMain, Rundll32Call, DllEntryPoint. The ServiceMain exported function indicates that this DLL is expected to be loaded as a service. If this function is successfully loaded, it will ultimately spawn a new instance of itself with the Rundll32Call export via a call to rundll32.exe. The Rundll32Call exported function begins by creating a named event named 'RunOnce'. This event ensures that only a single instance of DDKong is executed at a given time. If this is the only instance of DDKong running at the time, the malware continues. If it's not, it dies. This ensures that only a single instance of DDKong is executed at a given time. DDKong attempts to decode an embedded configuration using a single byte XOR key of 0xC3. After this configuration is decoded and parsed, DDKONG proceeds to send a beacon to the configured remote server via a raw TCP connection. The packet has a header of length 32 and an optional payload. In the beacon, no payload is provided, and as such, the length of this packet is set to zero. After it sends the beacon, the malware expects a response command of either 0x4 or 0x6. Both responses instruct the malware to download and load a remote plugin. In the event 0x4 is specified, the malware is instructed to load the exported 'InitAction' function. If 0x6 is specified, the malware is instructed to load the exported 'KernelDllCmdAction' function. Prior to downloading the plugin, the malware downloads a buffer that is concatenated with the embedded configuration and ultimately provided to the plugin at runtime. As we can see in the above text, two full file paths are included in this buffer, providing us with insight into the original malware family's name, as well as the author. After this buffer is collected, the malware downloads the plugin and loads the appropriate function. This plugin provides the attacker with the ability to both list files and download/upload files on the victim machine.

The tag is: *misp-galaxy:tool="DDKONG"*

DDKONG has relationships with:

- similar: *misp-galaxy:malpedia="DDKONG"* with *estimative-language:likelihood-probability="likely"*

Table 5123. Table References

Links

PLAINTEE

This sample is configured with three exported functions: Add, Sub, DllEntryPoint. The DLL expects the export named 'Add' to be used when initially loaded. When this function is executed PLAINTEE executes a command in a new process to add persistence. Next, the malware calls the 'Sub' function which begins by spawning a mutex named 'microsoftfuckedupb' to ensure only a single instance is running at a given time. In addition, PLAINTEE will create a unique GUID via a call to CoCreateGuid() to be used as an identifier for the victim. The malware then proceeds to collect general system enumeration data about the infected machine and enters a loop where it will decode an embedded config blob and send an initial beacon to the C2 server. The configuration

blob is encoded using a simple single-byte XOR scheme. The first byte of the string is used as the XOR key to in turn decode the remainder of the data. The malware then proceeds to beacon to the configured port via a custom UDP protocol. The network traffic is encoded in a similar fashion, with a random byte being selected as the first byte, which is then used to decode the remainder of the packet via XOR. This beacon is continuously sent out until a valid response is obtained from the C2 server (there is no sleep timer set). After the initial beacon, there is a two second delay in between all other requests made. This response is expected to have a return command of 0x66660002 and to contain the same GUID that was sent to the C2 server. Once this response is received, the malware spawns several new threads, with different Command parameters, with the overall objective of loading and executing a new plugin that is to be received from the C2 server. During a file analysis of PLAINTEE in WildFire, we observed the attackers download and execute a plugin during the runtime for that sample. PLAINTEE expects the downloaded plugin to be a DLL with an export function of either 'shell' or 'file'. The plugin uses the same network protocol as PLAINTEE and so we were able to trivially decode further commands that were sent. The following commands were observed: tasklist, ipconfig /all. The attacker performed these two commands 33 seconds apart. As automated commands are typically performed more quickly this indicates that they may have been sent manually by the attacker.

The tag is: *misp-galaxy:tool="PLAINTEE"*

Bisonal

In early May, Unit 42 discovered an attack campaign against at least one defense company in Russia and one unidentified organization in South Korea delivering a variant of Bisonal malware. While not previously publicly documented, the variant has been in the wild since at least 2014. There are three primary differences between it and older Bisonal malware including a different cipher and encryption for C2 communication, and a large rewrite of the code for both network communication and maintaining persistence. To date, we have only collected 14 samples of this variant, indicating it may be sparingly used. The adversary behind these attacks lured the targets into launching the Microsoft Windows executable malware by masquerading it as a PDF file (using a fake PDF icon) and reusing publicly available data for the decoy PDF file's contents. Attacks using Bisonal have been blogged about in the past. In 2013, both COSEINC and FireEye revealed attacks using Bisonal against Japanese organizations . In October 2017, AhnLab published a report called "Operation Bitter Biscuit," an attack campaign against South Korea, Japan, India and Russia using Bisonal and its successors, Bioazih and Dexbia.

https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/

Agent ORM

Agent ORM began circulating alongside Skeur in campaigns throughout the second half of 2015. The

malware collects basic system information and is able to take screenshots of victim systems. It is used to download next-stage payloads when systems of interest are identified. It is strongly suspected that Agent ORM has been deprecated in favor of script-based first-stage implants (VB Flash, JS Flash, and Bateleur).

The tag is: *misp-galaxy:tool="Agent ORM"*

Agent ORM is also known as:

- Tosliph
- DRIFTPIN

Table 5128. Table References

Links
https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/

VB Flash

VB Flash was first observed being deployed alongside Agent ORM in September 2015. It is likely that this was developed as a replacement to Agent ORM and contained similar capabilities. The first observed instance of VB Flash included comments and was easy to analyze—later versions soon began to integrate multiple layers of obfuscation. Several versions of VB Flash were developed including ones that utilized Google Forms, Google Macros, and Google Spreadsheets together to make a command-and-control (C2) channel. This variant would POST victim data to a specified Google form, then make a request to a Google macro script, receiving an address for a Google Spreadsheet from which to request commands.

The tag is: *misp-galaxy:tool="VB Flash"*

VB Flash is also known as:

- HALFBAKED

VB Flash has relationships with:

- similar: *misp-galaxy:mitre-malware="HALFBAKED - S0151"* with *estimative-language:likelihood-probability="likely"*

Table 5129. Table References

Links
https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/

JS Flash

JS Flash capabilities closely resemble those of VB Flash and leverage interesting techniques in deployment via batch scripts embedded as OLE objects in malicious documents. Many iterations of JS Flash were observed being tested before deployment, containing minor changes to obfuscation

and more complex additions, such as the ability to download TinyMet (a cutdown of the Metasploit Meterpreter payload). PowerShell was also used heavily for the execution of commands and arbitrary script execution. No JS Flash samples were observed being deployed after November 2017.

The tag is: *misp-galaxy:tool="JS Flash"*

JS Flash is also known as:

- JavaScript variant of HALFBAKED

Table 5130. Table References

Links
https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/

Bateleur

Bateleur deployments began not long after JS Flash and were also written in JavaScript. Deployments were more infrequent and testing was not observed. It is likely that Bateleur was run in parallel as an alternative tool and eventually replaced JS Flash as CARBON SPIDER's first stage tool of choice. Although much simpler in design than JS Flash, all executing out of a single script with more basic obfuscation, Bateleur has a wealth of capabilities—including the ability to download arbitrary scripts and executables, deploy TinyMet, execute commands via PowerShell, deploy a credential stealer, and collect victim system information such as screenshots.

The tag is: *misp-galaxy:tool="Bateleur"*

Bateleur has relationships with:

- similar: *misp-galaxy:malpedia="Bateleur"* with *estimative-language:likelihood-probability="likely"*

MagentoCore Malware

A Dutch security researcher has lifted the veil on a massive website hacking campaign that has infected 7,339 Magento stores with a script that collects payment card data from people shopping

on the sites. The script is what industry experts call a "payment card scraper" or "skimmer." Hackers breach sites and modify their source code to load the script along with its legitimate files. The script usually loads on store checkout pages and secretly records payment card details entered in payment forms, data that it later sends to a server under the hacker's control.

The tag is: *misp-galaxy:tool="MagentoCore Malware"*

Table 5146. Table References

Xbash

Xbash is a malware family that is targeting Linux and Microsoft Windows servers. We can tie this malware, which we have named Xbash, to the Iron Group, a threat actor group known for previous ransomware attacks. Xbash was developed using Python and converted into self-contained Linux ELF executables by abusing the legitimate tool PyInstaller for distribution. Xbash aimed on discovering unprotected services, deleting victim's MySQL, PostgreSQL and MongoDB databases, and ransom for Bitcoins. Linux based systems are targeted for ransomware and botnet capabilities. The ransomware targets and deletes linux databases and there is no evidence of any functionality

that makes recovery even possible by payment the ransom. Where as, windows based systems are targeted for coinmining & self-propagating capabilities. Xbash spreads by attacking weak passwords and unpatched vulnerabilities.

The tag is: *misp-galaxy:tool="Xbash"*

Table 5148. Table References

Links

Chainshot

The new piece of malware, which received the name Chainshot, is used in the early stages of an attack to activate a downloader for the final payload in a malicious chain reaction.

The tag is: *misp-galaxy:tool="Chainshot"*

Table 5150. Table References

Links
https://www.bleepingcomputer.com/news/security/new-chainshot-malware-found-by-cracking-512-bit-rsa-key/

CroniX

The researchers named this campaign CroniX, a moniker that derives from the malware's use of Cron to achieve persistence and Xhide to launch executables with fake process names. The cryptocurrency minted on victim's computers is Monero (XMR), the coin of choice in cryptojacking activities. To make sure that rival activity does not revive, CroniX deletes the binaries of other cryptominers present on the system. Another action CroniX takes to establish supremacy on the machine is to check the names of the processes and kill those that swallow 60% of the CPU or more.

The tag is: *misp-galaxy:tool="CroniX"*

Table 5151. Table References

Links
https://www.bleepingcomputer.com/news/security/cronix-cryptominer-kills-rivals-to-reign-supreme/

FASTCash

Treasury has identified a sophisticated cyber-enabled ATM cash out campaign we are calling FASTCash. FASTCash has been active since late 2016 targeting banks in Africa and Asia to remotely compromise payment switch application servers within banks to facilitate fraudulent transactions, primarily involving ATMs, to steal cash equivalent to tens of millions of dollars. FBI has attributed malware used in this campaign to the North Korean government. We expect FASTCash to continue targeting retail payment systems vulnerable to remote exploitation.

The tag is: *misp-galaxy:tool="FASTCash"*

Zebrocy

Zebrocy is a tool used by APT28, which has been observed since late 2015. The communications module used by Zebrocy transmits using HTTP. The implant has key logging and file exfiltration functionality and utilises a file collection capability that identifies files with particular extensions.

The tag is: *misp-galaxy:tool="Zebrocy"*

Zebrocy is also known as:

- Zekapab

GhostMiner

GhostMiner is a new cryptocurrency mining malware. By the end of March 2018, a new variant of mining malware was detected targeting MSSQL, phpMyAdmin, and Oracle WebLogic servers. The sample uses Powershell to execute code with volatile resources and scans the server's processes to detect and stop other miners that might have been running prior to execution. The fileless malware has become more popular in the last years. The malicious code runs directly in main memory without writing any file on disk, where an antivirus engine could detect it.

KingMiner

A recently discovered cryptomining operation forces access to Windows servers to use their CPU cycles for mining Monero coins. Detected six months ago, the activity went through multiple stages of evolution. Since it was spotted in mid-June, the malware received two updates and the number of attacks keeps increasing. The researchers at CheckPoint analyzed the new threat and gave it the

name KingMiner. They found that it targets Microsoft IIS and SQL Servers in particular and runs a brute-force attack to gain access. Once in, the malware determines the CPU architecture and checks for older versions of itself to remove them.

OSX/Shlayer

The initial Trojan horse infection (the fake Flash Player installer) component of OSX/Shlayer leverages shell scripts to download additional malware or adware onto the infected system. The

primary goal of OSX/Shlayer is to download and install adware onto an infected Mac. Although "adware" may not sound like a big deal, it can be a lot more harmful than the name implies; be sure to watch our aforementioned interview with Amit Serper to learn more about one particular example of malicious Mac adware. At least one variant of the malware also appears to exhibit an interesting behavior: It checks whether one of several Mac anti-virus products is installed.

The tag is: *misp-galaxy:tool="OSX/Shlayer"*
